Dial, a quarterly magazine, published from 1840 to 1844, and edited by Emerson and Margaret Fuller. Among its contributors, besides those already mentioned, were Ripley, Thoreau, Parker, James Freeman Clarke, Charles A. Dana, John S. Dwight, C. P. Cranch, Charles Emerson and William H. Channing, another nephew of Dr. Channing. It contained, along with a good deal of rubbish, some of the best poetry and prose that have been published in America. The most lasting part of its contents were the contributions of Emerson and Thoreau. But even as a whole, it is so unique a way-mark in the history of our literature that all its four volumes--copies of which {453} had become scarce--have been recently reprinted in answer to a demand certainly very unusual in the case of an extinct periodical. >From time to time Emerson collected and published his lectures under various titles. A first series of Essays came out in 1841, and a second in 1844; the Conduct of Life in 1860, Society and Solitude in 1870, Letters and Social Aims, in 1876, and the Fortune of the Republic in 1878. In 1847 he issued a volume of Poems, and 1865 Mayday and Other Poems. These writings, as a whole, were variations on a single theme, expansions and illustrations of the philosophy set forth in Nature, and his early addresses. They were strikingly original, rich in thought, filled with wisdom, with lofty morality and spiritual religion. Emerson, said Lowell, first "cut the cable that bound us to English thought and gave us a chance at the dangers and glories of blue water." Nevertheless, as it used to be the fashion to find an English analogue for every American writer, so that Cooper was called the American Scott, and Mrs. Sigourney was described as the Hemans of America, a well-worn critical tradition has coupled Emerson with Carlyle. That his mind received a nudge from Carlyle's early essays and from Sartor Resartus is beyond a doubt. They were life-long friends and correspondents, and Emerson's Representative Men is, in some sort, a counterpart of Carlyle's Hero Worship. But in temper and style the two writers were widely different. Carlyle's pessimism and {454} dissatisfaction with the general drift of things gained upon him more and more, while Emerson was a consistent optimist to the end. The last of his writings published during his life-time, the Fortune of the Republic, contrasts strangely in its hopefulness with the desperation of Carlyle's later utterances. Even in presence of the doubt as to man's personal immortality he takes refuge in a high and stoical faith. "I think all sound minds rest on a certain preliminary conviction, namely: that if it be best that conscious personal life shall continue it will continue, and if not best, then it will not; and we, if we saw the whole, should of course see that it was better so." It is this conviction that gives to Emerson's writings their serenity and their tonic quality at the same time that it narrows the range of his dealings with life. As the idealist declines to cross-examine those facts which he regards as merely phenomenal, and looks upon this outward face of things as upon a mask not worthy to dismay the fixed soul, so the optimist turns away his eyes from the evil which he disposes of as merely negative, as the shadow of the good. Hawthorne's interest in the problem of sin finds little place in Emerson's philosophy. Passion comes not nigh him and Faust disturbs him with its disagreeableness. Pessimism is to him "the only skepticism." The greatest literature is that which is most broadly human, or, in other words, that which will square best with all philosophies. But Emerson's {455} genius was interpretive rather than constructive. The poet dwells in the cheerful world of phenomena. He is most the poet who realizes most intensely the good and the bad of human life. But Idealism makes experience shadowy and subordinates action to contemplation. To it the cities of men, with their "frivolous populations,"
". . . are but sailing foam-bells
Along thought's causing stream."

Shakespeare does not forget that the world will one day vanish "like the baseless fabric of a vision," and that we ourselves are "such stuff as dreams are made on;" but this is not the mood in which he dwells. Again: while it is for the philosopher to reduce variety to unity, it is the poet's task to detect the manifold under uniformity. In the great creative poets, in Shakespeare and Dante and Goethe, how infinite the swarm of persons, the multitude of forms! But with Emerson the type is important, the common element. "In youth we are mad for persons. But the larger experience of man discovers the identical nature appearing through them all." "The same--the same!" he exclaims in his essay on Plato. "Friend and foe are of one stuff; the plowman, the plow and the furrow are of one stuff." And this is the thought in Brahma:
"They reckon ill who leave me out;
When me they fly I am the wings:
I am the doubter and the doubt,
And I the hymn the Brahmin sings."

{456} It is not easy to fancy a writer who holds this altitude toward "persons" descending to the composition of a novel or a play. Emerson showed, indeed, a fine power of character analysis in his English Traits and Representative Men and in his memoirs of Thoreau and Margaret Fuller. There is even a sort of dramatic humor

in his portrait of Socrates. But upon the whole he stands midway between constructive artists, whose instinct it is to tell a story or sing a song, and philosophers, like Schelling, who give poetic expression to a system of thought. He belongs to the class of minds of which Sir Thomas Browne is the best English example. He set a high value upon Browne, to whose style his own, though far more sententious, bears a resemblance. Browne's saying, for example, "All things are artificial, for nature is the art of God," sounds like Emerson, whose workmanship, for the rest, in his prose essays was exceedingly fine and close. He was not afraid to be homely and racy in expressing thought of the highest spirituality. "Hitch your wagon to a star" is a good instance of his favorite manner. Emerson's verse often seems careless in technique. Most of his pieces are scrappy and have the air of runic rimes, or little oracular "voicings"--as they say in Concord--in rhythmic shape, of single thoughts on "Worship," "Character," "Heroism," "Art," "Politics," "Culture," etc. The content is the important thing, and the form is too frequently awkward or bald. Sometimes, indeed, in the {457} clear-obscure of Emerson's poetry the deep wisdom of the thought finds its most natural expression in the imaginative simplicity of the language. But though this artlessness in him became too frequently in his imitators, like Thoreau and Ellery Channing, an obtruded simplicity, among his own poems are many that leave nothing to be desired in point of wording and of verse. His Hymn Sung at the Completion of the Concord Monument, in 1836, is the perfect model of an occasional poem. Its lines were on every one's lips at the time of the centennial celebrations in 1876, and "the shot heard round the world" has hardly echoed farther than the song which chronicled it. Equally current is the stanza from Voluntaries :

"So nigh is grandeur to our dust,
So near is God to man,
When Duty whispers low, 'Thou must,'
The youth replies, 'I can.'"

So, too, the famous lines from the Problem :

"The hand that rounded Peter's dome,
And groined the aisles of Christian Rome,
Wrought in a sad sincerity.
Himself from God he could not free;
He builded better than he knew;
The conscious stone to beauty grew."

The most noteworthy of Emerson's pupils was Henry David Thoreau, "the poet-naturalist." After his graduation from Harvard College, in 1837, Thoreau engaged in school teaching and in {458} the manufacture of lead-pencils, but soon gave up all regular business and devoted himself to walking, reading, and the study of nature. He was at one time private tutor in a family on Staten Island, and he supported himself for a season by doing odd jobs in land surveying for the farmers about Concord. In 1845 he built, with his own hands, a small cabin on the banks of Walden Pond, near Concord, and lived there in seclusion for two years. His expenses during these years were nine cents a day, and he gave an account of his experiment in his most characteristic book, Walden, published in 1854. His Week on the Concord and Merrimac Rivers appeared in 1849. From time to time he went farther afield, and his journeys were reported in Cape Cod, the Maine Woods, Excursions, and a Yankee in Canada, all of which, as well as a volume of Letters and Early Spring in Massachusetts, have been given to the public since his death, which happened in 1862. No one has lived so close to nature, and written of it so intimately, as Thoreau. His life was a lesson in economy and a sermon on Emerson's text, "Lessen your denominator." He wished to reduce existence to the simplest terms--to

"live all alone
Close to the bone,
And where life is sweet
Constantly eat."

He had a passion for the wild, and seems like an Anglo-Saxon reversion to the type of the Red {459} Indian. The most distinctive note in Thoreau is his inhumanity. Emerson spoke of him as a "perfect piece of stoicism." "Man," said Thoreau, "is only the point on which I stand." He strove to realize the objective life of nature--nature in its aloofness from man; to identify himself, with the moose and the mountain. He listened, with his ear close to the

ground, for the voice of the earth. "What are the trees saying?" he exclaimed. Following upon the trail of the lumberman he asked the primeval wilderness for its secret, and "saw beneath dim aisles, in odorous beds, The slight linnaea hang its twin-born heads." He tried to interpret the thought of Ktaadn and to fathom the meaning of the billows on the back of Cape Cod, in their indifference to the shipwrecked bodies that they rolled ashore. "After sitting in my chamber many days, reading the poets, I have been out early on a foggy morning and heard the cry of an owl in a neighboring wood as from a nature behind the common, unexplored by science or by literature. None of the feathered race has yet realized my youthful conceptions of the woodland depths. I had seen the red election-birds brought from their recesses on my comrade's string, and fancied that their plumage would assume stranger and more dazzling colors, like the tints of evening, in proportion as I advanced farther into the darkness and solitude of the forest. Still less have I seen such strong and wild tints on any poet's string." {460} It was on the mystical side that Thoreau apprehended transcendentalism. Mysticism has been defined as the soul's recognition of its identity with nature. This thought lies plainly in Schelling's philosophy, and he illustrated it by his famous figure of the magnet. Mind and nature are one; they are the positive and negative poles of the magnet. In man, the Absolute--that is, God--becomes conscious of himself; makes of himself, as nature, an object to himself as mind. "The souls of men," said Schelling, "are but the innumerable individual eyes with which our infinite World-Spirit beholds himself." This thought is also clearly present in Emerson's view of nature, and has caused him to be accused of pantheism. But if by pantheism is meant the doctrine that the underlying principle of the universe is matter or force, none of the transcendentalists was a pantheist. In their view nature was divine. Their poetry is always haunted by the sense of a spiritual reality which abides beyond the phenomena. Thus in Emerson's Two Rivers:

"Thy summer voice, Musketaquit,[1]

Repeats the music of the rain,
But sweeter rivers pulsing flit
Through thee as thou through Concord plain.

"Thou in thy narrow banks art pent:
The stream I love unbounded goes;
Through flood and sea and firmament,
Through light, through life, it forward flows.

{461}

"I see the inundation sweet,
I hear the spending of the stream,
Through years, through men, through nature fleet,
Through passion, thought, through power and dream."

This mood occurs frequently in Thoreau. The hard world of matter becomes suddenly all fluent and spiritual, and he sees himself in it--sees God. "This earth," he cries, "which is spread out like a map around me, is but the lining of my inmost soul exposed." "In me is the sucker that I see;" and, of Walden Pond,

"I am its stony shore,
And the breeze that passes o'er."

"Suddenly old Time winked at me--ah, you know me, you rogue--and news had come that IT was well. That ancient universe is in such capital health, I think, undoubtedly, it will never die. . . . I see, smell, taste, hear, feel that everlasting something to which we are allied, at once our maker, our abode, our destiny, our very selves." It was something ulterior that Thoreau sought in nature. "The other world," he wrote, "is all my art: my pencils will draw no other: my jackknife will cut nothing else." Thoreau did not scorn, however, like Emerson, to "examine too microscopically the universal tablet." He was a close observer and accurate reporter of the ways of birds and plants and the minuter aspects of nature. He has had many followers, who have produced much pleasant literature on outdoor {462} life. But in none of them is there that unique combination of the poet, the naturalist and the mystic which gives his page its wild original flavor. He had the woodcraft of a hunter and the eye of a botanist, but his imagination did not stop short with the fact. The sound of a tree falling in the Maine woods was to him "as though a door had shut somewhere in the damp and shaggy wilderness." He saw small things in cosmic relations. His trip

down the tame Concord has for the reader the excitement of a voyage of exploration into far and unknown regions. The river just above Sherman's Bridge, in time of flood "when the wind blows freshly on a raw March day, heaving up the surface into dark and sober billows," was like Lake Huron, "and you may run aground on Cranberry Island," and "get as good a freezing there as anywhere on the North-west coast." He said that most of the phenomena described in Kane's voyages could be observed in Concord. The literature of transcendentalism was like the light of the stars in a winter night, keen and cold and high. It had the pale cast of thought, and was almost too spiritual and remote to "hit the sense of mortal sight." But it was at least indigenous. If not an American literature--not national and not inclusive of all sides of American life--it was, at all events, a genuine New England literature and true to the spirit of its section. The tough Puritan stock had at last put forth a {463} blossom which compared with the warm, robust growths of English soil even as the delicate wind flower of the northern spring compares with the cowslips and daisies of old England. In 1842 Nathaniel Hawthorne (1804-1864) the greatest American romancer, came to Concord. He had recently left Brook Farm, had just been married, and with his bride he settled down in the "Old Manse" for three paradisaical years. A picture of this protracted honeymoon and this sequestered life, as tranquil as the slow stream on whose banks it was passed, is given in the introductory chapter to his *Mosses from an Old Manse*, 1846, and in the more personal and confidential records of his *American Note Books*, posthumously published. Hawthorne was thirty-eight when he took his place among the Concord literati. His childhood and youth had been spent partly at his birthplace, the old and already somewhat decayed sea-port town of Salem, and partly at his grandfather's farm on Sebago Lake, in Maine, then on the edge of the primitive forest. Maine did not become a State, indeed, until 1820, the year before Hawthorne entered Bowdoin College, whence he was graduated in 1825, in the same class with Henry W. Longfellow and one year behind Franklin Pierce, afterward President of the United States. After leaving college Hawthorne buried himself for years in the seclusion of his home at Salem. His mother, who was early widowed, had withdrawn entirely from the world. For months {464} at a time Hawthorne kept his room, seeing no other society than that of his mother and sisters, reading all sorts of books and writing wild tales, most of which he destroyed as soon as he had written them. At twilight he would emerge from the house for a solitary ramble through the streets of the town or along the sea-side. Old Salem had much that was picturesque in its associations. It had been the scene of the witch trials in the seventeenth century, and it abounded in ancient mansions, the homes of retired whalers and India merchants. Hawthorne's father had been a ship captain, and many of his ancestors had followed the sea. One of his forefathers, moreover, had been a certain Judge Hawthorne, who in 1691 had sentenced several of the witches to death. The thought of this affected Hawthorne's imagination with a pleasing horror and he utilized it afterward in his *House of the Seven Gables*. Many of the old Salem houses, too, had their family histories, with now and then the hint of some obscure crime or dark misfortune which haunted posterity with its curse till all the stock died out, or fell into poverty and evil ways, as in the Pyncheon family of Hawthorne's romance. In the preface to the *Marble Faun* Hawthorne wrote: "No author without a trial can conceive of the difficulty of writing a romance about a country where there is no shadow, no antiquity, no mystery, no picturesque and gloomy wrong, nor any thing but a commonplace prosperity in broad and simple daylight." And yet it may {465} be doubted whether any environment could have been found more fitted to his peculiar genius than this of his native town, or any preparation better calculated to ripen the faculty that was in him than these long, lonely years of waiting and brooding thought. From time to time he contributed a story or a sketch to some periodical, such as S. G. Goodrich's *Annual*, the *Token*, or the *Knickerbocker Magazine*. Some of these attracted the attention of the judicious; but they were anonymous and signed by various *noms de plume*, and their author was at this time--to use his own words--"the obscurest man of letters in America." In 1828 he had issued anonymously and at his own expense a short romance, entitled *Fanshawe*. It had little success, and copies of the first edition are now exceedingly rare. In 1837 he published a collection of his magazine pieces under the title, *Twice Told Tales*. The book was generously praised in the *North American Review* by his former classmate, Longfellow; and Edgar Poe showed his keen critical perception by predicting that the writer would easily put himself at the head of imaginative literature in America if he would discard allegory, drop short stories and compose a genuine romance. Poe compared Hawthorne's work with that of the German romancer, Tieck, and it is interesting to find confirmation of this dictum in passages of the *American Note Books*, in which Hawthorne speaks of laboring over Tieck with a German dictionary. The {466} *Twice Told Tales* are the work of a recluse, who makes guesses at life from a knowledge of his own heart, acquired by a habit of introspection, but who has had little contact with men. Many of them were shadowy and others were morbid and unwholesome. But their gloom was of an interior kind, never the physically horrible of Poe. It arose from weird psychological situations like that of *Ethan Brand* in his search for the unpardonable sin. Hawthorne was true to the inherited instinct of Puritanism; he took the conscience for his theme, and in these early tales he was already absorbed in the problem of evil, the subtle ways in which sin works out its retribution, and the species of fate or necessity that the wrong-doer makes for himself in the inevitable sequences of his crime. Hawthorne was strongly drawn toward symbols and types, and never quite

followed Poe's advice to abandon allegory. The *Scarlet Letter* and his other romances are not, indeed, strictly allegories, since the characters are men and women and not mere personifications of abstract qualities. Still they all have a certain allegorical tinge. In the *Marble Faun*, for example, Hilda, Kenyon, Miriam and Donatello have been ingeniously explained as personifications respectively of the conscience, the reason, the imagination and the senses. Without going so far as this, it is possible to see in these and in Hawthorne's other creations something typical and representative. He uses his characters like algebraic symbols to work out certain problems with: they are rather more and yet rather less than flesh and blood individuals. The stories in *Twice Told Tales* and in the second collection, *Mosses from an Old Manse*, 1846, are more openly allegorical than his later work. Thus the *Minister's Black Veil* is a sort of anticipation of Arthur Dimmesdale in the *Scarlet Letter*. From 1846 to 1849 Hawthorne held the position of Surveyor of the Custom House of Salem. In the preface to the *Scarlet Letter* he sketched some of the government officials with whom this office had brought him into contact in a way that gave some offense to the friends of the victims and a great deal of amusement to the public. Hawthorne's humor was quiet and fine, like Irving's, but less genial and with a more satiric edge to it. The book last named was written at Salem and published in 1850, just before its author's removal to Lenox, now a sort of inland Newport, but then an unfashionable resort among the Berkshire hills. Whatever obscurity may have hung over Hawthorne hitherto was effectually dissolved by this powerful tale, which was as vivid in coloring as the implication of its title. Hawthorne chose for his background the somber life of the early settlers in New England. He had always been drawn toward this part of American history, and in *Twice Told Tales* had given some illustrations of it in *Endicott's Red Cross* and *Legends of the Province House*. Against this dark foil moved in strong relief the figures of Hester Prynne, the woman taken in adultery, her paramour, the Rev. Arthur Dimmesdale, her husband, old Roger Chillingworth, and her illegitimate child. In tragic power, in its grasp of the elementary passions of human nature and its deep and subtle insight into the inmost secrets of the heart, this is Hawthorne's greatest book. He never crowded his canvas with figures. In the *Blithedale Romance* and the *Marble Faun* there is the same *parti carré* or group of four characters. In the *House of the Seven Gables* there are five. The last mentioned of these, published in 1852, was of a more subdued intensity than the *Scarlet Letter*, but equally original and, upon the whole, perhaps equally good. The *Blithedale Romance*, published in the same year, though not strikingly inferior to the others, adhered more to conventional patterns in its plot and in the sensational nature of its ending. The suicide of the heroine by drowning, and the terrible scene of the recovery of her body, were suggested to the author by an experience of his own on Concord River, the account of which, in his own words, may be read in Julian Hawthorne's *Nathaniel Hawthorne and His Wife*. In 1852 Hawthorne returned to Concord and bought the "Wayside" property, which he retained until his death. But in the following year his old college friend Pierce, now become President, appointed him Consul to Liverpool, and he went abroad for seven years. The most valuable fruit of his foreign residence was the romance of the *Marble Faun*, 1860; the longest of his fictions and the richest in descriptive beauty. The theme of this was the development of the soul through the experience of sin. There is a haunting mystery thrown about the story, like a soft veil of mist, veiling the beginning and the end. There is even a delicate teasing suggestion of the preternatural in Donatello, the Faun, a creation as original as Shakspeare's Caliban, or Fouqué's Undine, and yet quite on this side the border-line of the human. *Our Old Home*, a book of charming papers on England, was published in 1863. Manifold experience of life and contact with men, affording scope for his always keen observation, had added range, fullness, warmth to the imaginative subtlety which had manifested itself even in his earliest tales. Two admirable books for children, the *Wonder Book* and *Tanglewood Tales*, in which the classical mythologies were retold; should also be mentioned in the list of Hawthorne's writings, as well as the *American*, *English*, and *Italian Note Books*, the first of which contains the seed thoughts of some of his finished works, together with hundreds of hints for plots, episodes, descriptions, etc., which he never found time to work out. Hawthorne's style, in his first sketches and stories a little stilted and "bookish," gradually acquired an exquisite perfection, and is as well worth study as that of any prose classic in the English tongue. Hawthorne was no transcendentalist. He dwelt much in a world of ideas, and he sometimes doubted whether the tree on the bank or its image in the stream were the more real. But this had little in common with the philosophical idealism of his neighbors. He revered Emerson, and he held kindly intercourse--albeit a silent man and easily bored--with Thoreau and Ellery Channing, and even with Margaret Fuller. But his sharp eyes saw whatever was whimsical or weak in the apostles of the new faith. He had little enthusiasm for causes or reforms, and among so many Abolitionists he remained a Democrat, and even wrote a campaign life of his friend Pierce. The village of Concord has perhaps done more for American literature than the city of New York. Certainly there are few places where associations, both patriotic and poetic, cluster so thickly. At one side of the grounds of the Old Manse--which has the river at its back--runs down a shaded lane to the Concord monument and the figure of the Minute Man and the successor of "the rude bridge that arched the flood." Scarce two miles away, among the woods, is little Walden--"God's drop." The men who made Concord famous are asleep in Sleepy Hollow, yet still their

memory prevails to draw seekers after truth to the Concord Summer School of Philosophy, which meets every year, to reason high of "God, Freedom, and Immortality," next-door to the "Wayside," and under the hill on whose ridge Hawthorne wore a path, as he paced up and down beneath the hemlocks. {471}

CHAPTER V.

THE CAMBRIDGE SCHOLARS.

1837-1861.

With few exceptions, the men who have made American literature what it is have been college graduates. And yet our colleges have not commonly been, in themselves, literary centers. Most of them have been small and poor, and situated in little towns or provincial cities. Their alumni scatter far and wide immediately after graduation, and even those of them who may feel drawn to a life of scholarship or letters find little to attract them at the home of their alma mater, and seek, by preference, the large cities where periodicals and publishing houses offer some hope of support in a literary career. Even in the older and better equipped universities the faculty is usually a corps of working scholars, each man intent upon his specialty and rather inclined to undervalue merely "literary" performance. In many cases the fastidious and hypercritical turn of mind which besets the scholar, the timid conservatism which naturally characterizes an ancient seat of learning and the spirit of theological conformity which suppresses free discussion have exerted their {473} benumbing influence upon the originality and creative impulse of their inmates. Hence it happens that, while the contributions of American college teachers to the exact sciences, to theology and philology, metaphysics, political philosophy and the severer branches of learning have been honorable and important, they have as a class made little mark upon the general literature of the country. The professors of literature in our colleges are usually persons who have made no additions to literature, and the professors of rhetoric seem ordinarily to have been selected to teach students how to write, for the reason that they themselves have never written any thing that any one has ever read. To these remarks the Harvard College of some fifty years ago offers a striking exception. It was not the large and fashionable university that it has lately grown to be, with its multiplied elective courses, its numerous faculty and its somewhat motley collection of undergraduates; but a small school of the classics and mathematics, with something of ethics, natural science and the modern languages added to its old-fashioned, scholastic curriculum, and with a very homogeneous _clientèle_, drawn mainly from the Unitarian families of Eastern Massachusetts. Nevertheless a finer intellectual life, in many respects, was lived at old Cambridge within the years covered by this chapter than nowadays at the same place, or at any date in any other American university town. The {474} neighborhood of Boston, where the commercial life has never so entirely overlain the intellectual as in New York and Philadelphia, has been a standing advantage to Harvard College. The recent upheaval in religious thought had secured toleration, and made possible that free and even audacious interchange of ideas without which a literary atmosphere is impossible. From these, or from whatever causes, it happened that the old Harvard scholarship had an elegant and tasteful side to it, so that the dry erudition of the schools blossomed into a generous culture, and there were men in the professors' chairs who were no less efficient as teachers because they were also poets, orators, wits and men of the world. In the seventeen years from 1821 to 1839 there were graduated from Harvard College Emerson, Holmes, Sumner, Phillips, Motley, Thoreau, Lowell, and

Edward Everett Hale, some of whom took up their residence at Cambridge, others at Boston and others at Concord, which was quite as much a spiritual suburb of Boston as Cambridge was. In 1836, when Longfellow became Professor of Modern Languages at Harvard, Sumner was lecturing in the Law School. The following year--in which Thoreau took his bachelor's degree--witnessed the delivery of Emerson's Phi Beta Kappa lecture on the *American Scholar* in the college chapel and Wendell Phillips's speech on the *Murder of Lovejoy* in Faneuil Hall. Lowell, whose description of the impression produced by {475} the former of these famous addresses has been quoted in a previous chapter, was an undergraduate at the time. He took his degree in 1838 and in 1855 succeeded Longfellow in the chair of Modern Languages. Holmes had been chosen in 1847 Professor of Anatomy and Physiology in the Medical School--a position which he held until 1882. The historians, Prescott and Bancroft, had been graduated in 1814 and 1817 respectively. The former's first important publication, *Ferdinand and Isabella*, appeared in 1837. Bancroft had been a tutor in the college in 1822-23 and the initial volume of his *History of the United States* was issued in 1835. Another of the Massachusetts school of historical writers, Francis Parkman, took his first degree at Harvard in 1844. Cambridge was still hardly more than a village, a rural outskirts of Boston, such as Lowell described it in his article, *Cambridge Thirty Years Ago*, originally contributed to *Putnam's Monthly* in 1853, and afterward reprinted in his *Fireside Travels*, 1864. The situation of a university scholar in old Cambridge was thus an almost ideal one. Within easy reach of a great city, with its literary and social clubs, its theaters, lecture courses, public meetings, dinner parties, etc., he yet lived withdrawn in an academic retirement among elm-shaded avenues and leafy gardens, the dome of the Boston State-house looming distantly across the meadows where the Charles laid its "steel blue sickle" upon the variegated, plush-like ground of the wide marsh. There was {476} thus, at all times during the quarter of a century embraced between 1837 and 1861, a group of brilliant men resident in or about Cambridge and Boston, meeting frequently and intimately, and exerting upon one another a most stimulating influence. Some of the closer circles--all concentric to the university--of which this group was loosely composed were laughed at by outsiders as "Mutual Admiration Societies." Such was, for instance, the "Five of Clubs," whose members were Longfellow, Sumner, C. C. Tellon, Professor of Greek at Harvard, and afterward president of the college; G. S. Hillard, a graceful lecturer, essayist and poet, of a somewhat amateurish kind; and Henry R. Cleveland, of Jamaica Plain, a lover of books and a writer of them. Henry Wadsworth Longfellow (1807-1882) the most widely read and loved of American poets--or indeed, of all contemporary poets in England and America--though identified with Cambridge for nearly fifty years was a native of Portland, Maine, and a graduate of Bowdoin College, in the same class with Hawthorne. Since leaving college, in 1825, he had studied and traveled for some years in Europe, and had held the professorship of modern languages at Bowdoin. He had published several text books, a number of articles on the Romance languages and literatures in the *North American Review*, a thin volume of metrical translations from the Spanish, a few original poems in various periodicals, and the pleasant sketches of European {477} travel entitled *Outre Mer*. But Longfellow's fame began with the appearance in 1839 of his *Voices of the Night*. Excepting an earlier collection by Bryant this was the first volume of real poetry published in New England, and it had more warmth and sweetness, a greater richness and variety than Bryant's work ever possessed. Longfellow's genius was almost feminine in its flexibility and its sympathetic quality. It readily took the color of its surroundings and opened itself eagerly to impressions of the beautiful from every quarter, but especially from books. This first volume contained a few things written during his student days at Bowdoin, one of which, a blank verse piece on *Autumn*, clearly shows the influence of Bryant's *Thanatopsis*. Most of these *juvenilia* had nature for their theme, but they were not so sternly true to the New England landscape as Thoreau or Bryant. The skylark and the ivy appear among their scenic properties, and in the best of them, *Woods in Winter*, it is the English "hawthorn" and not any American tree, through which the gale is made to blow, just as later Longfellow uses "rooks" instead of crows. The young poet's fancy was instinctively putting out feelers toward the storied lands of the Old World, and in his *Hymn of the Moravian Nuns of Bethlehem* he transformed the rude church of the Moravian sisters to a cathedral with "glimmering tapers," swinging censers, chancel, altar, cows and "dim mysterious aisle." After his visit to Europe, {478} Longfellow returned deeply imbued with the spirit of romance. It was his mission to refine our national taste by opening to American readers, in their own vernacular, new springs of beauty in the literatures of foreign tongues. The fact that this mission was interpretative, rather than creative, hardly detracts from Longfellow's true originality. It merely indicates that his inspiration came to him in the first instance from other sources than the common life about him. He naturally began as a translator, and this first volume contained, among other things, exquisite renderings from the German of Uhland, Salis, and Müller, from the Danish, French, Spanish and Anglo-Saxon, and a few passages from Dante. Longfellow remained all his life a translator, and in subtler ways than by direct translation he infused the fine essence of European poetry into his own. He loved—

"Tales that have the rime of age

And chronicles of eld."

The golden light of romance is shed upon his page, and it is his habit to borrow mediaeval and Catholic imagery from his favorite middle ages, even when writing of American subjects. To him the clouds are hooded friars, that "tell their beads in drops of rain;" the midnight winds blowing through woods and mountain passes are chanting solemn masses for the repose of the dying year, and the strain ends with the prayer--

"Kyrie, eleyson,
Christe, eleyson."

{479} In his journal he wrote characteristically: "The black shadows lie upon the grass like engravings in a book. Autumn has written his rubric on the illuminated leaves, the wind turns them over and chants like a friar." This in Cambridge, of a moonshiny night, on the first day of the American October. But several of the pieces in *Voices of the Night* sprang more immediately from the poet's own inner experience. The *Hymn to the Night*, the *Psalm of Life*, the *Reaper and the Flowers*, *Footsteps of Angels*, the *Light of Stars*, and the *Beleaguered City* spoke of love, bereavement, comfort, patience and faith. In these lovely songs and in many others of the same kind which he afterward wrote, Longfellow touched the hearts of all his countrymen. America is a country of homes, and Longfellow, as the poet of sentiment and of the domestic affections, became and remains far more general in his appeal than such a "cosmic" singer as Whitman, who is still practically unknown to the "fierce democracy" to which he has addressed himself. It would be hard to over-estimate the influence for good exerted by the tender feeling and the pure and sweet morality which the hundreds of thousands of copies of Longfellow's writings, that have been circulated among readers of all classes in America and England, have brought with them. Three later collections, *Ballads and Other Poems*, 1842; the *Belfry of Bruges*, 1846; and the *Seaside and the Fireside*, 1850, comprise most of what is {480} noteworthy in Longfellow's minor poetry. The first of these embraced, together with some renderings from the German and the Scandinavian languages, specimens of stronger original work than the author had yet put forth; namely, the two powerful ballads of the *Skeleton in Armor* and the *Wreck of the Hesperus*. The former of these, written in the swift leaping meter of Drayton's *Ode to the Cambro Britons on their Harp*, was suggested by the digging up of a mail-clad skeleton at Fall River--a circumstance which the poet linked with the traditions about the Round Tower at Newport and gave to the whole the spirit of a Norse viking song of war and of the sea. The *Wreck of the Hesperus* was occasioned by the news of shipwrecks on the coast near Gloucester and by the name of a reef--"Norman's Woe"--where many of them took place. It was written one night between twelve and three, and cost the poet, he said, "hardly an effort." Indeed, it is the spontaneous ease and grace, the unflinching taste of Longfellow's lines, which are their best technical quality. There is nothing obscure or esoteric about his poetry. If there is little passion or intellectual depth, there is always genuine poetic feeling, often a very high order of imagination and almost invariably the choice of the right word. In this volume were also included the *Village Blacksmith* and *Excelsior*. The latter, and the *Psalm of Life*, have had a "damnable iteration" which causes them to figure as Longfellow's most popular {481} pieces. They are by no means, however, among his best. They are vigorously expressed commonplaces of that hortatory kind which passes for poetry, but is, in reality, a vague species of preaching. In the *Belfry of Bruges* and the *Seaside and the Fireside*, the translations were still kept up, and among the original pieces were the *Occultation of Orion*--the most imaginative of all Longfellow's poems; *Seaweed*, which has very noble stanzas, the favorite *Old Clock on the Stairs*, the *Building of the Ship*, with its magnificent closing apostrophe to the Union, and the *Fire of Driftwood*, the subtlest in feeling of any thing that the poet ever wrote. With these were verses of a more familiar quality, such as the *Bridge*, *Resignation*, and the *Day Is Done*, and many others, all reflecting moods of gentle and pensive sentiment, and drawing from analogies in nature or in legend lessons which, if somewhat obvious, were expressed with perfect art. Like Keats, he apprehended every thing on its beautiful side. Longfellow was all poet. Like Ophelia in *Hamlet*,
"Thought and affection, passion, hell itself,
He turns to favor and to prettiness."

He cared very little about the intellectual movement of the age. The transcendental ideas of Emerson passed over his head and left him undisturbed. For politics he had that gentlemanly distaste which the cultivated class in America had {482} already begun to entertain. In 1842 he printed a small volume of *Poems on Slavery*, which drew commendation from his friend Sumner, but had nothing of the fervor of Whittier's or Lowell's utterances on the same subject. It is interesting to compare his journals with Hawthorne's *American Note Books* and to observe in what very different ways the two writers made prey of their daily experiences for literary material. A favorite haunt of Longfellow's was the bridge between Boston and Cambridgeport, the same which he put into verse in his poem, the *Bridge*. "I always stop on the bridge," he writes in his journal; "tide waters are beautiful. From the ocean up

into the land they go, like messengers, to ask why the tribute has not been paid. The brooks and rivers answer that there has been little harvest of snow and rain this year. Floating sea-weed and kelp is carried up into the meadows, as returning sailors bring oranges in bandanna handkerchiefs to friends in the country." And again: "We leaned for awhile on the wooden rail and enjoyed the silvery reflection on the sea, making sundry comparisons. Among other thoughts we had this cheering one, that the whole sea was flashing with this heavenly light, though we saw it only in a single track; the dark waves are the dark providences of God; luminous, though not to us; and even to ourselves in another position." "Walk on the bridge, both ends of which are lost in the fog, like human life midway between two eternities; {483} beginning and ending in mist." In Hawthorne an allegoric meaning is usually something deeper and subtler than this, and seldom so openly expressed. Many of Longfellow's poems--the *Beleaguered City*, for example--may be definitely divided into two parts; in the first, a story is told or a natural phenomenon described; in the second, the spiritual application of the parable is formally set forth. This method became with him almost a trick of style, and his readers learned to look for the *haec fabula docet* at the end as a matter of course. As for the prevailing optimism in Longfellow's view of life--of which the above passage is an instance--it seemed to be in him an affair of temperament, and not, as in Emerson, the result of philosophic insight. Perhaps, however, in the last analysis optimism and pessimism are subjective--the expression of temperament or individual experience, since the facts of life are the same, whether seen through Schopenhauer's eyes or through Emerson's. If there is any particular in which Longfellow's inspiration came to him at first hand and not through books, it is in respect to the aspects of the sea. On this theme no American poet has written more beautifully and with a keener sympathy than the author of the *Wreck of the Hesperus* and of *Seaweed*. In 1847 was published the long poem of *Evangeline*. The story of the Acadian peasant girl, who was separated from her lover in the dispersion of her people by the English troops, and after weary wanderings and a life-long search found him at last, {484} an old man dying in a Philadelphia hospital, was told to Longfellow by the Rev. H. L. Conolly, who had previously suggested it to Hawthorne as a subject for a story. Longfellow, characteristically enough, "got up" the local color for his poem from Haliburton's account of the dispersion of the Grand-Pré Acadians, from Darby's *Geographical Description of Louisiana* and Watson's *Annals of Philadelphia*. He never needed to go much outside of his library for literary impulse and material. Whatever may be held as to Longfellow's inventive powers as a creator of characters or an interpreter of American life, his originality as an artist is manifested by his successful domestication in *Evangeline* of the dactylic hexameter, which no English poet had yet used with effect. The English poet, Arthur Hugh Clough, who lived for a time in Cambridge, followed Longfellow's example in the use of hexameter in his *Bothie of Tober-na-Vuolich*, so that we have now arrived at the time--a proud moment for American letters--when the works of our writers began to react upon the literature of Europe. But the beauty of the descriptions in *Evangeline* and the pathos--somewhat too drawn out--of the story made it dear to a multitude of readers who cared nothing about the technical disputes of Poe and other critics as to whether or not Longfellow's lines were sufficiently "spondaic" to truthfully represent the quantitative hexameters of Homer and Vergil. In 1855 appeared *Hiawatha*, Longfellow's most {485} aboriginal and "American" book. The tripping trochaic measure he borrowed from the Finnish epic *Kalevala*. The vague, childlike mythology of the Indian tribes, with its anthropomorphic sense of the brotherhood between men, animals, and the forms of inanimate nature, he took from Schoolcraft's *Algic Researches*, 1839. He fixed forever, in a skillfully chosen poetic form, the more inward and imaginative part of Indian character, as Cooper had given permanence to its external and active side. Of Longfellow's dramatic experiments the *Golden Legend*, 1851, alone deserves mention here. This was in his chosen realm; a tale taken from the ecclesiastical annals of the middle ages, precious with martyrs' blood and bathed in the rich twilight of the cloister. It contains some of his best work, but its merit is rather poetic than dramatic; although Ruskin praised it for the closeness with which it entered into the temper of the monk. Longfellow has pleased the people more than the critics. He gave freely what he had, and the gift was beautiful. Those who have looked in his poetry for something else than poetry, or for poetry of some other kind, have not been slow to assert that he was a lady's poet; one who satisfied callow youths and school-girls by uttering commonplaces in graceful and musical shape, but who offered no strong meat for men. Miss Fuller called his poetry thin and the poet himself a "dandy Pindar." This is not true of his poetry, {486} or of the best of it. But he had a singing and not a talking voice, and in his prose one becomes sensible of a certain weakness. *Hyperion*, for example, published in 1839, a loitering fiction, interspersed with descriptions of European travel, is, upon the whole, a weak book, over flowery in diction and sentimental in tone. The crown of Longfellow's achievements as a translator was his great version of Dante's *Divina Commedia*, published between 1867 and 1870. It is a severely literal, almost a line for line, rendering. The meter is preserved, but the rhyme sacrificed. If not the best English poem constructed from Dante, it is at all events the most faithful and scholarly paraphrase. The sonnets which accompanied it are among Longfellow's best work. He seems to have been raised by daily communion with the great Tuscan into a habit of deeper and more subtle thought than is elsewhere common in his poetry. Oliver Wendell Holmes (1809-) is a native of Cambridge and a graduate of Harvard in the class of '29; a

class whose anniversary reunions he has celebrated in something like forty distinct poems and songs. For sheer cleverness and versatility Dr. Holmes is, perhaps, unrivaled among American men of letters. He has been poet, wit, humorist, novelist, essayist and a college lecturer and writer on medical topics. In all of these departments he has produced work which ranks high, if not with the highest. His father, {487} Dr. Abiel Holmes, was a graduate of Yale and an orthodox minister of liberal temper, but the son early threw in his lot with the Unitarians; and, as was natural to a man of a satiric turn and with a very human enjoyment of a fight, whose youth was cast in an age of theological controversy, he has always had his fling at Calvinism and has prolonged the slogans of old battles into a later generation; sometimes, perhaps, insisting upon them rather wearisomely and beyond the limits of good taste. He had, even as an undergraduate, a reputation for cleverness at writing comic verses, and many of his good things in this kind, such as the Dorchester Giant and the Height of the Ridiculous, were contributed to the Collegian, a students' paper. But he first drew the attention of a wider public by his spirited ballad of Old Ironsides--

"Ay! Tear her tattered ensign down!"--

composed about 1830, when it was proposed by the government to take to pieces the unseaworthy hulk of the famous old man-of-war, "Constitution." Holmes's indignant protest--which has been a favorite subject for school-boy declamation--had the effect of postponing the vessel's fate for a great many years. From 1830-35 the young poet was pursuing his medical studies in Boston and Paris, contributing now and then some verses to the magazines. Of his life as a medical student in Paris there are many pleasant reminiscences in his Autocrat and other writings, as where he tells, for {488} instance, of a dinner party of Americans in the French capital, where one of the company brought tears of home-sickness into the eyes of his sodales by saying that the tinkle of the ice in the champagne-glasses reminded him of the cowbells in the rocky old pastures of New England. In 1836 he printed his first collection of poems. The volume contained among a number of pieces broadly comic, like the September Gale, the Music Grinders, and the Ballad of the Oysterman--which at once became widely popular--a few poems of a finer and quieter temper, in which there was a quaint blending of the humorous and the pathetic. Such were My Aunt and the Last Leaf--which Abraham Lincoln found "inexpressibly touching," and which it is difficult to read without the double tribute of a smile and a tear. The volume contained also Poetry: A Metrical Essay, read before the Harvard Chapter of the Phi Beta Kappa Society, which was the first of that long line of capital occasional poems which Holmes has been spinning for half a century with no sign of fatigue and with scarcely any falling off in freshness; poems read or spoken or sung at all manner of gatherings, public and private; at Harvard commencements, class days, and other academic anniversaries; at inaugurations, centennials, dedications of cemeteries, meetings of medical associations, mercantile libraries, Burns clubs and New England societies; at rural festivals and city fairs; openings of theaters, layings of corner stones, {489} birthday celebrations, jubilees, funerals, commemoration services, dinners of welcome or farewell to Dickens, Bryant, Everett, Whittier, Longfellow, Grant, Farragut, the Grand Duke Alexis, the Chinese Embassy and what not. Probably no poet of any age or clime has written so much and so well to order. He has been particularly happy in verses of a convivial kind, toasts for big civic feasts, or post-prandial rhymes for the petit comité--the snug little dinners of the chosen few. His

"The quaint trick to cram the pithy line
That cracks so crisply over bubbling wine."

And although he could write on occasion a Song for a Temperance Dinner, he has preferred to chant the praise of the punch bowl and to

"feel the old convivial glow (unaided) o'er me stealing,
The warm, champagny, old-particular-brandy-punchy feeling."

It would be impossible to enumerate the many good things of this sort which Holmes has written, full of wit and wisdom, and of humor lightly dashed with sentiment and sparkling with droll analogies, sudden puns, and unexpected turns of rhyme and phrase. Among the best of them are Nux Postcoenatica, A Modest Request, Ode for a Social Meeting, The Boys, and Rip Van Winkle, M.D. Holmes's favorite measure, in his longer poems, is the heroic couplet which Pope's example seems to have consecrated forever to satiric and didactic verse. He writes as easily in this {490} meter as if it were prose, and with much of Pope's epigrammatic neatness. He also manages with facility the anapaestics of Moore and the ballad stanza which Hood had made the vehicle for his drolleries. It cannot be expected that verses manufactured to pop with the corks and fizz with the champagne at academic banquets should much outlive the occasion; or that the habit of producing such verses on demand should

foster in the producer that "high seriousness" which Matthew Arnold asserts to be one mark of all great poetry. Holmes's poetry is mostly on the colloquial level, excellent society-verse, but even in its serious moments too smart and too pretty to be taken very gravely; with a certain glitter, knowingness and flippancy about it and an absence of that self-forgetfulness and intense absorption in its theme which characterize the work of the higher imagination. This is rather the product of fancy and wit. Wit, indeed, in the old sense of quickness in the perception of analogies is the staple of his mind. His resources in the way of figure, illustration, allusion and anecdote are wonderful. Age cannot wither him nor custom stale his infinite variety, and there is as much powder in his latest pyrotechnics as in the rockets which he sent up half a century ago. Yet, though the humorist in him rather outweighs the poet, he has written a few things, like the Chambered Nautilus and Homesick in Heaven, which are as purely and deeply poetic as the One-Hoss Shay and the Prologue are funny. {491} Dr. Holmes is not of the stuff of which idealists and enthusiasts are made. As a physician and a student of science, the facts of the material universe have counted for much with him. His clear, positive, alert intellect was always impatient of mysticism. He had the sharp eye of the satirist and the man of the world for oddities of dress, dialect and manners. Naturally the transcendental movement struck him on its ludicrous side, and in his After-Dinner Poem, read at the Phi Beta Kappa dinner at Cambridge in 1843, he had his laugh at the "Orphic odes" and "runes" of the bedlamite seer and bard of mystery

"Who rides a beetle which he calls a 'sphinx,'
And O what questions asked in club-foot rhyme
Of Earth the tongueless, and the deaf-mute Time!
Here babbling 'Insight' shouts in Nature's ears
His last conundrum on the orbs and spheres;
There Self-inspection sucks its little thumb,
With 'Whence am I?' and 'Wherefore did I come?'"

Curiously enough, the author of these lines lived to write an appreciative life of the poet who wrote the Sphinx. There was a good deal of toryism or social conservatism in Holmes. He acknowledged a preference for the man with a pedigree, the man who owned family portraits, had been brought up in familiarity with books, and could pronounce "view" correctly. Readers unhappily not of the "Brahmin caste of New England" have sometimes resented as snobbishness Holmes's harping {492} on "family," and his perpetual application of certain favorite shibboleths to other people's ways of speech. "The woman who calc'lates is lost."

"Learning condemns beyond the reach of hope
The careless lips that speak of soap for soap. . . .
Do put your accents in the proper spot;
Don't, let me beg you, don't say 'How?' for 'What?'
The things named 'pants' in certain documents,
A word not made for gentlemen, but 'gents.'"

With the rest of "society" he was disposed to ridicule the abolition movement as a crotchet of the eccentric and the long-haired. But when the civil war broke out he lent his pen, his tongue, and his own flesh and blood to the cause of the Union. The individuality of Holmes's writings comes in part from their local and provincial bias. He has been the laureate of Harvard College and the bard of Boston city, an urban poet, with a cockneyish fondness for old Boston ways and things--the Common and the Frog Pond, Faneuil Hall and King's Chapel and the Old South, Bunker Hill, Long Wharf, the Tea Party, and the town crier. It was Holmes who invented the playful saying that "Boston State House is the hub of the solar system." In 1857 was started the Atlantic Monthly, a magazine which has published a good share of the best work done by American writers within the past thirty years. Its immediate success was assured by Dr. Holmes's brilliant series of papers, the {493} Autocrat of the Breakfast Table, 1858, followed at once by the Professor at the Breakfast Table, 1859, and later by the Poet at the Breakfast Table, 1873. The Autocrat is its author's masterpiece, and holds the fine quintessence of his humor, his scholarship, his satire, genial observation, and ripe experience of men and cities. The form is as unique and original as the contents, being something between an essay and a drama; a succession of monologues or table-talks at a typical American boarding-house, with a thread of story running through the whole. The variety of mood and thought is so great that these conversations never tire, and the prose is interspersed with some of the author's choicest verse. The Professor at the Breakfast Table followed too closely on the heels of the Autocrat, and had less freshness. The third number of the series was better, and was pleasantly reminiscent and slightly garrulous, Dr. Holmes being now (1873) sixty-four

years old, and entitled to the gossiping privilege of age. The personnel of the Breakfast Table series, such as the landlady and the landlady's daughter and her son, Benjamin Franklin; the schoolmistress, the young man named John, the Divinity Student, the Kohinoor, the Sculpin, the Scarabaeus and the Old Gentleman who sits opposite, are not fully drawn characters, but outlined figures, lightly sketched--as is the Autocrat's wont--by means of some trick of speech, or dress, or feature, but they are quite life-like enough for their purpose, which is mainly to {494} furnish listeners and foils to the eloquence and wit of the chief talker. In 1860 and 1867 Holmes entered the field of fiction with two "medicated novels," Elsie Venner and the Guardian Angel. The first of these was a singular tale, whose heroine united with her very fascinating human attributes something of the nature of a serpent; her mother having been bitten by a rattlesnake a few months before the birth of the girl, and kept alive meanwhile by the use of powerful antidotes. The heroine of the Guardian Angel inherited lawless instincts from a vein of Indian blood in her ancestry. These two books were studies of certain medico-psychological problems. They preached Dr. Holmes's favorite doctrines of heredity and of the modified nature of moral responsibility by reason of transmitted tendencies which limit the freedom of the will. In Elsie Venner, in particular, the weirdly imaginative and speculative character of the leading motive suggests Hawthorne's method in fiction, but the background and the subsidiary figures have a realism that is in abrupt contrast with this, and gives a kind of doubleness and want of keeping to the whole. The Yankee characters, in particular, and the satirical pictures of New England country life are open to the charge of caricature. In the Guardian Angel the figure of Byles Gridley, the old scholar, is drawn with thorough sympathy, and though some of his acts are improbable he is, on the whole, Holmes's most {495} vital conception in the region of dramatic creation. James Russell Lowell (1819-), the foremost of American critics and of living American poets is, like Holmes, a native of Cambridge, and, like Emerson and Holmes, a clergyman's son. In 1855 he succeeded Longfellow as Professor of Modern Languages in Harvard College. Of late years he has held important diplomatic posts, like Everett, Irving, Bancroft, Motley, and other Americans distinguished in letters, having been United States Minister to Spain, and, under two administrations, to the Court of St. James. Lowell is not so spontaneously and exclusively a poet as Longfellow. His fame has been of slower growth, and his popularity with the average reader has never been so great. His appeal has been to the few rather than the many, to an audience of scholars and of the judicious rather than to the "groundlings" of the general public. Nevertheless his verse, though without the evenness, instinctive grace, and unerring good taste of Longfellow's, has more energy and a stronger intellectual fiber; while in prose he is very greatly the superior. His first volume, A Year's Life, 1841, gave little promise. In 1843 he started a magazine, the Pioneer, which only reached its third number, though it counted among its contributors Hawthorne, Poe, Whittier, and Miss Barrett (afterward Mrs. Browning). A second volume of poems, printed in 1844, showed a distinct advance, in such {496} pieces as the Shepherd of King Admetus, Rhoecus, a classical myth, told in excellent blank verse, and the same in subject with one of Landor's polished intaglios; and the Legend of Brittany, a narrative poem, which had fine passages, but no firmness in the management of the story. As yet, it was evident, the young poet had not found his theme. This came with the outbreak of the Mexican War, which was unpopular in New England, and which the Free Soil party regarded as a slaveholders' war waged without provocation against a sister republic, and simply for the purpose of extending the area of slavery. In 1846, accordingly, the Biglow Papers began to appear in the Boston Courier, and were collected and published in book form in 1848. These were a series of rhymed satires upon the government and the war party, written in the Yankee dialect, and supposed to be the work of Hosea Biglow, a home-spun genius in a down-east country town, whose letters to the editor were indorsed and accompanied by the comments of the Rev. Homer Wilbur, A.M., pastor of the First Church in Jaalam, and (prospective) member of many learned societies. The first paper was a derisive address to a recruiting sergeant, with a denunciation of the "nigger-drivin' States" and the "northern dough-faces," a plain hint that the North would do better to secede than to continue doing dirty work for the South, and an expression of those universal peace doctrines which were then in the air, and to which {497} Longfellow gave serious utterance in his Occultation of Orion.

"Ez for war, I call it murder--
There you hev it plain an' flat:
I don't want to go no furder
Than my Testyment for that;
God hez said so plump an' fairly,
It's ez long as it is broad,
An' you've gut to git up airly
Ef you want to take in God."

The second number was a versified paraphrase of a letter received from Mr. Birdofredom Sawin, "a yung feller of our town that wuz cussed fool enuff to goe atrottin inter Miss Chiff arter a drum and fife," and who finds when he gets to Mexico that

"This kind o' sogerin' aint a mite like our October trainin'."

Of the subsequent papers the best was, perhaps, What Mr. Robinson Thinks, an election ballad, which caused universal laughter, and was on every body's tongue.

The Biglow Papers remain Lowell's most original contribution to American literature. They are, all in all, the best political satires in the language, and unequaled as portraiture of the Yankee character, with its 'cuteness, its homely wit, and its latent poetry. Under the racy humor of the dialect--which became in Lowell's hands a medium of literary expression almost as effective as {498} Burns's Ayrshire Scotch--burned that moral enthusiasm and that hatred of wrong and deification of duty--"Stern daughter of the voice of God"--which, in the tough New England stock, stands instead of the passion in the blood of southern races. Lowell's serious poems on political questions, such as the Present Crisis, Ode to Freedom, and the Capture of Fugitive Slaves, have the old Puritan fervor, and such lines as

"They are slaves who dare not be
In the right with two or three,"

and the passage beginning

"Truth forever on the scaffold, Wrong forever on the throne,"

became watchwords in the conflict against slavery and disunion. Some of these were published in his volume of 1848 and the collected edition of his poems, in two volumes, issued in 1850. These also included his most ambitious narrative poem, the Vision of Sir Launfal, an allegorical and spiritual treatment of one of the legends of the Holy Grail. Lowell's genius was not epic, but lyric and didactic. The merit of Sir Launfal is not in the telling of the story, but in the beautiful descriptive episodes, one of which, commencing,

"And what is so rare as a day in June?
Then if ever come perfect days;"

is as current as any thing that he has written. It is significant of the lack of a natural impulse {499} toward narrative invention in Lowell, that, unlike Longfellow and Holmes, he never tried his hand at a novel. One of the most important parts of a novelist's equipment he certainly possesses; namely, an insight into character, and an ability to delineate it. This gift is seen especially in his sketch of Parson Wilbur, who edited the Biglow Papers with a delightfully pedantic introduction, glossary, and notes; in the prose essay On a Certain Condescension in Foreigners, and in the uncompleted poem, Fitz-Adam's Story. See also the sketch of Captain Underhill in the essay on New England Two Centuries Ago. The Biglow Papers when brought out in a volume were prefaced by imaginary notices of the press, including a capital parody of Carlyle, and a reprint from the "Jaalam Independent Blunderbuss," of the first sketch--afterward amplified and enriched--of that perfect Yankee idyl, the Courtin. Between 1862 and 1865 a second series of Biglow Papers appeared, called out by the events of the civil war. Some of these, as, for instance, Jonathan to John, a remonstrance with England for her unfriendly attitude toward the North, were not inferior to any thing in the earlier series; and others were even superior as poems, equal indeed, in pathos and intensity to any thing that Lowell has written in his professedly serious verse. In such passages the dialect wears rather thin, and there is a certain incongruity between the rustic spelling and the vivid beauty and power {500} and the figurative cast of the phrase in stanzas like the following:

"Wut's words to them whose faith an' truth
On war's red techstone rang true metal,
Who ventered life an' love an' youth
For the gret prize o' death in battle?
To him who, deadly hurt, agen
Flashed on afore the charge's thunder,

Tippin' with fire the bolt of men
That rived the rebel line asunder?"

Charles Sumner, a somewhat heavy person, with little sense of humor, wished that the author of the *Biglow Papers* "could have used good English." In the lines just quoted, indeed, the bad English adds nothing to the effect. In 1848 Lowell wrote *A Fable for Critics*, something after the style of Sir John Suckling's *Session of the Poets*; a piece of rollicking doggerel in which he surveyed the American Parnassus, scattering about headlong fun, sharp satire and sound criticism in equal proportion. Never an industrious workman, like Longfellow, at the poetic craft, but preferring to wait for the mood to seize him, he allowed eighteen years to go by, from 1850 to 1868, before publishing another volume of verse. In the latter year appeared *Under the Willows*, which contains some of his ripest and most perfect work; notably *A Winter Evening Hymn to my Fire*, with its noble and touching close--suggested by, perhaps, at any rate recalling, the dedication of Goethe's *Faust*, "Ihr naht euch wieder, schwankende Gestalten;" {501} the subtle *Footpath* and *In the Twilight*, the lovely little poems *Auf Wiedersehen* and *After the Funeral*, and a number of spirited political pieces, such as *Villa Franca*, and the *Washers of the Shroud*. This volume contained also his *Ode Recited at the Harvard Commemoration* in 1865. This, although uneven, is one of the finest occasional poems in the language, and the most important contribution which our civil war has made to song. It was charged with the grave emotion of one who not only shared the patriotic grief and exultation of his *alma mater* in the sacrifice of her sons, but who felt a more personal sorrow in the loss of kindred of his own, fallen in the front of battle. Particularly noteworthy in this memorial ode are the tribute to Abraham Lincoln, the third strophe, beginning, "Many loved Truth:" the exordium--"O Beautiful! my Country! ours once more!" and the close of the eighth strophe, where the poet chants of the youthful heroes who

"Come transfigured back,
Secure from change in their high-hearted ways,
Beautiful evermore and with the rays
Of morn on their white Shields of Expectation."

From 1857 to 1862 Lowell edited the *Atlantic Monthly*, and from 1863 to 1872 the *North American Review*. His prose, beginning with an early volume of *Conversations on Some of the Old Poets*, 1844, has consisted mainly of critical essays on individual writers, such as Dante, Chaucer, Spenser, {502} Emerson, Shakespere, Thoreau, Pope, Carlyle, etc., together with papers of a more miscellaneous kind, like *Witchcraft*, *New England Two Centuries Ago*, *My Garden Acquaintance*, *A Good Word for Winter*, *Abraham Lincoln*, etc., etc. Two volumes of these were published in 1870 and 1876, under the title *Among My Books*, and another, *My Study Windows*, in 1871. As a literary critic Lowell ranks easily among the first of living writers. His scholarship is thorough, his judgment sure, and he pours out upon his page an unwithholding wealth of knowledge, humor, wit and imagination from the fullness of an overflowing mind. His prose has not the chastened correctness and "low tone" of Matthew Arnold's. It is rich, exuberant, and sometimes over fanciful, running away into excesses of allusion or following the lead of a chance pun so as sometimes to lay itself open to the charge of pedantry and bad taste. Lowell's resources in the way of illustration and comparison are endless, and the readiness of his wit and his delight in using it put many temptations in his way. Purists in style accordingly take offense at his saying that "Milton is the only man who ever got much poetry out of a cataract, and that was a cataract in his eye;" or of his speaking of "a gentleman for whom the bottle before him reversed the wonder of the stereoscope and substituted the Gaston *v* for the *b* in binocular," which is certainly a puzzling and roundabout fashion of telling us that he had drunk so much {503} that he saw double. The critics also find fault with his coining such words as "undisprivacied" and with his writing such lines as the famous one--from the *Cathedral*, 1870-- "Spume-sliding down the baffled decuman." It must be acknowledged that his style lacks the crowning grace of simplicity, but it is precisely by reason of its allusive quality that scholarly readers take pleasure in it. They like a diction that has stuff in it and is woven thick, and where a thing is said in such a way as to recall many other things. Mention should be made, in connection with this Cambridge circle, of one writer who touched its circumference briefly. This was Sylvester Judd, a graduate of Yale, who entered the Harvard Divinity School in 1837 and in 1840 became minister of a Unitarian church in Augusta, Maine. Judd published several books, but the only one of them at all rememberable was *Margaret*, 1845, a novel of which Lowell said in *A Fable for Critics* that it was "the first Yankee book with the soul of Down East in it." It was very imperfect in point of art, and its second part--a rhapsodical description of a sort of Unitarian Utopia--is quite unreadable. But in the delineation of the few chief characters and of the rude, wild life of an outlying New England township just after the close of the revolutionary war, as well as in the tragic power of the catastrophe, there was genius of a high order. {504} As the country has grown older and more populous, and works

in all departments of thought have multiplied, it becomes necessary to draw more strictly the line between the literature of knowledge and the literature of power. Political history, in and of itself, scarcely falls within the limits of this sketch, and yet it cannot be altogether dismissed; for the historian's art at its highest demands imagination, narrative skill, and a sense of unity and proportion in the selection and arrangement of his facts, all of which are literary qualities. It is significant that many of our best historians have begun authorship in the domain of imaginative literature: Bancroft with an early volume of poems; Motley with his historical romances *Merry Mount* and *Morton's Hope*; and Parkman with a novel, *Vassall Morton*. The oldest of that modern group of writers that have given America an honorable position in the historical literature of the world was William Hickling Prescott (1796-1859.) Prescott chose for his theme the history of the Spanish conquests in the New World, a subject full of romantic incident and susceptible of that glowing and perhaps slightly over gorgeous coloring which he laid on with a liberal hand. His completed histories, in their order, are the *Reign of Ferdinand and Isabella*, 1837; the *Conquest of Mexico*, 1843--a topic which Irving had relinquished to him; and the *Conquest of Peru*, 1847. Prescott was fortunate in being born to leisure and fortune, but he had difficulties of {505} another kind to overcome. He was nearly blind, and had to teach himself Spanish and look up authorities through the help of others and to write with a noctograph or by amanuenses. George Bancroft (1800-) issued the first volume of his great *History of the United States* in 1834, and exactly half a century later the final volume of the work, bringing the subject down to 1789. Bancroft had studied at Göttingen and imbibed from the German historian Heeren the scientific method of historical study. He had access to original sources, in the nature of collections and state papers in the governmental archives of Europe, of which no American had hitherto been able to avail himself. His history in thoroughness of treatment leaves nothing to be desired, and has become the standard authority on the subject. As a literary performance merely, it is somewhat wanting in flavor, Bancroft's manner being heavy and stiff when compared with Motley's or Parkman's. The historian's services to his country have been publicly recognized by his successive appointments as Secretary of the Navy, Minister to England, and Minister to Germany. The greatest, on the whole, of American historians was John Lothrop Motley (1814-1877), who, like Bancroft, was a student at Göttingen and United States Minister to England. His *Rise of the Dutch Republic*, 1856, and *History of the United Netherlands*, published in installments from 1861 to {506} 1868, equaled Bancroft's work in scientific thoroughness and philosophic grasp, and Prescott's in the picturesque brilliancy of the narrative, while it excelled them both in its masterly analysis of great historic characters, reminding the reader, in this particular, of Macaulay's figure painting. The episodes of the siege of Antwerp and the sack of the cathedral, and of the defeat and wreck of the Spanish Armada, are as graphic as Prescott's famous description of Cortez's capture of the city of Mexico; while the elder historian has nothing to compare with Motley's vivid personal sketches of Queen Elizabeth, Philip the Second, Henry of Navarre, and William the Silent. The *Life of John of Barneveld*, 1874, completed this series of studies upon the history of the Netherlands, a theme to which Motley was attracted because the heroic struggle of the Dutch for liberty offered, in some respects, a parallel to the growth of political independence in Anglo-Saxon communities, and especially in his own America. The last of these Massachusetts historical writers whom we shall mention is Francis Parkman (1823-), whose subject has the advantage of being thoroughly American. His *Oregon Trail*, 1847, a series of sketches of prairie and Rocky Mountain life, originally contributed to the *Knickerbocker Magazine*, displays his early interest in the American Indians. In 1851 appeared his first historical work, the *Conspiracy of Pontiac*. This has been followed by the series entitled *France and England* {507} in North America, the six successive parts of which are as follows: the *Pioneers of France in the New World*; the *Jesuits in North America*; *La Salle and the Discovery of the Great West*; the *Old Régime in Canada*; *Count Frontenac and New France*; and *Montcalm and Wolfe*. These narratives have a wonderful vividness, and a romantic interest not inferior to Cooper's novels. Parkman made himself personally familiar with the scenes which he described, and some of the best descriptions of American woods and waters are to be found in his histories. If any fault is to be found with his books, indeed, it is that their picturesqueness and "fine writing" are a little in excess. The political literature of the years from 1837 to 1861 hinged upon the antislavery struggle. In this "irrepressible conflict" Massachusetts led the van. Garrison had written in his *Liberator*, in 1830, "I will be as harsh as truth and as uncompromising as justice. I am in earnest; I will not equivocate; I will not excuse; I will not retreat a single inch; and I will be heard." But the Garrisonian abolitionists remained for a long time, even in the North, a small and despised faction. It was a great point gained when men of education and social standing like Wendell Phillips (1811-1884), and Charles Sumner (1811-1874), joined themselves to the cause. Both of these were graduates of Harvard and men of scholarly pursuits. They became the representative orators of the antislavery party, Phillips on the platform {508} and Sumner in the Senate. The former first came before the public in his fiery speech, delivered in Faneuil Hall December 8, 1837, before a meeting called to denounce the murder of Lovejoy, who had been killed at Alton, Ill., while defending his press against a pro-slavery mob. Thenceforth Phillips's voice was never idle in behalf of the slave. His eloquence was impassioned and direct, and his English singularly pure, simple, and nervous. He is

perhaps nearer to Demosthenes than any other American orator. He was a most fascinating platform speaker on themes outside of politics, and his lecture on the Lost Arts was a favorite with audiences of all sorts. Sumner was a man of intellectual tastes, who entered politics reluctantly, and only in obedience to the resistless leading of his conscience. He was a student of literature and art; a connoisseur of engravings, for example, of which he made a valuable collection. He was fond of books, conversation, and foreign travel, and in Europe, while still a young man, had made a remarkable impression in society. But he left all this for public life, and in 1851 was elected, as Webster's successor, to the Senate of the United States. Thereafter he remained the leader of the Abolitionists in Congress until slavery was abolished. His influence throughout the North was greatly increased by the brutal attack upon him in the Senate chamber in 1856 by "Bully Brooks" of South Carolina. {509} Sumner's oratory was stately and somewhat labored. While speaking he always seemed, as has been wittily said, to be surveying a "broad landscape of his own convictions." His most impressive qualities as a speaker were his intense moral earnestness and his thorough knowledge of his subject. The most telling of his parliamentary speeches are perhaps his speech On the Kansas-Nebraska Bill, of February 3, 1854, and On the Crime against Kansas, May 19 and 20, 1856; of his platform addresses, the oration on the True Grandeur of Nations.

1. Henry Wadsworth Longfellow. *Voices of the Night. The Skeleton in Armor. The Wreck of the Hesperus. The Village Blacksmith. The Belfry of Bruges and Other Poems* (1846). By the Seaside. Hiawatha. Tales of a Wayside Inn.

2. Oliver Wendell Holmes. *Autocrat of the Breakfast Table. Elsie Venner. Old Ironsides. The Last Leaf. My Aunt. The Music-Grinders. On Lending a Punch Bowl. Nux Postcoenatica. A Modest Request. The Living Temple. Meeting of the Alumni of Harvard College. Homesick in Heaven. Epilogue to the Breakfast Table Series. The Boys. Dorothy. The Iron Gate.*

3. James Russell Lowell. *The Biglow Papers* (two series). *Under the Willows and Other Poems*. 1868. *Rhoecus. The Shepherd of King Admetus. The Vision of Sir Launfal. The {510} Present Crisis. The Dandelion. The Birch Tree. Beaver Brook. {511}

CHAPTER VI.

LITERATURE IN THE CITIES.

1837-1861.

Literature as a profession has hardly existed in the United States until very recently. Even now the number of those who support themselves by purely literary work is small, although the growth of the reading public and the establishment of great magazines, such as Harper's, the Century, and the Atlantic, have made a market for intellectual wares which forty years ago would have seemed a godsend to poorly paid Bohemians like Poe or obscure men of genius like Hawthorne. About 1840 two Philadelphia magazines--Godey's Lady's Book and Graham's Monthly--began to pay their contributors twelve dollars a page, a price then thought wildly munificent. But the first magazine of the modern type was Harper's Monthly, founded in 1850. American books have always

suffered, and still continue to suffer, from the want of an international copyright, which has flooded the country with cheap reprints and translations of foreign works, with which the domestic product has been unable to contend on such uneven terms. With the first ocean steamers there {512} started up a class of large-paged weeklies in New York and elsewhere, such as *Brother Jonathan*, the *New World*, and the *Corsair*, which furnished their readers with the freshest writings of Dickens and Bulwer and other British celebrities within a fortnight after their appearance in London. This still further restricted the profits of native authors and nearly drove them from the field of periodical literature. By special arrangement the novels of Thackeray and other English writers were printed in *Harper's* in installments simultaneously with their issue in English periodicals. The *Atlantic* was the first of our magazines which was founded expressly for the encouragement of home talent, and which had a purely Yankee flavor. Journalism was the profession which naturally attracted men of letters, as having most in common with their chosen work and as giving them a medium, under their own control, through which they could address the public. A few favored scholars, like Prescott, were made independent by the possession of private fortunes. Others, like Holmes, Longfellow, and Lowell, gave to literature such leisure as they could get in the intervals of an active profession or of college work. Still others, like Emerson and Thoreau, by living in the country and making their modest competence--eked out in Emerson's case by lecturing here and there--suffice for their simple needs, secured themselves freedom from the restraints of any regular calling. But in default of some such *pou sto* our men of {513} letters have usually sought the cities and allied themselves with the press. It will be remembered that Lowell started a short-lived magazine on his own account, and that he afterward edited the *Atlantic* and the *North American*. Also that Ripley and Charles A. Dana betook themselves to journalism after the break up of the Brook Farm Community. In the same way William Cullen Bryant (1794-1878), the earliest American poet of importance, whose impulses drew him to the solitudes of nature, was compelled to gain a livelihood by conducting a daily newspaper; or, as he himself puts it, was

"Forced to drudge for the dregs of men,
And scrawl strange words with the barbarous pen."

Bryant was born at Cummington, in Berkshire, the westernmost county of Massachusetts. After two years in Williams College he studied law, and practiced for nine years as a country lawyer in Plainfield and Great Barrington. Following the line of the Housatonic Valley, the social and theological affiliations of Berkshire have always been closer with Connecticut and New York than with Boston and Eastern Massachusetts. Accordingly, when, in 1825, Bryant yielded to the attractions of a literary career, he betook himself to New York city, where, after a brief experiment in conducting a monthly magazine, the *New York Review and Athenaeum*, he assumed the editorship of the {514} *Evening Post*, a Democratic and Free-trade journal, with which he remained connected till his death. He already had a reputation as a poet when he entered the ranks of metropolitan journalism. In 1816 his *Thanatopsis* had been published in the *North American Review*, and had attracted immediate and general admiration. It had been finished, indeed, two years before, when the poet was only in his nineteenth year, and was a wonderful instance of precocity. The thought in this stately hymn was not that of a young man, but of a sage who has reflected long upon the universality, the necessity, and the majesty of death. Bryant's blank verse when at its best, as in *Thanatopsis* and the *Forest Hymn*, is extremely noble. In gravity and dignity it is surpassed by no English blank verse of this century, though in rich and various modulation it falls below Tennyson's *Ulysses* and *Morte d'Arthur*. It was characteristic of Bryant's limitations that he came thus early into possession of his faculty. His range was always a narrow one, and about his poetry, as a whole, there is a certain coldness, rigidity, and solemnity. His fixed position among American poets is described in his own *Hymn to the North Star*:

"And thou dost see them rise,
Star of the pole! and thou dost see them set.
Alone, in thy cold skies,
Thou keep'st thy old, unmoving station yet,
Nor join'st the dances of that glittering train,
Nor dipp'st thy virgin orb in the blue western main."

{515}

In 1821 he read the *Ages*, a didactic poem in thirty-five stanzas, before the Phi Beta Kappa Society at Cambridge, and in the same year brought out his first volume of poems. A second collection appeared in 1832, which was printed in London under the auspices of Washington Irving. Bryant was the first American poet who had much of an

audience in England, and Wordsworth is said to have learned Thanatopsis by heart. Bryant was, indeed, in a measure, a scholar of Wordsworth's school, and his place among American poets corresponds roughly, though not precisely, to Wordsworth's among English poets. With no humor, with somewhat restricted sympathies, with little flexibility or openness to new impressions, but gifted with a high, austere imagination, Bryant became the meditative poet of nature. His best poems are those in which he draws lessons from nature, or sings of its calming, purifying, and bracing influences upon the human soul. His office, in other words, is the same which Matthew Arnold asserts to be the peculiar office of modern poetry, "the moral interpretation of nature." Poems of this class are Green River, To a Waterfowl, June, the Death of the Flowers, and the Evening Wind. The song, "O fairest of the Rural Maids," which has more fancy than is common in Bryant, and which Poe pronounced his best poem, has an obvious resemblance to Wordsworth's "Three years she grew in sun and shade," and both of these nameless pieces might fitly be {516} entitled--as Wordsworth's is in Mr. Palgrave's Golden Treasury--"The Education of Nature." Although Bryant's career is identified with New York, his poetry is all of New England. His heart was always turning back fondly to the woods and streams of the Berkshire hills. There was nothing of that urban strain in him which appears in Holmes and Willis. He was, in especial, the poet of autumn, of the American October and the New England Indian Summer, that season of "dropping nuts" and "smoky light," to whose subtle analogy with the decay of the young by the New England disease, consumption, he gave such tender expression in the Death of the Flowers; and amid whose "bright, late quiet," he wished himself to pass away. Bryant is our poet of "the melancholy days," as Lowell is of June. If, by chance, he touches upon June, it is not with the exultant gladness of Lowell in meadows full of bobolinks, and in the summer day that is

--simply perfect from its own resource
As to the bee the new campanula's
Illuminate seclusion swung in air."

Rather, the stir of new life in the clod suggests to Bryant by contrast the thought of death; and there is nowhere in his poetry a passage of deeper feeling than the closing stanzas of June, in which he speaks of himself, by anticipation, as of one

"Whose part in all the pomp that fills
The circuit of the summer hills
Is--that his grave is green."

{517} Bryant is, par excellence, the poet of New England wild flowers, the yellow violet, the fringed gentian--to each of which he dedicated an entire poem--the orchis and the golden rod, "the aster in the wood and the yellow sunflower by the brook." With these his name will be associated as Wordsworth's with the daffodil and the lesser celandine, and Emerson's with the rhodora. Except when writing of nature he was apt to be commonplace, and there are not many such energetic lines in his purely reflective verse as these famous ones from the Battle Field :

"Truth crushed to earth shall rise again;
The eternal years of God are hers;
But Error, wounded, writhes in pain,
And dies among his worshipers."

He added but slowly to the number of his poems, publishing a new collection in 1840, another in 1844, and Thirty Poems in 1864. His work at all ages was remarkably even. Thanatopsis was as mature as any thing that he wrote afterward, and among his later pieces, the Planting of the Apple Tree and the Flood of Years were as fresh as any thing that he had written in the first flush of youth. Bryant's poetic style was always pure and correct, without any tincture of affectation or extravagance. His prose writings are not important, consisting mainly of papers of the Salmagundi variety contributed to the Talisman, an annual published in 1827-30; some rather sketchy stories, Tales of the {518} Glauber Spa, 1832; and impressions of Europe, entitled, Letters of a Traveler, issued in two series, in 1849 and 1858. In 1869 and 1871 appeared his blank-verse translations of the Iliad and Odyssey, a remarkable achievement for a man of his age, and not excelled, upon the whole, by any recent metrical version of Homer in the English tongue. Bryant's half century of service as the editor of a daily paper should not be overlooked. The Evening Post, under his management, was always honest, gentlemanly, and courageous, and did much to raise the tone of journalism in New York. Another Massachusetts poet, who was outside the Boston coterie, like Bryant, and, like him, tried his hand at journalism, was John Greenleaf Whittier (1807-). He was born in a

solitary farmhouse near Haverhill, in the valley of the Merrimack, and his life has been passed mostly at his native place and at the neighboring town of Amesbury. The local color, which is very pronounced in his poetry, is that of the Merrimack from the vicinity of Haverhill to its mouth at Newburyport, a region of hillside farms, opening out below into wide marshes--"the low, green prairies of the sea," and the beaches of Hampton and Salisbury. The scenery of the Merrimack is familiar to all readers of Whittier: the cotton-spinning towns along its banks, with their factories and dams, the sloping pastures and orchards of the back country, the sands of Plum Island and the level reaches of water meadow between which glide the broad-sailed "gundalows"--a {519} local corruption of gondola--laden with hay. Whittier was a farmer lad, and had only such education as the district school could supply, supplemented by two years at the Haverhill Academy. In his School Days he gives a picture of the little old country school-house as it used to be, the only alma mater of so many distinguished Americans, and to which many others who have afterward trodden the pavements of great universities look back so fondly as to their first wicket gate into the land of knowledge.

"Still sits the school-house by the road,
A ragged beggar sunning;
Around it still the sumachs grow
And blackberry vines are running.

"Within, the master's desk is seen,
Deep-scarred by raps official;
The warping floor, the battered seats,
The jack-knife's carved initial."

A copy of Burns awoke the slumbering instinct in the young poet, and he began to contribute verses to Garrison's Free Press, published at Newburyport, and to the Haverhill Gazette. Then he went to Boston, and became editor for a short time of the Manufacturer. Next he edited the Essex Gazette, at Haverhill, and in 1830 he took charge of George D. Prentice's paper, the New England Weekly Review, at Hartford, Conn. Here he fell in with a young Connecticut poet of much promise, J. G. C. Brainard, editor of the {520} Connecticut Mirror, whose "Remains" Whittier edited in 1832. At Hartford, too, he published his first book, a volume of prose and verse, entitled Legends of New England, 1831, which is not otherwise remarkable than as showing his early interest in Indian colonial traditions--especially those which had a touch of the supernatural--a mine which he afterward worked to good purpose in the Bridal of Pennacook, the Witch's Daughter, and similar poems. Some of the Legends testify to Brainard's influence and to the influence of Whittier's temporary residence at Hartford. One of the prose pieces, for example, deals with the famous "Moodus Noises" at Haddam, on the Connecticut River, and one of the poems is the same in subject with Brainard's Black Fox of Salmon River. After a year and a half at Hartford, Whittier returned to Haverhill and to farming. The antislavery agitation was now beginning, and into this he threw himself with all the ardor of his nature. He became the poet of the reform as Garrison was its apostle, and Sumner and Phillips its speakers. In 1833 he published Justice and Expediency, a prose tract against slavery, and in the same year he took part in the formation of the American Antislavery Society at Philadelphia, sitting in the convention as a delegate of the Boston Abolitionists. Whittier was a Quaker, and that denomination, influenced by the preaching of John Woolman and others, had long since quietly abolished slavery within its own communion. The {521} Quakers of Philadelphia and elsewhere took an earnest though peaceful part in the Garrisonian movement. But it was a strange irony of fate that had made the fiery-hearted Whittier a Friend. His poems against slavery and disunion have the martial ring of a Tyrtæus or a Körner, added to the stern religious zeal of Cromwell's Ironsides. They are like the sound of the trumpet blown before the walls of Jericho, or the Psalms of David denouncing woe upon the enemies of God's chosen people. If there is any purely Puritan strain in American poetry it is in the war-hymns of the Quaker "Hermit of Amesbury." Of these patriotic poems there were three principal collections: Voices of Freedom, 1849; the Panorama and Other Poems, 1856; and In War Time, 1863; Whittier's work as the poet of freedom was done when, on hearing the bells ring for the passage of the constitutional amendment abolishing slavery, he wrote his splendid Laus Deo, thrilling with the ancient Hebrew spirit: "Loud and long

Lift the old exulting song,
Sing with Miriam by the sea--
He has cast the mighty down,
Horse and rider sink and drown,
He hath triumphed gloriously."

Of his poems distinctly relating to the events of the civil war, the best, or at all events the most popular, is Barbara Frietchie. Ichabod, expressing the indignation of the Free Soilers at Daniel Webster's seventh of March speech in defense of the {522} Fugitive Slave Law, is one of Whittier's best political poems, and not altogether unworthy of comparison with Browning's Lost Leader. The language of Whittier's warlike lyrics is biblical, and many of his purely devotional pieces are religious poetry of a high order and have been included in numerous collections of hymns. Of his songs of faith and doubt, the best are perhaps Our Master, Chapel of the Hermits, and Eternal Goodness; one stanza from the last of which is familiar:

"I know not where His islands lift
Their fronded palms in air,
I only know I cannot drift
Beyond His love and care."

But from politics and war Whittier turned gladly to sing the homely life of the New England country side. His rural ballads and idyls are as genuinely American as any thing that our poets have written, and have been recommended, as such, to English working-men by Whittier's co-religionist, John Bright. The most popular of these is probably Maud Muller, whose closing couplet has passed into proverb. Skipper Ireson's Ride is also very current. Better than either of them, as poetry, is Telling the Bees. But Whittier's masterpiece in work of a descriptive and reminiscent kind is Snow Bound, 1866, a New England fireside idyl which in its truthfulness recalls the Winter Evening of Cowper's Task and Burns's Cotter's Saturday Night, but in sweetness and animation is superior to either of them. Although in {523} some things a Puritan of the Puritans, Whittier has never forgotten that he is also a Friend, and several of his ballads and songs have been upon the subject of the early Quaker persecutions in Massachusetts. The most impressive of these is Cassandra Southwick. The latest of them, the King's Missive, originally contributed to the Memorial History of Boston in 1880, and reprinted the next year in a volume with other poems, has been the occasion of a rather lively controversy. The Bridal of Pennacook, 1848, and the Tent on the Beach, 1867, which contain some of his best work, were series of ballads told by different narrators, after the fashion of Longfellow's Tales of a Wayside Inn. As an artist in verse Whittier is strong and fervid, rather than delicate or rich. He uses only a few metrical forms--by preference the eight-syllabled rhyming couplet

--"Maud Muller on a summer's day
Raked the meadow sweet with hay," etc.--

and the emphatic tramp of this measure becomes very monotonous, as do some of Whittier's mannerisms; which proceed, however, never from affectation, but from a lack of study and variety, and so, no doubt, in part from the want of that academic culture and thorough technical equipment which Lowell and Longfellow enjoyed. Though his poems are not in dialect, like Lowell's Biglow Papers, he knows how to make an artistic use of homely provincial words, such as "chore," {524} which give his idyls of the hearth and the barnyard a genuine Doric cast. Whittier's prose is inferior to his verse. The fluency which was a besetting sin of his poetry when released from the fetters of rhyme and meter ran into wordiness. His prose writings were partly contributions to the slavery controversy, partly biographical sketches of English and American reformers, and partly studies of the scenery and folk-lore of the Merrimack Valley. Those of most literary interest were the Supernaturalism of New England, 1847, and some of the papers in Literary Recreations and Miscellanies, 1854. While Massachusetts was creating an American literature, other sections of the Union were by no means idle. The West, indeed, was as yet too raw to add any thing of importance to the artistic product of the country. The South was hampered by circumstances which will presently be described. But in and about the seaboard cities of New York, Philadelphia, Baltimore and Richmond, many pens were busy filling the columns of literary weeklies and monthlies; and there was a considerable output, such as it was, of books of poetry, fiction, travel, and miscellaneous light literature. Time has already relegated most of these to the dusty top-shelves. To rehearse the names of the numerous contributors to the old Knickerbocker Magazine, to Godey's, and Graham's, and the New Mirror, and the Southern Literary Messenger, or to run over the list of authorlings and poetasters in Poe's papers on {525} the Literati of New York, would be very much like reading the inscriptions on the head-stones of an old grave-yard. In the columns of these prehistoric magazines and in the book notices and reviews away back in the thirties and forties, one encounters the handiwork and the names of Emerson, Holmes, Longfellow, Hawthorne, and Lowell, embodied in this mass of forgotten literature. It would have required a good deal of critical acumen, at the time, to predict that these and a few others would soon be thrown out into bold relief, as the significant and permanent names in the literature of their generation, while Paulding, Hirst, Fay, Dawes, Mrs. Osgood, and scores of others who figured beside them in the fashionable periodicals, and filled

quite as large a space in the public eye, would sink into oblivion in less than thirty years. Some of these latter were clever enough people; they entertained their contemporary public sufficiently, but their work had no vitality or "power of continuance." The great majority of the writings of any period are necessarily ephemeral, and time by a slow process of natural selection is constantly sifting out the few representative books which shall carry on the memory of the period to posterity. Now and then it may be predicted of some undoubted work of genius, even at the moment that it sees the light, that it is destined to endure. But tastes and fashions change, and few things are better calculated to inspire the literary critic with humility than to read {526} the prophecies in old reviews and see how the future, now become the present, has quietly given them the lie. >From among the professional littérateurs of his day emerges, with ever sharper distinctness as time goes on, the name of Edgar Allan Poe (1809-1849.) By the irony of fate Poe was born at Boston, and his first volume, Tamerlane and Other Poems, 1827, was printed in that city and bore upon its title page the words, "By a Bostonian." But his parentage, so far as it was any thing, was southern. His father was a Marylander who had gone upon the stage and married an actress, herself the daughter of an actress and a native of England. Left an orphan by the early death of both parents, Poe was adopted by a Mr. Allan, a wealthy merchant of Richmond, Va. He was educated partly at an English school, was student for a time in the University of Virginia and afterward a cadet in the Military Academy at West Point. His youth was wild and irregular: he gambled and drank, was proud, bitter and perverse; finally quarreled with his guardian and adopted father--by whom he was disowned--and then betook himself to the life of a literary hack. His brilliant but underpaid work for various periodicals soon brought him into notice, and he was given the editorship of the Southern Literary Messenger, published at Richmond, and subsequently of the Gentlemen's --afterward Graham's -- Magazine in Philadelphia. These and all other positions Poe forfeited through his {527} dissipated habits and wayward temper, and finally, in 1844, he drifted to New York, where he found employment on the Evening Mirror and then on the Broadway Journal. He died of delirium tremens at the Marine Hospital in Baltimore. His life was one of the most wretched in literary history. He was an extreme instance of what used to be called the "eccentricity of genius." He had the irritable vanity which is popularly supposed to accompany the poetic temperament, and was so insanely egotistic as to imagine that Longfellow and others were constantly plagiarizing from him. The best side of Poe's character came out in his domestic relations, in which he displayed great tenderness, patience and fidelity. His instincts were gentlemanly, and his manner and conversation were often winning. In the place of moral feeling he had the artistic conscience. In his critical papers, except where warped by passion or prejudice, he showed neither fear nor favor, denouncing bad work by the most illustrious hands and commending obscure merit. The "impudent literary cliques" who puffed each other's books; the feeble chirrupings of the bardlings who manufactured verses for the "Annals;" and the twaddle of the "genial" incapables who praised them in flabby reviews--all these Poe exposed with ferocious honesty. Nor, though his writings are un_moral, can they be called in any sense im_moral. His poetry is as pure in its unearthliness as Bryant's in its austerity. {528} By 1831 Poe had published three thin books of verse, none of which had attracted notice, although the latest contained the drafts of a few of his most perfect poems, such as Israfel, the Valley of Unrest, the City in the Sea, and one of the two pieces inscribed To Helen. It was his habit to touch and retouch his work until it grew under his more practiced hand into a shape that satisfied his fastidious taste. Hence the same poem frequently reappears in different stages of development in successive editions. Poe was a subtle artist in the realm of the weird and the fantastic. In his intellectual nature there was a strange conjunction; an imagination as spiritual as Shelley's, though, unlike Shelley's, haunted perpetually with shapes of fear and the imagery of ruin; with this, an analytic power, a scientific exactness, and a mechanical ingenuity more usual in a chemist or a mathematician than in a poet. He studied carefully the mechanism of his verse and experimented endlessly with verbal and musical effects, such as repetition, and monotone, and the selection of words in which the consonants alliterated and the vowels varied. In his Philosophy of Composition he described how his best known poem, the Raven, was systematically built up on a preconceived plan in which the number of lines was first determined and the word "nevermore" selected as a starting point. No one who knows the mood in which poetry is composed will believe that this ingenious piece of dissection really describes the way in {529} which the Raven was conceived and written, or that any such deliberate and self-conscious process could originate the associations from which a true poem springs. But it flattered Poe's pride of intellect to assert that his cooler reason had control not only over the execution of his poetry, but over the very well-head of thought and emotion. Some of his most successful stories, like the Gold Bug, the Mystery of Marie Roget, the Purloined Letter, and the Murders in the Rue Morgue, were applications of this analytic faculty to the solution of puzzles, such as the finding of buried treasure or of a lost document, or the ferreting out of a mysterious crime. After the publication of the Gold Bug he received from all parts of the country specimens of cipher writing, which he delighted to work out. Others of his tales were clever pieces of mystification, like Hans Pfaall, the story of a journey to the moon, or experiments at giving verisimilitude to wild improbabilities by the skillful introduction of scientific details, as in the Facts in the Case of M. Valdemar and Von Kempelen's Discovery. In his narratives

of this kind Poe anticipated the detective novels of Gaboriau and Wilkie Collins, the scientific hoaxes of Jules Verne, and, though in a less degree, the artfully worked up likeness to fact in Edward Everett Hale's *Man Without a Country*, and similar fictions. While Dickens's *Barnaby Rudge* was publishing in parts, Poe showed his skill as a plot hunter by publishing a paper in *Graham's Magazine* in which the very tangled intrigue of the novel was correctly raveled and the finale predicted in advance. In his union of imagination and analytic power Poe resembled Coleridge, who, if any one, was his teacher in poetry and criticism. Poe's verse often reminds one of *Christabel* and the *Ancient Mariner*, still oftener of *Kubla Khan*. Like Coleridge, too, he indulged at times in the opium habit. But in Poe the artist predominated over every thing else. He began not with sentiment or thought, but with technique, with melody and color, tricks of language, and effects of verse. It is curious to study the growth of his style in his successive volumes of poetry. At first these are metrical experiments and vague images, original, and with a fascinating suggestiveness, but with so little meaning that some of his earlier pieces are hardly removed from nonsense. Gradually, like distant music drawing nearer and nearer, his poetry becomes fuller of imagination and of an inward significance, without ever losing, however, its mysterious aloofness from the real world of the senses. It was a part of Poe's literary creed--formed upon his own practice and his own limitations, but set forth with a great display of a priori reasoning in his essay on the *Poetic Principle* and elsewhere--that pleasure and not instruction or moral exhortation was the end of poetry; that beauty and not truth or goodness was its means; and, furthermore, that the pleasure which it gave should be indefinite. About his own poetry there was always this indefiniteness. His imagination dwelt in a strange country of dream--a "ghoul-haunted region of Weir," "out of space, out of time"--filled with unsubstantial landscapes, and peopled by spectral shapes. And yet there is a wonderful, hidden significance in this uncanny scenery. The reader feels that the wild, fantasmal imagery is in itself a kind of language, and that it in some way expresses a brooding thought or passion, the terror and despair of a lost soul. Sometimes there is an obvious allegory, as in the *Haunted Palace*, which is the parable of a ruined mind, or in the *Raven*, the most popular of all Poe's poems, originally published in the *American Whig Review* for February, 1845. Sometimes the meaning is more obscure, as in *Ulalume*, which, to most people, is quite incomprehensible, and yet to all readers of poetic feeling is among the most characteristic, and, therefore, the most fascinating, of its author's creations. Now and then, as in the beautiful ballad, *Annabel Lee*, and *To One in Paradise*, the poet emerges into the light of common human feeling and speaks a more intelligible language. But in general his poetry is not the poetry of the heart, and its passion is not the passion of flesh and blood. In Poe the thought of death is always near, and of the shadowy borderland between death and life.

"The play is the tragedy 'Man,'
And its hero the Conqueror Worm,"

{532} The prose tale, *Ligeia*, in which these verses are inserted, is one of the most powerful of all Poe's writings, and its theme is the power of the will to overcome death. In that singularly impressive poem, the *Sleeper*, the morbid horror which invests the tomb springs from the same source, the materiality of Poe's imagination, which refuses to let the soul go free from the body. This quality explains why Poe's *Tales of the Grotesque* and *Arabesque*, 1840, are on a lower plane than Hawthorne's romances, to which a few of them, like *William Wilson* and the *Man of the Crowd*, have some resemblance. The former of these, in particular, is in Hawthorne's peculiar province, the allegory of the conscience. But in general the tragedy in Hawthorne is a spiritual one, while Poe calls in the aid of material forces. The passion of physical fear or of superstitious horror is that which his writings most frequently excite. These tales represent various grades of the frightful and the ghastly, from the mere bug-a-boo story like the *Black Cat*, which makes children afraid to go in the dark, up to the breathless terror of the *Cask of Amontillado*, or the *Red Death*. Poe's masterpiece in this kind is the fateful tale of the *Fall of the House of Usher*, with its solemn and magnificent close. His prose, at its best, often recalls, in its richly imaginative cast, the manner of De Quincey in such passages as his *Dream Fugue*, or *Our Ladies of Sorrow*. In {533} descriptive pieces like the *Domain of Arnheim*, and stories of adventure like the *Descent into the Maelstrom*, and his long sea tale, *The Narrative of Arthur Gordon Pym*, 1838, he displayed a realistic inventiveness almost equal to Swift's or De Foe's. He was not without a mocking irony, but he had no constructive humor, and his attempts at the facetious were mostly failures. Poe's magical creations were rootless flowers. He took no hold upon the life about him, and cared nothing for the public concerns of his country. His poems and tales might have been written *in vacuo* for any thing American in them. Perhaps for this reason, in part, his fame has been so cosmopolitan. In France especially his writings have been favorites. Charles Baudelaire, the author of the *Fleurs du Mal*, translated them into French, and his own impressive but unhealthy poetry shows evidence of Poe's influence. The defect in Poe was in character, a defect which will make itself felt in art as in life. If he had had the sweet home feeling of Longfellow or the moral fervor of Whittier he might have been a greater poet than either.

"If I could dwell
Where Israfael
Hath dwelt, and he where I,
He might not sing so wildly well
A mortal melody,
While a bolder note than this might swell
From my lyre within the sky!"

{534} Though Poe was a southerner, if not by birth, at least by race and breeding, there was nothing distinctly southern about his peculiar genius, and in his wandering life he was associated as much with Philadelphia and New York as with Baltimore and Richmond. The conditions which had made the southern colonies unfruitful in literary and educational works before the Revolution continued to act down to the time of the civil war. Eli Whitney's invention of the cotton gin in the closing years of the last century gave extension to slavery, making it profitable to cultivate the new staple by enormous gangs of field hands working under the whip of the overseer in large plantations. Slavery became henceforth a business speculation in the States furthest south, and not, as in Old Virginia and Kentucky, a comparatively mild domestic system. The necessity of defending its peculiar institution against the attacks of a growing faction in the North compelled the South to throw all its intellectual strength into politics, which, for that matter, is the natural occupation and excitement of a social aristocracy. Meanwhile immigration sought the free States, and there was no middle class at the South. The "poor whites" were ignorant and degraded. There were people of education in the cities and on some of the plantations, but there was no great educated class from which a literature could proceed. And the culture of the South, such as it was, was becoming old-fashioned and local, as the section was isolated {535} more and more from the rest of the Union and from the enlightened public opinion of Europe by its reactionary prejudices and its sensitiveness on the subject of slavery. Nothing can be imagined more ridiculously provincial than the sophomorical editorials in the southern press just before the outbreak of the war, or than the backward and ill-informed articles which passed for reviews in the poorly supported periodicals of the South. In the general dearth of work of high and permanent value, one or two southern authors may be mentioned whose writings have at least done something to illustrate the life and scenery of their section. When in 1833 the Baltimore *Saturday Visitor* offered a prize of a hundred dollars for the best prose tale, one of the committee who awarded the prize to Poe's first story, the MS. *Found in a Bottle*, was John P. Kennedy, a Whig gentleman of Baltimore, who afterward became Secretary of the Navy in Fillmore's administration. The year before he had published *Swallow Barn*, a series of agreeable sketches of country life in Virginia. In 1835 and 1838 he published his two novels, *Horse-Shoe Robinson* and *Rob of the Bowl*, the former a story of the Revolutionary War in South Carolina; the latter an historical tale of colonial Maryland. These had sufficient success to warrant reprinting as late as 1852. But the most popular and voluminous of all Southern writers of fiction was William Gilmore Simms, a South Carolinian, who died in 1870. He wrote over thirty {536} novels, mostly romances of Revolutionary history, southern life and wild adventure, among the best of which were the *Partisan*, 1835, and the *Yemassee*. Simms was an inferior Cooper, with a difference. His novels are good boys' books, but are crude and hasty in composition. He was strongly southern in his sympathies, though his newspaper, the *Charleston City Gazette*, took part against the Nullifiers. His miscellaneous writings include several histories and biographies, political tracts, addresses and critical papers contributed to southern magazines. He also wrote numerous poems, the most ambitious of which was *Atlantis, a Story of the Sea*, 1832. His poems have little value except as here and there illustrating local scenery and manners, as in *Southern Passages and Pictures*, 1839. Mr. John Esten Cooke's pleasant but not very strong *Virginia Comedians* was, perhaps, in literary quality the best southern novel produced before the civil war. When Poe came to New York, the most conspicuous literary figure of the metropolis, with the possible exception of Bryant and Halleck, was N. P. Willis, one of the editors of the *Evening Mirror*, upon which journal Poe was for a time engaged. Willis had made a literary reputation, when a student at Yale, by his *Scripture Poems*, written in smooth blank verse. Afterward he had edited the *American Monthly* in his native city of Boston, and more recently he had published *Pencillings by the Way*, 1835, a pleasant record of {537} European saunterings; *Inklings of Adventure*, 1836, a collection of dashing stories and sketches of American and foreign life; and *Letters from Under a Bridge*, 1839, a series of charming rural letters from his country place at Owego, on the Susquehanna. Willis's work, always graceful and sparkling, sometimes even brilliant, though light in substance and jaunty in style, had quickly raised him to the summit of popularity. During the years from 1835 to 1850 he was the most successful American magazinist, and even down to the day of his death, in 1867, he retained his hold upon the attention of the fashionable public by his easy paragraphing and correspondence in the *Mirror* and its successor, the *Home Journal*, which catered to the literary wants of the

beau monde. Much of Willis's work was ephemeral, though clever of its kind, but a few of his best tales and sketches, such as _F. Smith_, _The Ghost Ball at Congress Hall_, _Edith Linsey_, and the _Lunatic's Skate_, together with some of the _Letters from Under a Bridge_, are worthy of preservation, not only as readable stories, but as society studies of life at American watering places like Nahant and Saratoga and Ballston Spa half a century ago. A number of his simpler poems, like _Unseen Spirits_, _Spring_, _To M--- from Abroad_, and _Lines on Leaving Europe_, still retain a deserved place in collections and anthologies. The senior editor of the _Mirror_, George P. Morris, was once a very popular song writer, and {538} his _Woodman, Spare that Tree_, still survives. Other residents of New York City who have written single famous pieces were Clement C. Moore, a professor in the General Theological Seminary, whose _Visit from St. Nicholas_--"Twas the Night Before Christmas," etc.--is a favorite ballad in every nursery in the land; Charles Fenno Hoffman, a novelist of reputation in his time, but now remembered only as the author of the song, _Sparkling and Bright_, and the patriotic ballad of _Monterey_; Robert H. Messinger, a native of Boston, but long resident in New York, where he was a familiar figure in fashionable society, who wrote _Give Me the Old_, a fine ode with a choice Horatian flavor; and William Allen Butler, a lawyer and occasional writer, whose capital satire of _Nothing to Wear_ was published anonymously and had a great run. Of younger poets, like Stoddard and Aldrich, who formerly wrote for the _Mirror_ and who are still living and working in the maturity of their powers, it is not within the limits and design of this sketch to speak. But one of their contemporaries, Bayard Taylor, who died, American Minister at Berlin, in 1878, though a Pennsylvanian by birth and rearing, may be reckoned among the "literati of New York." A farmer lad from Chester County, who had learned the printer's trade and printed a little volume of his juvenile verses in 1844, he came to New York shortly after with credentials from Dr. Griswold, the editor of _Graham's_, and obtaining encouragement and aid {539} from Willis, Horace Greeley and others, he set out to make the tour of Europe, walking from town to town in Germany and getting employment now and then at his trade to help pay the expenses of the trip. The story of these _Wanderjahre_ he told in his _Views Afoot_, 1846. This was the first of eleven books of travel written during the course of his life. He was an inveterate nomad, and his journeyings carried him to the remotest regions--to California, India, China, Japan and the isles of the sea, to Central Africa and the Soudan, Palestine, Egypt, Iceland and the "by-ways of Europe." His head-quarters at home were in New York, where he did literary work for the _Tribune_. He was a rapid and incessant worker, throwing off many volumes of verse and prose, fiction, essays, sketches, translations and criticism, mainly contributed in the first instance to the magazines. His versatility was very marked, and his poetry ranged from _Rhymes of Travel_, 1848, and _Poems of the Orient_, 1854, to idyls and home ballads of Pennsylvania life, like the _Quaker Widow_ and the _Old Pennsylvania Farmer_, and, on the other side, to ambitious and somewhat mystical poems, like the _Masque of the Gods_, 1872--written in four days--and dramatic experiments like the _Prophet_, 1874, and _Prince Deukalion_, 1878. He was a man of buoyant and eager nature, with a great appetite for new experience, a remarkable memory, a talent for learning languages, and a too great readiness to take the hue of his favorite books. From {540} his facility, his openness to external impressions of scenery and costume and his habit of turning these at once into the service of his pen, it results that there is something "newspapery" and superficial about most of his prose. It is reporter's work, though reporting of a high order. His poetry, too, though full of glow and picturesqueness, is largely imitative, suggesting Tennyson not unfrequently, but more often Shelley. His spirited _Bedouin Song_, for example, has an echo of Shelley's _Lines to an Indian Air_:

"From the desert I come to thee
 On a stallion shod with fire;
 And the winds are left behind
 In the speed of my desire.
 Under thy window I stand
 And the midnight hears my cry;
 I love thee, I love but thee
 With a love that shall not die."

The dangerous quickness with which he caught the manner of other poets made him an admirable parodist and translator. His _Echo Club_, 1876, contains some of the best travesties in the tongue, and his great translation of Goethe's _Faust_, 1870-71--with its wonderfully close reproduction of the original meters--is one of the glories of American literature. All in all, Taylor may unhesitatingly be put first among our poets of the second generation--the generation succeeding that of Longfellow and Lowell--although the lack in him of original genius self-determined to a {541} peculiar sphere, or the want of an inward fixity and concentration to resist the rich tumult of outward impressions, has made him less significant in the history of our literary thought than some other writers less

generously endowed. Taylor's novels had the qualities of his verse. They were profuse, eloquent and faulty. *John Godfrey's Fortune*, 1864, gave a picture of bohemian life in New York. *Hannah Thurston*, 1863, and the *Story of Kennett*, 1866, introduced many incidents and persons from the old Quaker life of rural Pennsylvania, as Taylor remembered it in his boyhood. The former was like Hawthorne's *Blithedale Romance*, a satire on fanatics and reformers, and its heroine is a nobly conceived character, though drawn with some exaggeration. The *Story of Kennett*, which is largely autobiographic, has a greater freshness and reality than the others and is full of personal recollections. In these novels, as in his short stories, Taylor's pictorial skill is greater on the whole than his power of creating characters or inventing plots. Literature in the West now began to have an existence. Another young poet from Chester County, Pa., namely, Thomas Buchanan Read, went to Cincinnati, and not to New York, to study sculpture and painting, about 1837, and one of his best-known poems, *Pons Maximus*, was written on the occasion of the opening of the suspension bridge across the Ohio. Read came East, to be sure, in 1841, and spent many years in our {542} seaboard cities and in Italy. He was distinctly a minor poet, but some of his Pennsylvania pastorals, like the *Deserted Road*, have a natural sweetness; and his luxurious *Drifting*, which combines the methods of painting and poetry, is justly popular. *Sheridan's Ride*--perhaps his most current piece--is a rather forced production and has been over-praised. The two Ohio sister poets, Alice and Phoebe Cary, were attracted to New York in 1850, as soon as their literary success seemed assured. They made that city their home for the remainder of their lives. Poe praised Alice Cary's *Pictures of Memory*, and Phoebe's *Nearer Home* has become a favorite hymn. There is nothing peculiarly Western about the verse of the Cary sisters. It is the poetry of sentiment, memory, and domestic affection, entirely feminine, rather tame and diffuse as a whole, but tender and sweet, cherished by many good women and dear to simple hearts. A stronger smack of the soil is in the negro melodies like *Uncle Ned*, *O Susanna*, *Old Folks at Home*, *Way Down South*, *Nelly was a Lady*, *My Old Kentucky Home*, etc., which were the work not of any southern poet, but of Stephen C. Foster, a native of Allegheny, Pa., and a resident of Cincinnati and Pittsburg. He composed the words and music of these, and many others of a similar kind, during the years 1847 to 1861. Taken together they form the most original and vital addition which this country has made to the psalmody {543} of the world, and entitle Foster to the first rank among American song writers. As Foster's plaintive melodies carried the pathos and humor of the plantation all over the land, so Mrs. Harriet Beecher Stowe's *Uncle Tom's Cabin*, 1852, brought home to millions of readers the sufferings of the negroes in the "black belt" of the cotton-growing States. This is the most popular novel ever written in America. Hundreds of thousands of copies were sold in this country and in England, and some forty translations were made into foreign tongues. In its dramatized form it still keeps the stage, and the statistics of circulating libraries show that even now it is in greater demand than any other single book. It did more than any other literary agency to rouse the public conscience to a sense of the shame and horror of slavery; more even than Garrison's *Liberator*; more than the indignant poems of Whittier and Lowell or the orations of Sumner and Phillips. It presented the thing concretely and dramatically, and in particular it made the odious Fugitive Slave Law forever impossible to enforce. It was useless for the defenders of slavery to protest that the picture was exaggerated and that overseers like Legree were the exception. The system under which such brutalities could happen, and did sometimes happen, was doomed. It is easy now to point out defects of taste and art in this masterpiece, to show that the tone is occasionally melodramatic, that some of the characters are {544} conventional, and that the literary execution is in parts feeble and in others coarse. In spite of all it remains true that *Uncle Tom's Cabin* is a great book, the work of genius seizing instinctively upon its opportunity and uttering the thought of the time with a power that thrilled the heart of the nation and of the world. Mrs. Stowe never repeated her first success. Some of her novels of New England life, such as the *Minister's Wooing*, 1859, and the *Pearl of Orr's Island*, 1862, have a mild kind of interest, and contain truthful portraiture of provincial ways and traits; while later fictions of a domestic type, like *Pink and White Tyranny*, and *My Wife and I*, are really beneath criticism. There were other Connecticut writers contemporary with Mrs. Stowe: Mrs. L. H. Sigourney, for example, a Hartford poetess, formerly known as "the Hemans of America," but now quite obsolete; and J. G. Percival of New Haven, a shy and eccentric scholar, whose geological work was of value, and whose memory is preserved by one or two of his simpler poems, still in circulation, such as *To Seneca Lake* and the *Coral Grove*. Another Hartford poet, Brainard--already spoken of as an early friend of Whittier--died young, leaving a few pieces which show that his lyrical gift was spontaneous and genuine but had received little cultivation. A much younger writer than either of these, Donald G. Mitchell, of New Haven, has a more lasting place in our literature, by virtue of his charmingly written *Reveries of a Bachelor*, {545} 1850, and *Dream Life*, 1852, stories which sketch themselves out in a series of reminiscences and lightly connected scenes, and which always appeal freshly to young men because they have that dreamy outlook upon life which is characteristic of youth. But, upon the whole, the most important contribution made by Connecticut in that generation to the literary stock of America was the Beecher family. Lyman Beecher had been an influential preacher and theologian, and a sturdy defender of orthodoxy against Boston Unitarianism. Of his numerous sons and

daughters, all more or less noted for intellectual vigor and independence, the most eminent were Mrs. Stowe and Henry Ward Beecher, the great pulpit orator of Brooklyn. Mr. Beecher was too busy a man to give more than his spare moments to general literature. His sermons, lectures, and addresses were reported for the daily papers and printed in part in book form; but these lose greatly when divorced from the large, warm, and benignant personality of the man. His volumes made up of articles in the *Independent* and the *Ledger*, such as *Star Papers*, 1855, and *Eyes and Ears*, 1862, contain many delightful *morceaux* upon country life and similar topics, though they are hardly wrought with sufficient closeness and care to take a permanent place in letters. Like Willis's *Ephemerae*, they are excellent literary journalism, but hardly literature. We may close our retrospect of American {546} literature before 1861 with a brief notice of one of the most striking literary phenomena of the time--the *Leaves of Grass* of Walt Whitman, published at Brooklyn in 1855. The author, born at West Hills, Long Island, in 1819, had been printer, school-teacher, editor, and builder. He had scribbled a good deal of poetry of the ordinary kind, which attracted little attention, but finding conventional rhymes and meters too cramping a vehicle for his need of expression, he discarded them for a kind of rhythmic chant, of which the following is a fair specimen:

"Press close, bare bosom'd night! Press close, magnetic,
nourishing night!
Night of south winds! night of the few large stars!
Still, nodding night! mad, naked, summer night!"

The invention was not altogether a new one. The English translation of the Psalms of David and of some of the Prophets, the *Poems of Ossian*, and some of Matthew Arnold's unrhymed pieces, especially the *Strayed Reveller*, have an irregular rhythm of this kind, to say nothing of the old Anglo-Saxon poems, like *Beowulf*, and the Scripture paraphrases attributed to Caedmon. But this species of *oratio soluta*, carried to the lengths to which Whitman carried it, had an air of novelty which was displeasing to some, while to others, weary of familiar measures and jingling rhymes, it was refreshing in its boldness and freedom. There is no consenting estimate of this poet. {547} Many think that his so-called poems are not poems at all, but simply a bad variety of prose; that there is nothing to him beyond a combination of affectation and indecency; and that the Whitman *culte* is a passing "fad" of a few literary men, and especially of a number of English critics like Rossetti, Swinburne, Buchanan, etc., who, being determined to have something unmistakably American--that is, different from any thing else--in writings from this side of the water before they will acknowledge any originality in them, have been misled into discovering in Whitman "the poet of Democracy." Others maintain that he is the greatest of American poets, or, indeed, of all modern poets; that he is "cosmic," or universal, and that he has put an end forever to puling rhymes and lines chopped up into metrical feet. Whether Whitman's poetry is formally poetry at all or merely the raw material of poetry, the chaotic and amorphous impression which it makes on readers of conservative tastes results from his effort to take up into his verse elements which poetry has usually left out--the ugly, the earthy, and even the disgusting; the "under side of things," which he holds not to be prosaic when apprehended with a strong, masculine joy in life and nature seen in all their aspects. The lack of these elements in the conventional poets seems to him and his disciples like leaving out the salt from the ocean, making poetry merely pretty and blinking whole classes of facts. Hence the naturalism and animalism of some of the {548} divisions in *Leaves of Grass*, particularly that entitled *Children of Adam*, which gave great offense by its immodesty, or its outspokenness. Whitman holds that nakedness is chaste; that all the functions of the body in healthy exercise are equally clean; that all, in fact, are divine; and that matter is as divine as spirit. The effort to get every thing into his poetry, to speak out his thought just as it comes to him, accounts, too, for his way of cataloguing objects without selection. His single expressions are often unsurpassed for descriptive beauty and truth. He speaks of "the vitreous pour of the full moon, just tinged with blue," of the "lisp" of the plane, of the prairies, "where herds of buffalo make a crawling spread of the square miles." But if there is any eternal distinction between poetry and prose the most liberal canons of the poetic art will never agree to accept lines like these:

"And [I] remember putting plasters on the galls of his neck
and ankles;
He stayed with me a week before he was recuperated, and
passed north."

Whitman is the spokesman of Democracy and of the future; full of brotherliness and hope, loving the warm, gregarious pressure of the crowd and the touch of his comrade's elbow in the ranks. He liked the people--multitudes of people; the swarm of life beheld from a Broadway omnibus or a Brooklyn ferry-boat. The rowdy and the Negro

{549} truck-driver were closer to his sympathy than the gentleman and the scholar. "I loafe and invite my soul," he writes: "I sound my barbaric yawp over the roofs of the world." His poem Walt Whitman, frankly egotistic, simply describes himself as a typical, average man--the same as any other man, and therefore not individual but universal. He has great tenderness and heartiness--"the good gray poet;" and during the civil war he devoted himself unreservedly to the wounded soldiers in the Washington hospitals--an experience which he has related in the Dresser and elsewhere. It is characteristic of his rough and ready camaraderie to use slang and newspaper English in his poetry, to call himself Walt instead of Walter, and to have his picture taken in a slouch hat and with a flannel shirt open at the throat. His decriers allege that he poses for effect; that he is simply a backward eddy in the tide, and significant only as a temporary reaction against ultra civilization--like Thoreau, though in a different way. But with all his mistakes in art there is a healthy, virile, tumultuous pulse of life in his lyric utterance and a great sweep of imagination in his panoramic view of times and countries. One likes to read him because he feels so good, enjoys so fully the play of his senses, and has such a lusty confidence in his own immortality and in the prospects of the human race. Stripped of verbiage and repetition, his ideas are not many. His indebtedness to Emerson--who wrote an introduction to {550} the Leaves of Grass--is manifest. He sings of man and not men, and the individual differences of character, sentiment, and passion, the dramatic elements of life, find small place in his system. It is too early to say what will be his final position in literary history. But it is noteworthy that the democratic masses have not accepted him yet as their poet. Whittier and Longfellow, the poets of conscience and feeling, are the darlings of the American people. The admiration, and even the knowledge of Whitman, are mostly esoteric, confined to the literary class. It is also not without significance as to the ultimate reception of his innovations in verse that he has numerous parodists, but no imitators. The tendency among our younger poets is not toward the abandonment of rhyme and meter, but toward the introduction of new stanza forms and an increasing carefulness and finish in the technique of their art. It is observable, too, that in his most inspired passages Whitman reverts to the old forms of verse; to blank verse, for example, in the Man-o'-War-Bird :

"Thou who hast slept all night upon the storm,
Waking renewed on thy prodigious pinions," etc.,

and elsewhere not infrequently to dactylic hexameters and pentameters:

"Earth of shine and dark, mottling the tide of the river! . . .
Far-swooping, elbowed earth! rich, apple-blossomed earth."

{551} Indeed, Whitman's most popular poem, My Captain, written after the assassination of Abraham Lincoln, differs little in form from ordinary verse, as a stanza of it will show:

"My captain does not answer, his lips are pale and still;
My father does not feel my arm, he has no pulse nor will;
The ship is anchored safe and sound, its voyage closed and done;
From fearful trip the victor ship comes in with object won.
 Exult, O shores, and ring, O bells!
 But I, with mournful tread,
 Walk the deck, my captain lies
 Fallen, cold and dead."

This is from Drum Taps, a volume of poems of the civil war. Whitman has also written prose having much the same quality as his poetry: Democratic Vistas, Memoranda of the Civil War, and more recently, Specimen Days. His residence of late years has been at Camden, New Jersey, where a centennial edition of his writings was published in 1876.

1. William Cullen Bryant. Thanatopsis. To a Waterfowl. Green River. Hymn to the North Star. A Forest Hymn. "O Fairest of the Rural Maids." June. The Death of the Flowers. The Evening Wind. The Battle Field. The Planting of the Apple-tree. The Flood of Years.

2. John Greenleaf Whittier. Cassandra {552} Southwick. The New Wife and the Old. The Virginia Slave Mother. Randolph of Roanoke. Barclay of Ary. The Witch of Wenham. Skipper Ireson's Ride. Marguerite. Maud Muller. Telling the Bees. My Playmate. Barbara Frietchie. Ichabod. Laus Deo. Snow Bound.

{554}

CHAPTER VII.

LITERATURE SINCE 1861.

A generation has nearly passed since the outbreak of the civil war, and although public affairs are still mainly in the hands of men who had reached manhood before the conflict opened, or who were old enough at that time to remember clearly its stirring events, the younger men who are daily coming forward to take their places know it only by tradition. It makes a definite break in the history of our literature, and a number of new literary schools and tendencies have appeared since its close. As to the literature of the war itself, it was largely the work of writers who had already reached or passed middle age. All of the more important authors described in the last three chapters survived the Rebellion, except Poe, who died in 1849, Prescott, who died in 1859, and Thoreau and Hawthorne, who died in the second and fourth years of the war, respectively. The final and authoritative history of the struggle has not yet been written, and cannot be written for many years to come. Many partial and tentative accounts have, however, appeared, among which may be mentioned, on the northern side, {555} Horace Greeley's American Conflict, 1864-66; Vice-president Wilson's Rise and Fall of the Slave Power in America, and J. W. Draper's American Civil War, 1868-70; on the southern side Alexander H. Stephens's Confederate States of America, Jefferson Davis's Rise and Fall of the Confederate States of America, and E. A. Pollard's Lost Cause. These, with the exception of Dr. Draper's philosophical narrative, have the advantage of being the work of actors in the political or military events which they describe, and the disadvantage of being, therefore, partisan--in some instances passionately partisan. A storehouse of materials for the coming historian is also at hand in Frank Moore's great collection, the Rebellion Record; in numerous regimental histories and histories of special armies, departments, and battles, like W. Swinton's Army of the Potomac; in the autobiographies and recollections of Grant and Sherman and other military leaders; in the "war papers," now publishing in the Century magazine, and in innumerable sketches and reminiscences by officers and privates on both sides. The war had its poetry, its humors and its general literature, some of which have been mentioned in connection with Whittier, Lowell, Holmes, Whitman, and others; and some of which remain to be mentioned, as the work of new writers, or of writers who had previously made little mark. There were war songs on both sides, few of which had much literary value excepting, perhaps, James {556} R. Randall's southern ballad, Maryland, My Maryland, sung to the old college air of Lauriger Horatius, and the grand martial chorus of John Brown's Body, an old Methodist hymn, to which the northern armies beat time as they went "marching on." Randall's song, though spirited, was marred by its fire-eating absurdities about "vandals" and "minions" and "northern scum," the cheap insults of the southern newspaper press. To furnish the John Brown chorus with words worthy of the music, Mrs. Julia Ward Howe wrote her Battle Hymn of the Republic, a noble poem, but rather too fine and literary for a song, and so never fully accepted by the

soldiers. Among the many verses which voiced the anguish and the patriotism of that stern time, which told of partings and homecomings, of women waiting by desolate hearths, in country homes, for tidings of husbands and sons who had gone to the war, or which celebrated individual deeds of heroism or sang the thousand private tragedies and heart-breaks of the great conflict, by far the greater number were of too humble a grade to survive the feeling of the hour. Among the best or the most popular of them were Kate Putnam Osgood's Driving Home the Cows, Mrs. Ethel Lynn Beers's All Quiet Along the Potomac, Forceythe Willson's Old Sergeant, and John James Piatt's Riding to Vote. Of the poets whom the war brought out, or developed, the most noteworthy were Henry Timrod, of South Carolina, and Henry Howard Brownell, of Connecticut. During the {557} war Timrod was with the Confederate Army of the West, as correspondent for the Charleston Mercury, and in 1864 he became assistant editor of the South Carolinian, at Columbia. Sherman's "march to the sea" broke up his business, and he returned to Charleston. A complete edition of his poems was published in 1873, six years after his death. The prettiest of all Timrod's poems is Katie, but more to our present purpose are Charleston--written in the time of blockade--and the Unknown Dead, which tells

"Of nameless graves on battle plains,
Wash'd by a single winter's rains,
Where, some beneath Virginian hills,
And some by green Atlantic rills,
Some by the waters of the West,
A myriad unknown heroes rest."

When the war was over a poet of New York State, F. M. Finch, sang of these and of other graves in his beautiful Decoration Day lyric, The Blue and the Gray, which spoke the word of reconciliation and consecration for North and South alike.

Brownell, whose Lyrics of a Day and War Lyrics were published respectively in 1864 and 1866, was private secretary to Farragut, on whose flag-ship, the Hartford, he was present at several great naval engagements, such as the "Passage of the Forts" below New Orleans, and the action off Mobile, described in his poem, the Bay Fight. {558} With some roughness and unevenness of execution, Brownell's poetry had a fire which places him next to Whittier as the Körner of the civil war. In him, especially, as in Whittier, is that Puritan sense of the righteousness of his cause which made the battle for the Union a holy war to the crusaders against slavery:

"Full red the furnace fires must glow
That melt the ore of mortal kind:
The mills of God are grinding slow,
But ah, how close they grind!"

"To-day the Dahlgren and the drum
Are dread apostles of his name;
His kingdom here can only come
By chrisim of blood and flame."

One of the earliest martyrs of the war was Theodore Winthrop, hardly known as a writer until the publication in the Atlantic Monthly of his vivid sketches of Washington as a Camp, describing the march of his regiment, the famous New York Seventh, and its first quarters in the Capitol at Washington. A tragic interest was given to these papers by Winthrop's gallant death in the action of Big Bethel, June 10, 1861. While this was still fresh in public recollection his manuscript novels were published, together with a collection of his stories and sketches reprinted from the magazines. His novels, though in parts crude and immature, have a dash and buoyancy--an out-door air about them--which give the reader a winning impression {559} of Winthrop's personality. The best of them is, perhaps, Cecil Dreeme, a romance that reminds one a little of Hawthorne, and the scene of which is the New York University building on Washington Square, a locality that has been further celebrated in Henry James's novel of Washington Square. Another member of this same Seventh Regiment, Fitz James O'Brien, an Irishman by birth, who died at Baltimore, in 1862, from the effects of a wound received in a cavalry skirmish, had contributed to the magazines a number of poems and of brilliant though fantastic tales, among which the Diamond Lens and What

Was It?_ had something of Edgar A. Poe's quality. Another Irish-American, Charles G. Halpine, under the pen-name of "Miles O'Reilly," wrote a good many clever ballads of the war, partly serious and partly in comic brogue. Prose writers of note furnished the magazines with narratives of their experience at the seat of war, among papers of which kind may be mentioned Dr. Holmes's *My Search for the Captain*, in the *Atlantic Monthly*, and Colonel T. W. Higginson's *Army Life in a Black Regiment*, collected into a volume in 1870. Of the public oratory of the war the foremost example is the ever-memorable address of Abraham Lincoln at the dedication of the National Cemetery at Gettysburg. The war had brought the nation to its intellectual majority. In the stress of that terrible fight there was no room for {560} buncombe and verbiage, such as the newspapers and stump-speakers used to dole out in *ante bellum* days. Lincoln's speech is short--a few grave words which he turned aside for a moment to speak in the midst of his task of saving the country. The speech is simple, naked of figures, every sentence impressed with a sense of responsibility for the work yet to be done and with a stern determination to do it. "In a larger sense," it says, "we cannot dedicate, we cannot consecrate, we cannot hallow this ground. The brave men, living and dead, who struggled here have consecrated it far above our poor power to add or detract. The world will little note nor long remember what we say here, but it can never forget what they did here. It is for us, the living, rather to be dedicated here to the unfinished work which they who fought here have thus far so nobly advanced. It is rather for us to be here dedicated to the great task remaining before us; that from these honored dead we take increased devotion to that cause for which they gave the last full measure of devotion; that we here highly resolve that these dead shall not have died in vain: that this nation, under God, shall have a new birth of freedom; and that government of the people, by the people, for the people, shall not perish from the earth." Here was eloquence of a different sort from the sonorous perorations of Webster or the polished climaxes of Everett. As we read the plain, strong language of this brief classic, with its solemnity, its restraint, {561} its "brave old wisdom of sincerity," we seem to see the president's homely features irradiated with the light of coming martyrdom—

"The kindly-earnest, brave, foreseeing man,
Sagacious, patient, dreading praise, not blame,
New birth of our new soil, the first American."

Within the past quarter of a century the popular school of American humor has reached its culmination. Every man of genius who is a humorist at all is so in a way peculiar to himself. There is no lack of individuality in the humor of Irving and Hawthorne and the wit of Holmes and Lowell, but although they are new in subject and application they are not new in kind. Irving, as we have seen, was the literary descendant of Addison. The character sketches in *Bracebridge Hall* are of the same family with Sir Roger de Coverley and the other figures of the Spectator Club. *Knickerbocker's History of New York*, though purely American in its matter, is not distinctly American in its method, which is akin to the mock heroic of Fielding and the irony of Swift in the *Voyage to Lilliput*. Irving's humor, like that of all the great English humorists, had its root in the perception of character--of the characteristic traits of men and classes of men, as ground of amusement. It depended for its effect, therefore, upon its truthfulness, its dramatic insight and sympathy, as did the humor of Shakspeare, of Sterne, Lamb, and Thackeray. This perception of the characteristic, {562} when pushed to excess, issues in grotesque and caricature, as in some of Dickens's inferior creations, which are little more than personified single tricks of manner, speech, feature, or dress. Hawthorne's rare humor differed from Irving's in temper but not in substance, and belonged, like Irving's, to the English variety. Dr. Holmes's more pronouncedly comic verse does not differ specifically from the *facetiae* of Thomas Hood, but his prominent trait is wit, which is the laughter of the head as humor is of the heart. The same is true, with qualifications, of Lowell, whose *Biglow Papers*, though humor of an original sort in their revelation of Yankee character, are essentially satirical. It is the cleverness, the shrewdness of the hits in the *Biglow Papers*, their logical, that is, *witty* character, as distinguished from their drollery, that arrests the attention. They are funny, but they are not so funny as they are smart. In all these writers humor was blent with more serious qualities, which gave fineness and literary value to their humorous writings. Their view of life was not exclusively comic. But there has been a class of jesters, of professional humorists in America, whose product is so indigenious, so different, if not in essence, yet at least in form and expression, from any European humor, that it may be regarded as a unique addition to the comic literature of the world. It has been accepted as such in England, where Artemus Ward and Mark Twain are familiar to multitudes who have never read the *One-Hoss-Shay* or the *Courtin'*. And though it {563} would be ridiculous to maintain that either of these writers takes rank with Lowell and Holmes, or to deny that there is an amount of flatness and coarseness in many of their labored fooleries which puts large portions of their writings below the line where real literature begins, still it will not do to ignore them as mere buffoons, or even to predict that their humors will soon be forgotten. It is true that no literary fashion is more subject to change than

the fashion of a jest, and that jokes that make one generation laugh seem insipid to the next. But there is something perennial in the fun of Rabelais, whom Bacon called "the great jester of France;" and though the puns of Shakspeare's clowns are detestable the clowns themselves have not lost their power to amuse. The Americans are not a gay people, but they are fond of a joke. Lincoln's "little stories" were characteristically Western, and it is doubtful whether he was more endeared to the masses by his solid virtues than by the humorous perception which made him one of them. The humor of which we are speaking now is a strictly popular and national possession. Though America has never, or not until lately, had a comic paper ranking with Punch or Charivari or the Fliegende Blätter, every newspaper has had its funny column. Our humorists have been graduated from the journalist's desk and sometimes from the printing-press, and now and then a local or country newspaper has risen into sudden prosperity from the possession of a {564} new humorist, as in the case of G. D. Prentice's Courier-Journal, or more recently of the Cleveland Plain Dealer, the Danbury News, the Burlington Hawkeye, the Arkansas Traveller, the Texas Siftings and numerous others. Nowadays there are even syndicates of humorists, who co-operate to supply fun for certain groups of periodicals. Of course the great majority of these manufacturers of jests for newspapers and comic almanacs are doomed to swift oblivion. But it is not so certain that the best of the class, like Clemens and Browne, will not long continue to be read as illustrative of one side of the American mind, or that their best things will not survive as long as the mots of Sydney Smith, which are still as current as ever. One of the earliest of them was Seba Smith, who, under the name of Major Jack Downing, did his best to make Jackson's administration ridiculous. B. P. Shillaber's "Mrs. Partington"--a sort of American Mrs. Malaprop--enjoyed great vogue before the war. Of a somewhat higher kind were the Phoenixiana, 1855, and Squibob Papers, 1856, of Lieutenant George H. Derby, "John Phoenix," one of the pioneers of literature on the Pacific coast at the time of the California gold fever of '49. Derby's proposal for A New System of English Grammar, his satirical account of the topographical survey of the two miles of road between San Francisco and the Mission Dolores, and his picture gallery made out of the conventional houses, steam-boats, rail-cars, runaway negroes {565} and other designs which used to figure in the advertising columns of the newspapers, were all very ingenious and clever. But all these pale before Artemus Ward--"Artemus the delicious," as Charles Reade called him--who first secured for this peculiarly American type of humor a hearing and reception abroad. Ever since the invention of Hosea Biglow, an imaginary personage of some sort, under cover of whom the author might conceal his own identity, has seemed a necessity to our humorists. Artemus Ward was a traveling showman who went about the country exhibiting a collection of wax "figgers" and whose experiences and reflections were reported in grammar and spelling of a most ingeniously eccentric kind. His inventor was Charles F. Browne, originally of Maine, a printer by trade and afterward a newspaper writer and editor at Boston, Toledo and Cleveland, where his comicalities in the Plainealer first began to attract notice. In 1860 he came to New York and joined the staff of Vanity Fair, a comic weekly of much brightness, which ran a short career and perished for want of capital. When Browne began to appear as a public lecturer people who had formed an idea of him from his impersonation of the shrewd and vulgar old showman were surprised to find him a gentlemanly-looking young man, who came upon the platform in correct evening dress, and "spoke his piece" in a quiet and somewhat mournful manner, stopping in apparent surprise when any one in the {566} audience laughed at any uncommonly outrageous absurdity. In London, where he delivered his Lecture on the Mormons, in 1866, the gravity of his bearing at first imposed upon his hearers, who had come to the hall in search of instructive information and were disappointed at the inadequate nature of the panorama which Browne had had made to illustrate his lecture. Occasionally some hitch would occur in the machinery of this and the lecturer would leave the rostrum for a few moments to "work the moon" that shone upon the Great Salt Lake, apologizing on his return on the ground that he was "a man short" and offering "to pay a good salary to any respectable boy of good parentage and education who is a good moonist." When it gradually dawned upon the British intellect that these and similar devices of the lecturer--such as the soft music which he had the pianist play at pathetic passages--nay, that the panorama and even the lecture itself were of a humorous intention, the joke began to take, and Artemus's success in England became assured. He was employed as one of the editors of Punch, but died at Southampton in the year following. Some of Artemus Ward's effects were produced by cacography or bad spelling, but there was genius in the wildly erratic way in which he handled even this rather low order of humor. It is a curious commentary on the wretchedness of our English orthography that the phonetic spelling of a word, as for example, wuz for was, should be {567} in itself an occasion of mirth. Other verbal effects of a different kind were among his devices, as in the passage where the seventeen widows of a deceased Mormon offered themselves to Artemus.

"And I said, 'Why is this thus? What is the reason of this thusness?'

They have a sigh--seventeen sighs of different size. They said--

"'O, soon thou will be gonested away.'

"I told them that when I got ready to leave a place I wentested."

"They said, 'Doth not like us?'"

"I said, 'I doth--I doth.'"

"I also said, 'I hope your intentions are honorable, as I am a lone child--my parents being far--far away.'"

"They then said, 'Wilt not marry us?'"

"I said, 'O no, it cannot was.'"

"When they cried, 'O cruel man! this is too much!--O! too much,' I told them that it was on account of the muchness that I declined."

It is hard to define the difference between the humor of one writer and another, or of one nation and another. It can be felt and can be illustrated by quoting examples, but scarcely described in general terms. It has been said of that class of American humorists of which Artemus Ward is a representative that their peculiarity consists in extravagance, surprise, audacity and irreverence. But all these qualities have characterized other schools of humor. There is the same element of surprise in De Quincey's {568} anticlimax, "Many a man has dated his ruin from some murder or other which, perhaps, at the time he thought little of," as in Artemus's truism that "a comic paper ought to publish a joke now and then." The violation of logic which makes us laugh at an Irish bull is likewise the source of the humor in Artemus's saying of Jeff Davis, that "it would have been better than ten dollars in his pocket if he had never been born." Or in his advice, "Always live within your income, even if you have to borrow money to do so;" or, again, in his announcement that, "Mr. Ward will pay no debts of his own contracting." A kind of ludicrous confusion, caused by an unusual collocation of words, is also one of his favorite tricks, as when he says of Brigham Young, "He's the most married man I ever saw in my life;" or when, having been drafted at several hundred different places where he had been exhibiting his wax figures, he says that if he went on he should soon become a regiment, and adds, "I never knew that there was so many of me." With this a whimsical under-statement and an affectation of simplicity, as where he expresses his willingness to sacrifice "even his wife's relations" on the altar of patriotism; or, where, in delightful unconsciousness of his own sins against orthography, he pronounces that "Chaucer was a great poet, but he couldn't spell," or where he says of the feast of raw dog, tendered him by the Indian chief, Wocky-bocky, "It don't agree with me. I prefer simple food." On the {569} whole, it may be said of original humor of this kind, as of other forms of originality in literature, that the elements of it are old, but the combinations are novel. Other humorists, like Henry W. Shaw ("Josh Billings"), and David R. Locke, ("Petroleum V. Nasby"), have used bad spelling as a part of their machinery; while Robert H. Newell, ("Orpheus C. Kerr"), Samuel L. Clemens, ("Mark Twain"), and more recently "Bill Nye," though belonging to the same school of low or broad comedy, have discarded cacography. Of these the most eminent, by all odds, is Mark Twain, who has probably made more people laugh than any other living writer. A Missourian by birth (1835), he served the usual apprenticeship at type-setting and editing country newspapers; spent seven years as a pilot on a Mississippi steam-boat, and seven years more mining and journalizing in Nevada, where he conducted the Virginia City Enterprise, finally drifted to San Francisco, and was associated with Bret Harte on the Californian, and in 1867 published his first book, the Jumping Frog. This was succeeded by the Innocents Abroad, 1869; Roughing It, 1872; A Tramp Abroad, 1880, and by others not so good. Mark Twain's drolleries have frequently the same air of innocence and surprise as Artemus Ward's, and there is a like suddenness in his turns of expression, as where he speaks of "the calm confidence of a Christian with four aces." If he did not originate, he at any rate employed very {570} effectively that now familiar device of the newspaper "funny man," of putting a painful situation euphemistically, as when he says of a man who was hanged that he "received injuries which terminated in his death." He uses to the full extent the American humorist's favorite resources of exaggeration and irreverence. An instance of the former quality may be seen in his famous description of a dog chasing a coyote, in Roughing It, or in his interview with the lightning-rod agent in Mark Twain's Sketches, 1875. He is a shrewd observer, and his humor has a more satirical side than Artemus Ward's, sometimes passing into downright denunciation. He delights particularly in ridiculing sentimental humbug and moralizing cant. He runs a tilt, as has been said, at "copy-book texts," at the temperance reformer, the tract distributor, the Good Boy of Sunday-school literature, and the women who send bouquets and sympathetic letters to interesting criminals. He gives a ludicrous turn to famous historical anecdotes, such as the story of George

Washington and his little hatchet; burlesques the time-honored adventure, in nautical romances, of the starving crew casting lots in the long boat, and spoils the dignity of antiquity by modern trivialities, saying of a discontented sailor on Columbus's ship, "He wanted fresh shad." The fun of *Innocents Abroad* consists in this irreverent application of modern, common sense, utilitarian, democratic standards to the memorable places and historic associations of {571} Europe. Tried by this test the Old Masters in the picture galleries become laughable. Abelard was a precious scoundrel, and the raptures of the guide books are parodied without mercy. The tourist weeps at the grave of Adam. At Genoa he drives the cicerone to despair by pretending never to have heard of Christopher Columbus, and inquiring innocently, "Is he dead?" It is Europe vulgarized and stripped of its illusions--Europe seen by a Western newspaper reporter without any "historic imagination." The method of this whole class of humorists is the opposite of Addison's or Irving's or Thackeray's. It does not amuse by the perception of the characteristic. It is not founded upon truth, but upon incongruity, distortion, unexpectedness. Everything in life is reversed, as in opera bouffe, and turned topsy turvy, so that paradox takes the place of the natural order of things. Nevertheless they have supplied a wholesome criticism upon sentimental excesses, and the world is in their debt for many a hearty laugh. In the *Atlantic Monthly* for December, 1863, appeared a tale entitled the *Man Without a Country*, which made a great sensation, and did much to strengthen patriotic feeling in one of the darkest hours of the nation's history. It was the story of one Philip Nolan, an army officer, whose head had been turned by Aaron Burr, and who, having been censured by a court-martial for some minor offense, exclaimed, petulantly, upon {572} mention being made of the United States Government, "Damn the United States! I wish that I might never hear the United States mentioned again." Thereupon he was sentenced to have his wish, and was kept all his life aboard the vessels of the navy, being sent off on long voyages and transferred from ship to ship, with orders to those in charge that his country and its concerns should never be spoken of in his presence. Such an air of reality, was given to the narrative by incidental references to actual persons and occurrences that many believed it true, and some were found who remembered Philip Nolan, but had heard different versions of his career. The author of this clever hoax--if hoax it may be called--was Edward Everett Hale, a Unitarian clergyman of Boston, who published a collection of stories in 1868, under the fantastic title, *If, Yes, and Perhaps*, indicating thereby that some of the tales were possible, some of them probable, and others might even be regarded as essentially true. A similar collection, *His Level Best and Other Stories* was published in 1873, and in the interval three volumes of a somewhat different kind, the *Ingham Papers* and *Sybaris and Other Homes*, both in 1869, and *Ten Times One Is Ten*, in 1871. The author shelters himself behind the imaginary figure of Captain Frederic Ingham, pastor of the Sandemanian Church at Naguadavick, and the same characters have a way of re-appearing in his successive volumes as old friends of the reader, which is pleasant at first, but in the end a {573} little tiresome. Mr. Hale is one of the most original and ingenious of American story writers. The old device of making wildly improbable inventions appear like fact by a realistic treatment of details--a device employed by Swift and Edgar Poe, and more lately by Jules Verne--became quite fresh and novel in his hands, and was managed with a humor all his own. Some of his best stories are *My Double and How He Undid Me*, describing how a busy clergyman found an Irishman who looked so much like himself that he trained him to pass as his duplicate, and sent him to do duty in his stead at public meetings, dinners, etc., thereby escaping bores and getting time for real work; the *Brick Moon*, a story of a projectile built and launched into space, to revolve in a fixed meridian about the earth and serve mariners as a mark of longitude; the *Rag Man and Rag Woman*, a tale of an impoverished couple who made a competence by saving the pamphlets, advertisements, wedding cards, etc., that came to them through the mail, and developing a paper business on that basis; and the *Skeleton in the Closet*, which shows how the fate of the Southern Confederacy was involved in the adventures of a certain hoop-skirt, "built in the eclipse and rigged with curses dark." Mr. Hale's historical scholarship and his exact habit of mind have aided him in the art of giving *vraisemblance* to absurdities. He is known in philanthropy as well as in letters, and his tales have a cheerful, busy, {574} practical way with them in consonance with his motto, "Look up and not down, look forward and not back, look out and not in, and lend a hand." It is too soon to sum up the literary history of the last quarter of a century. The writers who have given it shape are still writing, and their work is therefore incomplete. But on the slightest review of it two facts become manifest: first, that New England has lost its long monopoly; and, secondly, that a marked feature of the period is the growth of realistic fiction. The electric tension of the atmosphere for thirty years preceding the civil war, the storm and stress of great public contests, and the intellectual stir produced by transcendentalism seem to have been more favorable to poetry and literary idealism than present conditions are. At all events there are no new poets who rank with Whittier, Longfellow, Lowell, and others of the elder generation, although George H. Boker, in Philadelphia, R. H. Stoddard and E. C. Stedman, in New York, and T. B. Aldrich, first in New York and afterward in Boston, have written creditable verse; not to speak of younger writers, whose work, however, for the most part, has been more distinguished by delicacy of execution than by native impulse. Mention has been made of the establishment of *Harper's Monthly Magazine*, which, under the conduct of its accomplished editor, George W. Curtis, has provided

the public with an abundance of good reading. The {575} old Putnam's Monthly, which ran from 1853 to 1858, and had a strong corps of contributors, was revived in 1868, and continued by that name till 1870, when it was succeeded by Scribner's Monthly, under the editorship of Dr. J. G. Holland, and this in 1881 by the Century, an efficient rival of Harper's in circulation, in literary excellence, and in the beauty of its wood engraving, the American school of which art these two great periodicals have done much to develop and encourage. Another New York monthly, the Galaxy, ran from 1866 to 1878, and was edited by Richard Grant White. During the present year a new Scribner's Magazine has also taken the field. The Atlantic, in Boston, and Lippincott's, in Philadelphia, are no unworthy competitors with these for public favor. During the forties began a new era of national expansion, somewhat resembling that described in a former chapter, and, like that, bearing fruit eventually in literature. The cession of Florida to the United States in 1845, and the annexation of Texas in the same year, were followed by the purchase of California in 1847, and its admission as a State in 1850. In 1849 came the great rush to the California gold fields. San Francisco, at first a mere collection of tents and board shanties, with a few adobe huts, grew with incredible rapidity into a great city; the wicked and wonderful city apostrophized by Bret Harte in his poem, San Francisco: {576}

"Serene, indifferent of Fate,
Thou sittest at the Western Gate;
Upon thy heights so lately won
Still slant the banners of the sun. . . .
I know thy cunning and thy greed,
Thy hard, high lust and willful deed."

The adventurers of all lands and races who flocked to the Pacific coast found there a motley state of society between civilization and savagery. There were the relics of the old Mexican occupation, the Spanish missions, with their Christianized Indians; the wild tribes of the plains--Apaches, Utes, and Navajoes; the Chinese coolies and washermen, all elements strange to the Atlantic seaboard and the States of the interior. The gold-hunters crossed, in stages or caravans, enormous prairies, alkaline deserts dotted with sage brush and seamed by deep cañons, and passes through gigantic mountain ranges. On the coast itself nature was unfamiliar: the climate was sub-tropical; fruits and vegetables grew to a mammoth size, corresponding to the enormous redwoods in the Mariposa groves and the prodigious scale of the scenery in the valley of the Yo Semite and the snow-capped peaks of the Sierras. At first there were few women, and the men led a wild, lawless existence in the mining camps. Hard upon the heels of the prospector followed the dram-shop, the gambling-hell, and the dance-hall. Every man carried his "Colt," and looked out for his own life and his "claim." Crime went unpunished or was taken in hand, {577} when it got too rampant, by vigilance committees. In the diggings, shaggy frontiersmen and "pikes" from Missouri mingled with the scum of eastern cities and with broken-down business men and young college graduates seeking their fortune. Surveyors and geologists came of necessity, speculators in mining stock and city lots set up their offices in the towns; later came a sprinkling of school-teachers and ministers. Fortunes were made in one day and lost the next at poker or loo. To-day the lucky miner who had struck a good "lead" was drinking champagne out of pails and treating the town; to-morrow he was "busted," and shouldered the pick for a new onslaught upon his luck. This strange, reckless life, was not without fascination, and highly picturesque and dramatic elements were present in it. It was, as Bret Harte says, "an era replete with a certain heroic Greek poetry," and sooner or later it was sure to find its poet. During the war California remained loyal to the Union, but was too far from the seat of conflict to experience any serious disturbance, and went on independently developing its own resources and becoming daily more civilized. By 1868 San Francisco had a literary magazine, the Overland Monthly, which ran until 1875. It had a decided local flavor, and the vignette on its title-page was a happily chosen emblem, representing a grizzly bear crossing a railway track. In an early number of the Overland was a story entitled the Luck of Roaring Camp, by Francis Bret Harte, a {578} native of Albany, N. Y., 1835, who had come to California at the age of seventeen, in time to catch the unique aspects of the life of the Forty-niners, before their vagabond communities had settled down into the law-abiding society of the present day. His first contribution was followed by other stories and sketches of a similar kind, such as the Outcasts of Poker Flat, Miggles, and Tennessee's Partner, and by verses, serious and humorous, of which last, Plain Language from Truthful James, better known as the Heathen Chinee, made an immediate hit, and carried its author's name into every corner of the English-speaking world. In 1871 he published a collection of his tales, another of his poems, and a volume of very clever parodies, Condensed Novels, which rank with Thackeray's Novels by Eminent Hands. Bret Harte's California stories were vivid, highly-colored pictures of life in the mining camps and raw towns of the Pacific coast. The pathetic and the grotesque went hand in hand in them, and the author aimed to show how even in the desperate characters gathered together there--the fortune hunters,

gamblers, thieves, murderers, drunkards, and prostitutes--the latent nobility of human nature asserted itself in acts of heroism, magnanimity, self-sacrifice, and touching fidelity. The same men who cheated at cards and shot each another down with tipsy curses were capable on occasion of the most romantic generosity and the most delicate chivalry. Critics were not wanting who held that, in the matter of dialect {579} and manners and other details, the narrator was not true to the facts. This was a comparatively unimportant charge; but a more serious question was the doubt whether his characters were essentially true to human nature, whether the wild soil of revenge and greed and dissolute living ever yields such flowers of devotion as blossom in *Tennessee's Partner* and the *Outcasts of Poker Flat*. However this may be, there is no question as to Harte's power as a narrator. His short stories are skillfully constructed and effectively told. They never drag, and are never overladen with description, reflection, or other lumber. In his poems in dialect we find the same variety of types and nationalities characteristic of the Pacific coast: the little Mexican maiden, Pachita, in the old mission garden; the wicked Bill Nye, who tries to cheat the Heathen Chinee at euchre and to rob Injin Dick of his winning lottery ticket; the geological society on the Stanislaw who settle their scientific debates with chunks of old red sandstone and the skulls of mammoths; the unlucky Mr. Dow, who finally strikes gold while digging a well, and builds a house with a "coopilow;" and Flynn, of Virginia, who saves his "pard's" life, at the sacrifice of his own, by holding up the timbers in the caving tunnel. These poems are mostly in monologue, like Browning's dramatic lyrics, exclamatory and abrupt in style, and with a good deal of indicated action, as in *Jim*, where a miner comes into a bar-room, looking for his old {580} chum, learns that he is dead, and is just turning away to hide his emotion, when he recognizes Jim in his informant:

"Well, thar--Good-by--
 No more, sir--I--
 Eh?
 What's that you say?--
 Why, dern it!--sho!--
 No? Yes! By Jo!
 Sold!
 Sold! Why, you limb;
 You ornery,
 Derved old
 Long-legged Jim!"

Bret Harte had many imitators, and not only did our newspaper poetry for a number of years abound in the properties of Californian life, such as gulches, placers, divides, etc., but writers further east applied his method to other conditions. Of these by far the most successful was John Hay, a native of Indiana and private secretary to President Lincoln, whose *Little Breeches*, *Jim Bludso*, and *Mystery of Gilgal* have rivaled Bret Harte's own verses in popularity. In the last-named piece the reader is given to feel that there is something rather cheerful and humorous in a bar-room fight which results in "the gals that winter, as a rule," going "alone to the singing school." In the two former we have heroes of the Bret Harte type, the same combination of superficial wickedness with inherent loyalty and tenderness. The profane farmer {581} of the South-west, who "doesn't pan out on the prophets," and who had taught his little son "to chaw terbacker, just to keep his milk-teeth white," but who believes in God and the angels ever since the miraculous recovery of the same little son when lost on the prairie in a blizzard; and the unsaintly and bigamistic captain of the *Prairie Belle*, who died like a hero, holding the nozzle of his burning boat against the bank "Till the last galoot's ashore." The manners and dialect of other classes and sections of the country have received abundant illustration of late years. Edward Eggleston's *Hoosier Schoolmaster*, 1871, and his other novels are pictures of rural life in the early days of Indiana. *Western Windows*, a volume of poems by John James Piatt, another native of Indiana, had an unmistakable local coloring. Charles G. Leland, of Philadelphia, in his *Hans Breitmann* ballads, in dialect, gave a humorous presentation of the German-American element in the cities. By the death, in 1881, of Sidney Lanier, a Georgian by birth, the South lost a poet of rare promise, whose original genius was somewhat hampered by his hesitation between two arts of expression, music and verse, and by his effort to co-ordinate them. His *Science of English Verse*, 1880, was a most suggestive, though hardly convincing, statement of that theory of their relation which he was working out in his practice. Some of his pieces, {582} like the *Mocking Bird* and the *Song of the Chattahoochie*, are the most characteristically Southern poetry that has been written in America. Joel Chandler Harris's *Uncle Remus* stories, in Negro dialect, are transcripts from the folklore of the plantations, while his collection of stories, *At Teague Poteet's*, together with Miss Murfree's *In the Tennessee Mountains* and her other books have made the Northern public familiar with the wild life of the "moonshiners," who distill illicit whiskey in the mountains of Georgia, North Carolina, and Tennessee. These tales

are not only exciting in incident, but strong and fresh in their delineations of character. Their descriptions of mountain scenery are also impressive, though, in the case of the last named writer, frequently too prolonged. George W. Cable's sketches of French Creole life in New Orleans attracted attention by their freshness and quaintness when published in the magazines and re-issued in book form as *Old Creole Days*, in 1879. His first regular novel, the *Grandissimes*, 1880, was likewise a story of Creole life. It had the same winning qualities as his short stories and sketches, but was an advance upon them in dramatic force, especially in the intensely tragic and powerfully told episode of "Bras Coupe." Mr. Cable has continued his studies of Louisiana types and ways in his later books, but the *Grandissimes* still remains his master-piece. All in all, he is, thus far, the most important literary figure of the New South, and the justness and {583} delicacy of his representations of life speak volumes for the sobering and refining agency of the civil war in the States whose "cause" was "lost," but whose true interests gained even more by the loss than did the interests of the victorious North. The four writers last mentioned have all come to the front within the past eight or ten years, and, in accordance with the plan of this sketch, receive here a mere passing notice. It remains to close our review of the literary history of the period since the war with a somewhat more extended account of the two favorite novelists whose work has done more than any thing else to shape the movement of recent fiction. These are Henry James, Jr., and William Dean Howells. Their writings, though dissimilar in some respects, are alike in this, that they are analytic in method and realistic in spirit. Cooper was a romancer pure and simple; he wrote the romance of adventure and of external incident. Hawthorne went much deeper, and with a finer spiritual insight dealt with the real passions of the heart and with men's inner experiences. This he did with truth and power; but, although himself a keen observer of whatever passed before his eyes, he was not careful to secure a photographic fidelity to the surface facts of speech, dress, manners, etc. Thus the talk of his characters is book talk, and not the actual language of the parlor or the street, with its slang, its colloquial ease and the intonations and shadings of phrase {584} and pronunciation which mark different sections of the country and different grades of society. His attempts at dialect, for example, were of the slenderest kind. His art is ideal, and his romances certainly do not rank as novels of real life. But with the growth of a richer and more complicated society in America fiction has grown more social and more minute in its observation. It would not be fair to classify the novels of James and Howells as the fiction of manners merely; they are also the fiction of character, but they aim to describe people not only as they are, in their inmost natures, but also as they look and talk and dress. They try to express character through manners, which is the way in which it is most often expressed in the daily existence of a conventional society. It is a principle of realism not to select exceptional persons or occurrences, but to take average men and women and their average experiences. The realists protest that the moving incident is not their trade, and that the stories have all been told. They want no plot and no hero. They will tell no rounded tale with a *dénouement*, in which all the parts are distributed, as in the fifth act of an old-fashioned comedy; but they will take a transcript from life and end when they get through, without informing the reader what becomes of the characters. And they will try to interest this reader in "poor real life" with its "foolish face." Their acknowledged masters are Balzac, George Eliot, Turgénieff, and Anthony {585} Trollope, and they regard novels as studies in sociology, honest reports of the writer's impressions, which may not be without a certain scientific value even. Mr. James's peculiar province is the international novel; a field which he created for himself, but which he has occupied in company with Howells, Mrs. Burnett, and many others. He was born into the best traditions of New England culture, his father being a resident of Cambridge, and a forcible writer on philosophical subjects, and his brother, William James, a professor in Harvard University. The novelist received most of his schooling in Europe, and has lived much abroad, with the result that he has become half denationalized and has engrafted a cosmopolitan indifference upon his Yankee inheritance. This, indeed, has constituted his opportunity. A close observer and a conscientious student of the literary art, he has added to his intellectual equipment the advantage of a curious doubleness in his point of view. He looks at America with the eyes of a foreigner and at Europe with the eyes of an American. He has so far thrown himself out of relation with American life that he describes a Boston horsecar or a New York hotel table with a sort of amused wonder. His starting-point was in criticism, and he has always maintained the critical attitude. He took up story-writing in order to help himself, by practical experiment, in his chosen art of literary criticism, and his volume on {586} *French Poets and Novelists*, 1878, is by no means the least valuable of his books. His short stories in the magazines were collected into a volume in 1875, with the title, *A Passionate Pilgrim and Other Stories*. One or two of these, as the *Last of the Valerii* and the *Madonna of the Future*, suggest Hawthorne, a very unsympathetic study of whom James afterward contributed to the "English Men of Letters" series. But in the name-story of the collection he was already in the line of his future development. This is the story of a middle-aged invalid American, who comes to England in search of health, and finds, too late, in the mellow atmosphere of the mother country, the repose and the congenial surroundings which he has all his life been longing for in his raw America. The pathos of his self-analysis and his confession of failure is subtly imagined. The impressions which he and his far-away English kinsfolk make on one another, their mutual attraction and repulsion, are described with that delicate perception of national

differences which makes the humor and sometimes the tragedy of James's later books, like the *American*, *Daisy Miller*, the *Europeans*, and *An International Episode*. His first novel was *Roderick Hudson*, 1876, not the most characteristic of his fictions, but perhaps the most powerful in its grasp of elementary passion. The analytic method and the critical attitude have their dangers in imaginative literature. In proportion as this writer's faculty of minute observation and his realistic objectivity {587} have increased upon him, the uncomfortable coldness which is felt in his youthful work has become actually disagreeable, and his art--growing constantly finer and surer in matters of detail--has seemed to dwell more and more in the region of mere manners and less in the higher realm of character and passion. In most of his writings the heart, somehow, is left out. We have seen that Irving, from his knowledge of England and America, and his long residence in both countries, became the mediator between the two great branches of the Anglo-Saxon race. This he did by the power of his sympathy with each. Henry James has likewise interpreted the two nations to one another in a subtler but less genial fashion than Irving, and not through sympathy, but through contrast, by bringing into relief the opposing ideals of life and society which have developed under different institutions. In his novel, the *American*, 1877, he has shown the actual misery which may result from the clashing of opposed social systems. In such clever sketches as *Daisy Miller*, 1879, the *Pension Beaurepas*, and *A Bundle of Letters*, he has exhibited types of the American girl, the American business man, the aesthetic feebling from Boston, and the Europeanized or would-be denationalized American campaigners in the Old World, and has set forth the ludicrous incongruities, perplexities, and misunderstandings which result from contradictory standards of conventional morality and behavior. In the *Europeans*, 1879, and an {588} *International Episode*, 1878, he has reversed the process, bringing Old World [Transcriber's note: World?] standards to the test of American ideas by transferring his *dramatis personae* to republican soil. The last-named of these illustrates how slender a plot realism requires for its purposes. It is nothing more than the history of an English girl of good family who marries an American gentleman and undertakes to live in America, but finds herself so uncomfortable in strange social conditions that she returns to England for life, while, contrariwise, the heroine's sister is so taken with the freedom of these very conditions that she elopes with another American and "goes West." James is a keen observer of the physiognomy of cities as well as of men, and his *Portraits of Places*, 1884, is among the most delightful contributions to the literature of foreign travel. Mr. Howells's writings are not without "international" touches. In *A Foregone Conclusion* and the *Lady of the Aroostook*, and others of his novels, the contrasted points of view in American and European life are introduced, and especially those variations in feeling, custom, dialect, etc., which make the modern Englishman and the modern American such objects of curiosity to each other, and which have been dwelt upon of late even unto satiety. But in general he finds his subjects at home, and if he does not know his own countrymen and countrywomen more intimately than Mr. James, at least {589} he loves them better. There is a warmer sentiment in his fictions, too; his men are better fellows and his women are more lovable. Howells was born in Ohio. His early life was that of a western country editor. In 1860 he published, jointly with his friend Piatt, a book of verse--*Poems of Two Friends*. In 1861 he was sent as consul to Venice, and the literary results of his sojourn there appeared in his sketches *Venetian Life*, 1865, and *Italian Journeys*, 1867. In 1871 he became editor of the *Atlantic Monthly*, and in the same year published his *Suburban Sketches*. All of these early volumes showed a quick eye for the picturesque, an unusual power of description, and humor of the most delicate quality; but as yet there was little approach to narrative. *Their Wedding Journey* was a revelation to the public of the interest that may lie in an ordinary bridal trip across the State of New York, when a close and sympathetic observation is brought to bear upon the characteristics of American life as it appears at railway stations and hotels, on steam-boats and in the streets of very commonplace towns. *A Chance Acquaintance*, 1873, was Howells's first novel, though even yet the story was set against a background of travel--pictures, a holiday trip on the St. Lawrence and the Saguenay; and descriptions of Quebec and the Falls of Montmorenci, etc., rather predominated over the narrative. Thus, gradually and by a natural process, complete characters and realistic novels, such as *A Modern* {590} *Instance*, 1882, and *Indian Summer*, evolved themselves from truthful sketches of places and persons seen by the way. The incompatibility existing between European and American views of life, which makes the comedy or the tragedy of Henry James's international fictions, is replaced in Howells's novels by the repulsion between differing social grades in the same country. The adjustment of these subtle distinctions forms a part of the problem of life in all complicated societies. Thus in *A Chance Acquaintance* the heroine is a bright and pretty Western girl, who becomes engaged during a pleasure tour to an irreproachable but offensively priggish young gentleman from Boston, and the engagement is broken by her in consequence of an unintended slight--the betrayal on the hero's part of a shade of mortification when he and his betrothed are suddenly brought into the presence of some fashionable ladies belonging to his own *monde*. The little comedy, *Out of the Question*, deals with this same adjustment of social scales; and in many of Howells's other novels, such as *Silas Lapham* and the *Lady of the Aroostook*, one of the main motives may be described to be the contact of the man who eats with his fork with the man who eats with his knife, and the shock thereby ensuing. In *Indian Summer* the complications arise from

the difference in age between the hero and heroine, and not from a difference in station or social antecedents. In all of these fictions the {591} misunderstandings come from an incompatibility of manner rather than of character, and, if any thing were to be objected to the probability of the story, it is that the climax hinges on delicacies and subtleties which, in real life, when there is opportunity for explanations, are readily brushed aside. But in *A Modern Instance* Howells touched the deeper springs of action. In this, his strongest work, the catastrophe is brought about, as in George Eliot's great novels, by the reaction of characters upon one another, and the story is realistic in a higher sense than any mere study of manners can be. His nearest approach to romance is in the *Undiscovered Country*, 1880, which deals with the Spiritualists and the Shakers, and in its study of problems that hover on the borders of the supernatural, in its out-of-the-way personages and adventures, and in a certain ideal poetic flavor about the whole book, has a strong resemblance to Hawthorne, especially to Hawthorne in the *Blithedale Romance*, where he comes closer to common ground with other romancers. It is interesting to compare *Undiscovered Country* with Henry James's *Bostonians*, the latest and one of the cleverest of his fictions, which is likewise a study of the clairvoyants, mediums, woman's rights' advocates, and all varieties of cranks, reformers, and patrons of "causes," for whom Boston has long been notorious. A most unlovely race of people they become under the cold scrutiny of Mr. James's cosmopolitan eyes, which see more clearly the {592} charlatanism, narrow-mindedness, mistaken fanaticism, morbid self-consciousness, disagreeable nervous intensity, and vulgar or ridiculous outside peculiarities of the humanitarians, than the nobility and moral enthusiasm which underlie the surface. Howells is almost the only successful American dramatist, and this in the field of parlor comedy. His little farces, the *Elevator*, the *Register*, the *Parlor Car*, etc., have a lightness and grace, with an exquisitely absurd situation, which remind us more of the *Comedies et Proverbes* of Alfred de Musset, or the many agreeable dialogues and monologues of the French domestic stage, than of any work of English or American hands. His softly ironical yet affectionate treatment of feminine ways is especially admirable. In his numerous types of sweetly illogical, inconsistent, and inconsequent womanhood he has perpetuated with a nicer art than Dickens what Thackeray calls "that great discovery," Mrs. Nickleby.

1. Theodore Winthrop. *Life in the Open Air*. Cecil Dreeme.
 2. Thomas Wentworth Higginson. *Life in a Black Regiment*.
 3. *Poetry of the Civil War*. Edited by Richard Grant White. New York: 1866.
 4. Charles Farrar Browne. *Artemus Ward--His Book*. Lecture on the Mormons. Artemus Ward in London.

CHAPTER VIII.

THEOLOGICAL AND RELIGIOUS LITERATURE IN AMERICA.

BY JOHN FLETCHER HURST.

The important field of theology and religion in America has yielded many and rich additions to the storehouse of letters. The *Bay Psalm Book*, published in Cambridge, Mass., in 1640, was the first book printed in the English colonies in America. Its leading authors were Richard Mather (1596-1669), of Dorchester, father of Increase and grandfather of the still more famous Cotton Mather, Thomas Welde and John Eliot, both of Roxbury. The book was a few years later revised by Henry Dunster and passed through as many as twenty-seven editions. While it was both printed and used in England and Scotland by dissenting churches, it was a constant companion in private and public worship in the Calvinistic churches of the Colonies. The early colonial writers on theology include Charles Chauncy (1589-1672), the second president of Harvard College, who wrote a treatise on *Justification*, Samuel Willard (1640-1707), whose *Complete Body of Divinity* was the first folio {595} publication in America; Solomon Stoddard (1643-1729), whose most celebrated work was *The Doctrine of Instituted Churches*, in which he advocated the converting power of the Lord's Supper; Charles Chauncy (1705-1787), a great-grandson of President Chauncy, celebrated as a stickler for great plainness in writing and speech, and one of the founders of Universalism in New England, whose *Seasonable Thoughts* was in opposition to the preaching of Whitefield; and Aaron Burr (1716-1757), father of the political opponent and slayer of Alexander Hamilton, and author of *The Supreme Deity of Our Lord Jesus Christ*. James Blair (1656-1743), of Virginia, the virtual founder and first president of William and Mary College, wrote *Our Saviour's Sermon on the Mount*, containing one hundred and seventeen sermons. The two Tennents, Gilbert (1703-1764) and William (1705-1777), Samuel Finley (1717-1764), and Samuel Davies (1723-1761) were pulpit orators whose sermons still hold high rank in the homiletic world. Others of the colonial period distinguished for their ability are: John Davenport (1597-1670), of New Haven, author of *The Saint's Anchor Hold*; Edward Johnson (died 1682), of Woburn, author of *The Wonder Working Providence of Sion's Saviour in New England*; Jonathan Dickinson (1688-1747), the first president of the College of New Jersey (Princeton University), who published *Familiar Letters upon Important Subjects in Religion*, Samuel Johnson (1696-1772), a {596} distinguished advocate of Episcopacy in Connecticut; Thomas Clap (1703-1767), president of Yale College, who was the author of the *Religious Condition of Colleges*; Samuel Mather (1706-1785), a son of Cotton Mather, among whose works was *An Attempt to Show that America was Known to the Ancients*; and Thomas Chalkley (1675-1749), and John Woolman (1720-1772), both belonging to the Friends, and whose *Journals* are admirable specimens of the Quaker spirit and simplicity. Some of the leading writers on theology whose activity was greatest about the time of the American Revolution are worthy of study. They are John Witherspoon (1722-1794) who, while he is better known as the sixth president of the College of New Jersey and a political writer of the Revolution, was also the author of *Ecclesiastical Characteristics*, a satirical work aimed at the Moderate party of the Church of Scotland, and written before he left that country for America; Charles Thomson (1729-1824), who was for fifteen years the secretary of the Continental Congress and published a *Translation of the Bible*; Elias Boudinot (1740-1821), the first president of the American Bible Society and a leading philanthropist of his time, who wrote *The Age of Revelation*, a reply to Paine's *Age of Reason*; Nathan Strong (1748-1816), the editor of *The Connecticut Evangelical Magazine* and pastor of First Church, Hartford; Isaac Backus (1724-1806), the author of the well-known *History of New England with Particular {597} Reference to the Baptists*; Ezra Stiles (1727-1795), president of Yale College, who published many discourses and wrote *An Ecclesiastical History of New England*, which was not completed and never published; William White (1748-1836), Bishop of Pennsylvania for fifty years, who wrote several works on Episcopacy, one of which was *Memoir of the Episcopal Church in the United States*; and William Linn (1752-1808), who published sermons on the *Leading Personages of Scripture History*. Belonging also to the Revolutionary period these should be noted: Mather Byles (1706-1788), a wit and punster of loyalist leanings, some of whose sermons have been many times

printed, and who was a kinsman of the Mathers; Jonathan Mayhew (1720-1766), whose *Sermon on the Repeal of the Stamp Act* was the most famous of his stirring addresses on the political issues already prominent at the time of his death; William Smith (1727-1803), provost of the University of Pennsylvania, who was, not to speak of his other works, the author of several meritorious sermons; Samuel Seabury (1729-1796), the first Protestant Episcopal bishop and author of two volumes of sermons; and Jacob Duché (1739-1798), rector of Christ Church, Philadelphia, who abandoned the American cause, but whose sermons were highly prized. A quartet of those who gained distinction as writers on doctrine are: Joseph Bellamy (1719-1790), an influential divine of the Edwardean school, and author of *The True Religion {598} Delineated*; Samuel Hopkins (1721-1803), the advocate of disinterested benevolence as a cardinal principle of theology and author of *The System of Doctrines Contained in Divine Revelation*; Jonathan Edwards the Younger (1745-1801), president of Union College and author of several discourses, the most celebrated of which are the three on the "Necessity of the Atonement and its Consistency with Free Grace in Forgiveness" (these sermons are the basis of what has since been named the Edwardean theory); and Elhanan Winchester (1751-1797), the Universalist preacher, one of whose chief works was *The Universal Restoration*. In the earlier group of theological authorship of the present century, or the national period, taking conspicuous place as doctrinal writers, are: Nathaniel Emmons (1745-1840), one of the foremost of the New School of Calvinistic theology, whose works on the important discussion lasting through a half century are marked by a peculiar force and point; Samuel Stanhope Smith (1750-1819), president of the College of New Jersey and author of *Evidences of the Christian Religion*; his successor in office, Ashbel Green (1762-1848), whose chief literary labor was bestowed on *The Christian Advocate*, a religious monthly which he edited for twelve years, and who wrote *Lectures on the Shorter Catechism*; Henry Ware (1764-1845), the acknowledged head of the Unitarians prior to the appearance of Channing, professor of divinity in Harvard, and author of *Letters to Trinitarians and {599} Calvinists*; Leonard Woods (1774-1854), professor in Andover for thirty-eight years, author of several able books on the Unitarian controversy; and Wilbur Fisk (1792-1839), the distinguished preacher and educator, and author of *The Calvinistic Controversy*. Other theological lights of the early years of the republic are also: John Mitchell Mason (1770-1829), provost of Columbia College, later president of Dickinson College, a prime mover in the founding of Union Theological Seminary, and author of many sermons of a high order; Edward Payson (1783-1827), whose sermons are noted for the same ardent spirituality and beauty that marked his life and pastorate at Portland, Me.; John Summerfield (1798-1825), a volume of whose strangely eloquent sermons was published after his early death; Ebenezer Porter (1772-1834), professor in Andover, whose *Lectures on Revivals of Religion* are still worthy of consultation; Eliphalet Nott (1773-1866), president of Union College for sixty-two years, whose *Lectures on Temperance* are accounted among the best literature on that great reform; John Henry Hobart (1775-1830), bishop of the diocese of New York, who was the author of *Festivals and Fasts*, and one of the founders of the General Theological Seminary in New York; Nathan Bangs (1778-1862), a leading Methodist divine, who wrote a *History of the Methodist Episcopal Church* and *Errors of Hofkinsianism*; and Leonard {600} Withington (1789-1885), author of *Solomon's Song Translated and Explained*, a valuable exegetical work. In a second group of leading writers on religion, coming nearer the middle of the nineteenth century we find as doctrinal authors: Archibald Alexander (1772-1851), author of *Evidences of Christianity*; Hosea Ballou (1771-1852), the Universalist preacher and author of *An Examination of the Doctrine of Future Retribution*; Nathaniel W. Taylor (1786-1859), the author of *Lectures on the Moral Government of God*, in which there is a marked divergence from the strict school of Calvinistic theologians; Gardiner Spring (1785-1873), a tower of strength in the pulpit of New York for over fifty years, and author of *The Bible Not of Man*; Alexander Campbell (1788-1865), whose *Public Debates* contain the record of his distinguished career as a controversialist and mark the formation of the religious society called Disciples of Christ; Robert J. Breckenridge (1800-1871), whose work on *The Knowledge of God Objectively and Subjectively Considered* gave him great distinction; George W. Bethune (1805-1862), who, besides several hymns, wrote *Lectures on the Heidelberg Catechism*; and James H. Thornwell (1811-1862), of the Southern Presbyterians, who left an able *Systematic Theology*. Those whose works were of a more practical nature are: Samuel Miller (1769-1850), whose most telling book was *Letters on Clerical Habits and Manners*; Lyman Beecher (1775-1863), the {601} celebrated father of his more celebrated son, and author of *Sermons on Temperance*; Thomas H. Skinner (1791-1871), professor in Andover and later in Union Theological Seminary, who wrote *Aids to Preaching and Hearing*, and translated and edited Vinet's *Homiletics and Pastoral Theology*; Charles G. Finney (1792-1875), of Oberlin, whose *Lectures on Revivals* embody the principles on which he himself conducted his celebrated evangelistic labors; Francis Wayland (1796-1865), the Baptist divine and author of a text-book on *Moral Science*, who also wrote *The Moral Dignity of the Missionary Enterprise*; Ichabod S. Spencer (1798-1854), whose *Pastor's Sketches* have a perennial interest; Theodore Dwight Woolsey (1801-1889), who, besides other books on the classics and law, published *The Religion of the Present and the Future*; Bela Bates Edwards (1802-1852), of Andover, whose chief work was that bestowed upon the *Quarterly*

Observer_, later the Biblical Repository_, and still later as editor of Bibliotheca Sacra_; James Waddell Alexander (1804-1859), author of Consolation; or, Discourses to the Suffering Children of God_; and George B. Cheever (1807-1890), who wrote several popular books on temperance, one being Deacon Giles's Distillery_. A group of noted writers whose books have special bearing on the Bible are: Moses Stuart (1780-1852), the distinguished Hebraist and author of several commentaries and of a Hebrew {602} Grammar, whose scholarship was one of the chief attractions at Andover; Samuel H. Turner (1790-1861), the distinguished commentator on Romans, Hebrews, Ephesians, and Galatians; Edward Robinson (1794-1863), whose Biblical Researches and New Testament Lexicon mark him as one of the foremost scholars of the century; George Bush (1796-1860), known chiefly as the author of Commentaries on the earlier parts of the Old Testament; Albert Barnes (1798-1870), whose Notes on the Scriptures still have a large place among the more popular works of exegesis; Stephen Olin (1797-1851) and John Price Durbin (1800-1876), both distinguished as educators and pulpit orators of the Methodist Episcopal Church, who each wrote on travels in Palestine and adjoining countries; William M. Thomson (1806-1894), the missionary and author of The Land and the Book_, a work of perpetual value; Joseph Addison Alexander (1809-1860), the famous philologist and author of valuable commentaries and a work on New Testament Literature_; and George Burgess (1809-1866), who wrote The Book of Psalms in English Verse_. Those who employed their pens in the field of history are; William Meade (1789-1862), author of Old Churches, Ministers, and Families of Virginia_; George Junkin (1790-1868), who wrote The Vindication_, which gives an account of the trial of Albert Barnes, from the Old School point of view; William B. Sprague (1795-1876), whose Annals {603} of the American Pulpit form a lasting monument to his literary ability; Robert Baird (1798-1863), author of A View of Religion in America_; Francis L. Hawks (1798-1866), who published the History of the Protestant Episcopal Church in Maryland and Virginia_; Morris J. Raphall (1798-1868), a prolific Jewish writer, whose Post-Biblical History of the Jews is a valuable book; Thomas C. Upham (1799-1871), professor in Bowdoin College and author of Mental Philosophy_, who also wrote the Life and Religious Experience of Madame Guyon_; William H. Furness (1802-1896), long the leader of Unitarians in Philadelphia, from whose imaginative pen came a peculiar book, A History of Jesus_; J. Daniel Rupp (born 1803), who wrote a History of the Religious Denominations in the United States_; and Abel Stevens (1815-1897), author of The History of Methodism and also of a History of the Methodist Episcopal Church_. Asahel Nettleton (1784-1844), best known as an evangelist, published a popular collection of Village Hymns_. Henry U. Onderdonk (1789-1858) and John Henry Hopkins (1792-1868) each wrote on the Episcopacy. Samuel Hanson Cox (1793-1880), a vigorous and original preacher of the New School Presbyterians, was the author of Interviews Memorable and Useful_. Henry B. Bascom (1796-1850), whose Sermons and Lectures were of vigorous thought but florid style, was very popular for many years; Nicholas Murray (1802-1861) under the nom-de-plume of "Kirwan" {604} wrote the celebrated Letters to Archbishop Hughes on the Catholic Question; and Edward Thomson (1810-1870), bishop of the Methodist Episcopal Church, was author of Moral and Religious Essays_, and other works. Among the American singers of sacred lyrics are Samuel Davies (1724-1761), Timothy Dwight. (1752-1817), Mrs. Phoebe H. Brown (1783-1861), Thomas Hastings (1784-1872), John Pierpont (1785-1866), Mrs. Lydia H. Sigourney (1791-1865), William B. Tappan (1794-1849), William A. Muhlenberg (1796-1877), George W. Doane (1799-1859), Ray Palmer (1808-1887), Samuel F. Smith (1808-1895), Edmund H. Sears (1810-1876), William Hunter (1811-1877), George Duffield (1818-1888), Arthur Cleveland Coxe (1818-1896), Samuel Longfellow (1819-1892), and Alice (1820-1871) and Phoebe Cary (1824-1871). >From the large number of writers of the latter half of this century whose productions have been added to the treasures of thought for coming generations and are worthy of generous attention we name: Charles Hodge (1797-1878), known best by his Systematic Theology_; and his son, Archibald Alexander Hodge (1823-1886), author of Outlines of Theology_; Charles P. McIlvaine (1798-1873), whose Evidences of Christianity are widely known and read; Mark Hopkins (1802-1887), who gave the world The Law of Love and Love as a Law_; Edwards A. Park (born 1808), whose leading work was on the Atonement_; Albert {605} Taylor Bledsoe (1809-1877), whose Theodicy was his chief work; James McCosh (1811-1894), whose later years were given to America, and whose Christianity and Positivism and Religious Aspects of Evolution were written in this country; Davis W. Clark (1812-1871), author of Man All Immortal_; John Miley (1813-1896), who was the author of a clear and able Systematic Theology of the Arminian type; Thomas O. Summers (1812-1882), who was a prolific author and whose Systematic Theology has been published since his death; and Lorenzo D. McCabe (1815-1897), who wrote on the Foreknowledge of God_. Those who have devoted their talent to the exposition of the Scriptures are: Thomas J. Conant (1802-1891), a biblical scholar and author of Historical Books of the Old Testament_; Daniel D. Whedon (1808-1885), who wrote Freedom of the Will and was the author of a valuable Commentary on the New Testament_; Horatio B. Hackett (1808-1875), whose exegetical works on Acts, Philemon, and Philippians have great merit; Tayler Lewis (1809-1877), the Nestor of classic linguistics, whose Six Days of Creation and the Divine-Human in the Scriptures are among his best books; Melancthon W. Jacobus (1816-1876), whose

Commentaries on the Gospels, Acts, and Genesis unite critical ability and popular style; Ezra Abbot (1818-1884), author of a critical work on the Authorship of the Fourth Gospel; Howard Crosby (1826-1891), the vigorous preacher and {606} author of The Seven Churches of Asia; William M. Taylor (1829-1895), whose works include excellent studies on several prominent Bible characters--Moses, David, Daniel, and Joseph; Henry Martyn Harman (1822-1897), the author of An Introduction to the Study of the Holy Scriptures; and Henry B. Ridgeway (1830-1895), who wrote The Lord's Land, a work based on his personal observations during an Oriental tour. Those who have treated historical themes include: Charles Elliot (1792-1869), whose ablest work was The Delineation of Roman Catholicism; Francis P. Kenrick (1797-1863), who, besides being the author of a Version of the Scriptures with Commentary, also wrote a work on The Supremacy of the Pope; Matthew Simpson (1810-1884), the eloquent bishop, who wrote A Cyclopaedia of Methodism and A Hundred Years of Methodism; James Freeman Clarke (1810-1888), author of The Ten Great Religions of the World; Henry B. Smith (1815-1877), whose History of the Church of Christ in Chronological Tables is much admired for its conciseness, accuracy, and thoroughness; William H. Odenheimer (1817-1879), author of The Origin and Compilation of the Prayer Book; Philip Schaff (1819-1893), the author of a learned History of the Christian Church and Creeeds of Christendom, and editor of the English translation of Lange's Commentary; William G. T. Shedd (1820-1894), who, besides other works, wrote A History of Christian Doctrine; Charles Force Deems (1820-1893), who {607} wrote a work on The Life of Christ; Henry Martyn Dexter (1821-1890), author of The Congregationalism of the Last Three Hundred Years; George R. Crooks (1822-1897), who, besides other labors in the field of the classics, wrote The Life of Bishop Matthew Simpson; Charles Porterfield Krauth (1823-1883), author of The Conservative Reformation and its Theology; Holland N. McTyeire (1824-1889), whose chief literary work was The History of Methodism; and John Gilmary Shea (1824-1892), who wrote many books on early American history connected with the Indians, one being a History of the French and Spanish Missions among the Indian Tribes of the United States. John McClintock (1814-1870), the scholarly Methodist divine and first president of Drew Theological Seminary, left a monument to his name in the great Cyclopaedia of Biblical, Theological, and Ecclesiastical Literature projected by him and his colaborer, James Strong (1822-1894), who completed the herculean task and added yet other works, notably his Exhaustive Concordance of the Bible. Daniel Curry (1809-1887), the keen editor and debater, has gathered sheaf of his various addresses in Platform Papers. Austin Phelps (1820-1890) wrote The Still Hour and The Theory of Preaching, which are fine specimens of his thoughtful work; and Phillips Brooks (1835-1893), the renowned preacher, left Sermons and Addresses, which still breathe the earnest and catholic spirit of their cultured author.

2. 19th Century: Anne C. Lynch Botta. *Handbook of Universal Literature From the Best and Latest Authorities*

PREFACE.

This work was begun many years ago, as a literary exercise, to meet the personal requirements of the writer, which were such as most persons experience on leaving school and "completing their education," as the phrase is. The world of literature lies before them, but where to begin, what course of study to pursue, in order best to comprehend it, are the problems which present themselves to the bewildered questioner, who finds himself in a position not unlike that of a traveler suddenly set down in an unknown country, without guide-book or map. The most natural course under such circumstances would be to begin at the beginning, and take a rapid survey of the entire field of literature, arriving at its details through this general view. But as this could be accomplished only by subjecting each individual to a severe and protracted course of systematic study, the idea was conceived of obviating this necessity to some extent by embodying the results of such a course in the form of the following work, which, after being long laid aside, is now at length completed. In conformity with this design, standard books have been condensed, with no alterations except such as were required to give unity to the whole work; and in some instances a few additions have been made. Where standard works have not been found, the sketches have been made from the best sources of information, and submitted to the criticism of able scholars. The literatures of different nations are so related, and have so influenced each other, that it is only by a survey of all that any single literature, or even any great literary work, can be fully comprehended, as the various groups and figures of a historical picture must be viewed as a whole, before they can assume their true place and proportions.

A.C.L.B.

CONTENTS.

LIST OF AUTHORITIES

INTRODUCTION.

THE ALPHABET.

1. The Origin of Letters.--2. The Phoenician Alphabet and Inscriptions.-- 3. The Greek Alphabet. Its Three Epochs.--
4. The Mediaeval Scripts. The Irish. The Anglo-Saxon. The Roman. The Gothic. The Runic.

CLASSIFICATION OF LANGUAGES

CHINESE LITERATURE.

1. Chinese Literature.--2. The Language.--3. The Writing.--4. The Five Classics and Four Books.--5. Chinese Religion and Philosophy. Lao-tsé. Confucius. Meng-tsé or Mencius.--6. Buddhism.--7. Social Constitution of China.--8. Invention of Printing.--9. Science, History, and Geography. Encyclopaedias.--10. Poetry.--11. Dramatic Literature and Fiction.--12. Education in China.

JAPANESE LITERATURE.

1. The Language.--2. The Religion.--3. The Literature. Influence of Women.--4. History.--5. The Drama and Poetry.--6. Geography. Newspapers. Novels. Medical Science.--7. Position of Woman.

SANSKRIT LITERATURE.

1. The Language.--2. The Social Constitution of India. Brahmanism.--3. Characteristics of the Literature and its Divisions.--4. The Vedas and other Sacred Books.--5. Sanskrit Poetry; Epic; the Ramayana and Mahabharata. Lyric Poetry. Didactic Poetry; the Hitopadesa. Dramatic Poetry.--6. History and Science.--7. Philosophy.--8. Buddhism.--9. Moral Philosophy. The Code of Manu.--10. Modern Literatures of India.--11. Education. The Brahmo Somaj.

BABYLONIAN AND ASSYRIAN LITERATURE.

1. The Accadians and Babylonians.--2. The Cuneiform Letters.--3. Babylonian and Assyrian Remains.

PHOENICIAN LITERATURE.

The Language.--The Remains.

SYRIAC LITERATURE.

The Language.--Influence of the Literature in the Eighth and Ninth Century.

PERSIAN LITERATURE.

1. The Persian Language and its Divisions.--2. Zendic Literature; the Zendavesta.--3. Pehlvi and Parsee Literatures.--4. The Ancient Religion of Persia; Zoroaster.--5. Modern Literature.--6. The Sufis.--7. Persian Poetry.--8. Persian Poets; Ferdusi; Eesedi of Tus; Togray, etc.--9. History and Philosophy.--10. Education in Persia.

HEBREW LITERATURE.

1. Hebrew Literature; its Divisions.--2. The Language; its Alphabet; its Structure; Peculiarities, Formation, and Phases.--3. The Old Testament.--4. Hebrew Education.--5. Fundamental Idea of Hebrew Literature.--6. Hebrew Poetry.--7. Lyric Poetry; Songs; the Psalms; the Prophets.--8. Pastoral Poetry and Didactic Poetry; the Proverbs and Ecclesiastes.--9. Epic and Dramatic Poetry; the Book of Job.--10. Hebrew History; the Pentateuch and other Historical Books.--11. Hebrew Philosophy.--12. Restoration of the Sacred Books.--13. Manuscripts and Translations.--14. Rabbinical Literature.--15. The New Revision of the Bible, and the New Biblical Manuscript.

EGYPTIAN LITERATURE.

1. The Language.--2. The Writing.--3. The Literature.--4. The Monuments.--5. The Discovery of Champollion.--6. Literary Remains; Historical; Religious; Epistolary; Fictitious; Scientific; Epic; Satirical and Judicial.--7. The Alexandrian Period.--8. The Literary Condition of Modern Egypt.

GREEK LITERATURE.

INTRODUCTION.--1. Greek Literature and its Divisions.--2. The Language.--3. The Religion.

Foreign Writers: Paine, Witherspoon, Rowson, Priestley, Wilson, Agassiz, Guyot,

Mrs. Robinson, Gurowski, and others.--11. Newspapers and Periodicals.
--12. Since 1860.

CONCLUSION.

INDEX.

LIST OF AUTHORITIES.

The following works are the sources from which this book is wholly or chiefly derived:--

Taylor's History of the Alphabet; Dwight's Philology; Herder's Spirit of Hebrew Poetry; Lowth's Hebrew Poetry; Asiatic Researches; the works of Gesenius, De Wette, Ewald, Colebrooke, Sir William Jones, Wilson, Ward; Schlegel's Hindu Language and Literature; Max Müller's History of Sanskrit Literature; and What India has taught us; Malcolm's History of Persia; Richardson on the Language of Eastern Nations; Adelung's Mithridates; Chodzko's Specimens of the Popular Poetry of Persia; Costello's Rose Garden of Persia; Rémusat's Mémoire sur l'Ecriture Chinoise; Davis on the Poetry of the Chinese; Williams's Middle Kingdom; The Mikado's Empire; Rein's Travels in Japan; Duhalde's Description de la Chine; Champollion's Letters; Wilkinson's Extracts from Hieroglyphical Subjects; the works of Bunsen, Müller, and Lane; Müller's History of the Literature of Ancient Greece, continued by Donaldson; Browne's History of Roman Classical Literature; Fiske's Manual of Classical Literature; Sismondi's Literature of the South of Europe; Goodrich's Universal History; Sanford's Rise and Progress of Literature; Schlegel's Lectures on the History of Literature; Schlegel's History of Dramatic Art; Tiraboschi's History of Italian Literature; Maffei, Corniani, and Ugoni on the same subject; Chambers's Handbooks of Italian and German Literature; Vilmar's History of German Literature; Foster's Handbook of French Literature; Nisard's Histoire de la Littérature Française; Demogeot's Histoire de la Littérature française; Ticknor's History of Spanish Literature; Talvi's (Mrs. Robinson) Literature of the Slavic Nations; Mallet's Northern Antiquities; Keyson's Religion of the Northmen; Pigott's Northern Mythology; William and Mary Howitt's Literature and Romance of Northern Europe; De s'Gravenweert's Sur la Littérature Néerlandaise; Siegenbeck's Histoire Littéraire des Pays- Bas; Da Pontes' Poets and Poetry of Germany; Menzel's German Literature; Spaulding's History of English Literature; Chambers's Cyclopaedia of English Literature; Shaw's English Literature; Stedman's Victorian Poets; Trübner's guide to American Literature; Duyckinck's Cyclopaedia of American Literature; Griswold's Poets and Prose Writers of America; Tuckerman's Sketch of American Literature; Frothingham's Transcendental Movement in New England. French, English, and American Encyclopaedias, Biographies, Dictionaries, and numerous other works of reference have also been extensively consulted.

INTRODUCTION.

THE ALPHABET.

1. The Origin of Letters.--2. The Phoenician Alphabet and Inscriptions.-- 3, The Greek Alphabet. Its Three Epochs.-- 4. The Medieval Scripts. The Irish. The Anglo-Saxon. The Roman. The Gothic. The Runic.

1. THE ORIGIN OF LETTERS.--Alphabetic writing is an art easy to acquire, but its invention has tasked the genius of the three most gifted nations of the ancient world. All primitive people have begun to record events and transmit messages by means of rude pictures of objects, intended to represent things or thoughts, which afterwards became the symbols of sounds. For instance, the letter M is traced down from the conventionalized picture of an owl in the ancient language of Egypt, Mulak. This was used first to denote the bird itself; then it stood for the name of the bird; then gradually became a syllabic sign to express the sound "mu," the first syllable of the name, and ultimately to denote "M," the initial sound of that syllable. In like manner A can be shown to be originally the picture of an eagle, D of a hand, F of the horned asp, R, of the mouth, and so on. Five systems of picture

writing have been independently invented,--the Egyptian, the Cuneiform, the Chinese, the Mexican, and the Hittite. The tradition of the ancient world, which assigned to the Phoenicians the glory of the invention of letters, declared that it was from Egypt that they originally derived the art of writing, which they afterwards carried into Greece, and the latest investigations have confirmed this tradition.

2. THE PHOENICIAN ALPHABET.--Of the Phoenician alphabet the Samaritan is the only living representative, the Sacred Script of the few families who still worship on Mount Gerizim. With this exception, it is only known to us by inscriptions, of which several hundred have been discovered. They form two well-marked varieties, the Moabite and the Sidonian. The most important monument of the first is the celebrated Moabite stone, discovered in 1868 on the site of the ancient capital of the land of Moab, portions of which are preserved in the Louvre. It gives an account of the revolt of the King of Moab against Jehoram, King of Israel, 890 B.C. The most important inscription of the Sidonian type is that on the magnificent sarcophagus of a king of Sidon, now one of the glories of the Louvre. A monument of the early Hebrew alphabet, another offshoot of the Phoenician, was discovered in 1880 in an inscription in the ancient tunnel which conveys water to the pool of Siloam.

3. THE GREEK ALPHABET.--The names, number, order, and forms of the primitive Greek alphabet attest its Semitic origin. Of the many inscriptions which remain, the earliest has been discovered, not in Greece, but upon the colossal portrait statues carved by Rameses the Great, in front of the stupendous cave temple at Abou-Simbel, at the time when the Hebrews were still in Egyptian bondage. In the seventh century B. C., certain Greek mercenaries in the service of an Egyptian king inscribed a record of their visit in five precious lines of writing, which the dry Nubian atmosphere has preserved almost in their pristine sharpness. The legend, according to which Cadmus the Tyrian sailed for Greece in search of Europa, the damsel who personified the West, designates the island of Thera as the earliest site of Phoenician colonization in the Aegean, and from inscriptions found there this may be regarded as the first spot of European soil on which words were written, and they exhibit better than any others the progressive form of the Cadmean alphabet. The oldest inscriptions found on Hellenic soil bearing a definite date are those cut on the pedestals of the statues which lined the sacred way leading to the temple of Apollo, near Miletus. Several of those, now in the British Museum, range in date over the sixth century B.C. They belong, not to the primitive alphabet, but to the Ionian, one of the local varieties which mark the second stage, which may be called the epoch of transition, which began in the seventh and lasted to the close of the fifth century B.C. It is not till the middle of the fifth century that we have any dated monuments belonging to the Western types. Among these are the names of the allied states of Hellas, inscribed on the coils of the three-headed bronze serpent which supported the gold tripod dedicated to the Delphian Apollo, 476 B.C. This famous monument was transported to Byzantium by Constantine the Great, and still stands in the Hippodrome at Constantinople. Of equal interest is the bronze Etruscan helmet in the British Museum, dedicated to the Olympian Zeus, in commemoration of the great victory off Cumae, which destroyed the naval supremacy of the Etruscans, 474 B.C., and is celebrated in an ode by Pindar. The third epoch witnessed the emergence of the classical alphabets of European culture, the Ionian and the Italic. The Ionian has been the source of the Eastern scripts, Romaic, Coptic, Slavic, and others. The Italic became the parent of the modern alphabets of Western Europe.

4. THE MEDIAEVAL SCRIPTS.--A variety of national scripts arose in the establishment of the Teutonic kingdoms upon the ruins of the Roman Empire. But the most magnificent of all mediaeval scripts was the Irish, which exercised a profound influence on the later alphabets of Europe. From a combination of the Roman and Irish arose the Anglo-Saxon script, the precursor of that which was developed in the ninth century by Alcuin of York, the friend and preceptor of Charlemagne. This was the parent of the Roman alphabet, in which our books are now printed. Among other deteriorations, there crept in, in the fourteenth century, the Gothic or black letter character, and these barbarous forms are still essentially retained by the Teutonic nations though discarded by the English and Latin races; but from its superior excellences the Roman alphabet is constantly extending its range and bids fair to become the sole alphabet of the future. In all the lands that were settled and overrun by the Scandinavians, there are found multitudes of inscriptions in the ancient alphabet of the Norsemen, which is called the Runic. The latest modern researches seem to prove that this was derived from the Greek, and probably dates back as far as the sixth century B.C. The Goths were early in occupation of the regions south of the Baltic and east of the Vistula, and in direct commercial intercourse with the Greek traders, from whom they doubtless obtained a knowledge of the Greek alphabet, as the Greeks themselves had gained it from the Phoenicians.

CLASSIFICATION OF LANGUAGES.

Modern philologists have made different classifications of the various languages of the world, one of which divides them into three great classes: the Monosyllabic, the Agglutinated, and the Inflected. --The first, or Monosyllabic class, contains those languages which consist only of separate, unvaried monosyllables. The words have no organization that adapts them for mutual affiliation, and there is in them, accordingly, an utter absence of all scientific forms and principles of grammar. The Chinese and a few languages in its vicinity, doubtless originally identical with it, are all that belong to this class. The languages of the North American Indians, though differing in many respects, have the same general grade of character. The second class consists of those languages which are formed by agglutination. The words combine only in a mechanical way; they have no elective affinity, and exhibit toward each other none of the active or sensitive capabilities of living organisms. Prepositions are joined to substantives, and pronouns to verbs, but never so as to make a new form of the original word, as in the inflected languages, and words thus placed in juxtaposition retain their personal identity unimpaired. The agglutinative languages are known also as the Turanian, from Turan, a name of Central Asia, and the principal varieties of this family are the Tartar, Finnish, Lappish, Hungarian, and Caucasian. They are classed together almost exclusively on the ground of correspondence in their grammatical structure, but they are bound together by ties of far less strength than those which connect the inflected languages. The race by whom they are spoken has, from the first, occupied more of the surface of the earth than either of the others, stretching westward from the shores of the Japan Sea to the neighborhood of Vienna, and southward from the Arctic Ocean to Afghanistan and the southern coast of Asia Minor. The inflected languages form the third great division. They have all a complete interior organization, complicated with many mutual relations and adaptations, and are thoroughly systematic in all their parts. Between this class and the monosyllabic there is all the difference that there is between organic and inorganic forms of matter; and between them and the agglutinative languages there is the same difference that exists in nature between mineral accretions and vegetable growths. The boundaries of this class of languages are the boundaries of cultivated humanity, and in their history lies embosomed that of the civilized portions of the world. Two great races speaking inflected languages, the Semitic and the Indo-European, have shared between them the peopling of the historic portions of the earth; and on this account these two languages have sometimes been called political or state languages, in contrast with the appellation of the Turanian as nomadic. The term Semitic is applied to that family of languages which are native in Southwestern Asia, and which are supposed to have been spoken by the descendants of Shem, the son of Noah. They are the Hebrew, Aramaic, Arabic, the ancient Egyptian or Coptic, the Chaldaic, and Phoenician. Of these the only living language of note is the Arabic, which has supplanted all the others, and wonderfully diffused its elements among the constituents of many of the Asiatic tongues. In Europe the Arabic has left a deep impress on the Spanish language, and is still represented in the Maltese, which is one of its dialects. The Semitic languages differ widely from the Indo-European in reference to their grammar, vocabulary, and idioms. On account of the great preponderance of the pictorial element in them, they may be called the metaphorical languages, while the Indo-European, from the prevailing style of their higher literature, may be called the philosophical languages. The Semitic nations also differ from the Indo-European in their national characteristics; while they have lived with remarkable uniformity on the vast open plains, or wandered over the wide and dreary deserts of their native region, the Indo-Europeans have spread themselves over both hemispheres, and carried civilization to its highest development. But the Semitic mind has not been without influence on human progress. It early recorded its thoughts, its wants, and achievements in the hieroglyphs of ancient Egypt; the Phoenicians, foremost in their day in commerce and the arts, introduced from Egypt alphabetic letters, of which all the world has since made use. The Jewish portion of the race, long in communication with Egypt, Phoenicia, Babylonia, and Persia, could not fail to impart to these nations some knowledge of their religion and literature, and it cannot be doubted that many new ideas and quickening influences were thus set in motion, and communicated to the more remote countries both of the East and West. The most ancient languages of the Indo-European stock may be grouped in two distinct family pairs: the Aryan, which comprises two leading families, the Indian and Iranian, and the Graeco-Italic or Pelasgic, which comprises the Greek family and its various dialects, and the Italic family, the chief-subdivisions of which are the Etruscan, the Latin, and the modern languages derived from the Latin. The other Indo-European families are the Lettic, Slavic, Gothic, and Celtic, with their various subdivisions. The word Aryan (Sanskrit, Arya), the oldest known name of the entire Indo-European family, signifies well-born, and was applied by the ancient Hindus to themselves in contradistinction to the rest of the world, whom they considered base-born and contemptible. In the country called Aryavarta, lying between the Himalaya and the Vindhya Mountains, the high table-land of Central Asia, more than two thousand years before Christ, our Hindu ancestors had their early home. >From this source there have been, historically, two great streams of Aryan migration. One, towards the south, stagnated in the fertile valleys, where they were walled in from all danger of invasion by the Himalaya Mountains on the north, the Indian Ocean on the south, and the deserts of Bactria on the west, and where the people sunk into a life of inglorious ease,

or wasted their powers in the regions of dreamy mysticism. The other migration, at first northern, and then western, includes the great families of nations in Northwestern Asia and in Europe. Forced by circumstances into a more objective life, and under the stimulus of more favorable influences, these nations have been brought into a marvelous state of individual and social progress, and to this branch of the human family belongs all the civilization of the present, and most of that which distinguishes the past. The Indo-European family of languages far surpasses the Semitic in variety, flexibility, beauty, and strength. It is remarkable for its vitality, and has the power of continually regenerating itself and bringing forth new linguistic creations. It renders most faithfully the various workings of the human mind, its wants, its aspirations, its passion, imagination, and reasoning power, and is most in harmony with the ever progressive spirit of man. In its varied scientific and artistic development it forms the most perfect family of languages on the globe, and modern civilization, by a chain reaching through thousands of years, ascends to this primitive source.

CHINESE LITERATURE.

1. Chinese literature.--2. The Language.--3. The Writing.--4. The five Classics and four Books.--5. Chinese Religion and Philosophy, Lao-tsé, Confucius, Meng-tsé or Mencius.--6. Buddhism.--7. Social Constitution of China.--8. Invention of Printing.--9. Science, History, and Geography. Encyclopaedias.--10. Poetry.--11. Dramatic Literature and Fiction.--12. Education in China.

1. CHINESE LITERATURE.--The Chinese literature is one of the most voluminous of all literatures, and among the most important of those of Asia. Originating in a vast empire, it is diffused among a population numbering nearly half the inhabitants of the globe. It is expressed by an original language differing from all others, it refers to a nation whose history may be traced back nearly five thousand years in an almost unbroken series of annals, and it illustrates the peculiar character of a people long unknown to the Western world.

2. THE LANGUAGE.--The date of the origin of this language is lost in antiquity, but there is no doubt that it is the most ancient now spoken, and probably the oldest written language used by man. It has undergone few alterations during successive ages, and this fact has served to deepen the lines of demarkation between the Chinese and other branches of the race and has resulted in a marked national life. It belongs to the monosyllabic family; its radical words number 450, but as many of these, by being pronounced with a different accent convey a different meaning, in reality they amount to 1,203. Its pronunciation varies in different provinces, but that of Nanking, the ancient capital of the Empire, is the most pure. Many dialects are spoken in the different provinces, but the Chinese proper is the literary tongue of the nation, the language of the court and of polite society, and it is vernacular in that portion of China called the Middle Kingdom.

3. THE WRITING.--There is an essential difference between the Chinese language as spoken and written, and the poverty of the former presents a striking contrast with the exuberance of the latter. Chinese writing, generally speaking, does not express the sounds of the words, but it represents the ideas or the objects indicated by them. Its alphabetical characters are therefore ideographic, and not phonetic. They were originally rude representations of the thing signified; but they have undergone various changes from picture-writing to the present more symbolical and more complete system. As the alphabetic signs represent objects or ideas, it would follow that there must be in writing as many characters as words in the spoken language. Yet many words, which have the same sound, represent different ideas; and these must be represented also in the written language. Thus the number of the written words far surpasses that of the spoken language. As far as they are used in the common writing, they amount to 2,425. The number of characters in the Chinese dictionary is 40,000, of which, however, only 10,000 are required for the general purposes of literature. They are disposed under 214 signs, which serve as keys, and which correspond to our alphabetic order. The Chinese language is written, from right to left, in vertical columns or in horizontal lines.

4. THE CLASSICS.--The first five canonical books are "The Book of Transformations," "The Book of History," "The Book of Rites," "The Spring and Autumn Annals," and "The Book of Odes" "The Book of Transformations" consists of sixty-four short essays on important themes, symbolically and enigmatically expressed, based on linear figures and diagrams. These cabala are held in high esteem by the learned, and the hundreds of fortune-tellers in the streets of Chinese towns practice their art on the basis of these mysteries. "The Book of History" was compiled by Confucius, 551-470 B. C., from the earliest records of the Empire, and in the estimation of the Chinese it contains

the seeds of all that is valuable in their political system, their history, and their religious rites, and is the basis of their tactics, music, and astronomy. It consists mainly of conversations between kings and their ministers, in which are traced the same patriarchal principles of government that guide the rulers of the present day. "The Book of Rites" is still the rule by which the Chinese regulate all the relations of life. No every-day ceremony is too insignificant to escape notice, and no social or domestic duty is beyond its scope. No work of the classics has left such an impression on the manners and customs of the people. Its rules are still minutely observed, and the office of the Board of Rites, one of the six governing boards of Peking, is to see that its precepts are carried out throughout the Empire. According to this system, all the relations of man to the family, society, the state, to morals, and to religion, are reduced to ceremonial, but this includes not only the external conduct, but it involves those right principles from which all true politeness and etiquette spring. The "Book of Odes" consists of national airs, chants, and sacrificial odes of great antiquity, some of them remarkable for their sublimity. It is difficult to estimate the power they have exerted over all subsequent generations of Chinese scholars. They are valuable for their religious character and for their illustration of early Chinese customs and feelings; but they are crude in measure, and wanting in that harmony which comes from study and cultivation. The "Spring and Autumn Annals" consist of bald statements of historical facts. Of the Four Books, the first three--the "Great Learning," the "Just Medium," and the "Confucian Analects"--are by the pupils and followers of Confucius. The last of the four books consists entirely of the writings of Mencius (371-288 B. C.). In originality and breadth of view he is superior to Confucius, and must be regarded as one of the greatest men Asiatic nations have produced. The Five Classics and Four Books would scarcely be considered more than curiosities in literature were it not for the incomparable influence, free from any debasing character, which they have exerted over so many millions of minds.

5. CHINESE RELIGION AND PHILOSOPHY.--Three periods may be distinguished in the history of the religious and philosophical progress of China. The first relates to ancient tradition, to the idea of one supreme God, to the patriarchal institutions, which were the foundation of the social organization of the Empire, and to the primitive customs and moral doctrines. It appears that this religion at length degenerated into that mingled idolatry and indifference which still characterizes the people of China. In the sixth century B.C., the corruption of the ancient religion having reached its height, a reaction took place which gave birth to the second, or philosophical period, which produced three systems. Lao-tsé, born 604 B.C., was the founder of the religion of the Tao, or of the external and supreme reason. The Tao is the primitive existence and intelligence, the great principle of the spiritual and material world, which must be worshiped through the purification of the soul, by retirement, abnegation, contemplation, and metempsychosis. This school gave rise to a sect of mystics similar to those of India. Later writers have debased the system of Lao-tsé, and cast aside his profound speculations for superstitious rituals and the multiplication of gods and goddesses. Confucius was the founder of the second school, which has exerted a far more extensive and beneficial influence on the political and social institutions of China. Confucius is a Latin name, corresponding to the original Kung-fu-tsé, Kung being the proper name, and Fu-tsé signifying reverend teacher or doctor. He was born 551 B.C., and educated by his mother, who impressed upon him a strong sense of morality. After a careful study of the ancient writings he decided to undertake the moral reform of his country, and giving up his high position of prime minister, he traveled extensively in China, preaching justice and virtue wherever he went. His doctrines, founded on the unity of God and the necessities of human nature, bore essentially a moral character, and being of a practical tendency, they exerted a great influence not only on the morals of the people, but also on their legislation, and the authority of Confucius became supreme. He died 479 B.C., at the age of seventy-two, eleven years before the birth of Socrates. He left a grandson, through whom the succession has been transmitted to the present day, and his descendants constitute a distinct class in Chinese society. At the close of the fourth century B.C., another philosopher appeared by the name of Meng-tsé, or Mencius (eminent and venerable teacher), whose method of instruction bore a strong similarity to that of Socrates. His books rank among the classics, and breathe a spirit of freedom and independence; they are full of irony on petty sovereigns and on their vices; they establish moral goodness above social position, and the will of the people above the arbitrary power of their rulers. He was much revered, and considered bolder and more eloquent than Confucius.

6. The third period of the intellectual development of the Chinese dates from the introduction of Buddhism into the country, under the name of the religion of Fo, 70 A.D. The emperor himself professes this religion, and its followers have the largest number of temples. The great bulk of Buddhist literature is of Indian origin. Buddhism, however, has lost in China much of its originality, and for the mass it has sunk into a low and debasing idolatry. Recently a new religion has sprung up in China, a mixture of ancient Chinese and Christian doctrines, which apparently finds great favor in some portions of the country.

7. SOCIAL CONSTITUTION OF CHINA.--The social constitution of China rests on the ancient traditions preserved in the canonical and classic books. The Chinese empire is founded on the patriarchal system, in which all authority over the family belongs to the *pater familias*. The emperor represents the great father of the nation, and is the supreme master of the state and the head of religion. All his subjects being considered as his children, they are all equal before him, and according to their capacity are admitted to the public offices. Hence no distinction of castes, no privileged classes, no nobility of birth; but a general equality under an absolute chief. The public administration is entirely in the hands of the emperor, who is assisted by his mandarins, both military and civil. They are admitted to this rank only after severe examinations, and from them the members of the different councils of the empire are selected. Among these the Board of Control, or the all-examining Court, and the Court of History and Literature deserve particular mention, as being more closely related to the subject of this work. The duty of this board consists in examining all the official acts of the government, and in preventing the enacting of those measures which they may deem detrimental to the best interests of the country. They can even reprove the personal acts of the emperor, an office which has afforded many occasions for the display of eloquence. The courage of some of the members of this board has been indeed sublime, giving to their words wonderful power. The Court of History and Literature superintends public education, examines those who aspire to the degree of mandarins, and decides on the pecuniary subsidies, which the government usually grants for defraying the expenses of the publication of great works on history and science.

8. INVENTION OF PRINTING.--At the close of the sixth century B.C. it was ordained that various texts in circulation should be engraved on wood to be printed and published. At first comparatively little use seems to have been made of the invention, which only reached its full development in the eleventh century, when movable types were first invented by a Chinese blacksmith, who printed books with them nearly five hundred years before Gutenberg appeared. In the third century B.C., one of the emperors conceived the mad scheme of destroying all existing records, and writing a new set of annals in his own name, in order that posterity might consider him the founder of the empire. Sixty years after this barbarous decree had been carried into execution, one of his successors, who desired as far as possible to repair the injury, caused these books to be re-written from a copy which had escaped destruction.

9. SCIENCE, HISTORY, AND GEOGRAPHY.--Comparing the scientific development of the Chinese with that of the Western world, it may be said that they have made little progress in any branch of science. There are, however, to be found in almost every department some works of no indifferent merit. In mathematics they begin only now to make some progress, since the mathematical works of Europe have been introduced into their country. Astrology still takes the place of astronomy, and the almanacs prepared at the observatory of Peking are made chiefly by foreigners. Books on natural philosophy abound, some of which are written by the emperors themselves. Medicine is imperfectly understood. They possess several valuable works on Chinese jurisprudence, on agriculture, economy, mechanics, trades, many cyclopaedias and compendia, and several dictionaries, composed with extraordinary skill and patience. To this department may be referred all educational books, the most of them written in rhyme, and according to a system of intellectual gradation. The historical and geographical works of China are the most valuable and interesting department of its literature. Each dynasty has its official chronicle, and the celebrated collection of twenty-one histories forms an almost unbroken record of the annals from, the third century B.C. to the middle of the seventeenth century, and contains a vast amount of information to European readers. The edition of this huge work, in sixty- six folio volumes, is to be found in the British Museum. This and many similar works of a general and of a local character unite in rendering this department rich and important for those who are interested in the history of Asiatic civilization. "The General Geography of the Chinese Empire" is a collection of the statistics of the country, with maps and tables, in two hundred and sixty volumes. The "Statutes of the Reigning Dynasty," from the year 1818, form more than one thousand volumes. Chinese topographical works are characterized by a minuteness of detail rarely equaled. Historical and literary encyclopaedias form a very notable feature in all Chinese libraries. These works show great research, clearness, and precision, and are largely drawn upon by European scholars. Early in the last century one of the emperors appointed a commission to reprint in one great collection all the works they might think worthy of preservation. The result was a compilation of 6,109 volumes, arranged under thirty-two heads, embracing works on every subject contained in the national literature. This work is unique of its kind, and the largest in the world.

10. POETRY.--The first development of literary talent in China, as elsewhere, is found in poetry, and in the earliest days songs and ballads were brought as offerings from the various principalities to the heads of government. At the

time of Confucius there existed a collection of three thousand songs, from which he selected those contained in the "Book of Odes." There is not much sublimity or depth of thought in these odes, but they abound in touches of nature, and are exceedingly interesting and curious, as showing how little change time has effected in the manners and customs of this singular people. Similar in character are the poems of the Tshian-teng-shi, another collection of lyrics published at the expense of the emperor, in several thousand volumes. Among modern poets may be mentioned the Emperor Khian-lung, who died at the close of the last century. After the time of Confucius the change in Chinese poetry became very marked, and, instead of the peaceful tone of his day, it reflected the unsettled condition of social and political affairs. The simple, monotheistic faith was exchanged for a superstitious belief in a host of gods and goddesses, a contempt for life, and an uncertainty of all beyond it. The period between 620 and 907 A.D., was one of great prosperity, and is looked upon as the golden age.

11. DRAMATIC LITERATURE AND FICTION.--Chinese literature affords no instance of real dramatic poetry or sustained effort of the imagination. The "Hundred Plays of the Yuen Dynasty" is the most celebrated collection, and many have been translated into European languages. One of them, "The Orphan of China," served as the groundwork of Voltaire's tragedy of that name. The drama, however, constitutes a large department in Chinese literature, though there are, properly speaking, no theatres in China. A platform in the open air is the ordinary stage, the decorations are hangings of cotton supported by a few poles of bamboo, and the action is frequently of the coarsest kind. When an actor comes on the stage, he says, "I am the mandarin so-and-so." If the drama requires the actor to enter a house, he takes some steps and says, "I have entered," and if he is supposed to travel, he does so by rapid running on the stage, cracking his whip, and saying afterwards, "I have arrived." The dialogue is written partly in verse and partly in prose, and the poetry is sometimes sung and sometimes recited. Many of their dramas are full of bustle and abound in incident. They often contain the life and adventures of an individual, some great sovereign or general, a history, in fact, thrown into action. Two thousand volumes of dramatic compositions are known, and the best of these amount to five hundred pieces. Among them may be mentioned the "Orphan of the House of Tacho," and the "Heir in Old Age," which have much force and character, and vividly describe the habits of the people. The Chinese are fond of historical and moral romances, which, however, are founded on reason and not on imagination, as are the Hindu and Persian tales. Their subjects are not submarine abysses, enchanted palaces, giants and genii, but man as he is in his actual life, as he lives with his fellow-men, with all his virtues and vices, sufferings and joys. But the Chinese novelists show more skill in the details than in the conception of their works; the characters are finished and developed in every respect. The pictures with which they adorn their works are minute and the descriptions poetical, though they often sacrifice to these qualities the unity of the subject. The characters of their novels are principally drawn from the middle class, as governors, literary men, etc. The episodes are, generally speaking, ordinary actions of common life--all the quiet incidents of the phlegmatic life of the Chinese, coupled with the regular and mechanical movements which distinguish that people. Among the numberless Chinese romances there are several which are considered classic. Such are the "Four Great Marvels' Books," and the "Stories of the Pirates on the Coast of Kiangnan."

12. EDUCATION IN CHINA. Most of the Chinese people have a knowledge of the rudiments of education. There is scarcely a man who does not know how to read the books of his profession. Public schools are everywhere established; in the cities there are colleges, in which pupils are taught the Chinese literature; and in Peking there is an imperial college for the education of the mandarins. The offices of the empire are only attained by scholarship. There are four literary degrees, which give title to different positions in the country. The government fosters the higher branches of education and patronizes the publication of literary works, which are distributed among the libraries, colleges, and functionaries. The press is restricted only from publishing licentious and revolutionary books. The future literature of China in many branches will be greatly modified by the introduction of foreign knowledge and influences.

JAPANESE LITERATURE

1. The Language.--2. The Religion.--3. The Literature. Influence of Women.--4. History.--5. The Drama and Poetry.--6. Geography. Newspapers. Novels. Medical Science.--7. Position of Woman.

1. THE LANGUAGE.--The Japanese is considered as belonging to the isolated languages, as philologists have thus far failed to classify it. It is agglutinative in its syntax, each word consisting of an unchangeable root and one or

several suffixes. Before the art of writing was known, poems, odes to the gods, and other fragments which still exist had been composed in this tongue, and it is probable that a much larger literature existed. During the first centuries of writing in Japan, the spoken and written language was identical, but with the study of the Chinese literature and the composition of native works almost exclusively in that language, there grew up differences between the colloquial and literary idiom, and the infusion of Chinese words steadily increased. In writing, the Chinese characters occupy the most important place. But all those words which express the wants, feelings, and concerns of everyday life, all that is deepest in the human heart, are for the most part native. If we would trace the fountains of the musical and beautiful language of Japan, we must seek them in the hearts and hear them flow from the lips of the mothers of the Island Empire. Among the anomalies with which Japan has surprised and delighted the world may be claimed that of woman's achievements in the domain of letters. It was woman's services, not man's, that made the Japanese a literary language, and under her influence the mobile forms of speech crystallized into perennial beauty. The written language has heretofore consisted mainly of characters borrowed from the Chinese, each character representing an idea of its own, so that in order to read and write the student must make himself acquainted with several thousand characters, and years are required to gain proficiency in these elementary arts. There also exists in Japan a syllabary alphabet of forty-seven characters, used at present as an auxiliary to the Chinese. Within a very recent period, since the acquisition of knowledge has become a necessity in Japan, a society has been formed by the most prominent men of the empire, for the purpose of assimilating the spoken and written language, taking the forty-seven native characters as the basis.

2. RELIGION.--The two great religions of Japan are Shintoism and Buddhism. The chief characteristic of the Shinto religion is the worship of ancestors, the deification of emperors, heroes, and scholars, and the adoration of the personified forces of nature. It lays down no precepts, teaches no morals or doctrines, and prescribes no ritual. The number of Shinto deities is enormous. In its higher form the chief object of the Shinto faith is to enjoy this life; in its lower forms it consists in a blind obedience to governmental and priestly dictates. On the recent accession of the Mikado to his former supreme power, an attempt was made to restore this ancient faith, but it failed, and Japan continues as it has been for ten centuries in the Buddhist faith. The religion of Buddha was introduced into Japan 581 A.D., and has exerted a most potent influence in forming the Japanese character. The Protestants of Japanese Buddhism are the followers of Shinran, 1262 A.D., who have wielded a vast influence in the religious development of the people both for good and evil. In this creed prayer, purity, and earnestness of life are insisted upon. The Scriptures of other sects are written in Sanskrit and Chinese which only the learned are able to read, those of the Shin sect are in the vernacular Japanese idiom. After the death of Shinran, Rennio, who died in 1500 A.D., produced sacred writings now daily read by the disciples of this denomination. Though greatly persecuted, the Shin sect have continually increased in numbers, wealth, and power, and now lead all in intelligence and influence. Of late they have organized their theological schools on the model of foreign countries that their young men may be trained to resist the Shinto and Christian faiths.

3. THE LITERATURE. INFLUENCE OF WOMEN.--Previous to the fourteenth century learning in Japan was confined to the court circle. The fourteenth, fifteenth, and sixteenth centuries are the dark ages when military domination put a stop to all learning except with a few priests. With the seventeenth century begins the modern period of general culture. The people are all fond of reading, and it is very common to see circulating libraries carried from house to house on the backs of men. As early as the tenth century, while the learned affected a pedantic style so interlarded with Chinese as to be unintelligible, the cultivation of the native tongue was left to the ladies of the court, a task which they nobly discharged. It is a remarkable fact, without parallel in the history of letters, that a very large proportion of the best writings of the best ages was the work of women, and their achievement in the domain of letters is one of the anomalies with which Japan has surprised and delighted the world. It was their genius that made the Japanese a literary language. The names and works of these authoresses are quoted at the present day.

4. HISTORY.--The earliest extant Japanese record is a work entitled "Kojiki," or book of ancient traditions. It treats of the creation, the gods and goddesses of the mythological period, and gives the history of the Mikados from the accession of Jimmu, year 1 (660 B.C.), to 1288 of the Japanese year. It was supposed to date from the first half of the eighth century, and another work "Nihonghi," a little later, also treats of the mythological period. It abounds in traces of Chinese influence, and in a measure supersedes the "Kojiki." These are the oldest books in the language. They are the chief exponents of the Shinto faith, and form the bases of many commentaries and subsequent works. The "History of Great Japan," composed in the latter part of the seventeenth century, by the Lord of Mito (died 1700), is the standard history of the present day. The external history of Japan, in twenty-two volumes, by Rai Sanyo (died 1832), composed in classical Chinese, is most widely read by men of education. The Japanese are

intensely proud of their history and take great care in making and preserving records. Memorial stones are among the most striking sights on the highways and in the towns, villages, and temple yards, in honor of some noted scholar, ruler, or benefactor. Few people are more thoroughly informed as to their own history. Every city, town, and village has its annals. Family records are faithfully copied from generation to generation. Almost every province has its encyclopaedic history, and every high-road its itineraries and guide-books, in which famous places and events are noted. In the large cities professional story-tellers and readers gain a lucrative livelihood by narrating both legendary and classical history, and the theatre is often the most faithful mirror of actual history. There are hundreds of child's histories in Japan. Many of the standard works are profusely illustrated, are models of style and eloquence, and parents delight to instruct their children in the national laws and traditions.

5. THE DRAMA.--The theatre is a favorite amusement, especially among the lower classes; the pieces represented are of a popular character and written in colloquial language, and generally founded on national history and tradition, or on the lives and adventures of the heroes and gods; and the scene is always laid in Japan. The play begins in the morning and lasts all day, spectators bringing their food with them. No classical dramatic author is known. Poetry has always been a favorite study with the Japanese. The most ancient poetical fragment, called a "Collection of Myriad Leaves," dates from the eighth century. The collection of "One Hundred Persons" is much later, and contains many poems written by the emperors themselves. The Japanese possess no great epic or didactic poems, although some of their lyrics are happy examples of quaint modes of thought and expression. It is difficult to translate them into a foreign tongue.

6. GEOGRAPHY. NEWSPAPERS AND NOVELS.--The largest section of Japanese literature is that treating of the local geography of the country itself. These works are minute in detail and of great length, describing events and monuments of historic interest. Before the recent revolution but one newspaper existed in Japan, but at present the list numbers several hundred. Freedom of the press is unknown, and fines and imprisonment for violation of the stringent laws are very frequent. Novels constitute a large section of Japanese literature. Fairy tales and story books abound. Many of them are translated into English; "The Royal Ronans" and other works have recently been published in New York. Medical science was borrowed from China, but upon this, as upon other matters, the Japanese improved. Acupuncture, or the introduction of needles into the living tissues for remedial purposes, was invented by the Japanese, as was the moxa, or the burning of the flesh for the same purpose.

7. POSITION OF WOMAN.--Women in Japan are treated with far more respect and consideration than elsewhere in the East. According to Japanese history the women of the early centuries were possessed of more intellectual and physical vigor, filling the offices of state and religion, and reaching a high plane of social dignity and honor. Of the one hundred and twenty-three Japanese sovereigns, nine have been women. The great heroine of Japanese history and tradition was the Empress Jingu, renowned for her beauty, piety, intelligence, and martial valor, who, about 200 A.D., invaded and conquered Corea. The female children of the lower classes receive tuition in private schools so generally established during the last two centuries throughout the country, and those of the higher classes at the hands of private tutors or governesses; and in every household may be found a great number of books exclusively on the duties of women.

SANSKRIT LITERATURE.

1. The Language.--2. The Social Constitution of India. Brahmanism.--3. Characteristics of the Literature and its Divisions.--4. The Vedas and other Sacred Books.--5. Sanskrit Poetry; Epic; The Ramayana and Mahabharata. Lyric Poetry. Didactic Poetry; the Hitopadesa. Dramatic Poetry.--6.. History and Science.--7. Philosophy. 8. Buddhism.--9. Moral Philosophy. The Code of Manu.--10. Modern Literatures of India.--11. Education. The Brahmo Somaj.

1. THE LANGUAGE.--Sanskrit is the literary language of the Hindus, and for two thousand years has served as the means of learned intercourse and composition. The name denotes cultivated or perfected, in distinction to the Prakrit or uncultivated, which sprang from it and was contemporary with it.

The study of Sanskrit by European scholars dates less than a century back, and it is important as the vehicle of an immense literature which lays open the outward and inner life of a remarkable people from a remote epoch nearly to the present day, and as being the most ancient and original of the Indo-European languages, throwing light upon them all. The Aryan or Indo-European race had its ancient home in Central Asia. Colonies migrated to the west and

founded the Persian, Greek, and Roman civilization, and settled in Spain and England. Other branches found their way through the passes of the Himalayas and spread themselves over India. Wherever they went they asserted their superiority over the earlier people whom they found in possession of the soil, and the history of civilization is everywhere the history of the Aryan race. The forefathers of the Greek and Roman, of the Englishman and the Hindu, dwelt together in India, spoke the same language, and worshiped the same gods. The languages of Europe and India are merely different forms of the original Aryan speech. This is especially true of the words of common family life. _Father, mother, brother, sister_, and _widow_, are substantially the same in most of the Aryan languages, whether spoken on the banks of the Ganges, the Tiber, or the Thames. The word _daughter_, which occurs in nearly all of them, is derived from the Sanskrit word signifying _to draw milk_, and preserves the memory of the time when the daughter was the little milkmaid in the primitive Aryan household. It is probable that as late as the third or fourth century B.C. it was still spoken. New dialects were engrafted upon it which at length superseded it, though it has continued to be revered as the sacred and literary language of the country. Among the modern tongues of India, the Hindi and the Hindustani may be mentioned; the former, the language of the pure Hindu population, is written in Sanskrit characters; the latter is the language of the Mohammedan Hindus, in which Arabic letters are used. Many of the other dialects spoken and written in Northern India are derived from the Sanskrit. Of the more important among them there are English grammars and dictionaries.

2. SOCIAL CONSTITUTION OF INDIA.--Hindu literature takes its character both from the social and the religious institutions of the country. The social constitution is based on the distinction of classes into which the people, from the earliest times, have been divided, and which were the natural effect of the long struggle between the aboriginal tribes and the new race which had invaded India. These castes are four: 1st. The Brahmins or priests; 2d. The warriors and princes; 3d. The husbandmen; 4th. The laborers. There are, besides, several impure classes, the result of an intermingling of the different castes. Of these lower classes some are considered utterly abominable--as that of the Pariahs. The different castes are kept distinct from each other by the most rigorous laws; though in modern times the system has been somewhat modified.

THE RELIGION.

In the period of the Vedas the religion of the Hindus was founded on the simple worship of Nature. But the Pantheism of this age was gradually superseded by the worship of the one Brahm, from which, according to this belief, the soul emanated, and to which it seeks to return. Brahm is an impersonality, the sum of all nature, the germ of all that is. Existence has no purpose, the world is wholly evil, and all good persons should desire to be taken out of it and to return to Brahm. This end is to be attained only by transmigration of the soul through all previous stages of life, migrating into the body of a higher or lower being according to the sins or merits of its former existence, either to finish or begin anew its purification. This religion of the Hindus led to the growth of a philosophy the precursor of that of Greece, whose aims were loftier and whose methods more ingenious. From Brahm, the impersonal soul of the universe, emanated the personal and active Brahma, who with Siva and Vishnu constitute the Trimurti or god under three forms. Siva is the second of the Hindu deities, and represents the primitive animating and destroying forces of nature. His symbols relate to these powers, and are worshiped more especially by the Sivaites--a numerous sect of this religion. The worshipers of Vishnu, called the Preserver, the first-born of Brahma, constitute the most extensive sect of India, and their ideas relating to this form of the Divinity are represented by tradition and poetry, and are particularly developed in the great monuments of Sanskrit literature. The myths connected with Vishnu refer especially to his incarnations or corporeal apparitions both in men and animals, which he submits to in order to conquer the spirit of evil. These incarnations are called Avatars, or descendings, and form an important part of Hindu epic poetry. Of the ten Avatars which are attributed to Vishnu, nine have already taken place; the last is yet to come, when the god shall descend again from heaven, to destroy the present world, and to restore peace and parity. The three forms of the Deity, emanating mutually from each other, are expressed by the three symbols, A U M, three letters in Sanskrit having but one sound, forming the mystical name _Om_, which never escapes the lips of the Hindus, but is meditated on in silence. The predominant worship of one or the other of these forms constitutes the peculiarities of the numerous sects of this religion. There are other inferior divinities, symbols of the forces of nature, guardians of the world, demi-gods, demons, and heroes, whose worship, however, is considered as a mode of reaching that divine rest, immersion and absorption in Brahm. To this end are directed the sacrifices, the prayers, the ablutions, the pilgrimages, and the penances, which occupy so large a place in the Hindu worship.

3. CHARACTERISTICS OF THE LITERATURE AND ITS DIVISIONS.--A greater part of the Sanskrit literature, which counts its works by thousands, still remains in manuscript. It was nearly all composed in metre, even works of law, morality, and science. Every department of knowledge and every branch of inquiry is represented, with the single exception of history, and this forms the most striking general characteristic of the literature, and one which robs it of a great share of worth and interest. Its place is in the intellectual rather than in the political history of the world. The literary monuments of the Sanskrit language correspond to the great eras in the history of India. The first period reaches back to that remote age, when those tribes of the Aryan race speaking Sanskrit emigrated to the northwestern portion of the Indian Peninsula, and established themselves there, an agricultural and pastoral people. That was the age in which were composed the prayers, hymns, and precepts afterwards collected in the form of the Vedas, the sacred books of the country. In the second period, the people, incited by the desire of conquest, penetrated into the fertile valleys lying between the Indus and the Ganges; and the struggle with the aboriginal inhabitants, which followed their invasion, gave birth to epic poetry, in which the wars of the different races were celebrated and the extension of Hindu civilization related. The third period embraces the successive ages of the formation and development of a learned and artistic literature. It contains collections of the ancient traditions, expositions of the Vedas, works on grammar, lexicography, and science; and its conclusion forms the golden age of Sanskrit literature, when, the country being ruled by liberal princes, poetry, and especially the drama, reached its highest degree of perfection. The chronology of these periods varies according to the systems of different orientalists. It is, however, admitted that the Vedas are the first literary productions of India, and that their origin cannot be later than the fifteenth century B.C. The period of the Vedas embraces the other sacred books, or commentaries founded upon them, though written several centuries afterwards. The second period, to which belong the two great epic poems, the "Ramayana" and the "Mahabharata," according to the best authorities ends with the sixth or seventh century B.C. The third period embraces all the poetical and scientific works written from that time to the third or fourth century B.C., when the language, having been progressively refined, became fixed in the writings of Kalidasa, Jayadeva, and other poets. A fourth period, including the tenth century A.D., may be added, distinguished by its erudition, grammatical, rhetorical, and scientific disquisitions, which, however, is not considered as belonging to the classical age. From the Hindu languages, originating in the Sanskrit, new literatures have sprung; but they are essentially founded on the ancient literature, which far surpasses them in extent and importance, and is the great model of them all. Indeed, its influence has not been limited to India; all the poetical and scientific works of Asia, China, and Japan included, have borrowed largely from it, and in Southern Russia the scanty literature of the Kalmucks is derived entirely from Hindu sources. The Sanskrit literature, known to Europe only recently, through the researches of the English and German orientalists, has now become the auxiliary and foundation of all philological studies.

4. THE VEDAS AND OTHER SACRED BOOKS.--The Vedas (knowledge or science) are the Bible of the Hindus, the most ancient book of the Aryan family, and contain the revelation of Brahm which was preserved by tradition and collected by Vyasa, a name which means compiler. The word Veda, however, should be taken, as a collective name for the sacred literature of the Vedic age which forms the background of the whole Indian world. Many works belonging to that age are lost, though a large number still exists. The most important of the Vedas are three in number. First, The "Rig- Veda," which is the great literary memorial of the settlement of the Aryans in the Punjab, and of their religious hymns and songs. Second, The "Yajur-Veda." Third, The "Sama-Veda." Each Veda divided into two parts: the first contains prayers and invocations, most of which are of a rhythmical character; the second records the precepts relative to those prayers and to the ceremonies of the sacrifices, and describes the religious myths and symbols. There are many commentaries on the Vedas of an ancient date, which are considered as sacred books, and relate to medicine, music, astronomy, astrology, grammar, philosophy, jurisprudence, and, indeed, to the whole circle of Hindu science. They represent a period of unknown antiquity, when the Aryans were divided into tribes of which the chieftain was the father and priest, and when women held a high position. Some of the most beautiful hymns of this age were composed by ladies and queens. The morals of Avyan, a woman of an early age, are still taught in the Hindu schools as the golden rule of life. India to-day acknowledges no higher authority in matters of religion, ceremonial, customs, and law than the Vedas, and the spirit of Vedantism, which is breathed by every Hindu from his earliest youth, pervades the prayers of the idolater, the speculations of the philosopher, and the proverbs of the beggar. The "Puranas" (ancient writings) hold an eminent rank in the religion and literature of the Hindus. Though of a more recent date than the Vedas, they possess the credit of an ancient and divine origin, and exercise an extensive and practical influence upon the people. They comprise vast collections of ancient traditions relating to theology, cosmology, and to the genealogy of gods and heroes. There are eighteen acknowledged Puranas, which altogether contain 400,000 stanzas. The "Upapuranas," also eighteen in number, are commentaries

on the Puranas. Finally, to the sacred books, and next to the Vedas both in antiquity and authority, belong the "Manavadharmasastra," or the ordinances of Manu, spoken of hereafter.

5. SANSKRIT POETRY.--This poetry, springing from the lively and powerful imagination of the Hindus, is inspired by their religious doctrines, and embodied in the most harmonious language. Exalted by their peculiar belief in pantheism and metempsychosis, they consider the universe and themselves as directly emanating from Brahm, and they strive to lose their own individuality, in its infinite essence. Yet, as impure beings, they feel their incapacity to obtain the highest moral perfection, except through a continual atonement, to which all nature is condemned. Hence Hindu poetry expresses a profound melancholy, which pervades the character as well as the literature of that people. This poetry breathes a spirit of perpetual sacrifice of the individual self, as the ideal of human life. The bards of India, inspired by this predominant feeling, have given to poetry nearly every form it has assumed in the Western world, and in each and all they have excelled. Sanskrit poetry is both metrical and rhythmical, equally free from the confused strains of un moulded genius and from the servile pedantry of conventional rules. The verse of eight syllables is the source of all other metres, and the sloka or double distich is the stanza most frequently used. Though this poetry presents too often extravagance of ideas, incumbrance of episodes, and monstrosity of images, as a general rule it is endowed with simplicity of style, pure coloring, sublime ideas, rare figures, and chaste epithets. Its exuberance must be attributed to the strange mythology of the Hindus, to the immensity of the fables which constitute the groundwork of their poems, and to the gigantic strength of their poetical imaginations. A striking peculiarity of Sanskrit poetry is its extensive use in treating of those subjects apparently the most difficult to reduce to a metrical form--not only the Vedas and Manu's code are composed in verse, but the sciences are expressed in this form. Even in the few works which may be called prose, the style is so modulated and bears so great a resemblance to the language of poetry as scarcely to be distinguished from it. The history of Sanskrit poetry is, in reality, the history of Sanskrit literature. The subjects of the epic poems of the Hindus are derived chiefly from their religious tenets, and relate to the incarnations of the gods, who, in their human forms, become the heroes of this poetry. The idea of an Almighty power warring against the spirit of evil destroys the possibility of struggle, and impairs the character of epic poetry; but the Hindu poets, by submitting their gods both to fate and to the condition of men, diminish their power and give them the character of epic heroes. The Hindu mythology, however, is the great obstacle which must ever prevent this poetry from becoming popular in the Western world. The great personifications of the Deity have not been softened down, as in the mythology of the Greeks, to the perfection of human symmetry, but are here exhibited in their original gigantic forms. Majesty is often expressed by enormous stature; power, by multitudinous hands; providence, by countless eyes; and omnipresence, by innumerable bodies. In addition to this, Hindu epic poetry departs so far from what may be called the vernacular idiom of thought and feeling, and refers to a people whose political and religious institutions, as well as moral habits, are so much at variance with our own, that no labor or skill could render its associations familiar. The Ramayana and the Mahabharata are the most important and sublime creations of Hindu literature, and the most colossal epic poems to be found in the literature of the world. They surpass in magnitude the Iliad and Odyssey, the Jerusalem Delivered and the Lusiad, as the pyramids of Egypt tower above the temples of Greece. The Ramayana (Rama and yana, expedition) describes the exploits of Rama, an incarnation of Vishnu, and the son of Dasaratha, king of Oude. Ravana, the prince of demons, had stolen from the gods the privilege of being invulnerable, and had thus acquired an equality with them. He could not be overcome except by a man, and the gods implored Vishnu to become incarnate in order that Ravana might be conquered. The origin and the development of this Avatar, the departing of Rama for the battlefield, the divine signs of his mission, his love and marriage with Sita, the daughter of the king Janaka, the persecution of his step-mother, by which the hero is sent into exile, his penance in the desert, the abduction of his bride by Ravana, the gigantic battles that ensue, the rescue of Sita, and the triumph of Rama constitute the principal plot of this wonderful poem, full of incidents and episodes of the most singular and beautiful character. Among these may be mentioned the descent of the goddess Ganga, which relates to the mythological origin of the river Ganges, and the story of Yajnadatta, a young penitent, who through mistake was killed by Dasaratha; the former splendid for its rich imagery, the latter incomparable for its elegiac character, and for its expression of the passionate sorrow of parental affection. The Ramayana was written by Valmiki, a poet belonging to an unknown period. It consists of seven cantos, and contains twenty-five thousand verses. The original, with its translation into Italian, was published in Paris by the government of Sardinia about the middle of this century. The Mahabharata (the great Bharata) has nearly the same antiquity as the Ramayana. It describes the greatest Avatar of Vishnu, the incarnation of the god in Krishna, and it presents a vast picture of the Hindu religion. It relates to the legendary history of the Bharata dynasty, especially to the wars between the Pandus and Kurus, two branches of a princely family of ancient India. Five sons of Pandu, having been unjustly exiled by their uncle, return, after many wonderful adventures, with a powerful army to oppose the Kurus, and being aided by Krishna, the incarnated

Vishnu, defeat their enemies and become lords of all the country. The poem describes the birth of Krishna, his escape from the dangers which surrounded his cradle, his miracles, his pastoral life, his rescue of sixteen thousand young girls who had become prisoners of a giant, his heroic deeds in the war of the Pandus, and finally his ascent to heaven, where he still leads the round dances of the spheres. This work is not more remarkable for the grandeur of its conceptions than for the information it affords respecting the social and religious systems of the ancient Hindus, which are here revealed with majestic and sublime eloquence. Five of its most esteemed episodes are called the Five Precious Stones. First among these may be mentioned the "Bhagavad-Gita," or the Divine Song, containing the revelation of Krishna, in the form of a dialogue between the god and his pupil Arjuna. Schlegel calls this episode the most beautiful, and perhaps the most truly philosophical, poem that the whole range of literature has produced. The Mahabharata is divided into eighteen cantos, and it contains two hundred thousand verses. It is attributed to Vyasa, the compiler of the Vedas, but it appears that it was the result of a period of literature rather than the work of a single poet. Its different incidents and episodes were probably separate poems, which from the earliest age were sung by the people, and later, by degrees, collected in one complete work. Of the Mahabharata we possess only a few episodes translated into English, such as the Bhagavad-Gita, by Wilkins. At a later period other epic poems were written, either as abridgments of the Ramayana and the Mahabharata, or founded on episodes contained in them. These, however, belong to a lower order of composition, and cannot be compared with the great works of Valmiki and Vyasa. In the development of lyric poetry the Hindu bards, particularly those of the third period, have been eminently successful; their power is great in the sublime and the pathetic, and manifests itself more particularly in awakening the tender sympathies of our nature. Here we find many poems full of grace and delicacy, and splendid for their charming descriptions of nature. Such are the "Meghaduta" and the "Ritusanhara" of Kalidasa, the "Madhava and Radha" of Jayadeva, and especially the "Gita-Govinda" of the same poet, or the adventures of Krishna as a shepherd, a poem in which the soft languors of love are depicted in enchanting colors, and which is adorned with all the magnificence of language and sentiment. Hindu poetry has a particular tendency to the didactic style and to embody religious and historical knowledge; every subject is treated in the form of verse, such as inscriptions, deeds, and dictionaries. Splendid examples of didactic poetry may be found in the episodes of the epic poems, and more particularly in the collections of fables and apologues in which the Sanskrit literature abounds. Among these the Hitopadesa is the most celebrated, in which Vishnu-saima instructs the sons of a king committed to his care. Perhaps there is no book, except the Bible, which has been translated into so many languages as these fables. They have spread in two branches over nearly the whole civilized world. The one, under the original name of the Hitopadesa, remains almost confined to India, while the other, under the title of "Calila and Dimna," has become famous over all western Asia and in all the countries of Europe, and has served as the model of the fables of all languages. To this department belong also the "Adventures of the Ten Princes," by Dandin, which, in an artistic point of view, is far superior to any other didactic writings of Hindu literature. The drama is the most interesting branch of Hindu literature. No other ancient people, except the Greeks, has brought forth anything so admirable in this department. It had its most flourishing period probably in the third or fourth century B.C. Its origin is attributed to Brahm, and its subjects are selected from the mythology. Whether the drama represents the legends of the gods, or the simple circumstances of ordinary life; whether it describes allegorical or historical subjects, it bears always the same character of its origin and of its tendency. Simplicity of plot, unity of episodes, and purity of language, unite in the formation of the Hindu dramas. Prose and verse, the serious and the comic, pantomime and music are intermingled in their representations. Only the principal characters, the gods, the Brahmins, and the kings, speak Sanskrit; women and the less important characters speak Prakrit, more or less refined according to their rank. Whatever may offend propriety, whatever may produce an unwholesome excitement, is excluded; for the hilarity of the audience, there is an occasional introduction on the stage of a parasite or a buffoon. The representation is usually opened by an apologue and always concluded with a prayer. Kalidasa, the Hindu Shakespeare, has been called by his countrymen the Bridegroom of Poetry. His language is harmonious and elevated, and in his compositions he unites grace and tenderness with grandeur and sublimity. Many of his dramas contain episodes selected from the epic poems, and are founded on the principles of Brahmanism. The "Messenger Cloud" of this author, a monologue rather than a drama, is unsurpassed in beauty of sentiment by any European poet. "Sakuntala," or the Fatal Ring, is considered one of the best dramas of Kalidasa. It has been translated into English by Sir W. Jones. Bhavabhuti, a Brahmin by birth, was called by his contemporaries the Sweet Speaking. He was the author of many dramas of distinguished merit, which rank next to those of Kalidasa.

6. HISTORY AND SCIENCE.--History, considered as the development of mankind in relation to its ideal, is unknown to Sanskrit literature. Indeed, the only historical work thus far discovered is the "History of Cashmere," a series of poetical compositions, written by different authors at different periods, the last of which brings down the annals to the sixteenth century A.D., when Cashmere became a province of the Mogul empire. In the scientific

department, the works on Sanskrit grammar and lexicography are models of logical and analytical research. There are also valuable works on jurisprudence, on rhetoric, poetry, music, and other arts. The Hindu system of decimal notation made its way through the Arabs to modern nations, our usual figures being, in their origin, letters of the Sanskrit alphabet. Their medical and surgical knowledge is deserving of study.

7. PHILOSOPHY.--The object of Hindu philosophy consists in obtaining emancipation from metempsychosis, through the absorption of the soul into Brahm, or the universal being. According to the different principles which philosophers adopt in attaining this supreme object, their doctrines are divided into the four following systems: 1st, Sensualism; 2d, Idealism; 3d, Mysticism; 4th, Eclecticism. Sensualism is represented in the school of Kapila, according to whose doctrine the purification of the soul must be effected through knowledge, the only source of which lies in sensual perception. In this system, nature, eternal and universal, is considered as the first cause, which produces intelligence and all the other principles of knowledge and existence. This philosophy of nature leads some of its followers to seek their purification in the sensual pleasures of this life, and in the loss of their own individuality in nature itself, in which they strive to be absorbed. Materialism, fatalism, and atheism are the natural consequences of the system of Kapila. Idealism is the foundation of three philosophical schools: the Dialectic, the Atomic, and the Vedanta. The Dialectic school considers the principles of knowledge as entirely distinct from nature; it admits the existence of universal ideas in the human mind; it establishes the syllogistic form as the complete method of reasoning, and finally, it holds as fundamental the duality of intelligence and nature. In this theory, the soul is considered as distinct from Brahm and also from the body. Man can approach Brahm, can unite himself to the universal soul, but can never lose his own individuality. The Atomic doctrine explains the origin of the world through the combination of eternal, simple atoms. It belongs to Idealism, for the predominance which it gives to ideas over sensation, and for the individuality and consciousness which it recognizes in man. The Vedanta is the true ideal pantheistic philosophy of India. It considers Brahm in two different states: first, as a pure, simple, abstract, and inert essence; secondly, as an active individuality. Nature in this system is only a special quality or quantity of Brahm, having no actual reality, and he who turns away from ail that is unreal and changeable and contemplates Brahm unceasingly, becomes one with it, and attains liberation. Mysticism comprehends all doctrines which deny authority to reason, and admit no other principles of knowledge or rule of life than supernatural or direct revelation. To this system belong the doctrines of Patanjali, which teach that man must emancipate himself from metempsychosis through contemplation and ecstasy to be attained by the calm of the senses, by corporeal penance, suspension of breath, and immobility of position. The followers of this school pass their lives in solitude, absorbed in this mystic contemplation. The forests, the deserts, and the environs of the temples are filled with these mystics, who, thus separated from external life, believe themselves the subjects of supernatural illumination and power. The Bhagavad-Gita, already spoken of, is the best exposition of this doctrine. The Eclectic school comprises all theories which deny the authority of the Vedas, and admit rational principles borrowed both from sensualism and idealism. Among these doctrines Buddhism is the principal.

8. BUDDHISM.--Buddhism is so called from Buddha, a name meaning deified teacher, which was given to Sakyamuni, or Saint Sakya, a reformer of Brahmanism, who introduced into the Hindu religion a more simple creed, and a milder and more humane code of morality. The date of the origin of this reform is uncertain. It is probably not earlier than the sixth century B.C. Buddhism, essentially a proselyting religion, spread over Central Asia and through the island of Ceylon. Its followers in India being persecuted and expelled from the country, penetrated into Thibet, and pushing forward into the wilderness of the Kalmucks and Mongols, entered China and Japan, where they introduced their warship under the name of the religion of Fo. Buddhism is more extensively diffused than any other form of religion in the world. Though it has never extended beyond the limits of Asia, its followers number over four hundred millions. As a philosophical school, Buddhism partakes both of sensualism and idealism; it admits sensual perception as the source of knowledge, but it grants to nature only an apparent existence. On this universal illusion, Buddhism founded a gigantic system of cosmogony, establishing an infinity of degrees in the scale of existences from that of pure being without form or quality to the lowest emanations. According to Buddha, the object of philosophy, as well as of religion, is the deliverance of the soul from metempsychosis, and therefore from all pain and illusion. He teaches that to break the endless rotation of transmigration the soul must be prevented from being born again, by purifying it even from the desire of existence. He denied the authority of the Vedas, and abolished or ignored the division of the people into castes, admitting whoever desired it to the priesthood. Notwithstanding the doctrine of metempsychosis, and the belief that life is only an endless round of birth and death, sin and suffering, the most sacred Buddhistic books teach a pure and elevated morality, and that the highest happiness is only to be reached through self-abnegation, universal benevolence, humility, patience, courage, self-knowledge, and contemplation. Much has been added to the original doctrines of Buddha in the way of mythology,

sacrifices, penances, mysticism, and hierarchy. Buddhism possesses a literature of its own; its language and style are simple and intelligible to the common people, to whom it is particularly addressed. For this reason the priests of this religion prefer to write in the dialects used by the people, and indeed some of their principal works are written in Prakrit or in Pali. Among these are many legends, and chronicles, and books on theology and jurisprudence. The literary men of Buddhism are generally the priests, who receive different names in different countries. A complete collection of the sacred books of Buddhism forms a theological body of one hundred and eight volumes.

9. MORAL PHILOSOPHY.--The moral philosophy of India is contained in the Sacred Book of Manavadharmasastra, or Code of Manu. This embraces a poetical account of Brahma and other gods, of the origin of the world and man, and of the duties arising from the relation of man towards Brahma and towards his fellow-men. Whether regarded for its great antiquity and classic beauty, or for its importance as being considered of divine revelation by the Hindu people, this Code must ever claim the attention of those who devote themselves to the study of the Sanskrit literature. Though inferior to the Vedas in antiquity, it is held to be equally sacred; and being more closely connected with the business of life, it has done so much towards moulding the opinions of the Hindus that it would be impossible to comprehend the literature or local usages of India without being master of its contents. It is believed by the Hindus that Brahma taught his laws to Manu in one hundred thousand verses, and that they were afterwards abridged for the use of mankind to four thousand. It is most probable that the work attributed to Manu is a collection made from various sources and at different periods. Among the duties prescribed by the laws of Manu man is enjoined to exert a full dominion over his senses, to study sacred science, to keep his heart pure, without which sacrifices are useless, to speak only when necessity requires, and to despise worldly honors. His principal duties toward his neighbor are to honor old age, to respect parents, the mother more than a thousand fathers, and the Brahmins more than father or mother, to injure no one, even in wish. Woman is taught that she cannot aspire to freedom, a girl is to depend on her father, a wife on her husband, and a widow on her son. The law forbids her to marry a second time. The Code of Manu is divided into twelve books or chapters, in which are treated separately the subjects of creation, education, marriage, domestic economy, the art of living, penal and civil laws, of punishments and atonements, of transmigration, and of the final blessed state. These ordinances or institutes contain much to be admired and much to be condemned. They form a system of despotism and priestcraft, both limited by law, but artfully conspiring to give mutual support, though with mutual checks. A spirit of sublime elevation and amiable benevolence pervades the whole work, sufficient to prove the author to have adored not the visible sun, but the incomparably greater light, according to the Vedas, which illuminates all, delights all, from which all proceed, to which all must return, and which alone can irradiate our souls.

10. MODERN LITERATURES OF INDIA.--The literature of the modern tongues of the Hindus consists chiefly of imitations and translations from the Sanskrit, Persian, Arabic, and from European languages. There is, however, an original epic poem, written in Hindi by Tshand, under the title of the "Adventures of Prithivi Raja," which is second only to the great Sanskrit poems. This work, which relates to the twelfth century A.D., describes the struggle of the Hindus against their Mohammedan conquerors. The poem of "Ramayana," by Tulsī-Das, and that of the "Ocean of Love," are extremely popular in India. The modern dialects contain many religious and national songs of exquisite beauty and delicacy. Among the poets of India, who have written in these dialects, Sauday, Mir-Mohammed Taqui, Wali, and Azad are the principal. The Hindi, which dates from the eleventh century A.D., is one of the languages of Aryan stock still spoken in Northern India. One of its principal dialects is the Hindustani, which is employed in the literature of the northern country. Its two divisions are the Hindi and Urdu, which represent the popular side of the national culture, and are almost exclusively used at the present day; the first chiefly by writers not belonging to the Brahminical order, while those of the Urdu dialect follow Persian models. The writings in each, though numerous, and not without pretension, have little interest for the European reader.

11. EDUCATION IN INDIA.--For the education of the Brahmins and of the higher classes, there was founded, in 1792, a Sanskrit College at Benares, the Hindu capital. The course of instruction embraces Persian, English, and Hindu law, and general literature. In 1854 universities were established at Calcutta, Madras, and Bombay. Of late public instruction has become a department of the government, and schools and colleges for higher instruction have been established in various parts of the country, and books and newspapers in English and in the vernacular are everywhere increasing. As far back as 1824 the American and English missionaries were the pioneers of female education. The recent report of the Indian Commission of Education deals particularly with this question, and attributes the wide difference between the extent of male and female acquirements to no inferiority in the mental capacities of women; on the contrary, they find their intellectual activity very keen, and often outlasting the mental energies of men. According to the traditions of pre-historic times, women occupied a high place in the early

civilization of India, and their capacity to govern is shown by the fact, that at the present day one of the best administered States has been ruled by native ladies during two generations, and that the most ably managed of the great landed properties are entirely in the hands of women. The chief causes which retard their education are to be found in the social customs of the country, the seclusion in which women live, the appropriation of the educational fund to the schools for boys, and the need of trained teachers. Notwithstanding all these disadvantages, the first Asiatic writer in the languages of the West who has made a literary fame in Europe is a young Hindu girl, Tora Dutt (1856-1877), whose writings in prose and verse in English, as well as in French, have called forth admiration and astonishment from the critics, and a sincere lament for her early death.

12. THE BRAMO-SOMAJ.--In 1830, under this name (Worshiping Assembly), Rammohun Roy founded a religious society in India, of which, after him, Keshub Chunder Sen (died 1884) was the most eminent member. Their aim is to establish a new religion for India and the world, founded on a belief in one God, which shall be freed from all the errors and corruptions of the past. They propose many important reforms, such as the abolition of caste, the remodeling of marriage customs, the emancipation and education of women, the abolition of infanticide and the worship of ancestors, and a general moral regeneration. Their chief aid to spiritual growth may be summed up in four words, self-culture, meditation, personal purity, and universal beneficence. Their influence has been already felt in the legislative affairs of India.

BABYLONIAN AND ASSYRIAN LITERATURE

1. The Accadians and Babylonians.--2. The Cuneiform Letters.--3. Babylonian and Assyrian Remains.

1. ACCADIANS AND BABYLONIANS.--Geographically, as well as historically and ethnographically, the district lying between the Tigris and Euphrates forms but one country, though the rival kingdoms of Assyria and Babylonia became, each in turn, superior to the other. The primitive inhabitants of this district were called Accadians, or Chaldeans, but little or nothing was known of them until within the last fifteen or twenty years. Their language was agglutinative, and they were the inventors of the cuneiform system of writing. The Babylonians conquered this people, borrowed their signs, and incorporated their literature. Soon after their conquest by the Babylonians, they established priestly caste in the state and assumed the worship, laws, and manners of their conquerors. They were devoted to the science of the stars, and determined the equinoctial and solstitial points, divided the ecliptic into twelve parts and the day into hours. The signs, names, and figures of the Zodiac, and the invention of the dial are some of the improvements in astronomy attributed to this people. With the decline of Babylon their influence declined, and they were afterwards known to the Greeks and Romans only as astrologers, magicians, and soothsayers.

2. THE CUNEIFORM LETTERS.--These characters, borrowed by the Semitic conquerors of the Accadians, the Babylonians, and Assyrians, were originally hieroglyphics, each denoting an object or an idea, but they were gradually corrupted into the forms we see on Assyrian monuments. They underwent many changes, and the various periods are distinguished as Archaic, hieratic, Assyrian, and later Babylonian.

3. BABYLONIAN AND ASSYRIAN REMAINS.--The origin and history of this civilization have only been made known to us by the very recent decipherment of native monuments. Before these discoveries the principal source of information was found in the writings of Borosus, a priest of Babylon, who lived about 300 B.C., and who translated the records of astronomy into Greek. Though his works have perished, we have quotations from them in Eusebius and other writers, which have been strikingly verified by the inscriptions. The chief work on astronomy, compiled for Sargon, one of the earliest Babylonian monarchs, is inscribed on seventy tablets, a copy of which is in the British Museum. The Babylonians understood the movements of the heavenly bodies, and Calisthenes, who accompanied Alexander on his eastern expedition, brought with him on his return the observations of 1903 years. The main purpose of all Babylonian astronomical observation, however, was astrological, to cast horoscopes, or to predict the weather. Babylon retained for a long time its ancient splendor after the conquest by Cyrus and the final fall of the empire, and in the first period of the Macedonian sway. But soon after that time its fame was extinguished, and its monuments, arts, and sciences perished. Assyria was a land of soldiers and possessed little native literature. The more peaceful pursuits had their home in Babylonia, where the universities of Erech and Borsippa were renowned down to classical times. The larger part of this literature was stamped in clay tablets and baked, and these were

numbered and arranged in order. Papyrus was also used, but none of this fragile material has been preserved. In the reign of Sardanapalus (660-647 B.C.) Assyrian art and literature reached their highest point. In the ruins of his palace have been found three chambers the floors of which were covered a foot deep with tablets of all sizes, from an inch to nine inches long, bearing inscriptions many of them so minute as to be read only by the aid of a magnifying glass. Though broken they have been partially restored and are among the most precious cuneiform inscriptions. They have only been deciphered within the present century, and thousands of inscriptions are yet buried among the ruins of Assyria. The most interesting of these remains yet discovered are the hymns to the gods, some of which strikingly resemble the Hebrew Psalms. Of older date is the collection of formulas which consists of omens and hymns and tablets relating to astronomy. Later than the hymns are the mythological poems, two of which are preserved intact. They are "The Deluge" and "The Descent of Istar into Hades." They form part of a very remarkable epic which centred round the adventures of a solar hero, and into which older and independent lays were woven as episodes. Copies are preserved in the British Museum. The literature on the subject of these remains is very extensive and rapidly increasing.

PHOENICIAN LITERATURE.

The Language.--The Remains.

The Phoenician language bore a strong affinity to the Hebrew, through which alone the inscriptions on coins and monuments can be interpreted, and these constitute the entire literary remains, though the Phoenicians had doubtless their archives and written laws. The inscriptions engraved on stone or metal are found chiefly in places once colonies, remote from Phoenicia itself. The Phoenician alphabet forms the basis of the Semitic and Indo-European graphic systems, and was itself doubtless based on the Egyptian hieratic writing. Sanchuniathon is the name given as that of the author of a history of Phoenicia which was translated into Greek and published by Philo, a grammarian of the second century A.D. A considerable fragment of this work is preserved in Eusebius, but after much learned controversy it is now believed that it was the work of Philo himself.

SYRIAC LITERATURE.

The Language.--Influence of the Literature In the Eighth and Ninth Century.

THE LANGUAGE.--The Aramaic language, early spoken in Syria and Mesopotamia, is a branch of the Semitic, and of this tongue the Chaldaic and Syriac were dialects. Chaldaic is supposed to be the language of Babylonia at the time of the captivity, and the earliest remains are a part of the Books of Daniel and Ezra, and the paraphrases or free translations of the Old Testament. The Hebrews having learned this language during the Babylonian exile, it continued in use for some time after their return, though the Hebrew remained the written and sacred tongue. Gradually, however, it lost this prerogative, and in the second century A.D. the Chaldaic was the only spoken language of Palestine. It is still used by the Nestorians and Maronites in their religious services and in their literary works. The spoken language of Syria has undergone many changes corresponding to the political changes of the country. The most prominent Syriac author is St. Ephraem, or Ephraem Syrus (350 A.D.), with whom begins the best period of Syriac literature, which continued until the ninth century. A great part of this literature has been lost, and what remains is only partially accessible. Its principal work was in the eighth and ninth centuries in introducing classical learning to the knowledge of the Arabs. In the seventh century, Jacob of Edessa gave the classical and sacred dialect its final form, and from this time the series of native grammarians and lexicographers continued unbroken to the time of its decline. The study of Syriac was introduced into Europe in the fifteenth century. Valuable collections of MSS., in this language, are to be found in the British Museum, and grammars and dictionaries have been published in Germany and in New York.

PERSIAN LITERATURE.

1. The Persian language and its Divisions.--2. Zendic Literature; The Zendavesta.--3. Pehlvi and Parsee Literatures.--4. The Ancient Religion of Persia; Zoroaster.--5. Modern Literature.--6. The Sufis.--7. Persian Poetry.--8. Persian Poets; Ferdusi; Essedi of Tus; Togray, etc.--9. History and Philosophy.--10. Education in Persia.

1. THE PERSIAN LANGUAGE AND ITS DIVISIONS.--The Persian language and its varieties, as far as they are known, belong to the great Indo-European family, and this common origin explains the affinities that exist between them and those of the ancient and modern languages of Europe. During successive ages, four idioms have prevailed in Persia, and Persian literature may be divided into four corresponding periods.

First. The period of the Zend (living), the most ancient of the Persian languages; it was from a remote, unknown age spoken in Media, Bactria, and in the northern part of Persia. This language partakes of the character both of the Sanskrit and of the Chaldaic. It is written from right to left, and it possesses, in its grammatical construction and its radical words, many elements in common with the Sanskrit and the German languages.

Second. The period of the Pehlvi, or language of heroes, anciently spoken in the western part of the country. Its alphabet is closely allied with the Zendic, to which it bears a great resemblance. It attained a high degree of perfection under the Parthian kings, 246 B.C. to 229 A.D.

Third. The period of the Parsee or the dialect of the southwestern part of the country. It reached its perfection under the dynasty of the Sassanides, 229-636 A.D. It has great analogy with the Zend, Pehlvi, and Sanskrit, and is endowed with peculiar grace and sweetness.

Fourth. The period of the modern Persian. After the conquest of Persia, and the introduction of the Mohammedan faith in the seventh century A.D., the ancient Parsee language became greatly modified by the Arabic. It adopted its alphabet, adding to it, however, four letters and three points, and borrowed from it not only words but whole phrases, and thus from the union of the Parsee and the Arabic was formed the modern Persian. Of its various dialects, the Deri is the language of the court and of literature.

2. ZENDIC LITERATURE.--To the first period belong the ancient sacred books of Persia, collected under the name of *Zendavesta* (living word), which contain the doctrines of Zoroaster, the prophet and lawgiver of ancient Persia. The *Zendavesta* is divided into two parts, one written in Zend, the other in Pehlvi; it contains traditions relating to the primitive condition and colonization of Persia, moral precepts, theological dogmas, prayers, and astronomical observations. The collection originally consisted of twenty-one chapters or treatises, of which only three have been preserved. Besides the *Zendavesta* there are two other sacred books, one containing prayers and hymns, and the other prayers to the Genii who preside over the days of the month. To this first period some writers refer the fables of Lokman, who is supposed to have lived in the tenth century B.C., and to have been a slave of Ethiopic origin; his apologues have been considered the model on which Greek fable was constructed. The work of Lokman, however, existing now only in the Arabic language, is believed by other writers to be of Arabic origin. It has been translated into the European languages, and is still read in the Persian schools. Among the Zendic books preserved in Arabic translations may also be mentioned the "*Giavidan Kird*," or the *Eternal Reason*, the work of Hushang, an ancient priest of Persia, a book full of beautiful and sublime maxims.

3. PEHLVI AND PARSEE LITERATURES.--The second period of Persian literature includes all the books written in Pehlvi, and especially all the translations and paraphrases of the works of the first period. There are also in this language a manual of the religion of Zoroaster, dictionaries of Pehlvi explained by the Parsee, inscriptions, and legends. When the seat of the Persian empire was transferred to the southern states under the Sassanides, the Pehlvi gave way to the Parsee, which became the prevailing language of Persia in the third period of its literature. The sacred books were translated into this tongue, in which many records, annals, and treatises on astronomy and medicine were also written. But all these monuments of Persian literature were destroyed by the conquest of Alexander the Great, and by the fury of the Mongols and Arabs. This language, however, has been immortalized by Ferdusi, whose poems contain little of that admixture of Arabic which characterizes the writings of the modern poets of Persia.

4. THE ANCIENT RELIGION OF PERSIA.--The ancient literature of Persia is mainly the exposition of its religion. Persia, Media, and Bactria acknowledged as their first religious prophet Honover, or Hom, symbolized in the star Sirius, and himself the symbol of the first eternal word, and of the tree of knowledge. In the numberless astronomical and mystic personifications under which Hom was represented, his individuality was lost, and little is known of his history or of his doctrines. It appears, however, that he was the founder of the magi (priests), the conservators and teachers of his doctrine, who formed a particular order, like that of the Levites of Israel and of the Chaldeans of Assyria. They did not constitute a hereditary caste like the Brahmans of India, but they were chosen from among the people. They claimed to foretell future events. They worshiped fire and the stars, and believed in two principles of good and evil, of which light and darkness were the symbols. Zoroaster, one of these magi, who probably lived in the eighth century B.C., undertook to elevate and reform this religion, which had then fallen from its primitive purity. Availing himself of the doctrines of the Chaldeans and of the Hebrews, Zoroaster, endowed by nature with extraordinary powers, sustained by popular enthusiasm, and aided by the favor of powerful princes, extended his reform throughout the country, and founded a new religion on the ancient worship. According to this religion the two great principles of the world were represented by Ormuzd and Ahriman, both born from eternity, and both contending for the dominion of the world. Ormuzd, the principle of good, is represented by light, and Ahriman, the principle of evil, by darkness. Light, then, being the body or symbol of Ormuzd, is worshiped in the sun and stars, in fire, and wherever it is found. Men are either the servants of Ormuzd, through virtue and wisdom, or the slaves of Ahriman, through folly and vice. Zoroaster explained the history of the world as the long contest of these two principles, which was to close with the conquest of Ormuzd over Ahriman. The moral code of Zoroaster is pure and elevated. It aims to assimilate the character of man to light, to dissipate the darkness of ignorance; it acknowledges Ormuzd as the ruler of the universe; it seeks to extend the triumph of virtue over the material and spiritual world. The religion of Zoroaster prevailed for many centuries in Persia. The Greeks adopted some of its ideas into their philosophy, and through the schools of the Gnostics and Neo-Platonists, its influence extended over Europe. After the conquest of Persia by the Mohammedans, the Fire-worshippers were driven to the deserts of Kerman, or took refuge in India, where, under the name of Parsees or Guebers, they still keep alive the sacred fire, and preserve the code of Zoroaster.

5. MODERN LITERATURE.--Some traces of the modern literature of Persia appeared shortly after the conquest of the country by the Arabians in the seventh century A.D.; but the true era dates from the ninth or tenth century. It may be divided into the departments of Poetry, History, and Philosophy.

6. THE SUFIS.--After the introduction of Mohammedanism into Persia, there arose a sect of pantheistic mystics called Sufis, to which most of the Persian poets belong. They teach their doctrine under the images of love, wine, intoxication, etc., by which, with them, a divine sentiment is always understood. The doctrines of the Sufis are undoubtedly of Hindu origin. Their fundamental tenets are, that nothing exists absolutely but God; that the human soul is an emanation from his essence and will finally be restored to him; that the great object of life should be a constant approach to the eternal spirit, to form as perfect a union with the divine nature as possible. Hence all worldly attachments should be avoided, and in all that we do a spiritual object should be kept in view. The great end with these philosophers is to attain to a state of perfection in spirituality and to be absorbed in holy contemplation, to the exclusion of all worldly recollections or interests.

7. PERSIAN POETRY.--The Persian tongue is peculiarly adapted to the purposes of poetry, which in that language is rich in forcible expressions, in bold metaphors, in ardent sentiments, and in descriptions animated with the most lively coloring. In poetical composition there is much art exercised by the Persian poets, and the arrangement of their language is a work of great care. One favorite measure which frequently ends a poem is called the Suja, literally the _cooing of doves_. The poetical compositions of the Persians are of several kinds; the gazel or ode usually treats of love, beauty, or friendship. The poet generally introduces his name in the last couplet. The idyl resembles the gazel, except that it is longer. Poetry enters as a universal element into all compositions; physics, mathematics, medicine, ethics, natural history, astronomy, grammar--all lend themselves to verse in Persia. The works of favorite poets are generally written on fine, silky paper, the ground of which is often powdered with gold or silver dust, the margins illuminated, and the whole perfumed with some costly essence. The magnificent volume containing the poem of Tussuf and Zuleika in the public library at Oxford affords a proof of the honors accorded to poetical composition. One of the finest specimens of calligraphy and illumination is the exordium to the life of Shah Jehan, for which the writer, besides the stipulated remuneration, had _his mouth stuffed with pearls_. There are three principal love stories in Persia which, from the earliest times, have been the themes of every poet. Scarcely one of the great masters of Persian literature but has adopted and added celebrity to these beautiful and interesting legends,

which can never be too often repeated to an Oriental ear. They are, the "History of Khosru and Shireen," the "Loves of Yussuf and Zuleika," and the "Misfortunes of Mejnoun and Leila." So powerful is the charm attached to these stories, that it appears to have been considered almost the imperative duty of all the poets to compose a new version of the old, familiar, and beloved traditions. Even down to a modern date, the Persians have not deserted their favorites, and these celebrated themes of verse reappear, from time to time, under new auspices. Each of these poems is expressive of a peculiar character. That of Khosru and Shireen may be considered exclusively the Persian romance; that of Mejnoun the Arabian; and that of Yussuf and Zuleika the sacred. The first presents a picture of happy love and female excellence in Shireen; Mejnoun is a representation of unfortunate love carried to madness; the third romance contains the ideal of perfection in Yussuf (Joseph) and the most passionate and imprudent love in Zuleika (the wife of Potiphar), and exhibits in strong relief the power of love and beauty, the mastery of mind, the weakness of overwhelming passion, and the victorious spirit of holiness.

8. PERSIAN POETS.--The first of Persian poets, the Homer of his country, is Abul Kasim Mansur, called Ferdusi or "Paradise," from the exquisite beauty of his compositions. He flourished in the reign of the Shah Mahmud (940-1020 A.D.). Mahmud commissioned him to write in his faultless verse a history of the monarchs of Persia, promising that for every thousand couplets he should receive a thousand pieces of gold. For thirty years he studied and labored on his epic poem, "the Shah Namah," or Book of Kings, and when it was completed he sent a copy of it, exquisitely written, to the sultan, who received it coldly, and treated the work of the aged poet with contempt. Disappointed at the ingratitude of the Shah, Ferdusi wrote some satirical lines, which soon reached the ear of Mahmud, who, piqued and offended at the freedom of the poet, ordered sixty thousand small pieces of money to be sent to him, instead of the gold which he had promised. Ferdusi was in the public bath when the money was given to him, and his rage and amazement exceeded all bounds when he found himself thus insulted. He distributed the paltry sum among the attendants of the bath and the slaves who brought it. He soon after avenged himself by writing a satire full of stinging invective, which he caused to be transmitted to the favorite vizier who had instigated the sultan against him. It was carefully sealed up, with directions that it should be read to Mahmud on some occasion when his mind was perturbed with affairs of state, and his temper ruffled, as it was a poem likely to afford him entertainment. Ferdusi having thus prepared his vengeance, quitted the ungrateful court without leave-taking, and was at a safe distance when news reached him that his lines had fully answered their intended purpose. Mahmud had heard and trembled, and too late discovered that he had ruined his own reputation forever. After the satire had been read by Shah Mahmud, the poet sought shelter in the court of the caliph of Bagdad, in whose honor he added a thousand couplets to the poem of the Shah Namah, and who rewarded him with the sixty thousand gold pieces, which had been withheld by Mahmud. Meantime, Ferdusi's poem of Yussuf, and his magnificent verses on several subjects, had received the fame they deserved. Shah Mahmud's late remorse awoke. Thinking by a tardy act of liberality to repair his former meanness, he dispatched to the author of the Shah Namah the sixty thousand pieces he had promised, a robe of state, and many apologies and expressions of friendship and admiration, requesting his return, and professing great sorrow for the past. But when the message arrived, Ferdusi was dead, and his family devoted the whole sum to the benevolent purpose he had intended--the erection of public buildings, and the general improvement of his native village, Tus. He died at the age of eighty. The Shah Namah contains the history of the kings of Persia down to the death of the last of the Sassanide race, who was deprived of his kingdom by the invasion of the Arabs during the caliphate of Omar, 636 A.D. The language of Ferdusi may be considered as the purest specimen of the ancient Parsee: Arabic words are seldom introduced. There are many episodes in the Shah Namah of great beauty, and the power and elegance of its verse are unrivaled. Essedi of Tus is distinguished as having been the master of Ferdusi, and as having aided his illustrious pupil in the completion of his great work. Among many poems which he wrote, the "Dispute between Day and Night" is the most celebrated. Togray was a native of Ispahan and contemporary with Ferdusi. He became so celebrated as a writer, that the title of Honor of Writers was given him. He was an alchemist, and wrote a treatise on the philosopher's stone. Moasi, called King of Poets, lived about the middle of the eleventh century. He obtained his title at the court of Ispahan, and rose to high dignity and honor. So renowned were his odes, that more than a hundred poets endeavored to imitate his style. Omar Kheyam, who was one of the most distinguished of the poets of Persia, lived toward the close of the eleventh century. He was remarkable for the freedom of his religious opinions and the boldness with which he denounced hypocrisy and intolerance. He particularly directed his satire against the mystic poets. Nizami, the first of the romantic poets, flourished in the latter part of the twelfth century A.D. His principal works are called the "Five Treasures," of which the "Loves of Khosru and Shireen" is the most celebrated, and in the treatment of which he has succeeded beyond all other poets. Sadi (1194-1282) is esteemed among the Persians as a master in poetry and in morality. He is better known in Europe than any other Eastern author, except Hafiz, and has been more frequently translated. Jami calls him the nightingale of the groves of Shiraz, of which city he was a native. He spent a part of his long life in travel

and in the acquisition of knowledge, and the remainder in retirement and devotion. His works are termed the salt-mine of poets, being revered as unrivaled models of the first genius in the world. His philosophy enabled him to support all the ills of life with patience and fortitude, and one of his remarks, arising from the destitute condition in which he once found himself, deserves preservation: "I never complained of my condition but once, when my feet were bare, and I had not money to buy shoes; but I met a man without feet, and I became contented with my lot." The works of Sadi are very numerous, and are popular and familiar everywhere in the East. His two greatest works are the "Bostan" and "Gulistan" (Bostan, the rose garden, and Gulistan, the fruit garden). They abound in striking beauties, and show great knowledge of human nature. Attar (1119-1233) was one of the great Sufi masters, and spent his life in devotion and contemplation. He died at the advanced age of 114. It would seem that poetry in the East was favorable to human life, so many of its professors attained to a great age, particularly those who professed the Sufi doctrine. The great work of Attar is a poem containing useful moral maxims. Rumi (1203-1272), usually called the Mullah, was an enthusiastic follower of the doctrine of the Sufis. His son succeeded him at the head of the sect, and surpassed his father not only in the virtues and attainments of the Sufis, but by his splendid poetical genius. His poems are regarded as the most perfect models of the mystic style. Sir William Jones says, "There is a depth and solemnity in his works unequalled by any poet of this class; even Hafiz must be considered inferior to him." Among the poets of Persia the name of Hafiz (d. 1389), the prince of Persian lyric poets, is most familiar to the English reader. He was born at Shiraz. Leading a life of poverty, of which he was proud, for he considered poverty the companion of genius, he constantly refused the invitation, of monarchs to visit their courts. There is endless variety in the poems of Hafiz, and they are replete with surpassing beauty of thought, feeling, and expression. The grace, ease, and fancy of his numbers are inimitable, and there is a magic in his lays which few even of his professed enemies have been able to resist. To the young, the gay, and the enthusiastic his verses are ever welcome, and the sage discovers in them a hidden mystery which reconciles him to their subjects. His tomb, near Shiraz, is visited as a sacred spot by pilgrims of all ages. The place of his birth is held in veneration, and there is not a Persian whose heart does not echo his strains. Jami (d. 1492) was born in Khorassan, in the village of Jam, from whence he is named,--his proper appellation being Abd Arahman. He was a Sufi, and preferred, like many of his fellow-poets, the meditations and ecstasies of mysticism to the pleasures of a court. His writings are very voluminous; he composed nearly forty volumes, all of great length, of which twenty-two are preserved at Oxford. The greater part of them treat of Mohammedan theology, and are written in the mystic style. He collected the most interesting under the name of the "Seven Stars of the Bear," or the "Seven Brothers," and among these is the famous poem of Yussuf and Zuleika. This favorite subject, which every Persian poet has touched with more or less success, has never been so beautifully rendered as by Jami. Nothing can exceed the admiration which this poem inspires in the East. Hatifi (d. 1520) was the nephew of the great poet Jami. It was his ambition to enter the lists with his uncle, by composing poems on similar subjects. Opinions are divided as to whether he succeeded as well as his master, but none can exceed him in sweetness and pathos. His version of the sad tale of Mejnoun and Leila, the Romeo and Juliet of the East, is confessedly superior to that of Nizami. The lyrical compositions of Sheik Feizi (d. 1575) are highly valued. In his mystic poems he approaches to the sublimity of Attar. His ideas are tinged with the belief of the Hindus, in which he was educated. When a boy he was introduced to the Brahmins by the Sultan Mohammed Akbar, as an orphan of their tribe, in order that he might learn their language and obtain possession of their religious secrets. He became attached to the daughter of the Brahmin who protected him, and she was offered to him--in marriage by the unsuspecting parent. After a struggle between inclination and honor, the latter prevailed, and he confessed the fraud. The Brahmin, struck with horror, attempted to put an end to his own existence, fearing that he had betrayed his oath and brought danger and disgrace on his sect. Feizi, with tears--and protestations, besought him to forbear, promising to submit to any command he might impose on him. The Brahmin consented to live, on condition that Feizi should take an oath never to translate the Vedas nor to repeat to any one the creed of the Hindus. Feizi entered into the desired obligations, parted with his adopted father, bade adieu to his love, and with a sinking heart returned home. Among his works the most important is the "Mahabarit," which contains the chronicles of the Hindu princes, and abounds in romantic episodes. The most celebrated recent Persian poet is Blab Phelair (1729-1825). He left many astronomical, moral, political, and literary works. He is called the Persian Voltaire. Among the collections of novels and fables, the "Lights of Canope" may be mentioned, imitated from the Hitopadesa. Persian literature is also enriched by translations of the standard works in Sanskrit, among which are the epic poems of Valmiki and Vyasa.

9. HISTORY AND PHILOSOPHY.--Among the most celebrated of the Persian historians is Mirkhond, who lived in the middle of the fifteenth century. His great work on universal history contains an account of the origin of the world, the life of the patriarchs, prophets, and philosophers of Persia, and affords valuable materials, especially for the history of the Middle Ages. His son, Khondemir, distinguished himself in the same branch of literature, and wrote two works which, for their historical correctness and elegance of style, are in great favor among the Persians.

Ferishta, who flourished in the beginning of the seventeenth century, is the author of a valuable history of India. Mirgholah, a historian of the eighteenth century, gives a contemporary history of Hindustan and of his own country, under the title of "A Glance at Recent Affairs," and in another work he treats of the causes which, at some future time, will probably lead to the fall of the British power in India. The "History of the Reigning Dynasty" is among the principal modern historical works of Persia. The Persians possess numerous works on rhetoric, geography, medicine, mathematics, and astronomy, few of which are entitled to much consideration. In philosophy may be mentioned the "Essence of Logic," an exposition in the Arabic language of the doctrines of Aristotle on logic; and the "Moral System of Nasir," published in the thirteenth century A.D., a valuable treatise on morals, economy, and politics.

10. EDUCATION IN PERSIA.--There are established, in every town and city, schools in which the poorer children can be instructed in the rudiments of the Persian and Arabic languages. The pupil, after he has learned the alphabet, reads the Koran in Arabic; next, fables in Persian; and lastly is taught to write a beautiful hand, which is considered a great accomplishment. The Persians are fond of poetry, and the lowest artisans can read or repeat the finest passages of their most admired poets. For the education of the higher classes there are in Persia many colleges and universities where the pupils are taught grammar, the Turkish and Arabic languages, rhetoric, philosophy, and poetry. The literary men are numerous; they pursue their studies till they are entitled to the honors of the colleges; afterwards they devote themselves to copying and illuminating manuscripts. Of late many celebrated European works have been translated and published in Persia.

HEBREW LITERATURE.

1. Hebrew Literature; its Divisions.--2. The Language; its Alphabet; its Structure; Peculiarities, Formation, and Phases.--3. The Old Testament.-- 4. Hebrew Education.--5. Fundamental Idea of Hebrew Literature.--6. Hebrew Poetry.--7. Lyric Poetry; Songs; the Psalms; the Prophets.--8. Pastoral Poetry and Didactic Poetry; the Proverbs and Ecclesiastes.--9. Epic and Dramatic Poetry; the Book of Job.--10. Hebrew History; the Pentateuch and other Historical Books.--11. Hebrew Philosophy.--12. Restoration of the Sacred Books.--13. Manuscripts and Translations.--14. Rabbinical Literature.--15. The New Revision of the Bible, and the New Biblical Manuscript.

1. HEBREW LITERATURE.--In the Hebrew literature we find expressed the national character of that ancient people who, for a period of four thousand years, through captivity, dispersion, and persecution of every kind, present the wonderful spectacle of a race preserving its nationality, its peculiarities of worship, of doctrine, and of literature. Its history reaches back to an early period of the world, its code of laws has been studied and imitated by the legislators of all ages and countries, and its literary monuments surpass in originality, poetic strength, and religious importance those of any other nation before the Christian era. The literature of the Hebrews may be divided into the four following periods:-- The first, extending from remote antiquity to the time of David, 1010 B.C., includes all the records of patriarchal civilization transmitted by tradition previous to the age of Moses, and contained in the Pentateuch or five books attributed to him after he had delivered the people from the bondage of Egypt. The second period extends from the time of David to the death of Solomon, 1010-940 B.C., and to this are referred some of the Psalms, Joshua, the Judges, and the Chronicles. The third period extends from the death of Solomon to the return from the Babylonian captivity, 940-532 B.C., and to this age belong the writings of most of the Prophets, The Song of Solomon, Proverbs, Ecclesiastes, the books of Samuel, of Kings, and of Ruth. The fourth period extends from their return from the Babylonian Captivity to the present time, and to this belong some of the Prophets, the Chronicles, Ezra, Nehemiah, Esther, the final completion of the Psalms, the Septuagint translation of the Bible, the writings of Josephus, of Philo of Alexandria, and the rabbinical literature.

2. THE LANGUAGE.--The Hebrew language is of Semitic origin; its alphabet consists of twenty-two letters. The number of accents is nearly forty, some of which distinguish the sentences like the punctuation of our language, and others serve to determine the number of syllables, or to mark the tone with which they are to be sung or spoken. The Hebrew character is of two kinds, the ancient or square, and the modern or rabbinical. In the first of these the Scriptures were originally written. The last is deprived of most of its angles, and is more easy and flowing. The Hebrew words as well as letters are written from right to left in common with, the Semitic tongues generally, and the language is regular, particularly in its conjugations. Indeed, it has but one conjugation, but with seven or eight variations, having the effect of as many different conjugations, and giving great variety of expression. The

predominance of these modifications over the noun, the idea of time contained in the roots of almost all its verbs, so expressive and so picturesque, and even the scarcity of its prepositions, adjectives, and adverbs, make this language in its organic structure breathe life, vigor, and emotion. If it lacks the flowery and luxuriant elements of the other oriental idioms, no one of these can be compared with the Hebrew tongue for the richness of its figures and imagery, for its depth, and for its majestic and imposing features. In the formation, development, and decay of this language, the following periods may be distinguished:-- First. From Abraham to Moses, when the old stock was changed by the infusion of the Egyptian and Arabic. Abraham, residing in Chaldea, spoke the Chaldaic language, then traveling through Egypt, and establishing himself in Canaan or Palestine, his language mingled its elements with the tongues spoken by those nations, and perhaps also with that of the Phoenicians, who early established commercial intercourse with him and his descendants. It is probable that the Hebrew language sprung from the mixture of these elements. Second. From Moses and the composition of the Pentateuch to Solomon, when it attained its perfection, not without being influenced by the Phoenician. This is the Golden Age of the Hebrew language. Third. From Solomon to Ezra, when, although increasing in beauty and sweetness, it became less pure by the adoption of foreign ideas and idioms. Fourth. From Ezra to the end of the reign of the Maccabees, when it was gradually lost in the Aramaean or Chaldaic tongue, and became a dead language. The Jews of the Middle Ages, incited by the learning of the Arabs in Spain, among whom they received the protection denied them by Christian nations, endeavored to restore their language to something of its original purity, and to render the Biblical Hebrew again a written language; but the Chaldaic idioms had taken too deep root to be eradicated, and besides, the ancient language was found insufficient for the necessities of an advancing civilization. Hence arose a new form of written Hebrew, called rabbinical from its origin and use among the rabbins. It borrowed largely from many contemporary languages, and though it became richer and more regular in its structure, it retained little of the strength and purity of the ancient Hebrew.

3. THE OLD TESTAMENT.--The literary productions of the Hebrews are collected in the sacred books of the Old Testament, in which, according to the celebrated orientalist, Sir William Jones, we can find more eloquence, more historical and moral truth, more poetry,--in a word, more beauties than we could gather from all other books together, of whatever country or language. Aside from its supernatural claims, this book stands alone among the literary monuments of other nations, for the sublimity of its doctrine, as well as for the simplicity of its style. It is the book of all centuries, countries, and conditions, and affords the best solution of the most mysterious problems concerning God and the world. It cultivates the taste, it elevates the mind, it nurses the soul with the word of life, and it has inspired the best productions of human genius.

4. HEBREW EDUCATION.--Religion, morals, legislation, history, poetry, and music were the special objects to which the attention of the Levites and Prophets was particularly directed. The general education of the people, however, was rather simple and domestic. They were trained in husbandry, and in military and gymnastic exercises, and they applied their minds almost exclusively to religious and moral doctrines and to divine worship; they learned to read and write their own language correctly, but they seldom learned foreign languages or read foreign books, and they carefully prevented strangers from obtaining a knowledge of their own.

5. FUNDAMENTAL IDEA OF HEBREW LITERATURE.--Monotheism was the fundamental idea of the Hebrew literature, as well as of the Hebrew religion, legislation, morals, politics, and philosophy. The idea of the unity of God constitutes the most striking characteristic of Hebrew poetry, and chiefly distinguishes it from that of all mythological nations. Other ancient literatures have created their divinities, endowed them with human passions, and painted their achievements in the glowing colors of poetry. The Hebrew poetry, on the contrary, makes no attempt to portray the Deity by the instruments of sensuous representation, but simple, majestic, and severe, it pours forth a perpetual anthem of praise and thanksgiving. The attributes of God, his power, his paternal love and wisdom, are described in the most sublime language of any age or nation. His seat is the heavens, the earth is his footstool, the heavenly hosts his servants; the sea is his, and he made it, and his hands prepared the dry land.

Placed under the immediate government of Jehovah, having with Him common objects of aversion and love, the Hebrews reached the very source of enthusiasm, the fire of which burned in the hearts of the prophets so fervently as to cause them to utter the denunciations and the promises of the Eternal in a tone suited to the inspired of God, and to sing his attributes and glories with a dignity and authority becoming them, as the vicegerents of God upon earth.

6. HEBREW POETRY.--The character of the people and their language, its mission, the pastoral life of the patriarchs, the beautiful and grand scenery of the country, the wonderful history of the nation, the feeling of divine inspiration, the promise of a Messiah who should raise the nation to glory, the imposing solemnities of the divine worship, and finally, the special order of the prophets, gave a strong impulse to the poetical genius of the nation, and concurred in producing a form of poetry which cannot be compared with any other for its simplicity and clearness, for its depth and majesty.

These features of Hebrew poetry, however, spring from its internal force rather than from any external form. Indeed, the Hebrew poets soar far above all others in that energy of feeling, impetuous and irresistible, which penetrates, warms, and moves the very soul. They reveal their anxieties as well as their hopes; they paint with truth and love the actual condition of the human race, with its sorrows and consolations, its hopes and fears, its love and hate. They select their images from the habitual ideas of the people, and personify inanimate objects—the mountains tremble and exult, deep cries unto deep. Another characteristic of Hebrew poetry is the strong feeling of nationality it expresses. Of their two most sublime poets, one was their legislator, the other their greatest king.

7. LYRIC POETRY.--In their national festivals the Hebrews sang the hymns of their lyric poets, accompanied by musical instruments. The art of singing, as connected with poetry, flourished especially under David, who instituted twenty-four choruses, composed of four thousand Levites, whose duty it was to sing in the public solemnities. It is generally believed that the Hebrew lyric poetry was not ruled by any measure, either of syllables or of time. Its predominant form was a succession of thoughts and a rhythmic movement, less of syllables and words than of ideas and images systematically arranged. The Psalms, especially, are essentially symmetrical, according to the Hebrew ritual, their verses being sung alternately by Levites and people, both in the synagogues and more frequently in the open air. The song of Moses after the passage of the Red

Sea is the most sublime triumphal hymn in any language, and of equal merit is his song of thanksgiving in Deuteronomy. Beautiful examples of the same order of poetry may be found in the song of Judith (though not canonical), and the songs of Deborah and Balaam. But Hebrew poetry attained its meridian splendor in the Psalms of David. The works of God in the creation of the world, and in the government of men; the illustrious deeds of the House of Jacob; the wonders and mysteries of the new Covenant are sung by David in a fervent out-pouring of an impulsive, passionate spirit, that alternately laments and exults, bows in contrition, or soars to the sublimest heights of devotion. The Psalms, even now, reduced to prose, after three thousand years, present the best and most sublime collection of lyrical poems, unequaled for their aspiration, their living imagery, their grand ideas, and majesty of style.

When at length the Hebrews, forgetful of their high duties and calling, trampled on their institutions and laws, prophets were raised up to recall the wandering people to their allegiance. ISAIAH, whether he foretells the future destiny of the nation, or the coming of the Messiah, in his majestic eloquence, sweetness, and simplicity, gives us the most perfect model of lyric poetry. He prophesied during the reigns of Azariah and Hezekiah, and his writings bear the mark of true inspiration.

JEREMIAH flourished during the darkest period in the history of the kingdom of Judah, and under the last four kings, previous to the Captivity. The Lamentations, in which he pours forth his grief for the fate of his country, are full of touching melancholy and pious resignation, and, in their harmonious and beautiful tone, show his ardent patriotism and his unshaken trust in the God of his fathers. He does not equal Isaiah in the sublimity of his conceptions and the variety of his imagery, but whatever may be the imperfections of his style, they are lost in the passion and vehemence of his poems.

DANIEL, after having straggled against the corruptions of Babylon, boldly foretells the decay of that empire with terrible power. His conceptions and images are truly sublime; but his style is less correct and regular than that of his predecessors, his language being a mixture of Hebrew and Chaldaic.

Such is also the style of EZEKIEL, who sings the development of the obscure prophesies of his master. His writings abound in dreams and visions, and convey rather the idea of the terrible than of the sublime.

These four, from the length of their writings, are called the Greater Prophets, to distinguish them from the twelve Minor Prophets: HOSEA, JOEL, AMOS, OBADIAH, JONAH, MICAHA, NAHUM, HABAKKUK, ZEPHANIAH, HAGGAI, ZECHARIAH, and MALACHI, all of whom, though endowed with different characteristics and genius, show in their writings more or less of that fire and vigor which can only be found in writers who were moved and warmed by the very spirit of God.

8. PASTORAL POETRY AND DIDACTIC POETRY.--The Song of Solomon and the history of Ruth are the best specimens of the Hebrew idyl, and breathe all the simplicity of pastoral life.

The books of Proverbs and Ecclesiastes contain treatises on moral philosophy, or rather, are didactic poems. The Proverb, which is a maxim of wisdom, greatly used by the ancients before the introduction of dissertation, is, as the name indicates, the prevalent form of the first of these books. In Ecclesiastes we have described the trials of a mind which has lost itself in undefined wishes and in despair, and the efficacious remedies for these mental diseases are shown in the pictures of the vanity of the world and in the final divine judgment, in which the problem of this life will have its complete solution. SOLOMON, the author of these works, adds splendor to the sublimity of his doctrines by the dignity of his style.

9. EPIC AND DRAMATIC POETRY.--The Book of Job may be considered as belonging either to epic or to dramatic poetry. Its exact date is uncertain; some writers refer it to the primitive period of Hebrew literature, and others to a later age; and, while some contend that Job was but an ideal, representing human suffering, whose story was sung by an anonymous poet, others, with more probability, regard him as an actual person, exposed to the trials and temptations described in this wonderful book. However this may be, it is certain that this monument of wisdom stands alone, and that it can be compared to no other production for the sublimity of its ideas, the vivacity and force of its expressions, the grandeur of its imagery, and the variety of its characters. No other work represents, in more true and vivid colors, the nobility and misery of humanity, the laws of necessity and Providence, and the trials to which the good are subjected for their moral improvement. Here the great straggle between evil and good appears in its true light, and human virtue heroically submits itself to the ordeal of misfortune. Here we learn that the evil and good of this life are by no means the measure of morality, and here we witness the final triumph of justice.

10. HEBREW HISTORY.--Moses, the most ancient of all historians, was also the first leader and legislator of the Hebrews. When at length the traditions of the patriarchs had become obscured and confused among the different nations of the earth, Moses was inspired to write the history of the human race, and especially of the chosen people, in order to bequeath to coming centuries a memorial of revealed truths and of the divine works of eternal Wisdom. Thus in the first chapters of Genesis, without aiming to write the complete annals of the first period of the world, he summed up the general history of man, and described, more especially, the genealogy of the patriarchs and of the generations previous to the time of the dispersion.

The subject of the book of Exodus is the delivery of the people from the Egyptian bondage, and it is not less admirable for the importance of the events which it describes, than for the manner in which they are related. In this, and in the following book of Numbers, the record of patriarchal life gives place to the teachings of Moses and to the history of the wanderings in the deserts of Arabia.

In Leviticus the constitution of the priesthood is described, as well as the peculiarities of a worship. Deuteronomy records the laws of Moses, and concludes with his sublime hymn of thanksgiving.

The historical books of Joshua, Judges, Samuel, Kings, Chronicles, Ezra, etc., contain the history of the Hebrew nation for nearly a thousand years, and relate the prosperity and the disasters of the chosen people. Here are recorded the deeds of Joshua, of Samson, of Samuel, of David, and of Solomon, the building of the Temple, the division of the tribes into two kingdoms, the prodigies of Elijah and Elisha, the impieties of Ahab, the calamities of Jedekiah, the destruction of Jerusalem and of the first Temple, the dispersion and the Babylonish captivity, the deliverance under Cyrus, and the rebuilding of the city and Temple under Ezra, and other great events in Hebrew history.

The internal evidence derived from the peculiar character of each of the historical books is decisive of their genuineness, which is supported above all suspicion of alteration or addition by the scrupulous conscientiousness

and veneration with which the Hebrews regarded their sacred writings. Their authenticity is also proved by the uniformity of doctrine which pervades them all, though written at different periods, by the simplicity and naturalness of the narrations, and by the sincerity of the writers.

These histories display neither vanity nor adulation, nor do they attempt to conceal from the reader whatever might be considered as faults in their authors or their heroes. While they select facts with a nice judgment, and present the most luminous picture of events and of their causes, they abstain from reasoning or speculation in regard to them.

11. HEBREW PHILOSOPHY.--Although the Hebrews, in their different sacred writings, have transmitted to us the best solution of the ancient philosophical questions on the creation of the world, on the Providence which rules it, on monotheism, and on the origin of sin, yet they have nowhere presented us with a complete system of philosophy.

During the Captivity, their doctrines were influenced by those of Zoroaster, and later, when many of the Jews established themselves in Egypt, they acquired some knowledge of the Greek philosophy, and the tenets of the sects of the Essenes bear a strong resemblance to the Pythagorean and Platonic schools. This resemblance appears most clearly in the writings of Philo of Alexandria, a Jew, born a few years before the birth of our Saviour. Though not belonging to the sect of the Essenes, he

followed their example in adopting the doctrines of Plato and taking them as the criterion in the interpretation of the Scriptures. So, also, Flavius Josephus, born in Jerusalem, 37 A.D., and Numenius, born in Syria, in the second century A.D., adopted the Greek philosophy, and by its doctrines amplified and expanded the tenets of Judaism.

12. RESTORATION OF THE SACRED BOOKS.--One of the most important eras in Hebrew literature is the period of the restoration of the Mosaic institutions, after the return from the Captivity. According to tradition, at that time Ezra established the great Synagogue, a college of one hundred and twenty learned men, who were appointed to collect copies of the ancient sacred books, the originals of which had been lost in the capture of Jerusalem by Nebuchadnezzar, and Nehemiah soon after placed this, or a new collection, in the Temple. The design of these reformers to give the people a religious canon in their ancient tongue induces the belief that they engaged in the work with the strictest fidelity to the old Mosaic institutions, and it is certain that the canon of the Old Testament, in the time of the Maccabees, was the same as that which we have at present.

13. MANUSCRIPTS AND TRANSLATIONS.--Of the canonical books of the Old Testament we have Hebrew manuscripts, printed editions, and translations. The most esteemed manuscripts are those of the Spanish Jews, of which the most ancient belong to the eleventh and twelfth centuries. The printed editions of the Bible in Hebrew are numerous. The earliest are those of Italy. Luther made his German translation from the edition of Brescia, printed in 1494. The earliest and most famous translation of the Old

Testament is the Septuagint, or Greek translation, which was made about 283 B.C. It may, probably, be attributed to the Alexandrian Jews, who, having lost the knowledge of the Hebrew, caused the translation to be made by some of their learned countrymen for the use of the Synagogues of Egypt. It was probably accomplished under the authority of the Sanhedrim, composed of seventy elders, and therefore called the Septuagint version, and from it the quotations in the New Testament are chiefly taken. It was regarded as canonical by the Jews to the exclusion of other books written in Greek, but not translated from the Hebrew, which we now call, by the Greek name, the Apocrypha.

The Vulgate or Latin translation, which has official authority in the Catholic Church, was made gradually from the eighth to the sixteenth century, partly from an old translation which was made from the Greek in the early history of the Church, and partly from translations from the Hebrew made by St. Jerome.

The English version of the Bible now in use in England and America was made by order of James I. It was accomplished by forty-seven distinguished scholars, divided into six classes, to each of which a part of the work was assigned. This translation occupied three years, and was printed in 1611.

14. RABBINICAL LITERATURE.--Rabbinical literature includes all the writings of the rabbins, or teachers of the Jews in the later period of Hebrew letters, who have interpreted and developed the literature of the earlier ages. The language made use of by them has its foundation in the Hebrew and Chaldaic, with various alterations and modifications in the use of words, the meaning of which they have considerably enlarged and extended. They have

frequently borrowed from the Arabic, Greek, and Latin, and from those modern tongues spoken where they severally resided.

The Talmud, from the Hebrew word signifying *he has learned*, is a collection of traditions illustrative of the laws and usages of the Jews. The Talmud consists of two parts, the Mishna and the Gemara. The Mishna, or *second law*, is a collection of rabbinical rules and precepts made in the second century. The Gemara (*completion* or *doctrine*) was composed in the third century. It is a collection of commentaries and explanations of the Mishna, and both together formed the Jerusalem Talmud.

The Babylonian rabbins composed new commentaries on the Mishna, and this formed the Babylonian Talmud. Both Talmuds were first committed to writing about 500 A.D. At the period of the Christian Era, the civil constitution, language, and mode of thinking among the Jews had undergone a complete revolution, and were entirely different from what they had been in the early period of the commonwealth. The Mosaic books contained rules no longer adapted to the situation of the nation, and many difficult questions arose to which their law afforded no satisfactory solution. The rabbins undertook to supply this defect, partly by commentaries on the Mosaic precepts, and partly by the composition of new rules.

The Talmud requires that wherever twelve adults reside together in one place, they shall erect a synagogue and serve the God of their fathers by a multitude of prayers and formalities, amidst the daily occupations of life. It allows usury, treats agricultural pursuits with contempt, and requires strict separation from the other races, and commits the government to the rabbins. The Talmud is followed by the Rabbinites, to which sect nearly all the European and American Jews belong. The sect of the Caraites rejects the Talmud and holds to the law of Moses only. It is less numerous, and its members are found chiefly in the East, or in Turkey and Eastern Russia. The Cabala, or oral tradition, is, according to the Jews, a perpetual divine revelation, preserved among the Jewish people by secret transmission. It sometimes denotes the doctrines of the prophets, but most commonly the mystical philosophy, which was probably introduced into Palestine from Egypt and Persia. It was first committed to writing in the second century A.D. The Cabala is divided into the symbolical and the real, of which the former gives a mystical signification to letters. The latter comprehends doctrines, and is divided into the theoretical and practical. The first aims to explain the Scriptures according to the secret traditions, while the last pretends to teach the art of performing miracles by an artificial use of the divine names and sentences of the sacred Scriptures. The Jews of the Middle Ages acquired great reputation for learning, especially in Spain, where they were allowed to study astronomy, mathematics, and medicine in the schools of the Moors. Granada and Cordova became the centres of rabbinical literature, which was also cultivated in France, Italy, Portugal, and Germany. In the sixteenth century the study of Hebrew and rabbinical literature became common among Christian scholars, and in the following centuries it became more interesting and important from the introduction of comparative philology in the department of languages. Rabbinical literature still has its students and interpreters. In Padua, Berlin, and Metz there are seminaries for the education of rabbins, which supply with able doctors the synagogues of Italy, Germany, and France. There is also a rabbinical school in Cincinnati, Ohio. The Polish rabbins and Talmudists, however, are the most celebrated.

15. THE NEW REVISION OF THE BIBLE.--The convocation of the English House of Bishops, which met at Canterbury in 1870, recommended a revised version of the Scriptures, and appointed a committee for the work of sixty-seven members from various ecclesiastical bodies of England, to which an American committee of thirty-five was added, and by their joint labors the revised edition of the New Testament was issued in 1881. The revised Old Testament is expected to appear during 1884. The advantages claimed for these new versions are: a more accurate rendering of the text, a correction of the errors of former translations, the removal of misleading archaisms and obsolete terms, better punctuation, arrangement in sections as well as chapters and verses, the metrical arrangement of poetry, and an increased number of marginal readings. In 1875, Bryennios, a metropolitan of the Greek Church, discovered in the library of the Most Holy Sepulchre at Constantinople a manuscript belonging to the second century A.D., which contains, among other valuable and interesting documents, one on the "Teaching of the Twelve Apostles," many points of which bear on the usages of the church, such as the mode of baptism, the celebration of the Eucharist, and the orders of the ministry. It was at first considered authentic and highly important, but more deliberate study tends to discredit its authority.

EGYPTIAN LITERATURE.

1. The Language.--2. The Writing.--3. The Literature.--4. The Monuments. --5. The Discovery of Champollion.--6. Literary Remains; Historical; Religious; Epistolary; Fictitious; Scientific; Epic; Satirical and Judicial.--7. The Alexandrian Period.--8. The Literary Condition of Modern Egypt.

1. THE LANGUAGE.--From the earliest times the language of Egypt was divided into three dialects: the Memphitic, spoken in Memphis and Lower Egypt; the Theban, or Sahidic, spoken in Upper Egypt; and the Bashmuric, a provincial variety belonging to the oases of the Lybian Desert. The Coptic tongue, which arose from a union of ancient Egyptian with the vulgar vernacular, later became mingled with Greek and Arabic words, and was written in the Greek alphabet. It was used in Egypt until the tenth century A.D., when it gave way to the Arabic; but the Christians still preserve it in their worship and in their translation of the Bible. By rejecting its foreign elements Egyptologists have been enabled to study this language in its purity, and to establish its grammar and construction. It is the exclusive character of the Christian Egyptian literature, and marks the last development and final decay of the Egyptian language.

2. THE WRITING.--Four distinct graphic systems were in use in ancient Egypt: the hieroglyphic, the hieratic, the demotic, and Coptic. The first expresses words partly by representation of the object and partly by signs indicating sounds, and was used chiefly for inscriptions. The hieratic characters presented a flowing and abbreviated form of the hieroglyphic, and were used more particularly in the papyri. The great body of Egyptian literature has reached us through this character, the reading of which can only be determined by resolving it into its prototype, hieroglyphics. The demotic writing indicates the rise of the vulgar tongue, which took place about the beginning of the seventh century B.C. It was used to transcribe hieroglyphic and hieratic inscriptions and papyri into the common idiom until the second century A.D., when the Coptic generally superseded it.

3. THE LITERATURE.--The literary history of ancient Egypt presents a remarkable exception to that of any other country. While the language underwent various modifications, and the written characters changed, the literature remained the same in all its principal features. This literature consists solely of inscriptions painted or engraved on monuments, or of written manuscripts on papyrus buried in the tombs or beneath the ruins of temples. It is so deficient in style, and so unsystematic in its construction, that it has taxed the labors of the ablest critics for the last fifty years to construct a whole from its disjointed materials, and these are so imperfect that many periods of Egyptian history are complete literary blanks. In the great period of the Rameses, novels or works of amusement predominated; under the Ptolemies, historical records, and in the Coptic or Christian stage, homilies and church rituals prevailed; but through every epoch the same general type appears. Notwithstanding these deficiencies, however, Egypt offers a most attractive field for the archaeologist, and new discoveries are constantly adding to our knowledge of this interesting country.

4. THE MONUMENTS.--The monuments of Egypt are religious, as the temples, sepulchral, as the necropoles, or triumphal, as the obelisks. The temples were the principal structures of the Egyptian cities, and their splendid ruins, covered with inscriptions, are among the most interesting remains of antiquity. Life after death, the leading idea of the religion of Egypt, was expressed in the construction of the tombs, so numerous in the vicinity of all the large cities. These necropoles, excavated in the rocks or hillsides, or built within the pyramids, consist of rows of chambers with halls supported by columns, which, with the walls, are often covered with paintings, historical or monumental, representing scenes from domestic or civil life. The great pyramids were probably built for the sepulchres of kings and their families, and the smaller ones for persons of inferior rank. The most magnificent of the triumphal monuments are the obelisks, gigantic monoliths of red or white granite, some of which are more than two hundred feet high, covered with inscriptions, and bearing the image of the triumphant king, painted or engraved. The splendid obelisk in the Place de la Concorde, at Paris, celebrates the glories of Rameses II. The obelisk now in New York is one of a pair erected at Heliopolis, before the Temple of the Sun, about 1600 B.C. In the reign of Augustus both were removed to Alexandria, and were known in modern times as Cleopatra's Needles. One was presented by the Khedive to the city of London in 1877, and the other to the city of New York the same year. The shaft on the latter bears two inscriptions, one celebrating Thothmes III., and the other Rameses II. One of the most characteristic monuments of Egypt is the statue of the Sphinx, so often found in the temples and necropoles. It is a recumbent figure, having a human head and breast and the body of a lion. Whatever idea the Egyptians may have attached to this symbol, it represents most truly the character of that people and the struggle of mind to free itself from the instincts of brutal nature.

5. THE DISCOVERY OF CHAMPOLLION.--During the expedition into Egypt, in 1799, in throwing up some earthworks near Rosetta, a town on the western arm of the Nile, an officer of the French army discovered a block or tablet of black basalt, upon which were engraved inscriptions in Egyptian and Greek characters. This tablet, called the Rosetta Stone, was sent to France and submitted to the orientologists for interpretation. The inscription was found to be a decree of the Egyptian priests in honor of Ptolemy Epiphanes (196 B.C.), which was ordered to be engraved on stone in sacred (hieroglyphic), common (demotic), and in Greek characters. Through this interpretation, Champollion (1790-1832), after much study, discovered and established the alphabetic system of Egyptian writing, and applying his discovery more extensively, he was able to decipher the names of the kings of Egypt from the Roman emperors back, through the Ptolemies, to the Pharaohs of the elder dynasties. This discovery was the key to the interpretation of all the ancient monuments of Egypt; by it the history of the country was thrown open for a period of twenty-six centuries, the annals of the neighboring nations were rendered more intelligible, the religion, arts, sciences, life, and manners of the ancient Egyptians were revealed to the modern world, and the obelisks, the innumerable papyri, and the walls of the temples and tombs were transformed into inexhaustible mines of historical and scientific knowledge.

6. LITERARY REMAINS; HISTORICAL; RELIGIOUS; EPISTOLARY; FICTITIOUS; SCIENTIFIC; EPIC; SATIRICAL AND JUDICIAL.--The Egyptian priests from the earliest times must have preserved the annals of their country, though obscured by myths and symbols. These annals, however, were destroyed by Cambyses (500 B.C.), who, during his invasion of the country, burned the temples where they were preserved, although they were soon rewritten, according to the testimony of Herodotus, who visited Egypt 450 B.C. In the third century B.C., Manetho, a priest and librarian of Heliopolis, wrote the succession of kings, and though the original work was lost, important fragments of it have been preserved by other writers. There seem to have been four periods in this history of ancient Egypt, marked by great changes in the social and political constitution of the country. In the first epoch, under the rule of the gods, demigods, and heroes, according to Manetho, it was probably colonized and ruled by the priests, in the name of the gods. The second period extends from Menes, the supposed founder of the monarchy, to the invasion of the Shepherd Kings, about 2000 B.C. In the third period, under this title, the Phoenicians probably ruled Egypt for three centuries, and it was one of these kings or Pharaohs of whom Joseph was the prime minister. In the fourth period, from 1180 to 350 B.C., the invaders were expelled and native rule restored, until the country was again conquered, first by the Persians, about 500 B.C., and again by the Greeks under Alexander, 350 B.C. From that time to the present no native ruler has sat on the throne of that country. After the conquest by Alexander the Great, who left it to the sway of the Ptolemies, it was successively conquered by the Romans, the Saracens, the Mamelukes, and the Turks. Since 1841 it has been governed by a viceroy under nominal allegiance to the Sultan of Turkey. In 1865 the title of khedive was substituted for that of viceroy. Early Egyptian chronology is in a great measure merely conjectural, and new information from the monuments only adds to the obscurity. The historical papyri are records of the kings or accounts of contemporary events. These, as well as the inscriptions on the monuments, generally in the form of panegyric, are inflated records of the successes of the heroes they celebrate, or explanations of the historical scenes painted or sculptured on the monuments. The early religion of Egypt was founded on a personification of the laws of Nature, centred in a mysterious unity. Egyptian nature, however, supplied but few great objects of worship as symbols of divine power, the desert, a natural enemy, the fertilizing river, and the sun, the all-pervading presence, worshiped as the source of life, the lord of time, and author of eternity. Three great realms composed the Egyptian cosmos; the heavens, where the sun, moon, and stars paced their daily round, the abode of the invisible king, typified by the sun and worshiped as Ammon Ra, the earth and the under-world, the abode of the dead. Here, too, reigned the universal lord under the name of Osiris, whose material manifestation, the sun, as he passed beneath the earth, lightened up the under-world, where the dead were judged, the just recompensed, and the guilty punished. Innumerable minor divinities, which originally personified attributes of the one Supreme Deity, were represented under the form of such animals as were endowed with like qualities. Every god was symbolized by some animal, which thus became an object of worship; but by confounding symbols with realities this worship soon degenerated into gross materialism and idolatry. The most important religious work in this literature is the "Book of the Dead," a funeral ritual. The earliest known copy is in hieratic writing of the oldest type, and was found in the tomb of a queen, who lived probably about 3000 B.C. The latest copy is of the second century A.D., and is written in pure Coptic. This work, consisting of one hundred and sixty-six chapters, is a collection of prayers of a magical character, an account of the adventures of the soul after death, and directions for reaching the Hall of Osiris. It is a marvel of confusion and poverty of thought. A complete translation may be found in "Egypt's Place in Universal History," by Bunsen (second edition), and specimens in almost every museum of Europe. There are other theological remains, such as the Metamorphoses of the gods and the Lament of Isis, but their meaning is disguised in allegory. The hymns and addresses to the sun abound in pure and lofty sentiment. The

epistolary writings are the best known and understood branch of Egyptian literature. From the Ramesid era, the most literary of all, we have about eighty letters on various subjects, interesting as illustrations of manners and specimens of style. The most important of these is the "Anastasi Papyri" in the British Museum, written about the time of the Exodus. Two valuable and tolerably complete relics represent the fictitious writing of Egyptian literature; they are "The Tale of Two Brothers," now in the British Museum, and "The Romance of Setna," recently discovered in the tomb of a Coptic monk. The former was evidently intended for the amusement of a royal prince. One of its most striking features is the low moral tone of the women introduced. "The Romance of Setna" turns upon the danger of acquiring possession of the sacred books. The opening and date of the story are missing. Fresh information is being constantly acquired as to the knowledge of science possessed by the ancient Egyptians. Geometry originated with them, or from remote ages they were acquainted with the principles of this science, as well as with those of hydrostatics and mechanics, as is proved by the immense structures which remain the wonder of the modern world. They cultivated astronomy from the earliest times, and they have transmitted to us their observations on the movements of the sun, the stars, the earth, and other planets. The obelisks served them as sun dials, and the pyramids as astronomical observatories. They had great skill in medicine and much knowledge of anatomy. The most remarkable medical papyri are to be found in the Berlin Museum. The epics and biographical sketches are narratives of personal adventure in war or travel, and are distinguished by some effort at grace of style. The epic of Pentaur, or the achievements of Rameses II., has been called the Egyptian Iliad. It is several centuries older than the Greek Iliad, and deserves admiration for its rapid narrative and epic unity. The history of Mohan (by some thought to be Moses) has been called the Egyptian Odyssey, in contrast to the preceding. Mohan was a high official, and this narrative describes his travels in Syria and Palestine. This papyrus is in the British Museum, and both epics have been translated. The satirical writings and beast fables of the Egyptians caricature the foibles of all classes, not sparing the sacred person of the king, and are often illustrated with satirical pictures. Besides these strictly literary remains, a large number of judicial documents, petitions, decrees, and treaties has been recovered.

7. THE ALEXANDRIAN PERIOD.--Egypt, in its flourishing period, having contributed to the civilization of Greece, became, in its turn, the pupil of that country. In the century following the age of Alexander the Great, under the rule of the Ptolemies, the philosophy and literature of Athens were transferred to Alexandria. Ptolemy Philadelphus, in the third century B.C., completed the celebrated Alexandrian Library, formed for the most part of Greek books, and presided over by Greek librarians. The school of Alexandria had its poets, its grammarians, and philosophers; but its poetry lacked the fire of genius, and its grammatical productions were more remarkable for sophistry and subtlety, than for soundness and depth of research. In the philosophy of Alexandria, the Eastern and Western systems combined, and this school had many distinguished disciples. In the first century of the Christian era, Egypt passed from the Greek kings to the Roman emperors, and the Alexandrian school continued to be adorned by the first men of the age. This splendor, more Grecian than Egyptian, was extinguished in the seventh century by the Saracens, who conquered the country, and, it is believed, burned the great Alexandrian Library. After the wars of the immediate successors of Mohammed, the Arabian princes protected literature, Alexandria recovered its schools, and other institutions of learning were established; but in the conquest of the country by the Turks, in the thirteenth century, all literary light was extinguished.

8. LITERARY CONDITION OF MODERN EGYPT.--For more than nine hundred years Cairo has possessed a university of high rank, which greatly increased in importance on the accession of Mehemet Ali, in 1805, who established many other schools, primary, scientific, medical, and military, though they were suffered to languish under his two successors. In 1865, when Ismail- Pacha mounted the throne as Khedive (tributary king), he gave powerful aid to the university and to public instruction everywhere. The number of students at the University of Cairo advanced to eleven thousand. The wife of the Khedive, the Princess Cachma-Afet, founded in 1873, and maintained from her privy purse, a school for the thorough instruction of girls, which led to the establishment of a similar institution by the Ministry of Public Instruction. This princess is the first in the history of Islam who, from the interior of the harem, has exerted her influence to educate and enlighten her sex. When the Khedive was driven into exile in 1879, the number of schools, nearly all the result of his energetic rule, was 4,817 and of pupils 170,000. Since the European intervention and domination the number of both has sensibly diminished, and a serious retrograde movement has taken place. The higher literature of Egypt at the present time is written in pure Arabic. The popular writing in magazines, periodicals, etc., is in Arabic mixed with Syriac and Egyptian dialects. Newspaper literature has greatly increased during the past eight years.

GREEK LITERATURE.

INTRODUCTION.--1. Greek Literature and its Divisions.--2. The Language.--
3. The Religion.

PERIOD FIRST.--1. Ante-Homeric Songs and Bards.--2. Poems of Homer; the Iliad; the Odyssey.--3. The Cyclic Poets and the Homeric Hymns.--4. Poems of Hesiod; the Works and Days; the Theogony.--5. Elegy and Epigram; Tyrtæus; Archilochus; Simonides.--6. Iambic Poetry, the Fable, and Parody; Aesop.--7. Greek Music and Lyric Poetry; Terpander.--8. Aeolic Lyric Poets; Alcaeus; Sappho; Anacreon.--9. Doric, or Choral Lyric Poets; Alcman; Stesichorus; Pindar.--10. The Orphic Doctrines and Poems.--11. Pre-Socratic Philosophy; Ionian, Eleatic, Pythagorean Schools.--12. History; Herodotus.

PERIOD SECOND.--1. Literary Predominance of Athens.--2. Greek Drama.--3. Tragedy.--4. The Tragic Poets; Aeschylus; Sophocles; Euripides.--5. Comedy; Aristophanes; Menander.--6. Oratory, Rhetoric, and History; Pericles; the Sophists; Lysias; Isocrates; Demosthenes; Thucydides; Xenophon.--7. Socrates and the Socratic Schools; Plato; Aristotle.

PERIOD THIRD.--1. Origin of the Alexandrian Literature.--2. The Alexandrian Poets; Philetas; Callimachus; Theocritus; Bion; Moschus.--3. The Prose Writers of Alexandria; Zenodotus; Aristophanes; Aristarchus; Eratosthenes; Euclid; Archimedes.--4. Philosophy of Alexandria; Neo-Platonism.--5. Anti-Neo-Platonic Tendencies; Epictetus; Lucian; Longinus. --6. Greek Literature in Rome; Dionysius of Halicarnassus; Flavius Josephus; Polybius; Diodorus; Strabo; Plutarch.--7. Continued Decline of Greek Literature.--8. Last Echoes of the Old Literature; Hypatia; Nonnus; Musæus; Byzantine Literature.--9. The New Testament and the Greek Fathers. Modern Literature; the Brothers Santsos and Alexander Rangabé.

INTRODUCTION.

1. GREEK LITERATURE AND ITS DIVISIONS.--The literary histories thus far sketched, with the exception of the Hebrew, occupy a subordinate position, and constitute but a small part of the general and continuous history of literature. As there are states whose interests are so detached from foreign nations and so centred in themselves that their history seems to form no link in the great chain of political events, so there are bodies of literature cut off from all connection with the course of general refinement, and bearing no relation to the development of mental power in the most civilized portions of the globe. Thus, the literature of India, with its great antiquity, its language, which, in fullness of expression, sweetness of tone, and regularity of structure, rivals the most perfect of those Western tongues to which it bears such an affinity, with all its affluence of imagery and its treasures of thought, has hitherto been destitute of any direct influence on the progress of general literature, and China has contributed still less to its advancement. Other branches of Oriental literature, as the Persian and Arabian, were equally isolated, until they were brought into contact with the European mind through the medium of the Crusaders and of the Moorish empire in Spain. We come now to speak of the literature of the Greeks; a literature whose continuous current has rolled down from remote ages to our own day, and whose influence has been more extensive and lasting than that of any other nation of the ancient or modern world. Endowed with profound sensibility and a lively imagination, surrounded by all the circumstances that could aid in perfecting the physical and intellectual powers, the Greeks early acquired that essentially literary and artistic character which became the source of the greatest productions of literature and art. This excellence was, also, in some measure due to their institutions; free from the system of castes which prevailed in India and Egypt, and which confined all learning by a sort of hereditary right to the priests, the tendency of the Greek mind was from the first liberal, diffusive, and aesthetic. The manifestation of their genius, from the first dawn of their intellectual culture, was of an original and peculiar character, and their plastic minds gave a new shape and value to whatever materials they drew from foreign sources. The ideas of the Egyptians and Orientals, which they adopted into their mythology, they cast in new moulds, and reproduced in more beautiful forms. The monstrous they subdued into the vast, the grotesque they softened into the graceful, and they diffused a fine spirit of humanity over the rude proportions of the primeval figures. So with the dogmas of their philosophy, borrowed from the same sources; all that could beautify the meagre, harmonize the incongruous, enliven the dull, or convert the crude materials of metaphysics into an elegant department of literature, belongs to the Greeks themselves. The Grecian mind became the foundation of the Roman and of all modern literatures, and its masterpieces afford the most splendid examples of artistic beauty and perfection that the world has ever seen. The history of Greek literature may be divided into three periods. The first, extending from remote antiquity to the age of Herodotus (484 B.C.), includes the earliest poetry of Greece, the ante-Homeric and the Homeric eras, the origin of

Greek elegy, epigram, iambic, and lyric poetry, and the first development of Greek philosophy. The second, or Athenian period, the golden age of Greek literature, extends from the age of Herodotus (484 B.C.) to the death of Alexander the Great (323 B.C.), and comprehends the development of the Greek drama in the works of Aeschylus, Sophocles, and Euripides, and of political oratory, history, and philosophy, in the works of Demosthenes, Thucydides, Xenophon, Plato, and Aristotle. The third, or the period of the decline of Greek literature, extending from the death of Alexander the Great (323 B.C.) to the fall of the Byzantine empire (1453 A.D.), is characterized by the removal of Greek learning and literature from Athens to Alexandria, and by its gradual decline and extinction.

2. THE LANGUAGE.--Of all known languages none has attained so high a degree of perfection as that of the Greeks. Belonging to the great Indo-European family, it is rich in significant words, strong and elegant in its combinations and phrases, and extremely musical, not only in its poetry, but in its prose. The Greek language must have attained great excellence at a very early period, for it existed in its essential perfection in the time of Homer. It was, also, early divided into dialects, as spoken by the various Hellenic tribes that inhabited different parts of the country. The principal of these found in written composition are the Aeolic, Doric, Ionic, and Attic, of which the Aeolic, the most ancient, was spoken north of the Isthmus, in the Aeolic colonies of Asia Minor, and in the northern islands of the Aegean Sea. It was chiefly cultivated by the lyric poets. The Doric, a variety of the Aeolic, characterized by its strength, was spoken in Peloponnesus, and in the Doric colonies of Asia Minor, Lower Italy, and Sicily. The Ionic, the most soft and liquid of all the dialects, belonged to the Ionian colonies of Asia Minor and the islands of the Archipelago. It was the language of Homer, Hesiod, and Herodotus. The Attic, which was the Ionic developed, enriched, and refined, was spoken in Attica, and prevailed in the flourishing period of Greek literature. After the fall of Constantinople, in 1453, the Greek language, which had been gradually declining, became entirely extinct, and a dialect, which had long before sprung up among the common people, took the place of the ancient, majestic, and refined tongue. This popular dialect in turn continued to degenerate until the middle of the last century. Recently institutions of learning have been established, and a new impulse given to improvement in Greece. Great progress has been made in the cultivation of the language, and great care is taken by modern Greek writers to avoid the use of foreign idioms and to preserve the ancient orthography. Many newspapers, periodicals, original works, and translations are published every year in Greece. The name Romaic, which has been applied to modern Greek, is now almost superseded by that of Neo-Hellenic.

3. THE RELIGION.--In the development of the Greek religion two periods may be distinguished, the ante-Homeric and the Homeric. As the heroic age of the Greek nation was preceded by one in which the cultivation of the land chiefly occupied the attention of the inhabitants, so there are traces and remnants of a state of the Greek religion, in which the gods were considered as exhibiting their power chiefly in the changes of the seasons, and in the operations and phenomena of outward nature. Imagination led these early inhabitants to discover, not only in the general phenomena of vegetation, the unfolding and death of the leaf and flower, and in the moist and dry seasons of the year, but also in the peculiar physical character of certain districts, a sign of the alternately hostile or peaceful, happy or ill-omened interference of certain deities. There are still preserved in the Greek mythology many legends of charming and touching simplicity, which had their origin at this period, when the Greek religion bore the character of a worship of the powers of nature. Though founded on the same ideas as most of the religions of the East, and particularly of Asia Minor, the earliest religion of the Greeks was richer and more various in its forms, and took a loftier and a wider range. The Grecian worship of nature, in all the various forms which it assumed, recognized one deity, as the highest of all, the head of the entire system, Zeus, the god of heaven and light; with him, and dwelling in the pure expanse of ether, is associated the goddess of the earth, who, in different temples, was worshiped under different names, as Hera, Demeter, and Dione. Besides this goddess, other beings are united with the supreme god, who are personifications of certain of his energies powerful deities who carry the influence of light over the earth, and destroy the opposing powers of darkness and confusion as Athena, born from the head of her father, and Apollo, the pure and shining god of light. There are other deities allied with earth and dwelling in her dark recesses; and as life appears not only to spring from the earth, but to return whence it sprung, these deities are, for the most part, also connected with death; as Hermes, who brings up the treasures of fruitfulness from the depths of the earth, and Cora, the child, now lost and now recovered by her mother, Demeter, the goddess both of reviving and of decaying nature. The element of water, Poseidon, was also introduced into this assemblage of the personified powers of nature, and peculiarly connected with the goddess of the earth; fire, Hephaestus, was represented as a powerful principle derived from heaven, having dominion over the earth, and closely allied with the goddess who sprang from the head of the supreme god. Other deities form less important parts of this system, as Dionysus, whose alternate joys and sufferings show a strong resemblance to the form which religious notions assumed in Asia Minor. Though not, like

the gods of Olympus, recognized by all the races of the Greeks, Dionysus exerted an important influence on the spirit of the Greek nation, and in sculpture and poetry gave rise to bold flights of imagination, and to powerful emotions, both of joy and sorrow. These notions concerning the gods must have undergone many changes before they assumed the form under which they appear in the poems of Homer and Hesiod. The Greek religion, as manifested through them, reached the second period of its development, belonging to that time when the most distinguished and prominent part of the people devoted their lives to the affairs of the state and the occupation of arms, and in which the heroic spirit was manifested according to these ideas. On Olympus, lying near the northern boundary of Greece, the highest mountain of that country, whose summit seems to touch the heavens, there rules the assembly or family of the gods; the chief of which, Zeus, summons at his pleasure the other gods to council, as Agamemnon summons the other princes. He is acquainted with the decrees of fate, and able to control them, and being himself king among the gods, he gives the kings of the earth their powers and dignity. By his side his wife, Hera, whose station entitles her to a large share of his rank and dominion; and a daughter of masculine character, Athena, a leader of battles and a protectress of citadels, who, by her wise counsels, deserves the confidence which her father bestows on her; besides these, there are a number of gods with various degrees of kindred, who have each their proper place and allotted duty on Olympus. The attention of this divine council is chiefly turned to the fortunes of nations and cities, and especially to the adventures and enterprises of the heroes, who being themselves, for the most part, sprung from the blood of the gods, form the connecting link between them and the ordinary herd of mankind. At this stage the ancient religion of nature had disappeared, and the gods who dwelt on Olympus scarcely manifested any connection with natural phenomena. Zeus exercises his power as a ruler and a king; Hera, Athena, and Apollo no longer symbolize the fertility of the earth, the clearness of the atmosphere, and the arrival of the serene spring; Hephaestus has passed from the powerful god of fire in heaven and earth into a laborious smith and worker of metals; Hermes is transformed into the messenger of Zeus; and the other deities which stood at a greater distance from the affairs of men are entirely forgotten, or scarcely mentioned in the Homeric mythology. These deities are known to us chiefly through the names given to them by the Romans, who adopted them at a later period, or identified them with deities of their own. Zeus was called by them Jupiter; Hera; Juno; Athena, Minerva; Ares, Mars; Artemis, Diana; Hermes, Mercury; Cora, Proserpine; Hephaestus, Vulcan; Poseidon, Neptune; Aphrodite, Venus; Dionysus, Bacchus.

PERIOD FIRST.

FROM REMOTE ANTIQUITY TO HERODOTUS (484 B.C.),

1. ANTE-HOMERIC SONGS AND BARDS.--Many centuries must have elapsed before the poetical language of the Greeks could have attained the splendor, copiousness, and fluency found in the poems of Homer. The first outpourings of poetical enthusiasm were, doubtless, songs describing, in few and simple verses, events which powerfully affected the feelings of the hearers. It is probable that the earliest were those that referred to the seasons and their phenomena, and that they were sung by the peasants at their corn and wine harvests, and had their origin in times of ancient rural simplicity. Songs of this kind had often a plaintive and melancholy character. Such was the song "Linus" mentioned by Homer, which was frequently sung at the grape-picking. This Linus evidently belongs to a class of heroes or demi-gods, of which many instances occur in the religions of Asia Minor. Boys of extraordinary beauty and in the flower of youth were supposed to have been drowned, or devoured by raging dogs, and their death was lamented at the harvests and other periods of the hot season. According to the tradition, Linus sprang from a divine origin, grew up with the shepherds among the lambs, and was torn in pieces by wild dogs, whence arose the festival of the lambs, at which many dogs were slain. The real object of lamentation was the tender beauty of spring, destroyed by the summer heat, and other phenomena of the same kind which the imagination of those times invested with a personal form, and represented as beings of a divine nature. Of similar meaning are many other songs, which were sung at the time of the summer heat or at the cutting of the corn. Such was the song called "Bormus" from its subject, a beautiful boy of that name, who, having gone to fetch water for the reapers, was, while drawing it, borne down by the nymphs of the stream. Such were the cries for the youth Hylas, swallowed up by the waters of a fountain, and the lament for Adonis, whose untimely death was celebrated by Sappho. The Paeans were songs originally dedicated to Apollo, and afterwards to other gods; their tune and words expressed hope and confidence to overcome, by the help of the god, great and imminent danger, or gratitude and thanksgiving for victory and safety. To this class belonged the vernal Paeans, which were sung at the termination of winter, and those sung in war before the attack on the enemy. The Threnos, or lamentations for the dead, were songs containing vehement expressions of grief, sung by professional singers standing near the bed upon which the body was laid, and accompanied by the cries and groans of women. The Hymenaeos was the joyful bridal song of the wedding festivals, in which there were

ordinarily two choruses, one of boys bearing burning torches and singing the hymenaeos to the clear sound of the pipe, and another of young girls dancing to the notes of the harp. The Chorus originally referred chiefly to dancing. The most ancient sense of the word is a place for dancing, and in these choruses young persons of both sexes danced together in rows, holding one another by the hand, while the citharist, or the player on the lyre, sitting in their midst, accompanied the sound of his instrument with songs, which took their name from the choruses in which they were sung. Besides these popular songs, there were the religious and heroic poems of the bards, who were, for the most part, natives of that portion of the country which surrounds the mountains of Helicon and Parnassus, distinguished as the home of the Muses. Among the bards devoted to the worship of Apollo and other deities, were Marsyas, the inventor of the flute, Musaeus and Orpheus. Many names of these ancient poets are recorded, but of their poetry, previous to Homer, not even a fragment remains. The bards or chanters of epic poetry were called Rhapsodists, from the manner in which they delivered their compositions; this name was applied equally to the minstrel who recited his own poems, and to him who declaimed anew songs that had been heard a thousand times before. The form of these heroic songs, probably settled and fixed by tradition, was the hexameter, as this metre gave to the epic poetry repose, majesty, a lofty and solemn tone, and rendered it equally adapted to the pythonesse who announced the decrees of the deity, and to the rhapsodist who recited the battles of heroes. The bards held an important post in the festal banquets, where they flattered the pride of the princes by singing the exploits of their forefathers.

2. POEMS OF HOMER.--Although seven cities contended for the honor of giving birth to Homer, it was the prevalent belief, in the flourishing times of Greece, that he was a native of Smyrna. He was probably born in that city about 1000 B.C. Little is known of his life, but the power of his transcendent genius is deeply impressed upon his works. He was called by the Greeks themselves, the poet; and the Iliad and the Odyssey were with them the ultimate standard of appeal on all matters of religious doctrine and early history. They were learned by boys at school, and became the study of men in their riper years, and in the time of Socrates there were Athenians who could repeat both poems by heart. In whatever part of the world a Greek settled, he carried with him a love for the great poet, and long after the Greek people had lost their independence, the Iliad and the Odyssey continued to maintain an undiminished hold upon their affections. The peculiar excellence of these poems lies in their sublimity and pathos, in their tenderness and simplicity, and they show in their author an inexhaustible vigor, that seems to revel in an endless display of prodigious energies. The universality of the powers of Homer is their most astonishing attribute. He is not great in any one thing; he is greatest in all things. He imagines with equal ease the terrible, the beautiful, the mean, the loathsome, and he paints them all with equal force. In his descriptions of external nature, in his exhibitions of human character and passion, no matter what the subject, he exhausts its capabilities. His pictures are true to the minutest touch; his men and women are made of flesh and blood. They lose nothing of their humanity for being cast in a heroic mould. He transfers himself into the identity of those whom he brings into action; masters the interior springs of their spiritual mechanism; and makes them move, look, speak, and do exactly as they would in real life. In the legends connected with the Trojan war, the anger of Achilles and the return of Ulysses, Homer found the subjects of the Iliad and Odyssey. The former relates that Agamemnon had stolen from Achilles, Briseis, his beloved slave, and describes the fatal consequences which the subsequent anger of Achilles brought upon the Greeks; and how the loss of his dearest friend, Patroclus, suddenly changed his hostile attitude, and brought about the destruction of Troy and of Hector, its magnanimous defender. The Odyssey is composed on a more artificial and complicated plan than the Iliad. The subject is the return of Ulysses from a land beyond the range of human knowledge to a home invaded by bands of insolent intruders, who seek to kill his son and rob him of his wife. The poem begins at that point where the hero is considered to be farthest from his home, in the central portion of the sea, where the nymph Calypso has kept him hidden from all mankind for seven years. Having by the help of the gods passed through innumerable dangers, after many adventures he reaches Ithaca, and is finally introduced into his own house as a beggar, where he is made to suffer the harshest treatment from the suitors of his wife, in order that he may afterwards appear with the stronger right as a terrible avenger. In this simple story a second was interwoven by the poet, which renders it richer and more complete, though more intricate and less natural. It is probable that Homer, after having sung the Iliad in the vigor of his youthful years, either composed the Odyssey in his old age, or communicated to some devoted disciple the plan of this poem. In the age immediately succeeding Homer, his great poems were doubtless recited as complete wholes, at the festivals of the princes; but when the contests of the rhapsodists became more animated, and more weight was laid on the art of the reciter than on the beauty of the poem he recited, and when other musical and poetical performances claimed a place, then they were permitted to repeat separate parts of poems, and the Iliad and Odyssey, as they had not yet been reduced to writing, existed for a time only as scattered and unconnected fragments; and we are still indebted to the regulator of the poetical contests (either Solon or Pisistratus) for having compelled the rhapsodists to follow one another according to the order of the

poem, and for having thus restored these great works to their pristine integrity. The poets, who either recited the poems of Homer or imitated him in their compositions, were called Homerides.

3. THE CYCLIC POETS AND THE HOMERIC HYMNS.--The poems of Homer, as they became the foundation of all Grecian literature, are likewise the central point of the epic poetry of Greece. All that is most excellent in this line originated from them, and was connected with them in the way of completion or continuation. After the time of Homer, a class of poets arose who, from their constant endeavor to connect their poems with those of this master, so that they might form a great cycle, were called the Cyclic Poets. They were probably Homeric rhapsodists by profession, to whom the constant recitation of the ancient Homeric poems would naturally suggest the idea of continuing them by essays of their own. The poems known as Homeric hymns formed an essential part of the epic style. They were hymns to the gods, bearing an epic character, and were called *proemia*, or preludes, and served the rhapsodists either as introductory strains for their recitation, or as a transition from the festivals of the gods to the competition of the singers of heroic poetry.

4. POEMS OF HESIOD.--Nothing certain can be affirmed respecting the date of Hesiod; a Boeotian by birth, he is considered by some ancient authorities as contemporary with Homer, while others suppose him to have flourished two or three generations later. The poetry of Hesiod is a faithful transcript of the whole condition of Boeotian life. It has nothing of that youthful and inexhaustible fancy of Homer which lights up the sublime images of a heroic age and moulds them into forms of surpassing beauty. The poetry of Hesiod appears struggling to emerge out of the narrow bounds of common life, which he strives to ennoble and to render more enduring. It is purely didactic, and its object is to disseminate knowledge, by which life may be improved, or to diffuse certain religious notions as to the influence of a superior destiny. His poem entitled "Works and Days" is so entirely occupied with the events of common life, that the author would not seem to have been a poet by profession, but some Boeotian husbandman whose mind had been moved by circumstances to give a poetical tone to the course of his thoughts and feelings. The unjust claim of Perses, the brother of Hesiod, to the small portion of their father's land which had been allotted to him, called forth this poem, in which he seeks to improve the character and habits of Perses, to deter him from acquiring riches by litigation, and to incite him to a life of labor, as the only source of permanent prosperity. He points out the succession in which his labors must follow if he determines to lead a life of industry, and gives wise rules of economy for the management of a family; and to illustrate and enforce the principal idea, he ingeniously combines with his precepts mythical narratives, fables, and descriptions. The "Theogony" of Hesiod is a production of the highest importance, as it contains the religious faith of Greece. It was through it that Greece first obtained a religious code, which, although without external sanction or priestly guardians and interpreters, must have produced the greatest influence on the religious condition of the Greeks.

5. ELEGY AND EPIGRAM.--Until the beginning of the seventh century B.C., the epic was the only kind of poetry cultivated in Greece, with the exception of the early songs and hymns, and the hexameter the only metre used by the poets. This exclusive prevalence of epic poetry was doubtless connected with the political state of the country. The ordinary subjects of these poems must have been highly acceptable to the princes who derived their race from the heroes, as was the case with all the royal families of early times. The republican movements, which deprived these families of their privileges, were favorable to the stronger development of each man's individuality, and the poet, who in the most perfect form of the epos was completely lost in his subject, now came before the people as a man with thoughts and objects of his own, and gave free vent to the emotions of his soul in elegiac and iambic strains. The word *elegeion* means nothing more than the combination of a hexameter and a pentameter, making together a distich, and an elegy is a poem of such verses. It was usually sung at the Symposia or literary festivals of the Greeks; in most cases its main subject was political; it afterwards assumed a plaintive or amatory tone. The elegy is the first regularly cultivated branch of Greek poetry, in which the flute alone and neither the cithara nor lyre was employed. It was not necessary that lamentations should form the subject of it, but emotion was essential, and excited by events or circumstances of the time or place the poet poured forth his heart in the unreserved expression of his fears and hopes. Tyrtaeus (fl. 694 B.C.), who went from Athens to Sparta, composed the most celebrated of his elegies on the occasion of the Messenian war, and when the Spartans were on a campaign, it was their custom after the evening meal, when the paean had been sung in honor of the gods, to recite these poems. From this time we find a union between the elegiac and iambic poetry; the same poet, who employs the elegy to express his joyous and melancholy emotions, has recourse to the iambus when his cool sense prompts him to censure the follies of mankind. The relation between these two metres is observable in Archilochus (fl. 688 B.C.) and Simonides (fl. 664 B.C.). The elegies of Archilochus, of which many fragments are extant (while of Simonides we only know that he composed elegies), had nothing of that spirit of which his iambics were full, but they contain the frank expression of a mind

powerfully affected by outward circumstances. With the Spartans, wine and the pleasures of the feast became the subject of the elegy, and it was also recited at the solemnities held in honor of all who had fallen for their country. The elegies of Solon (592-559 B.C.) were pure expressions of his political feelings. Simonides of Scios, the renowned lyric poet, the contemporary of Pindar and Aeschylus, was one of the great masters of elegiac song. The epigram was originally an inscription on a tombstone, or a votive offering in a temple, or on any other thing which required explanation. The unexpected turn of thought and pointedness of expression, which the moderns consider the essence of this species of composition, were not required in the ancient Greek epigram, where nothing was wanted but that the entire thought should be conveyed within the limit of a few distichs, and thus, in the hands of the early poets, the epigram was remarkable for the conciseness and expressiveness of its language and differed in this respect from the elegy, in which full expression was given to the feelings of the poet. It was Simonides who first gave to the epigram all the perfection of which it was capable, and he was frequently employed by the states which fought against the Persians to adorn with inscriptions the tombs of their fallen warriors. The most celebrated of these is the inimitable inscription on the Spartans who died at Thermopylae: "Foreigner, tell the Lacedaemonians that we are lying here in obedience to their laws." On the Rhodian lyric poet, Timocreon, an opponent of Simonides in his art, he wrote the following in the form of an epitaph: "Having eaten much and drank much and said much evil of other men, here I lie, Timocreon the Rhodian."

6. IAMBIC POETRY, THE FABLE AND PARODY.--The kind of poetry known by the ancients as Iambic was created among the Athenians by Archilochus at the same time as the elegy. It arose at a period when the Greeks, accustomed only to the calm, unimpassioned tone of the epos, had but just found a temperate expression of lively emotion in the elegy. It was a light, tripping measure, sometimes loosely constructed, or purposely halting and broken, well adapted to vituperation, unrestrained by any regard to morality and decency. At the public tables of Sparta keen and pointed raillery was permitted, and some of the most venerable and sacred of their religious rites afforded occasion for their unsparing and audacious jests. This raillery was so ancient and inveterate a custom, that it had given rise to a peculiar word, which originally denoted nothing but the jests and banter used at these festivals, namely, *Iambus*. All the wanton extravagance which was elsewhere repressed by law or custom, here, under the protection of religion, burst forth with boundless license, and these scurrilous effusions were at length reduced by Archilochus into the systematic form of iambic metre. Akin to the iambic are two sorts of poetry, the fable and the parody, which, though differing widely from each other, have both their source in the turn for the delineation of the ludicrous, and both stand in close historical relation to the iambic. The fable in Greece originated in an intentional travesty of human affairs. It is probable that the taste for fables of beasts and numerous similar inventions found its way from the East, since this sort of symbolical narrative is more in accordance with the Oriental than with the Greek character. Aesop (fl. 572 B.C.) was very far from being regarded by the Greeks as one of their poets, and still less as a writer. They considered him merely as an ingenious fabulist, to whom, at a later period, nearly all fables, that were invented or derived from any other source, were attributed. He was a slave, whose wit and pleasantry procured him his freedom, and who finally perished in Delphi, where the people, exasperated by his sarcastic fables, put him to death on a charge of robbing the temple. No metrical versions of these fables are known to have existed in early times. The word "parody" means an adoption of the form of some celebrated poem with such changes as to produce a totally different effect, and generally to substitute mean and ridiculous for elevated and poetical sentiments. "The Battle of the Frogs and Mice," attributed to Homer, but bearing evident traces of a later age, belongs to this species of poetry.

7. GREEK MUSIC AND LYRIC POETRY.--It was not until the minds of the Greeks had been elevated by the productions of the epic muse, that the genius of original poets broke loose from the dominion of the epic style, and invented new forms for expressing the emotions of a mind profoundly agitated by passing events; with few innovations in the elegy, but with greater boldness in the iambic metre. In these two forms, Greek poetry entered the domain of real life. The elegy and iambus contain the germ of the lyric style, though they do not themselves come under that head. The Greek lyric poetry was characterized by the expression of deeper and more impassioned feeling, and a more impetuous tone than the elegy and iambus, and at the same time the effect was heightened by appropriate vocal and instrumental music, and often by the figures of the dance. In this union of the sister arts, poetry was indeed predominant, yet music, in its turn, exercised a reciprocal influence on poetry, so that as it became more cultivated, the choice of the musical measure decided the tone of the whole poem. The history of Greek music begins with Terpander the Lesbian (fl. 670 B.C.), who was many times the victor in the musical contests at the Pythian temple of Delphi. He added three new strings to the cithara, which had consisted only of four, and this heptachord was employed by Pindar, and remained long in high repute; he was also the first who marked the different tones in music. With other musicians, he united the music of Asia Minor with that of the ancient

Greeks, and founded on it a system in which each style had its appropriate character. By the efforts of Terpander and one or two other masters, music was brought to a high degree of excellence, and adapted to express any feeling to which the poet could give a more definite character and meaning, and thus they had solved the great problem of their art. It was in Greece the constant endeavor of the great poets, thinkers, and statesmen who interested themselves in the education of youth, to give a good direction to this art; they all dreaded the increasing prevalence of a luxuriant style of instrumental music and an unrestricted flight into the boundless realms of harmony. The lyric poetry of the Greeks was of two kinds, and cultivated by two different schools of poets. One, called the Aeolic, flourished among the Aeolians of Asia Minor, and particularly in the island of Lesbos; the other, the Doric, which, although diffused over the whole of Greece, was at first principally cultivated by the Dorians. These two schools differed essentially in the subjects, as in the form and style of their poems. The Doric was intended to be executed by choruses, and to be sung to choral dances; while the Aeolic was recited by a single person, who accompanied his recitation with a stringed instrument, generally the lyre.

8. AEOLIC LYRIC POETS.--Alcaeus (fl. 611 B.C.), born in Mytilene in the island of Lesbos, being driven out of his native city for political reasons, wandered about the world, and, in the midst of troubles and perils, struck the lyre and gave utterance to the passionate emotions of his mind. His war-songs express a stirring, martial spirit; and a noble nature, accompanied with strong passions, appears in all his poems, especially in those in which he sings the praises of love and wine, though little of his erotic poetry has reached our time. It is evident that poetry was not with him a mere pastime or exercise of skill, but a means of pouring out the inmost feelings of the soul. Sappho (fl. 600 B.C.) the other leader of the Aeolic school of poetry, was the object of the admiration of all antiquity. She was contemporary with Alcaeus, and in her verses to him we plainly discern the feeling of unimpeached honor proper to a free-born and well-educated maiden. Alcaeus testifies that the attractions and loveliness of Sappho did not derogate from her moral worth when he calls her "violet-crowned, pure, sweetly smiling Sappho." This testimony is, indeed, opposed to the accounts of later writers, but the probable cause of the false imputations in reference to Sappho seems to be that the refined Athenians were incapable of appreciating the frank simplicity with which she poured forth her feelings, and therefore they confounded them with unblushing immodesty. While the men of Athens were distinguished for their perfection in every branch of art, none of their women emerged from the obscurity of domestic life. "That woman is the best," says Pericles, "of whom the least is said among men, whether for good or for evil." But the Aeolians had in some degree preserved the ancient Greek manners, and their women enjoyed a distinct individual existence and moral character. They doubtless participated in the general high state of civilization, which not only fostered poetical talents of a high order among women, but produced in them a turn for philosophical reflection. This was so utterly inconsistent with Athenian manners, that we cannot wonder that women, who had in any degree overstepped the bounds prescribed to their sex at Athens, should be represented by the licentious pen of Athenian comic writers as lost to every sense of shame and decency. Sappho, in her odes, made frequent mention of a youth to whom she gave her whole heart, while he requited her love with cold indifference; but there is no trace of her having named the object of her passion. She may have celebrated the beautiful and mythical Phaon in such a manner that the verses were supposed to refer to a lover of her own. The account of her leap from the Leucadian rock is rather a poetical image, than a real event in the life of the poetess. The true conception of the erotic poetry of Sappho can only be drawn from the fragments of her odes, which, though numerous, are for the most part very short. Among them, we must distinguish the Epithalamia or hymeneals, which were peculiarly adapted to the genius of the poetess from the exquisite perception she seems to have had of whatever was attractive in either sex. From the numerous fragments that remain, these poems appear to have had great beauty and much of that expression which the simple and natural manners of the times allowed, and the warm and sensitive heart of the poetess suggested. That Sappho's fame was spread throughout Greece, may be seen from the history of Solon, who was her contemporary. Hearing his nephew recite one of her poems, he said that he would not willingly die until he had learned it by heart. And, doubtless, from that circle of accomplished women, of whom she formed the brilliant centre, a flood of poetic light was poured forth on every side. Among them may be mentioned the names of Damophila and Erinna, whose poem, "The Spindle," was highly esteemed by the ancients. The genius of Anacreon (fl. 540 B.C.), though akin to that of Alcaeus and Sappho, had an entirely different bent. He seems to consider life as valuable only so far as it can be spent in wine, love, and social enjoyment. The Ionic softness and departure from strict rule may also be perceived in his versification. The different odes preserved under his name are the productions of poets of a much later date. With Anacreon ceased the species of lyric poetry in which he excelled; indeed, he stands alone in it, and the tender softness of his song was soon drowned by the louder tones of the choral poetry. The *Scolia* were a kind of lyric songs sung at social meals, when the spirit was raised by wine and conversation to a lyrical pitch. The lyre or a sprig of myrtle was handed round the table and presented to any one who could amuse the company by a song or even a good sentence in a lyrical form.

9. DORIC, OR CHORAL LYRIC POETS.--The chorus was in general use in Greece before the time of Homer, and nearly every variety of the choral poetry, which was afterwards so brilliantly developed, existed at that remote period in a rude, unfinished state. After the improvements made by Terpander and others in musical art, choral poetry rapidly progressed towards perfection. The poets during the period of progress were Alcman and Stesichorus, while finished lyric poetry is represented by Ibycus, Simonides, his disciple Bacchylides and Pindar. These great poets were only the representatives of the fervor with which the religious festivals inspired all classes. Choral dances were performed by the whole people with great ardor and enthusiasm; every considerable town had its poet, who devoted his whole life to the training and exhibition of choruses. Alcman (b. 660 B.C.) was a Lydian of Sardis, and an emancipated slave. His poems exhibit a great variety of metre, of dialect, and of poetic tone. He is regarded as having overcome the difficulties presented by the rough dialect of Sparta, and as having succeeded in investing it with a certain grace. He is one of the poets whose image is most effaced by time, and of whom we can obtain little accurate knowledge. The admiration awarded him by antiquity is scarcely justified by the extant remains of his poems. Stesichorus (fl. 611 B.C.) lived at a time when the predominant tendency of the Greek mind was towards lyric poetry. His special business was the training and direction of the choruses, and he assumed the name of Stesichorus, or leader of choruses, his real name being Tesias. His metres approach more nearly to the epos than those of Aleman. As Quintilian says, he sustained the weight of epic poetry with the lyre. His language accorded with the tone of his poetry, and he is not less remarkable in himself, than as the precursor of the perfect lyric poetry of Pindar. Arion (625-585 B.C.) was chiefly known in Greece as the perfecter of the "Dithyramb," a song of Bacchanalian festivals, doubtless of great antiquity. Its character, like the worship to which it belonged, was always impassioned and enthusiastic; the extremes of feeling, rapturous pleasure, and wild lamentation were both expressed in it. Ibycus (b. 528 B.C.) was a wandering poet, as is attested by the story of his death having been avenged by the cranes. His poetical style resembles that of Stesichorus, as also his subjects. The erotic poetry of Ibycus is most celebrated, and breathes a fervor of passion far exceeding that of any similar production of Greek literature. Simonides (556-468 B.C.) has already been described as one of the great masters of the elegy and epigram. In depth and novelty of ideas, and in the fervor of poetic feeling, he was far inferior to his contemporary Pindar, but he was probably the most prolific lyric poet of Greece. According to the frequent reproach of the ancients, he was the first that sold his poems for money. His style was not as lofty as that of Pindar, but what he lost in sublimity he gained in pathos. Bacchylides (fl. 450 B.C.), the nephew of Simonides, devoted his genius chiefly to the pleasures of private life, love, and wine, and his productions, when compared with those of Simonides, are marked by less moral elevation. Timocreon the Rhodian (fl. 471 B.C.) owes his chief celebrity among the ancients to the hate he bore to Themistocles in political life, and to Simonides on the field of poetry. Pindar (522-435 B.C.) was the contemporary of Aeschylus, but as the causes which determined his poetical character are to be sought in an earlier age, and in the Doric and Aeolic parts of Greece, he may properly be placed at the close of the early period, while Aeschylus stands at the head of the new epoch of literature. Like Hesiod, Pindar was a native of Boeotia, and that there was still much love for music and poetry there is proved by the fact that two women, Myrtis and Corinna, had obtained great celebrity in these arts during the youth of this poet. Myrtis (fl. 490 B.C.) strove with him for the prize at the public games, and Corinna (fl. 490 B.C.) is said to have gained the victory over him five times. Too little of the poetry of Corinna has been preserved to allow a judgment on her style of composition. Pindar made the arts of poetry and music the business of his life, and his fame soon spread throughout Greece and the neighboring countries. He excelled in all the known varieties of choral poetry, but the only class of poems that enable us to judge of his general style is his triumphal odes. When a victory was gained in a contest at a festival by the speed of horses, the strength and dexterity of the human body, or by skill in music, such a victory, which shed honor not only on the victor, but also on his family, and even on his native city, demanded a public celebration. An occasion of this kind had always a religious character, and often began with a procession to an altar or temple, where a sacrifice was offered, followed by a banquet, and the solemnity concluded with a merry and boisterous revel. At this sacred and at the same time joyous festival, the chorus appeared and recited the triumphal hymn, which was considered the fairest ornament of the triumph. Such an occasion, a victory in the sacred games and its end, the ennobling of a ceremony connected with the worship of the gods, required that the ode should be composed in a lofty and dignified style. Pindar does not content himself with celebrating the bodily prowess of the victor alone, but he usually adds some moral virtue which he has shown, and which he recommends and extols. Sometimes this virtue is moderation, wisdom, or filial love, more often piety to the gods, and he expounds to the victor his destiny, by showing him the dependence of his exploits on the higher order of things. Mythical narratives occupy much space in these odes, for in the time of Pindar the mythical past was invested with a splendor and sublimity, of which even the faint reflection was sufficient to embellish the present.

10. ORPHIC DOCTRINES AND POEMS.--The interval between Homer and Pindar is an important period in the history of Greek civilization. In Homer we perceive that infancy of the mind which lives in seeing and imagining, and whose moral judgments are determined by impulses of feeling rather than by rules of conduct, while with Pindar the chief effort of his genius is to discover the true standard of moral government. This great change of opinion must have been affected by the efforts of many sages and poets. All the Greek religious poetry, treating of death and of the world beyond the grave, refers to the deities whose influence was supposed to be exercised in the dark regions at the centre of the earth, and who had little connection with the political and social relations of human life. They formed a class apart from the gods of Olympus; the mysteries of the Greeks were connected with their worship alone, and the love of immortality first found support in a belief in these deities. The mysteries of Demeter, especially those celebrated at Eleusis, inspired the most animating hopes with regard to the soul after death. These mysteries, however, had little influence on the literature of the nation; but there was a society of persons called the followers of Orpheus, who published their notions and committed them to literary works. Under the guidance of the ancient mystical poet, Orpheus, they dedicated themselves to the worship of Bacchus or Dionysus, in which they sought satisfaction for an ardent longing after the soothing and elevating influences of religion, and upon the worship of this deity they founded their hopes of an ultimate immortality of the soul. Unlike the popular worshippers of Bacchus, they did not indulge in unrestrained pleasure or frantic enthusiasm, but rather aimed at an ascetic purity of life and manners. It is difficult to tell when this association was formed in Greece, but we find in Hesiod something of the Orphic spirit, and the beginning of higher and more hopeful views of death. The endeavor to obtain a knowledge of divine and human things was in Greece slowly and with difficulty evolved from their religious notions, and it was for a long time confined to the refining and rationalizing of their mythology. An extensive Orphic literature first appeared at the time of the Persian war, when the remains of the Pythagorean order in Magna Graecia united themselves to the Orphic associations. The philosophy of Pythagoras, however, had no analogy with the spirit of the Orphic mysteries, in which the worship of Dionysus was the centre of all religious ideas, while the Pythagorean philosophers preferred the worship of Apollo and the Muses. In the Orphic theogony we find, for the first time, the idea of creation. Another difference between the notions of the Orphic poets and those of the early Greeks was that the former did not limit their views to the present state of mankind, still less did they acquiesce in Hesiod's melancholy doctrine of successive ages, each one worse than the preceding; but they looked for a cessation of strife, a state of happiness and beatitude at the end of all things. Their hopes of this result were founded on Dionysus, from the worship of whom all their peculiar religious ideas were derived. This god, the son of Zeus, is to succeed him in the government of the world, to restore the Golden Age, and to liberate human souls, who, according to an Orphic notion, are punished by being confined in the body as in a prison. The sufferings of the soul in its prison, the steps and transitions by which it passes to a higher state of existence, and its gradual purification and enlightenment, were all fully described in these poems. Thus, in the poetry of the first five centuries of Greek literature, especially at the close of this period, we find, instead of the calm enjoyment of outward nature which characterized the early epic poetry, a profound sense of the misery of human life, and an ardent longing for a condition of greater happiness. This feeling, indeed, was not so extended as to become common to the whole Greek nation, but it took deep root in individual minds, and was connected with more serious and spiritual views of human nature.

11. PRE-SOCRATIC PHILOSOPHY.--Philosophy was early cultivated by the Greeks, who first among all nations distinguished it from religion and mythology. For some time, however, after its origin, it was as far removed from the ordinary thoughts and occupations of the people as poetry was intimately connected with them. Poetry idealizes all that is most characteristic of a nation; its religion, mythology, political and social institutions, and manners. Philosophy, on the other hand, begins by detaching the mind from the opinions and habits in which it has been bred up, from the national conceptions of the gods and the universe, and from traditionary maxims of ethics and politics. The philosophy of Greece, antecedent to the time of Socrates, is contained in the doctrines of the Ionic, Eleatic, and Pythagorean schools. Thales of Miletus (639-548 B.C.) was the first in the series of the Ionic philosophers. He was one of the Seven Sages, who by their practical wisdom nobly contributed to the flourishing condition of Greece. Thales, Solon, Bion (fl. 570 B.C.), Cleobulus (fl. 542 B.C.), Periander (fl. 598 B.C.), Pittacus of Mytilene (579 B.C.), and Chilon (fl. 542 B.C.), were the seven philosophers called the seven sages by their countrymen. Thales is said to have foretold an eclipse of the sun, for which he doubtless employed astronomical formulae, which he had obtained from the Chaldeans. His tendency was practical, and where his own knowledge was insufficient, he applied the discoveries of other nations more advanced than his own. He considered all nature as endowed with life, and sought to discover the principles of external forms in the powers which lie beneath; he taught that water was the principle of things. Anaximander (fl. 547 B.C.), and Anaximenes (fl. 548 B.C.) were the other two most distinguished representatives of the Ionic school. The former believed that chaotic matter was the principle of all

things, the latter taught that it was air. The Eleatic school is represented by Xenophanes, Parmenides, and Zeno. As the philosophers of the first school were called Ionians from the country in which they resided, so these were named from Elea, a Greek colony of Italy. Xenophanes (fl. 538 B.C.), the founder of this school, adopted a different principle from that of the Ionic philosophers, and proceeded upon an ideal system, while that of the latter was exclusively founded upon experience. He began with the idea of the godhead, and showed the necessity of considering it as an eternal and unchanging existence, and represented the anthropomorphic conceptions of the Greeks concerning their gods as mere prejudices. In his works he retained the poetic form of composition, some fragments of which he himself recited at public festivals, after the manner of the rhapsodists. Parmenides flourished 504 years B.C. His philosophy rested upon the idea of existence which excluded the idea of creation, and thus fell into pantheism. His poem on "Nature" was composed in the epic metre, and in it he expressed in beautiful forms the most abstract ideas. Zeno of Elea (fl. 500 B.C.) was a pupil of Parmenides, and the earliest prose writer among the Greek philosophers. He developed the doctrines of his master by showing the absurdities involved in the ideas of variety and of creation, as opposed to one and universal substance. Other philosophers belonging to Iona or Elea may be referred to these schools, as Heraclitus, Empedocles, Democritus, and Anaxagoras, whose doctrines, however, vary from those of the representatives of the philosophical systems above named. Heraclitus (fl. 505 B.C.) dealt rather in intimations of important truths than in popular exposition of them; his cardinal doctrine seems to have been that everything is in perpetual motion, that nothing has any permanent existence, and that everything is assuming a new form or perishing: the principle of this perpetual motion he supposed to be fixe, though probably he did not mean material fire, but some higher and more universal agent. Like nearly all the philosophers, he despised the popular religion. Empedocles (fl. 440 B.C.) wrote a doctrinal poem concerning nature, fragments of which have been preserved. He denied the possibility of creation, and held the doctrine of an eternal and imperishable existence; but he considered this existence as having different natures, and admitted that fire, earth, air, and water were the four elements of all things. These elements he supposed to be governed by two principles, one positive and one negative, that is to say, connecting love and dissolving discord. Democritus (fl. 460 B.C.) embodied his extensive knowledge in a series of writings, of which only a few fragments have been preserved. Cicero compared him with Plato for rhythm and elegance of language. He derived the manifold phenomena of the world from the different form, disposition, and arrangement of the innumerable elements or atoms as they become united. He is the founder of the atomic doctrine. Anaxagoras (fl. 456 B.C.) rejected all popular notions of religion, excluded the idea of creation and destruction, and taught that atoms were unchangeable and imperishable; that spirit, the purest and subtlest of all things, gave to these atoms the impulse by which they took the forms of individual things and beings; and that this impulse was given in circular motion, which kept the heavenly bodies in their courses. But none of his doctrines gave so much offence or was considered so clear a proof of his atheism as his opinion that the sun, the bountiful god Helios, who shines both upon mortals and immortals, was a mass of red-hot iron. His doctrines tended powerfully by their rapid diffusion to undermine the principles on which the worship of the ancient gods rested, and they therefore prepared the way for the subsequent triumph of Christianity. The Pythagorean or Italic School was founded by Pythagoras, who is said to have flourished between 540 and 500 B.C. Pythagoras was probably an Ionian who emigrated to Italy, and there established his school. His principal efforts were directed to practical life, especially to the regulation of political institutions, and his influence was exercised by means of lectures, or sayings, or by the establishment and direction of the Pythagorean associations. He encouraged the study of mathematics and music, and considered singing to the cithara as best fitted to produce that mental repose and harmony of soul which he regarded as the highest object of education.

12. HISTORY.--It is remarkable that a people so cultivated as the Greeks should have been so long without feeling the want of a correct record of their transactions in war and peace. The difference between this nation and the Orientals, in this respect, is very great. But the division of the country into numerous small states, and the republican form of the governments, prevented a concentration of interest on particular events and persons, and owing to the dissensions between the republics, their historical traditions could not but offend some while they flattered others; it was not until a late period that the Greeks considered contemporary events as worthy of being thought or written of. But for this absence of authentic history, Greek literature could never have become what it was. By the purely fictitious character of its poetry, and its freedom from the shackles of particular truths, it acquired that general probability which led Aristotle to consider poetry as more philosophical than history. Greek art, likewise, from the lateness of the period at which it descended from the representation of gods and heroes to the portraits of real men, acquired a nobleness and beauty of form which it could not otherwise have obtained. This poetical basis gave the literature of the Greeks a noble and liberal turn. Writing was probably known in Greece some centuries before the time of Cadmus of Miletus (fl. 522 B.C.), but it had not been employed for the purpose of preserving any detailed historical record, and even when, towards the end of the age of the Seven Sages (550 B.C.), some writers of

historical narratives began to appear, they did not select recent historical events, but those of distant times and countries; so entirely did they believe that oral tradition and the daily discussions of common life were sufficient records of the events of their own time and country. Cadmus of Miletus is mentioned as the first historian, but his works seem to have been early lost. To him, and other Greek historians before the time of Herodotus, scholars have given the name of Logographers, from Logos, signifying any discourse in prose. The first Greek to whom it occurred that a narrative of facts might be made intensely interesting was Herodotus (484-432 B.C.), a native of Halicarnassus in Asia Minor, the Homer of Greek history. Obligated, for political reasons, to leave his native land, he visited many countries, such as Egypt, Babylon, and Persia, and spent the latter years of his life in one of the Grecian settlements in Italy, where he devoted himself to the composition of his work. His travels were undertaken from the pure spirit of inquiry, and for that age they were very extensive and important. It is probable that his great and intricate plan, hitherto unknown in the historical writings of the Greeks, did not at first occur to him, and that it was only in his later years that he conceived the complete idea of a work so far beyond those of his predecessors and contemporaries. It is stated that he recited his history at different festivals, which is quite credible, though there is little authority for the story that at one of these Thucydides was present as a boy, and shed tears, drawn forth by his own desire for knowledge and his intense interest in the narrative. His work comprehends a history of nearly all the nations of the world at that time known. It has an epic character, not only from the equable and uninterrupted flow of the narrative, but also from certain pervading ideas which give a tone to the whole. The principal of these is the idea of a fixed destiny, of a wise arrangement of the world, which has prescribed to every being his path, and which allots ruin and destruction not only to crime and violence, but to excessive power and riches and the overweening pride which is their companion. In this consists the envy of the gods so often mentioned by Herodotus, and usually called by the other Greeks the divine Nemesis. He constantly adverts in his narrative to the influence of this divine power, the Daemonion, as he calls it. He shows how the Deity visits the sins of the ancestors upon their descendants, how man rushes, as it were, wilfully upon his own destruction, and how oracles mislead by their ambiguity, when interpreted by blind passion. He shows his awe of the divine Nemesis by his moderation and the firmness with which he keeps down the ebullitions of national pride. He points out traits of greatness of character in the hostile kings of Persia, and shows his countrymen how often they owed their successes to Providence and external advantages rather than to their own valor and ability. Since Herodotus saw the working of a divine agency in all human events, and considered the exhibition of it as the main object of his history, his aim is totally different from that of a historian who regards the events of life merely with reference to men. He is, in truth, a theologian and a poet as well as a historian. It is, however, vain to deny that when Herodotus did not see himself the events which he describes, he is often deceived by the misrepresentations of others; yet, without his single-hearted simplicity, his disposition to listen to every remarkable account, and his admiration for the wonders of the Eastern world, Herodotus would never have imparted to us many valuable accounts. Modern travelers, naturalists, and geographers have often had occasion to admire the truth, and correctness of the information contained in his simple and marvelous narratives. But no dissertation on this writer can convey any idea of the impression made by reading his work; his language closely approximates to oral narration; it is like hearing a person speak who has seen and lived through a variety of remarkable things, and whose greatest delight consists in recalling these images of the past. Though a Dorian by birth, he adopted the Ionic dialect, with its uncontracted terminations, its accumulated vowels, and its soft forms. These various elements conspire to render the work of Herodotus a production as perfect in its kind as any human work can be.

PERIOD SECOND.

THE EPOCH OF THE ATHENIAN LITERATURE (484-322 B.C.).

1. LITERARY PREDOMINANCE OF ATHENS.--Among the Greeks a national literature was early formed. Every literary work in the Greek language, in whatever dialect it might be composed, was enjoyed by the whole nation, and the fame of remarkable writers soon spread throughout Greece. Certain cities were considered almost as theatres, where the poets and sages could bring their powers and acquirements into public notice. Among these, Sparta stood highest down to the time of the Persian war. But when Athens, raised by her political power and the mental qualities of her citizens, acquired the rank of the capital of Greece, literature assumed a different form, and there is no more important epoch in the history of the Greek intellect than the time when she obtained this pre-eminence over her sister states. The character of the Athenians peculiarly fitted them to take this lead; they were Ionians, and the boundless resources and mobility of the Ionian spirit are shown by their astonishing productions in Asia Minor and in the islands, in the two centuries previous to the Persian war; in their iambic and elegiac poetry,

and in the germs of philosophic inquiry and historical composition. The literature of those who remained in Attica seemed poor and meagre when compared with that luxuriant outburst; nor did it appear, till a later period, that the progress of the Athenian intellect was the more sound and lasting. The Ionians of Asia Minor, becoming at length enfeebled and corrupted by the luxuries of the East, passed easily under the power of the Persians, while the inhabitants of Attica, encompassed and oppressed by the manly tribes of Greece, and forced to keep the sword constantly in their hands, exerted all their talents and thus developed all their extraordinary powers. Solon, the great lawgiver, arose to combine moral strictness and order with freedom of action. After Solon came the dominion of the Pisistratidae, which lasted from about 560 to 510 B.C. They showed a fondness for art, diffused a taste for poetry among the Athenians, and naturalized at Athens the best literary productions of Greece. They were unquestionably the first to introduce the entire recital of the Iliad and Odyssey; they also brought to Athens the most distinguished lyric poets of the time, Anacreon, Simonides, and others. But, notwithstanding their patronage of literature and art, it was not till after the fall of their dynasty that Athens shot up with a vigor that can only be derived from the consciousness of every citizen that he has a share in the common weal. It is a remarkable fact that Athens produced her most excellent works in literature and art in the midst of the greatest political convulsions, and of her utmost efforts for conquest and self-preservation. The long dominion of the Pisistratids produced nothing more important than the first rudiments of the tragic drama, for the origin of comedy at the country festivals of Bacchus falls in the time before Pisistratus. On the other hand, the thirty years between the expulsion of Hippias, the last of the Pisistratids, and the battle of Salamis (510-480 B.C.), was a period marked by great events both in politics and literature. Athens contended with success against her warlike neighbors, supported the Ionians in their revolt against Persia, and warded off the first powerful attack of the Persians upon Greece. During the same period, the pathetic tragedies of Phrynichus and the lofty tragedies of Aeschylus appeared on the stage, political eloquence was awakened in Themistocles, and everything seemed to give promise of future greatness. The political events which followed the Persian war gradually gave to Athens the dominion over her allies, so that she became the sovereign of a large and flourishing empire, comprehending the islands and coasts of the Aegean and a part of the Euxine sea. In this manner was gained a wide basis for the lofty edifice of political glory, which was raised by her statesmen. The completion of this splendid structure was due to Pericles (500-429 B.C.). Through his influence Athens became a dominant community, whose chief business it was to administer the affairs of an extensive empire, flourishing in agriculture, industry, and commerce. Pericles, however, did not make the acquisition of power the highest object of his exertions; his aim was to realize in Athens the idea which he had conceived of human greatness, that great and noble thoughts should pervade the whole mass of the ruling people; and this was, in fact, the case as long as his influence lasted, to a greater degree than has occurred in any other period of history. The objects to which Pericles directed the people, and for which he accumulated so much power and wealth at Athens, may be best seen in the still extant works of architecture and sculpture which originated under his administration. He induced the Athenian people to expend on the decoration of Athens a larger part of its ample revenues than was ever applied to this purpose in any other state, either republican or monarchical. Of the surpassing skill with which he collected into one focus the rays of artistic genius at Athens, no stronger proof can be afforded, than the fact that no subsequent period, through the patronage of Macedonian or Roman princes, produced works of equal excellence. Indeed, it may be said that the creations of the age of Pericles are the only works of art which completely satisfy the most refined and cultivated taste. But this brilliant exhibition of human excellence was not without its dark side, nor the flourishing state of Athenian civilization exempt from the elements of decay. The political position of Athens soon led to a conflict between the patriotism and moderation of her citizens, and their interests and passions. From the earliest times, this city had stood in an unfriendly relation to the rest of Greece, and her policy of compelling so many cities to contribute their wealth in order to make her the focus of art and civilization was accompanied with offensive pride and selfish patriotism. The energy in action, which distinguished the Athenians, degenerated into a restless love of adventure; and that dexterity in the use of words, which they cultivated more than the other Greeks, induced them to subject everything to discussion, and destroyed the habits founded on unreasoning faith. The principles of the policy of Pericles were closely connected with the demoralization which followed his administration. By founding the power of the Athenians on the dominion of the sea, he led them to abandon land war and the military exercises requisite for it, which had hardened the old warriors at Marathon. As he made them a dominant people, whose time was chiefly devoted to the business of governing their widely-extended empire, it was necessary for him to provide that the common citizens of Athens should be able to gain a livelihood by their attention to public business, and accordingly, a large revenue was distributed among them in the form of wages for attendance in the courts of justice and other public assemblies. These payments to citizens for their share in the public business were quite new in Greece, and many considered the sitting and listening in these assemblies as an idle life in comparison with the labor of the plowman and vine-grower in the country, and for a long time the industrious cultivators, the brave warriors, and the men of old-fashioned morality were opposed, among the citizens of Athens, to the loquacious, luxurious,

and dissolute generation who passed their whole time in the market-place and courts of justice. The contests between these two parties are the main subject of the early Attic comedy. Literature and art, however, were not, during the Peloponnesian war, affected by the corruption of morals. The works of this period exhibit not only a perfection of form but also an elevation of soul and a grandeur of conception, which fill us with admiration not only for those who produced them, but for those who could enjoy such works of art. A step farther, and the love of genuine beauty gave place to a desire for evil pleasures, and the love of wisdom degenerated into an idle use of words.

2. THE DRAMA.--The spirit of an age is more completely represented by its poetry than by its prose composition, and accordingly we may best trace the character of the three different stages of civilization among the Greeks in the three grand divisions of their poetry. The epic belongs to their monarchical period, when the minds of the people were impregnated and swayed by legends handed down from antiquity. Elegiac, iambic, and lyric poetry arose in the more stirring and agitated times which accompanied the development of republican governments, times in which each individual gave vent to his personal aims and wishes, and all the depths of the human breast were unlocked by the inspirations of poetry. And now, when at the summit of Greek civilization, in the very prime of Athenian power and freedom, we see dramatic poetry spring up as the organ of the prevailing thoughts and feelings of the time, we are naturally led to ask how it comes that this style of poetry agreed so well with the spirit of the age, and so far outstripped its competitors in the contest for public favor. Dramatic poetry, as its name implies, represents actions, which are not, as in the epos, merely narrated, but seem to take place before the eyes of the spectator. The epic poet appears to regard the events, which he relates from afar, as objects of calm contemplation and admiration, and is always conscious of the great interval between him and them, while the dramatist plunges with his entire soul into the scenes of human life, and seems himself to experience the events which he exhibits to our view. The drama comprehends and develops the events of human life with a force and depth which no other style of poetry can reach. If we carry ourselves in imagination back to a time when dramatic composition was unknown, we must acknowledge that its creation required great boldness of mind. Hitherto the bard had only sung of gods and heroes; it was, therefore, a great change for the poet himself to come forward all at once in the character of the god or hero, in a nation which, even in its amusements, had always adhered closely to established usages. It is true that there is much in human nature which impels it to dramatic representations, such as the universal love of imitating other persons, and the child-like liveliness with which a narrator, strongly impressed with his subject, delivers a speech which he has heard or perhaps only imagined. Yet there is a wide step from these disjointed elements to the genuine drama, and it seems that no nation, except the Greeks, ever made this step. The dramatic poetry of the Hindus belongs to a time when there had been much intercourse between Greece and India; even in ancient Greece and Italy, dramatic poetry, and especially tragedy, attained to perfection only in Athens, and here it was exhibited only at a few festivals of a single god, Dionysus, while epic rhapsodies and lyric odes were recited on various occasions. All this is incomprehensible, if we suppose dramatic poetry to have originated in causes independent of the peculiar circumstances of time and place. If a love of imitation and a delight in disguising the real person under a mask were the basis upon which this style of poetry was raised, the drama would have been as natural and as universal among men as these qualities are common to their nature. A more satisfactory explanation of the origin of the Greek drama may be found in its connection with the worship of the gods, and particularly that of Bacchus. The gods were supposed to dwell in their temples and to participate in their festivals, and it was not considered presumptuous or unbecoming to represent them as acting like human beings, as was frequently done by mimic representations. The worship of Bacchus had one quality which was more than any other calculated to give birth to the drama, and particularly to tragedy, namely, the enthusiasm which formed an essential part of it, and which proceeded from an impassioned sympathy with the events of nature in connection with the course of the seasons. The original participants in these festivals believed that they perceived the god to be really affected by the changes of nature, killed or dying, flying and rescued, or reanimated, victorious, and dominant. Although the great changes, which took place in the religion and cultivation of the Greeks, banished from their minds the conviction that these events really occurred, yet an enthusiastic sympathy with the god and his fortunes, as with real events, always remained. The swarm of subordinate beings by whom Bacchus was surrounded--satyrs, nymphs, and a variety of beautiful and grotesque forms--were ever present to the fancy of the Greeks, and it was not necessary to depart very widely from the ordinary course of ideas to imagine them visible to human eyes among the solitary woods and rocks. The custom, so prevalent at the festivals of Bacchus, of taking the disguise of satyrs, doubtless originated in the desire to approach more nearly to the presence of their divinity. The desire of escaping from self into something new and strange, of living in an imaginary world, broke forth in a thousand instances in those festivals. It was seen in the coloring of the body, the wearing of skins and masks of wood or bark, and in the complete costume belonging to the character. The learned writers of antiquity agree in stating that tragedy, as well as comedy, was originally a choral

song. The action, the adventures of the gods, was presupposed or only symbolically indicated; the chorus expressed their feelings upon it. This choral song belonged to the class of the *dithyramb*, an enthusiastic ode to Bacchus, capable of expressing every variety of feeling excited by the worship of that god. It was first sung by revelers at convivial meetings, afterwards it was regularly executed by a chorus. The subject of these tragic choruses sometimes changed from Bacchus to other heroes distinguished for their misfortunes and suffering. The reason why the dithyramb and afterwards tragedy was transferred from that god to heroes and not to other gods of the Greek Olympus, was that the latter were elevated above the chances of fortune and the alternations of joy and grief to which both Bacchus and the heroes were subject. It is stated by Aristotle, that tragedy originated with the chief singers of the dithyramb. It is probable that they represented Bacchus himself or his messengers, that they came forward and narrated his perils and escapes, and that the chorus then expressed their feeling, as at passing events. The chorus thus naturally assumed the character of satellites of Bacchus, whence they easily fell into the parts of satyrs, who were his companions in sportive adventures, as well as in combats and misfortunes. The name of tragedy, or goat's song, was derived from the resemblance of the singers, in their character of satyrs, to goats. Thus far tragedy had advanced among the Dorians, who, therefore, considered themselves the inventors of it. All its further development belongs to the Athenians. In the time of Pisistratus, Thespis (506 B.C.) first caused tragedy to become a drama, though a very simple one. He connected with the choral representation a regular dialogue, by joining one person to the chorus who was the *first actor*. He introduced linen masks, and thus the one actor might appear in several characters. In the drama of Thespis we find the satyric drama confounded with tragedy, and the persons of the chorus frequently representing satyrs. The dances of the chorus were still a principal part of the performance; the ancient tragedians, in general, were teachers of dancing, as well as poets and musicians. In Phrynichus (fl. 512 B.C.) the lyric predominated over the dramatic element. Like Thespis, he had only one actor, but he used this actor for different characters, and he was the first who brought female parts upon the stage, which, according to the manners of the ancients, could be acted only by men. In several instances it is remarkable that Phrynichus deviated from mythical subjects to those taken from contemporary history.

3. TRAGEDY.--The tragedy of antiquity was entirely different from that which, in progress of time, arose among other nations; a picture of human life, agitated by the passions, and corresponding as accurately as possible to its original in all its features. Ancient tragedy departs entirely from ordinary life; its character is in the highest degree ideal, and its development necessary, and essentially directed by the fate to which gods and men were subjected. As tragedy and dramatic exhibitions, generally, were seen only at the festivals of Bacchus, they retained a sort of Bacchic coloring, and the extraordinary excitement of all minds at these festivals, by raising them above the tone of every-day existence, gave both to the tragic and comic muse unwonted energy and fire. The Bacchic festal costume, which the actors wore, consisted of long striped garments reaching to the ground, over which were thrown upper garments of some brilliant color, with gay trimmings and gold ornaments. The choruses also vied with each other in the splendor of their dress, as well as in the excellence of their singing and dancing. The chorus, which always bore a subordinate part in the action of the tragedy, was in no respect distinguished from the stature and appearance of ordinary men, while the actor, who represented the god or hero, required to be raised above the usual dimensions of mortals. A tragic actor was a strange, and, according to the taste of the ancients themselves at a later period, a very monstrous being. His person was lengthened out considerably beyond the proportions of the human figure by the very high soles of the tragic shoe, and by the length of the tragic mask, and the chest, body, legs, and arms were stuffed and padded to a corresponding size; the body thus lost much of its natural flexibility, and the gesticulation consisted of stiff, angular movements, in which little was left to the emotion or the inspiration of the moment. Masks, which had originated in the taste for mumming and disguises of all sorts, prevalent at the Bacchic festivals, were an indispensable accompaniment to tragedy. They not only concealed the individual features of well-known actors, and enabled the spectators entirely to forget the performer in his part, but gave to his whole aspect that ideal character which the tragedy of antiquity demanded. The tragic mask was not intentionally ugly and caricatured like the comic, but the half-open mouth, the large eye-sockets, and sharply-defined features, in which every characteristic was presented in its utmost strength, and the bright and hard coloring were calculated to make the impression of a being agitated by the emotions and passions of human nature in a degree far above the standard of common life. The masks could, however, be changed between the acts, so as to represent the necessary changes in the state or emotions of the persons. The ancient theatres were stone buildings of enormous size, calculated to accommodate the whole free and adult population of a great city at the spectacles and festal games. These theatres were not designed exclusively for dramatic poetry; choral dances, processions, revels, and all sorts of representations were held in them. We find theatres in every part of Greece, though dramatic poetry was the peculiar growth of Athens. The whole structure of the theatre, as well as the drama itself, may be traced to the chorus, whose station was the original centre of the whole performance. The orchestra, which occupied a circular level space in the

centre of the building, grew out of the chorus or dancing-place of the Homeric times. The altar of Bacchus, around which the dithyrambic chorus danced in a circle, had given rise to a sort of raised platform in the centre of the orchestra, which served as a resting-place for the chorus. The chorus sang alone when the actors had quitted the stage, or alternately with the persons of the drama, and sometimes entered into dialogues with them. These persons represented heroes of the mythical world, whose whole aspect bespoke something mightier and more sublime than ordinary humanity, and it was the part of the chorus to show the impression made by the incidents of the drama on lower and feebler minds, and thus, as it were, to interpret them to the audience, with whom they owned a more kindred nature. The ancient stage was remarkably long, and of little depth; it was called the *proscenium*, because it was in front of the *scene*. *Scene* properly means *tent* or *hut*, such as originally marked the dwelling of the principal person. This hut at length gave place to a stately scene, enriched with architectural decorations, yet its purpose remained the same. We have seen how a single actor was added to the chorus by Thespis, who caused him to represent in succession all the persons of the drama. Aeschylus added a second actor in order to obtain the contrast of two acting persons on the stage; even Sophocles did not venture beyond the introduction of a third. But the ancients laid more stress upon the precise number and mutual relations of these actors than can here be explained.

4. THE TRAGIC POETS.--Aeschylus (525-477 B.C.), like almost all the great masters of poetry in ancient Greece, was a poet by profession, and from the great improvements which he introduced into tragedy he was regarded by the Athenians as its founder. Of the seventy tragedies which he is said to have written, only seven are extant. Of these, the "Prometheus" is beyond all question his greatest work. The genius of Aeschylus inclined rather to the awful and sublime, than to the tender and pathetic. He excels in representing the superhuman, in depicting demigods and heroes, and in tracing the irresistible march of fate. The depth of poetical feeling in him is accompanied with intense and philosophical thought; he does not merely represent individual tragical events, but he recurs to the greater elements of tragedy--the subjection of the gods and Titans, and the original dignity and greatness of nature and of man. He delights to portray this gigantic strength, as in his Prometheus chained and tortured, but invincible; and these representations have a moral sublimity far above mere poetic beauty. His tragedies were at once political, patriotic, and religious. Sophocles (495-406 B.C.), as a poet, is universally allowed to have brought the drama to the highest degree of perfection of which it was susceptible. Indeed, the Greek mind may be said to have culminated in him; his writings overflow with that indescribable charm which only flashes through those of other poets. His plots are worked up with more skill and care than those of either of his great rivals, Aeschylus or Euripides, and he added the last improvement to the form of the drama by the introduction of a third actor,--a change which greatly enlarged the scope of the action. Of the many tragedies which he is said to have written, only seven are extant. Of these, the "Oedipus Tyrannus" is particularly remarkable for its skillful development, and for the manner in which the interest of the piece increases through each succeeding act. Of all the poets of antiquity, Sophocles has penetrated most deeply into the recesses of the human heart. His tragedies appear to us as pictures of the mind, as poetical developments of the secrets of our souls, and of the laws to which their nature makes them amenable. In Euripides (480-407 B.C.) we discover the first traces of decline in the Greek tragedy. He diminished its dignity by depriving it of its ideal character, and by bringing it down to the level of every-day life. All the characters of Euripides have that loquacity and dexterity in the use of words which distinguished the Athenians of his day; yet in spite of all these faults he has many beauties, and is particularly remarkable for pathos, so that Aristotle calls him the most tragic of poets. Eighteen of his tragedies are still extant. The contemporaries of the three great tragic poets, Aeschylus, Sophocles, and Euripides, must be regarded for the most part as far from insignificant, since they maintained their place on the stage beside them, and not unfrequently gained the tragic prize in competition with them; yet the general character of these poets must have been deficient in that depth and peculiar force of genius by which these great tragedians were distinguished. If this had not been the case, their works would assuredly have attracted greater attention, and would have been read more frequently in later times.

5. COMEDY.--Greek comedy was distinguished as the Old, the Middle, and the New. As tragedy arose from the winter feast of Bacchus, which fostered an enthusiastic sympathy with the apparent sorrows of the god of nature, comedy arose from the concluding feast of the vintage, at which an exulting joy over the inexhaustible riches of nature manifested itself in wantonness of every kind. In such a feast, the Comus, or Bacchanalian procession, was a principal ingredient. This was a tumultuous mixture of the wild carouse, the noisy song, and the drunken dance; and the meaning of the word comedy is a *comus* *song*. It was from this lyric comedy that the dramatic comedy was gradually produced. It received its full development from Cratinus, who lived in the age of Pericles. Cratinus and his younger contemporaries, Eupolis (431 B.C.) and Aristophanes (452-380 B.C.), were the great poets of the old Attic comedy. Of their works, only eleven dramas of Aristophanes are extant. The

chief object of these comedies was to excite laughter by the boldest and most ludicrous caricature, and, provided that end was obtained, the poet seems to have cared little about the justice of the picture. It is scarcely possible to imagine the unmeasured and unsparing license of attack assumed by these comedies upon the gods, the institutions, the politicians, philosophers, poets, private citizens, and women of Athens. With this universal liberty of subject there is combined a poignancy of derision and satire, a fecundity of imagination, and a richness of poetical expression such as cannot be surpassed. Towards the end of the career of Aristophanes, however, this unrestricted license of the comedy began gradually to disappear. The Old comedy was succeeded by the Middle Attic comedy, in which the satire was no longer directed against the influential men or rulers of the people, but was rich in ridicule of the Platonic Academy, of the newly revived sect of the Pythagoreans, and of the orators, rhetoricians, and poets of the day. In this transition from the Old to the Middle comedy, we may discern at once the great revolution that had taken place in the domestic history of Athens, when the Athenians, from a nation of politicians, became a nation of literary men; when it was no longer the opposition of political ideas, but the contest of opposing schools of philosophers and rhetoricians, which set all heads in motion. The poets of this comedy were very numerous. The last poets of the Middle comedy were contemporaries of the writers of the New, who rose up as their rivals, and who were only distinguished from them by following the new tendency more decidedly and exclusively. Menander (342-293 B.C.) was one of the first of these poets, and he is also the most perfect of them. The Athens of his day differed from that of the time of Pericles, in the same way that an old man, weak in body but fond of life, good-humored and self-indulgent, differs from the vigorous, middle-aged man at the summit of his mental strength and bodily energy. Since there was so little in politics to interest or to employ the mind, the Athenians found an object in the occurrences of social life and the charm of dissolute enjoyment. Dramatic poetry now, for the first time, centred in love, as it has since done among all nations to whom the Greek cultivation has descended. But it certainly was not love in those nobler forms to which it has since elevated itself. Menander painted truly the degenerate world in which he lived, actuated by no mighty impulses, no noble aspirations. He was contemporary with Epicurus, and their characters had much in common; both were deficient in the inspiration of high moral ideas. The comedy of Menander and his contemporaries completed what Euripides had begun on the tragic stage a hundred years before their time. They deprived their characters of that ideal grandeur which had been most conspicuous in the creations of Aeschylus and the earlier poets, and thus tragedy and comedy, which had started from such different beginnings, here met as at the same point. The comedies of Menander may be considered as almost the conclusion of Attic literature; he was the last original poet of Athens; those who arose at a later period were but gleaners after the rich harvest of Greek poetry had been gathered.

6. ORATORY, RHETORIC, AND HISTORY.--We may distinguish three epochs in the history of Attic prose from Pericles to Alexander the Great: first, that of Pericles and Thucydides; second, that of Lysias, Socrates, and Plato; and, third, that of Demosthenes and Aeschines. Public speaking had been common in Greece from the earliest times, but as the works of Athenian orators alone have come down to us, we may conclude that oratory was cultivated in a much higher degree at Athens than elsewhere. No speech of Pericles has been preserved in writing; only a few of his emphatic and nervous expressions were kept in remembrance; but a general impression of the grandeur of his oratory long prevailed among the Greeks, from which we may form a clear conception of his style. The sole object of the oratory of Pericles was to produce conviction; he did not aim to excite any sudden or transient burst of passion by working on the emotions of the heart; nor did he use any of those means employed by the orators of a later age to set in motion the unruly impulses of the multitude. His manner was tranquil, with hardly any change of feature; his garments were undisturbed by any oratorical gesticulations, and his voice was equable and sustained. He never condescended to flatter the people, and his dignity never stooped to merriment. Although there was more of reasoning than imagination in his speeches, he gave a vivid and impressive coloring to his language by the use of striking metaphors and comparisons, as when, at the funeral of a number of young persons who had fallen in battle, he used the beautiful figure, that "the year had lost its spring." The cultivation of the art of oratory among the Athenians was due to a combination of the natural eloquence displayed by the Athenian statesmen, and especially by Pericles, with the rhetorical studies of the sophists, who exercised a greater influence on the culture of the Greek mind than any other class of men, the poets excepted. The sophists, as their name indicates, were persons who made knowledge their profession, and undertook to impart it to every one who was willing to place himself under their guidance; they were reproached with being the first to sell knowledge for money, for they not only demanded pay from those who came to hear their lectures, but they undertook, for a certain sum, to give young men a complete sophistical education. Pupils flocked to them in crowds, and they acquired such riches as neither art nor science had ever before earned among the Greeks. If we consider their doctrines philosophically, they amounted to a denial or renunciation of all true science. They were able to speak with equal plausibility for and against the same position; not in order to discover the truth, but to show the nothingness of truth. In the improvement of written composition, however, a high value must be set on their services. They made language the object of their study; they aimed at correctness and beauty of style, and they laid

the foundation for the polished diction of Plato and Demosthenes. They taught that the sole aim of the orator is to turn the minds of his hearers into such a train as may best suit his own interest; that, consequently, rhetoric is the agent of persuasion, the art of all arts, because the rhetorician is able to speak well and convincingly on every subject, though he may have no accurate knowledge respecting it. The Peloponnesian war, which terminated in the downfall of Athens, was succeeded by a period of exhaustion and repose. The fine arts were checked in their progress, and poetry degenerated into empty bombast. Yet at this very time prose literature began a new career, which led to its fairest development. Lysias and Isocrates gave an entirely new form to oratory by the happy alterations which they in different ways introduced into the old prose style. Lysias (fl. 359 B.C.), in the fiftieth year of his age, began to follow the trade of writing speeches for such private individuals as could not trust their own skill in addressing a court; for this object, a plain, unartificial style was best suited, because citizens who called in the aid of the speech-writer had no knowledge of rhetoric, and thus Lysias was obliged to originate a style, which became more and more confirmed by habit. The consequence was, that for his contemporaries and for all ages he stands forth as the first and in many respects the perfect pattern of a plain style. The narrative part of the speech, for which he was particularly famous, is always natural, interesting, and lively, and often relieved by mimic touches which give it a wonderful air of reality. The proofs and confutations are distinguished by a clearness of reasoning and a boldness of argument which leave no room for doubt; in a word, the speeches are just what they ought to be in order to obtain a favorable decision, an object in which, it seems, he often succeeded. Of his many orations, thirty-five have come down to us. Isocrates (fl. 338 B.C.) established a school for political oratory, which became the first and most flourishing in Greece. His orations were mostly destined for this school. Though neither a great statesman nor philosopher in himself, Isocrates constitutes an epoch as a rhetorician or artist of language. His influence extended far beyond the limits of his own school, and without his reconstruction of the style of Attic oratory we could have had no Demosthenes and no Cicero; through these, the school of Isocrates has extended its influence even to the oratory of our own day. The verdict of his contemporaries, ratified by posterity, has pronounced Demosthenes (380-322 B.C.) the greatest orator that has ever lived, yet he had no natural advantages for oratory. A feeble frame and a weak voice, a shy and awkward manner, the ungraceful gesticulations of one whose limbs had never been duly exercised, and a defective articulation, would have deterred most men from even attempting to address an Athenian assembly; but the ambition and perseverance of Demosthenes enabled him to triumph over every disadvantage. He improved his bodily powers by running, his voice by speaking aloud as he walked up hill, or declaimed against the roar of the sea; he practiced graceful delivery before a looking-glass, and controlled his unruly articulation by speaking with pebbles in his mouth. His want of fluency he remedied by diligent composition, and by copying and committing to memory the works of the best authors. By these means he came forth as the acknowledged leader of the assembly, and, even by the confession of his deadliest enemies, the first orator of Greece. His harangues to the people, and his speeches on public and private causes, which have been preserved, form a collection of sixty-one orations. The most important efforts of Demosthenes, however, were the series of public speeches referring to Philip of Macedon, and known as the twelve Philippics, a name which has become a general designation for spirited invectives. The main characteristic of his eloquence consisted in the use of the common language of his age and country. He took great pains in the choice and arrangement of his words, and aimed at the utmost conciseness, making epithets, even common adjectives, do the work of a whole sentence, and thus, by his perfect delivery and action, a sentence composed of ordinary terms sometimes smote with the weight of a sledge-hammer. In his orations there is not any long or close train of reasoning, still less any profound observations or remote and ingenious allusions, but a constant succession of remarks, bearing immediately on the matter in hand, perfectly plain, and as readily admitted as easily understood. These are intermingled with the most striking appeals either to feelings which all were conscious of, and deeply agitated by, though ashamed to own, or to sentiments which every man was panting to utter and delighted to hear thundered forth,—bursts of oratory, which either overwhelmed or relieved the audience. Such characteristics constituted the principal glory of the great orator. The most eminent of the contemporaries of Demosthenes were Isaeus (420-348 B.C.), an artificial and elaborate orator; Lycurgus (393-328 B.C.), a celebrated civil reformer of Athens; Hypereides, contemporary of Lycurgus; and, above all, Aeschines (389-314 B.C.), the great rival of Demosthenes, of whose numerous speeches only three have been preserved. At a later period we find two schools of rhetoric, the Attic, founded by Aeschines, and the Asiatic, established by Hegesias of Magnesia. The former proposed as models of oratory the great Athenian orators, the latter depended on artificial manners, and produced speeches distinguished rather by rhetorical ornaments and a rapid flow of diction than by weight and force of style. In the historical department, Thucydides (471-391 B.C.) began an entirely new class of historical writing. While Herodotus aimed at giving a vivid picture of all that fell under the cognizance of the senses, and endeavored to represent a superior power ruling over the destinies of princes and people, the attention of Thucydides was directed to human action, as it is developed from the character and situation of the individual. His history, from its unity of action, may be considered as a historical drama, the subject being the

Athenian domination over Greece, and the parties the belligerent republics. Clearness in the narrative, harmony and consistency of the details with the general history, are the characteristics of his work; and in his style he combines the concise and pregnant oratory of Pericles with the vigorous but artificial style of the rhetoricians. Demosthenes was so diligent a student of Thucydides that he copied out his history eight times. Xenophon (445-391 B.C.) may also be classed among the great historians, his name being most favorably known from the "Anabasis," in which he describes the retreat of the ten thousand Greek mercenaries in the service of Cyrus, the Persian king, among whom he himself played a prominent part. The minuteness of detail, the picturesque simplicity of the style, and the air of reality which pervades it, have made it a favorite with every age. In his memorials of Socrates, he records the conversations of a man whom he had admired and listened to, but whom he did not understand. In the language of Xenophon we find the first approximation to the common dialect, which became afterwards the universal language of Greece. He wrote several other works, in which, however, no development of one great and pervading idea can be found; but in all of them there is a singular clearness and beauty of description.

7. SOCRATES AND THE SOCRATIC SCHOOLS.--Although Socrates (468-399 B.C.) left no writings behind him, yet the intellect of Greece was powerfully affected by the principles of his philosophy, and the greatest literary genius that ever appeared in Hellas owed most of his mental training to his early intercourse with him. It was by means of conversation, by a searching process of question and answer, that Socrates endeavored to lead his pupils to a consciousness of their own ignorance, and thus to awaken in their minds an anxiety to obtain more exact views. This method of questioning he reduced to a scientific process, and "dialectics" became a name for the art of reasoning and the science of logic. The subject-matter of this method was moral science considered with special reference to politics. To him may be justly attributed induction and general definitions, and he applied this practical logic to a common-sense estimate of the duties of man both as a moral being and as a member of a community, and thus he first treated moral philosophy according to scientific principles. No less than ten schools of philosophers claimed him as their head, though the majority of them imperfectly represented his doctrines. By his influence on Plato, and through him on Aristotle, he constituted himself the founder of the philosophy which is still recognized in the civilized world.

>From the doctrine held by Socrates, that virtue was dependent on knowledge, Euclides of Megara (fl. 398 B.C.), the founder of the Megaric school, submitted moral philosophy to dialectical reasoning and logical refinements; and from the Socratic principle of the union between virtue and happiness, Aristippus of Cyrene (fl. 396 B.C.) deduced the doctrine which became the characteristic of the Cyrenian school, affirming that pleasure was the ultimate end of life and the higher good; while Antisthenes (fl. 396 B.C.) constructed the Cynic philosophy, which placed the ideal of virtue in the absence of every need, and hence in the disregarding of every interest, wealth, honor, and enjoyment, and in the independence of any restraints of life and society. Diogenes of Sinope (fl. 300 B.C.) was one of the most prominent followers of this school. He, like his master, Antisthenes, always appeared in the most beggarly clothing, with the staff and wallet of mendicancy; and this ostentation of self-denial drew from Socrates the exclamation, that he saw the vanity of Antisthenes through the holes in his garments. Plato (429-348 B.C.) was the only--one of the disciples of Socrates who represented the whole doctrines of his teacher. We owe to him that the ideas which Socrates awakened have been made the germ of one of the grandest systems of speculation that the world has ever seen, and that it has been conveyed to us in literary compositions which are unequalled in refinement of conception, or in vigor and gracefulness of style. At the age of nineteen he became one of the pupils and associates of Socrates, and did not leave him until that martyr of intellectual freedom drank the fatal cup of hemlock. He afterwards traveled in Asia Minor, in Egypt, in Italy, and Sicily, and made himself acquainted with all contemporary philosophy. During the latter part of his life he was engaged as a public lecturer on philosophy. His lectures were delivered in the gardens of the Academia, and they have left proof of their celebrity in the structure of language, which has derived from them a term now common to all places of instruction. Of the importance of the Socratic and Pythagorean elements in Plato's philosophy there can be no doubt; but he transmuted all he touched into his own forms of thought and language, and there was no branch of speculative literature which he had not mastered. By adopting the form of dialogue, in which all his extant works have come down to us, he was enabled to criticise the various systems of philosophy then current in Greece, and also to gratify his own dramatic genius, and his almost unrivaled power of keeping up an assumed character. The works of Plato have been divided into three classes: first, the elementary dialogues, or those which contain the germs of all that follows, of logic as the instrument of philosophy, and of ideas as its proper object; second, progressive dialogues, which treat of the distinction between philosophical and common knowledge, in their united application to the proposed and real sciences, ethics, and physics; third, the constructive dialogues, in which the practical is completely united with the speculative, with an appendix containing laws, epistles, etc. The fundamental principle of Plato's philosophy is the belief in an eternal and self-existent cause, the origin of all things. From this divine Being emanate not only the souls of men, which are immortal, but that of the universe itself, which is supposed to be animated by a divine spirit. The material objects of our sight, and other senses, are mere fleeting emanations of the divine idea; it is only this idea itself that is really

existent; the objects of sensuous perception are mere appearances, taking their forms by participation in the idea; hence it follows, that in Plato's philosophy all knowledge is innate, and acquired by the soul before birth, when it was able to contemplate real existences, and all our ideas of this world are mere reminiscences of their true and eternal patterns. The belief of Plato in the immortality of the soul naturally led him to establish a high standard of moral excellence, and, like his great teacher, he constantly inculcates temperance, justice, and purity of life. His political views are developed in the "Republic" and in the "Laws," in which the main feature of his system is the subordination, or rather the entire sacrifice of the individual to the state. The style of Plato is in every way worthy of his position in universal literature, and modern scholars have confirmed the encomium of Aristotle, that all his dialogues exhibit extraordinary acuteness, elaborate elegance, bold originality, and curious speculation. In Plato, the powers of imagination were just as conspicuous as those of reasoning and reflection; he had all the chief characteristics of a poet, especially of a dramatic poet, and if his rank as a philosopher had been lower than it is, he would still have ranked high among dramatic writers for his life-like representations of the personages whose opinions he wished to combat or to defend. Aristotle (384-322 B.C.) occupies a position among the leaders of human thought not inferior to that of his teacher, Plato. He was a native of Stagira, in Macedonia, and is hence often called the Stagyrite. He early repaired to Athens, and became a pupil of Plato, who called him the soul of his school. He was afterwards invited by Philip of Macedon to undertake the literary education of Alexander, at that time thirteen years old. This charge continued about three years. He afterwards returned to Athens, where he opened his school in a gymnasium called the Lyceum, delivering his lessons as he walked to and fro, and from these saunters his scholars were called Peripatetics, or saunterers. During this period he composed most of his extant works. Alexander placed at his disposal a large sum for his collections in natural history, and employed some thousands of men in procuring specimens for his museum. After the death of Alexander, he was accused of blasphemy to the gods, and, warned by the fate of Socrates, he withdrew from Athens to Chalcis, where he afterwards died. In looking at the mere catalogue of the works of Aristotle, we are struck with his vast range of knowledge. He aimed at nothing less than the completion of a general encyclopedia of philosophy. He was the author of the first scientific cultivation of each science, and there was hardly any quality distinguishing a philosopher as such, which he did not possess in an eminent degree. Of all the philosophical systems of antiquity, that of Aristotle was the best adapted to the physical wants of mankind. His works consisted of treatises on natural, moral, and political philosophy, history, rhetoric, criticism,—indeed, there was scarcely a branch of knowledge which his vast and comprehensive genius did not embrace. His greatest claim to our admiration is as a logician. He perfected and brought into form those elements of the dialectic art which had been struck out by Socrates and Plato, and wrought them, by his additions, into so complete a system, that he may be regarded as, at once, the founder and perfecter of logic as an art, which has since, even down to our own days, been but very little improved. The style of Aristotle has nothing to attract those who prefer the embellishments of a work to its subject-matter and the scientific results which it presents.

PERIOD THIRD.

EPOCH OF THE DECLINE OF GREEK LITERATURE, 322 B.C.-1453 A.D.

1. ORIGIN OF THE ALEXANDRIAN LITERATURE.—As the literary predominance of

Athens was due mainly to the political importance of Attica, the downfall of Athenian independence brought with it a deterioration, and ultimately an extinction of that intellectual centralization which for more than a century had fostered and developed the highest efforts of the genius and culture of the Greeks. While the living literature of Greece was thus dying away, the conquests of Alexander prepared a new home for the muses on the coast of that wonderful country, to which all the nations of antiquity had owed a part of their science and religious belief. In Egypt, as in other regions, Alexander gave directions for the foundation of a city to be called after his own name, which became the magnificent metropolis of the Hellenic world. This capital was the residence of a family who attracted to their court all the living representatives of the literature of Greece, and stored up in their enormous library all the best works of the classical period. It was chiefly during the reigns of the first three Ptolemies that Alexandria was made the new home of Greek literature. Ptolemy Soter (306-285 B.C.) laid the foundations of the library, and instituted the museum, or temple of the muses, where the literary men of the age were maintained by endowments. This encouragement of literature was continued by Ptolemy Philadelphus (285-247 B.C.). He had the celebrated Callimachus for his librarian, who bought up not only the whole of Aristotle's great collection of works, but transferred the native annals of Egypt and Judea to the domain of Greek literature by employing the priest Manetho to translate the hieroglyphics of his own temple-archives into the language of the court, and by procuring from the Sanhedrim of Jerusalem the first part of that celebrated version of the Hebrew sacred books, which was afterwards completed and known as the Septuagint, or version of the Seventy. Ptolemy Euergetes (247-222 B.C.)

increased the library by depriving the Athenians of their authentic editions of the great dramatists. In the course of time the library founded at Pergamos was transferred to Egypt, and thus we are indebted to the Ptolemies for preserving to our times all the best specimens of Greek literature which have come down to us. This encouragement of letters, however, called forth no great original genius; but a few eminent men of science, many second-rate and artificial poets, and a host of grammarians and literary pedants.

2. THE ALEXANDRIAN POETS.--Among the poets of the period, Philetas,

Callimachus, Lycophron, Apollonius, and the writers of idyls, Theocritus, Bion, and Moschus are the most eminent. The founder of a school of poetry at Alexandria, and the model for imitation with the Roman writers of elegiac poetry, was Philetas of Cos (fl. 260 B. C.), whose extreme emaciation of person exposed him to the imputation of wearing lead in the soles of his shoes, lest he should be blown away. He was chiefly celebrated as an elegiac poet, in whom ingenious, elegant, and harmonious versification took the place of higher poetry. Callimachus (fl. 260 B.C.) was the type of an Alexandrian man of letters, distinguished by skill rather than genius, the most finished specimen of what might be effected by talent, learning, and ambition, backed by the patronage of a court. He was a living representative of the great library over which he presided; he was not only a writer of all kinds of poetry, but a critic, grammarian, historian, and geographer. Of his writings, a few poems only are extant. Next to Callimachus, as a representative of the learned poetry of Alexandria, stands the dramatist Lycophron (fl. 250 B.C.). All his works are lost, with the exception of the oracular poem called the "Alexandra," or "Cassandra," on the merits of which very opposite opinions are entertained. Apollonius, known as the Rhodian (fl. 240 B.C.), was a native of Alexandria, and a pupil of Callimachus, through whose influence he was driven from his native city, when he established himself in the island of Rhodes, where he was so honored and distinguished that he took the name of the Rhodian. On the death of Callimachus, he was appointed to succeed him as librarian at Alexandria. His reputation depends on his epic poem, the "Argonautic Expedition." Of all the writers of the Alexandrian period, the bucolic poets have enjoyed the most popularity. Their pastoral poems were called Idyls, from their pictorial and descriptive character, that is, little pictures of common life, a name for which the later writers have sometimes substituted the term Eclogues, that is, selections, which is applicable to any short poem, whether complete and original, or appearing as an extract. The name of Idyls, however, was afterwards applicable to pastoral poems. Theocritus (fl. 272 B.C.) gives his name to the most important of these extant bucolics. He had an original genius for poetry of the highest kind; the absence of the usual affectation of the Alexandrian school, constant appeals to nature, a fine perception of character, and a keen sense of both the beautiful and the ludicrous, indicate the high order of his literary talent, and account for his universal and undiminished popularity. The two other bucolic poets of the Alexandrian school were Bion (fl. 275 B.C.), born near Smyrna, and his pupil Moschus of Syracuse (fl. 273 B.C.). It appears, from an elegy by Moschus, that Bion migrated from Asia Minor to Sicily, where he was poisoned. He wrote harmonious verses with a good deal of pathos and tenderness, but he is as inferior to Theocritus as he is superior to Moschus, whose artificial style characterizes him rather as a learned versifier than a true poet.

3. PROSE WRITERS OF ALEXANDRIA.--Many of the most eminent poets were also

prose writers, and they exhibited their versatility by writing on almost every subject of literary interest. The progress of prose writing manifested itself from grammar and criticism to the more elaborate and learned treatment of history and chronology, and to observations and speculations in pure and mixed mathematics. Demetrius the Phalerian (fl. 295 B.C.), Zenodotus (fl. 279 B.C.), Aristophanes (fl. 200 B.C.), and Aristarchus (fl. 156 B.C.), the three last of whom were successively intrusted with the management of the Library, were the representatives of the Alexandrian school of grammar and criticism. They devoted themselves chiefly to the revision of the text of Homer, which was finally established by Aristarchus. In the historical department may be mentioned Ptolemy Soter, who wrote the history of the wars of Alexander the Great; Apollodorus (fl. 200 B.C.), whose "Bibliotheca" contains a general sketch of the mystic legends of the Greeks; Eratosthenes (fl. 235 B.C.), the founder of scientific chronology in Greek history; Manetho (fl. 280 B.C.), who introduced the Greeks to a knowledge of the Egyptian religion and annals; and Berosus of Babylon, his contemporary, whose work, fragments of which were preserved by Josephus, was known as the "Babylonian Annals." While the Greeks of Alexandria thus gained a knowledge of the religious books of the nations conquered by Alexander, the same curiosity, combined with the necessities of the Jews of Alexandria, gave birth to the translation of the Bible into Greek, known under the name of Septuagint, which has exercised a more lasting influence on the civilized world than that of any book that has ever appeared in a new tongue. The beginning of that translation was probably made in the reigns of the first Ptolemies (320-249 B.C.), while the remainder was completed at a later period. The wonderful advance, which took place in pure and applied mathematics, is chiefly due to the learned men who settled in Alexandria; the greatest mathematicians and the most eminent founders of scientific geography were all either immediately or indirectly connected with the school of

Alexandria. Euclid (fl. 300 B.C.) founded a famous school of geometry in that city, in the reign of the first Ptolemy. Almost the only incident of his life which is known to us is a conversation between him and that king, who, having asked if there was no easier method of learning the science, is said to have been told by Euclid, that "there was no royal path to geometry." His most famous work is his "Elements of Pure Mathematics," at the present time a manual of instruction and the foundation of all geometrical treatises. Archimedes (287-212 B.C.) was a native of Syracuse, in Sicily, but he traveled to Egypt at an early age, and studied mathematics there in the school of Euclid. He not only distinguished himself as a pure mathematician and astronomer, and as the founder of the theory of statics, but he discovered the law of specific gravity, and constructed some of the most useful machines in the mechanic arts, such as the pulley and the hydraulic screw. His works are written in the Doric dialect. Apollonius of Perga (221-204 B.C.) distinguished himself in the mathematical department by his work on "Conic Elements." Eratosthenes was not only prominent in the science of chronology, but was also the founder of astronomical geography, and the author of many valuable works in various branches of philosophy. Hipparchus (fl. 150 B.C.) is considered the founder of the science of exact astronomy, from his great work, the "Catalogue of the Fixed Stars," his discovery of the precession of the equinoxes, and many other valuable astronomical observations and calculations.

4. ALEXANDRIAN PHILOSOPHY.--Athens, which had been the centre of Greek

literature during the second or classical period of its development, had now, in all respects but one, resigned the intellectual leadership to the city of the Ptolemies. While Alexandria was producing a series of learned poets, scholars, and discoverers in science, Athenian literature was mainly represented by the establishment of certain forms of mental and moral philosophy founded on the various Socratic schools. Two schools of philosophy were established at Athens at the time of the death of Aristotle: that of the Academy, in which he himself had studied, and that of the Lyceum, which he had founded, as the seat of his peripatetic system. But the older schools soon reappeared under new names: the Megarics, with an infusion of the doctrines of Democritus, revived in the skeptic philosophy of Pyrrhon (375-285 B.C.). Epicurus (342-370 B.C.) founded the school to which he gave his name, by a similar combination of Democritean philosophy with the doctrines of the Cyrenaics; the Cynics were developed into Stoics by Zeno (341-260 B.C.), who borrowed much from the Megaric school and from the Old Academy; and, finally, the Middle and New Academy arose from a combination of doctrines which were peculiar to many of these sects. Though these different schools, which flourished at Athens, had early representatives in Alexandria, their different doctrines, coming in contact with the ancient religious systems of the Persians, Jews, and Hindus, underwent essential modifications, and gave birth to a kind of eclecticism, which became later an important element in the development of Christian history. The rationalism of the Platonic school and the supernaturalism of the Jewish Scriptures were chiefly mingled together, and from this amalgamation sprang the system of Neo-Platonism. When the early teachers of Christianity at Alexandria strove to show the harmony of the Gospel with the great principles of the Greco-Jewish philosophy, it underwent new modifications, and the Neo-Platonic school, which sprang up in Alexandria three centuries B.C., was completed in the first and second centuries of the Christian era. The common characteristic of the Neo-Platonists was a tendency to mysticism. Some of them believed that they were the subjects of divine inspiration and illumination; able to look into the future and to work miracles. Philo-Judaeus (fl. 20 B.C.), Numenius (fl. 150 A.D.), Ammonius Saccas (fl. 200 A.D.), Plotinus (fl. 260 A.D.), Porphyry (fl. 260 A.D.), and several fathers of the Greek Church are among the principal disciples of this school.

5. ANTI-NEO-PLATONIC TENDENCIES.--

While the Neo-Platonism of Alexandria introduced into Greek philosophy Oriental ideas and tendencies, other positive and practical doctrines also prevailed, founded on common sense and conscience. First among these were the tenets of the Stoics, who owed their system mainly and immediately to the teaching of Epictetus (fl. 60 A.D.), who opposed the Oriental enthusiasm of the Neo-Platonists. He was originally a slave, and became a prominent teacher of philosophy in Rome, in the reign of Domitian. He left nothing in writing, and we are indebted for a knowledge of his doctrines to Arrian, who compiled his lectures or philosophical dissertations in eight books, of which only four are preserved, and the "Manual of Epictetus," a valuable compendium of the doctrines of the Stoics. The Emperor Marcus Aurelius not only lectured at Rome on the principles of Epictetus, but he left us his private meditations, composed in the midst of a camp, and exhibiting the serenity of a mind which had made itself independent of outward actions and warring passions within. Lucian (fl. 150 A.D.) may be compared to Voltaire, whom he equaled in his powers both of rhetoric and ridicule, and surpassed in his more conscientious and courageous love of truth. Though the results of his efforts against heathenism were merely negative, he prepared the way for Christianity by giving the death-blow to declining idolatry. Lucian, as a man of letters, is on many accounts interesting, and in reference to his own age and to the literature of Greece he is entitled to an important position both with regard to the religious and philosophical results of his works, and to the introduction of a purer Greek style, which he taught and exemplified. Longinus (fl. 230 A.D.), both as an opponent of Neo-Platonism and as a sound and sensible critic, occupies a position similar to that of Lucian, in the declining period of Greek literary history.

During a visit to the East, he became known to Zenobia, queen of Palmyra, who adopted the celebrated scholar as her instructor in the language and literature of Greece, her adviser and chief minister; and when Palmyra fell before the Roman power he was put to death by the Roman emperor. To his treatise on "The Sublime" he is chiefly indebted for his fame. When France, in the reign of Louis XIV., gave a tone to the literary judgments of Europe, this work was translated by Boileau, and received by the wits of Paris as an established manual in all that related to the sublime and beautiful.

6. GREEK LITERATURE IN ROME.--After the subjugation of Greece by the Romans, Greek authors wrote in their own language and published their works in Rome; illustrious Romans chose the idiom of Plato as the best medium for the expression of their own thoughts; dramatic poets gained a reputation by imitating the tragedies and comedies of Athens, and every versifier felt compelled by fashion to revive the metres of ancient Greece. This naturalization of Greek literature at Rome was due to the rudeness and poverty of the national literature of Italy, to the influence exerted by the Greek colonies, and to the political subjugation of Greece. In Rome, Greek libraries were established by the Emperor Augustus and his successors; and the knowledge of the Greek language was considered a necessary accomplishment. Cicero made his countrymen acquainted with the philosophical schools of Athens, and Rome became more and more the rival of Alexandria, both as a receptacle for the best Greek writings and as a seat of learning, where Greek authors found appreciation and patronage. The Greek poets, who were fostered and encouraged at Rome, were chiefly writers of epigrams, and their poems are preserved in the collections called "Anthologies." The growing demand for forensic eloquence naturally led the Roman orators to find their examples in those of Athens, and to the study of rhetoric in the Grecian writers. Among the writers on rhetoric whose works seem to have produced the greatest effect at the beginning of the Roman period, we mention Dionysius of Halicarnassus (fl. 7 B.C.). As a critic, he occupies the first rank among the ancients. Besides his rhetorical treatises, he wrote a work on "Roman Archaeology," the object of which was to show that the Romans were not, after all, barbarians, as was generally supposed, but a pure Greek race, whose institutions, religion, and manners were traceable to an identity with those of the noblest Hellenes. What Dionysius endeavored to do for the gratification of his own countrymen, by giving them a Greek version of Roman history, an accomplished Jew, who lived about a century later, attempted, from the opposite point of view, for his own fallen race, in a work which was a direct imitation of that just described. Flavius Josephus (fl. 60 A.D.) wrote the "Jewish Archaeology" in order to show the Roman conquerors of Jerusalem that the Jews did not deserve the contempt with which they were universally regarded. His "History of the Jewish Wars" is an able and valuable work. At an earlier period, Polybius (204-122 B.C.) wrote to explain to the Greeks how the power of the Romans had established itself in Greece. His great work was a universal history, but of the forty books of which it consisted only five have been preserved; perhaps no historical work has ever been written with such definiteness of purpose or unity of plan, or with such self-consciousness on the part of the writer. The object to which he directs attention is the manner in which fortune or providence uses the ability and energy of man as instruments in carrying out what is predetermined, and specially the exemplification of these principles in the wonderful growth of the Roman power during the fifty-three years of which he treats. Taking his history as a whole, it is hardly possible to speak in too high terms of it, though the style has many blemishes, such as endless digressions, wearisome repetition of his own principles and colloquial vulgarisms. Diodorus, a native of Sicily, generally known as the Sicilian (Siculus), flourished in the time of the first two Caesars. In his great work, the "Historical Library," it was his object to write a history of the world down to the commencement of Caesar's Gallic wars. He is content to give a bare recital of the facts, which crowded upon him and left him no time to be diffuse or ornamental. The geography of Strabo (fl. 10 A.D.), which has made his name familiar to modern scholars, has come down to us very nearly complete. Its merits are literary rather than scientific. His object was to give an instructive and readable account of the known world, from the point of view taken by a Greek man of letters. His style is simple, unadorned, and unaffected. Plutarch (40-120 A.D.) may be classed among the philosophers as well as among the historians. Though he has left many essays and works on different subjects, he is best known as a biographer. His lives of celebrated Greeks and Romans have made his name familiar to the readers of every country. The universal popularity of his biographies is due to the fact that they are dramatic pictures, in which each personage is represented as acting according to his leading characteristics. Pausanias (fl. 184 A.D.), a professed describer of countries and of their antiquities and works of art, in his "Gazetteer of Hellas" has left the best repertory of information for the topography, local history, religious observances, architecture, and sculpture of the different states of Greece. Among the scientific men of this period we find Ptolemy, whose name for more than a thousand years was coextensive with the sciences of astronomy and geography. He was a native of Alexandria, and flourished about the latter part of the second century. The best known of his works is his "Great Construction of Astronomy." He was the first to indicate the true shape of Spain, Gaul, and Ireland; as a writer, he deserves to be held in high estimation. Galen (fl. 130 A.D.) was a writer on philosophy and medicine, with whom

few could vie in productiveness. It was his object to combine philosophy with medical science, and his works for fifteen centuries were received as oracular authorities throughout the civilized world.

7. CONTINUED DECLINE OF GREEK LITERATURE.--The adoption of the Christian religion by Constantine, and his establishment of the seat of government in his new city of Constantinople, concurred in causing the rapid decline of Greek literature in the fourth and following centuries. Christianity, no longer the object of persecution, became the dominant religion of the state, and the profession of its tenets was the shortest road to influence and honor. The old literature, with its mythological allusions, became less and less fashionable, and the Greek poets, philosophers, and orators of the better periods gradually lost their attractions. Greek, the official language of Constantinople, was spoken there, with different degrees of corruption, by Syrians, Bulgarians, and Goths; and thus, as Christianity undermined the old classical literature, the political condition of the capital deteriorated the language itself. Other causes accelerated the decadence of Greek learning: the great library at Alexandria, and the school which had been established in connection with it, were destroyed at the end of the fourth century by the edict of Theodosius, and the conquest of Egypt by the Saracens in the seventh century only completed the work of destruction. Justinian closed the schools of Athens, and prohibited the teaching of philosophy; the Arabs overthrew those established elsewhere, and there remained only the institutions of Constantinople. But long before the establishment of the Turks on the ruins of the Byzantine empire, Greek literature had ceased to claim any original or independent existence. The opposition between the literary spirit of heathen Greece and the Christian scholarship of the time of Constantine and his immediate successors, which grew up very gradually, was the result of the Oriental superstitions which distorted Christianity and disturbed the old philosophy. The abortive attempt of the Emperor Julian to create a reaction in favor of heathenism was the cause of the open antagonism between the classical and Christian forms of literature. The church, however, was soon enabled not only to dictate its own rules of literary criticism, but to destroy the writings of its most formidable antagonists. The last rays of heathen cultivation in Italy were extinguished in the gloomy dungeon of Boethius, and the period so justly designated as the Dark Ages began both in eastern and western Europe.

8. LAST ECHOES OF THE OLD LITERATURE--From the time when Christianity placed itself in opposition to the old culture of heathen Greece and Rome, down to the period of the revival of classical literature in the fifteenth and sixteenth centuries, the classical spirit was nearly extinct both in eastern and western Europe. In Italy, the triumph of barbarism was more sudden and complete. In the eastern empire there was a certain literary activity, and in the department of history, Byzantine literature was conspicuously prolific. The imperial family of the Comneni, in the eleventh and twelfth centuries, and the Palaeologi, who reigned from the thirteenth century to the end of the eastern empire, endeavored to revive the taste for literature and learning. But the echoes of the past became fainter and fainter, and when Constantinople fell into the hands of the Turks, 1453 A.D., the wandering Greeks who found their way into Italy could only serve as language-masters to a race of scholars, who thus recovered the learning that had ceased to exist among the Greeks themselves. The last manifestations of the old classical learning by the Alexandrian school, which had done so much in the second and first centuries before our era, may be divided into three classes. In the first are placed the mathematical and geographical studies, which had been brought to such perfection by Euclid, his successors, and after them by Ptolemy. In the second class we have the substitution of prose romances for the bucolic and erotic poetry of the Alexandrian and Sicilian writers. In the third class the revival, by Nonnus and his followers, of a learned epos, of much the same kind as the poems of Callimachus. Among the representatives of the mathematical school of Alexandria was Theon, whose celebrity is obscured by that of his daughter Hypatia (fl. 415 A.D.), whose sex, youth, beauty, and cruel fate have made her a most interesting martyr of philosophy. She presided in the public school at Alexandria, where she taught mathematics and the philosophy of Ammonius and Plotinus. Her influence over the educated classes of that city excited the jealousy of the archbishop. She was given up to the violence of a superstitious and brutal mob, attacked as she was passing through the streets in her chariot, torn in pieces, and her mutilated body thrown to the flames. When rhetorical prose superseded composition in verse, the greater facility of style naturally led to more detailed narratives, and the sophist who would have been a poet in the time of Callimachus, became a writer of prose romances in the final period of Greek literature. The first ascertained beginning of this style of light reading, which occupies so large a space in the catalogues of modern libraries, was in the time of the Emperor Trajan, when a Syrian or Babylonian freedman, named Iamblichus, published a love story called the "Babylonian Adventures." Among his successors is Longus, of whose work, "The Lesbian Adventure," it is sufficient to say, that it was the model of the "Diana" of Montemayor, the "Aminta" of Tasso, the "Pastor Fido" of Guarini, and the "Gentle Shepherd" of Allan Ramsay. While the sophists were amusing themselves by clothing erotic and bucolic subjects in rhetorical prose, an Egyptian boldly

revived the epos which had been cultivated at Alexandria in the earliest days of the Museum. Nonnus probably flourished at the commencement of the fifth century A.D. His epic poem, which, in accordance with the terminology of the age, is called "Dionysian Adventures," is an enormous farrago of learning on the well-worked subject of Bacchus. The most interesting of the epic productions of the school of Nonnus is the story of "Hero and Leander," in 340 verses, which bears the name of Musaeus. For grace of diction, metrical elegance, and simple pathos, this little canto stands far before the other poems of the same age. The Hero and Leander of Musaeus is the dying swan-note of Greek poetry, the last distinct note of the old music of Hellas. In the Byzantine literature, there are works which claim no originality, but have a higher value than their contemporaries, because they give extracts or fragments of the lost writings of the best days of Greece. Next in value follow the lexicographers, the grammarians, and commentators. The most voluminous department, however, of Byzantine literature, was that of the historians, annalists, chroniclers, biographers, and antiquarians, whose works form a continuous series of Byzantine annals from the time of Constantine the Great to the taking of the capital by the Turks. This literature was also enlivened by several poets, and enriched by some writers on natural history and medicine.

9. THE NEW TESTAMENT AND THE GREEK FATHERS.--The history of Greek literature would be imperfect without some allusion to a class of writings not usually included in the range of classical studies. The first of these works, the Septuagint version of the Old Testament, before mentioned, and the Greek Apocrypha, may properly be termed Hebrew-Grecian. Their spirit is wholly at variance with that of pagan literature, and it cannot be doubted that they exerted great influence when made known to the pagans of Alexandria. Many of the books termed the Apocrypha were originally written in Greek, and mostly before the Christian era. Many of them contain authentic narratives, and are valuable as illustrating the circumstances of the age to which they refer. The other class of writings alluded to comprehends the works of the Christian authors. As the influence of Christianity became more diffused during the first and second centuries, its regenerating power became visible. After the time of Christ, there appeared, in both the Greek and Latin tongues, works wholly different in their spirit and character from all that is found in pagan literature. The collection of sacred writings contained in the New Testament and the works of the early fathers constitute a distinct and interesting feature in the literature of the age in which they appeared. The writings of the New Testament, considered simply in their literary aspect, are distinguished by a simplicity, earnestness, naturalness, and beauty that find no parallel in the literature of the world. But the consideration must not be overlooked, that they were the work of those men who wrote as they were moved of the Holy Ghost, that they contain the life and the teachings of the great Founder of our faith, and that they come to us invested with divine authority. Their influence upon the ages which have succeeded them is incalculable, and it is still widening as the knowledge of Christianity increases. The composition of the New Testament is historical, epistolary, and prophetic. The first five books, or the historical division, contain an account of the life and death of our Saviour, and some account of the first movements of the Apostles. The epistolary division consists of letters addressed by the Apostles to the different churches or to individuals. The last, the book of Revelation, the only part that is considered prophetic, differs from the others in its use of that symbolical language which had been common to the Hebrew prophets, in the sublimity and majesty of its imagery, and in its prediction of the final and universal triumph of Christianity. The writings of the Apostolic Fathers, or the immediate successors of the Apostles, were held in high estimation by the primitive Christians. Of those who wrote under this denomination, the venerable Polycarp and Ignatius, after they had both attained the age of eighty years, sealed their faith in the blood of martyrdom. The former was burned at the stake in Smyrna, and the latter devoured by lions in the amphitheatre of Rome. In the second and third centuries, Christianity numbered among its advocates many distinguished scholars and philosophers, particularly among the Greeks. Their productions may be classed under the heads of biblical, controversial, doctrinal, historical, and homiletical. Among the most distinguished of the Greek fathers were Justin Martyr (fl. 89 A.D.), an eminent Christian philosopher and speculative thinker; Clement of Alexandria (fl. 190 A.D.), who has left us a collection of works, which, for learning and literary talent, stand unrivaled among the writings of the early Christian fathers; Origen (184-253 A.D.), who, in his numerous works, attempted to reconcile philosophy with Christianity; Eusebius (fl. 325 A.D.), whose ecclesiastical history is ranked among the most valuable remains of Christian antiquity; Athanasius, famous for his controversy with Arius; Gregory Nazianzen (329-390 A.D.), distinguished for his rare union of eloquence and piety, a great orator and theologian; Basil (329-379 A.D.) whose works, mostly of a purely theological character, exhibit occasionally decided proofs of his strong feeling for the beauties of nature; and John Chrysostom (347-407 A.D.), the founder of the art of preaching, whose extant homilies breathe a spirit of sincere earnestness and of true genius. To these may be added Nemeseus (fl. 400 A.D.), whose work on the "Nature of Man" is distinguished by the purity of its style and by the traces of a careful study of classical authors, and Synesius (378-430 A.D.), who maintained the parallel importance of pagan and Christian literature, and who has always been held in high estimation for his epistles, hymns, and dramas.

MODERN LITERATURE.

At the time of the fall of Constantinople, ancient Greek was still the vehicle of literature, and as such it has been preserved to our day. After the political changes of the present century, however, it was felt by the best Greek writers that the old forms were no longer fitted to express modern ideas, and hence it has become transfused with those better adapted to the clear and rapid expression of modern literature, though at the same time the body and substance, as well as the grammar, of the language have been retained. From an early age, along with the literary language of Greece, there existed a conversational language, which varied in different localities, and out of this grew the Modern Greek or Neo-Hellenic. After the fall of Constantinople, the Greeks were prominent in spreading a knowledge of their language through Europe, and but few works of importance were produced. During the eighteenth century a revival of enthusiasm for education and literature took place, and a period of great literary activity has since followed. Perhaps no nation now produces so much literature in proportion to its numbers, although the number of readers is small and there are great difficulties in publishing. In these circumstances, the Ralli and other distinguished Greeks have nobly come forward and published books at their own expense, and great activity prevails in every department of letters. Since the establishment of Greek independence, three writers have secured for themselves a permanent place in literature as men of true genius: the two brothers Panagiotis and Alexander Santsos, and Alexander Rangabé. The brothers Santsos threw all their energies into the war for independence and sang of its glories. Panagiotis (d. 1868) was always lyrical, and Alexander (d. 1863) always satirical. Both were highly ideal in their conceptions, and both had a rich command of musical language. The other great poet of regenerated Greece is Alexander Rangabé, whose works range through almost every department of literature, though it is on his poems that his claim to remembrance will specially rest. They are distinguished by fine poetic feeling, rare command of exquisite and harmonious language, and singular beauty and purity of thought. His poetical works consist of hymns, odes, songs, narrative poems, ballads, tragedies, comedies, and translations. There is no department in prose literature which is not well represented in modern Greek, and many women have particularly distinguished themselves.

ROMAN LITERATURE.

INTRODUCTION.--1. Roman Literature and its Divisions.--2. The Language; Ethnographical Elements of the Latin Language; the Umbrian; Oscan; Etruscan; the Old Roman Tongue; Saturnian Verse; Peculiarities of the Latin Language.--3. The Roman Religion.

PERIOD FIRST.--1. Early Literature of the Romans; the Fescennine Songs; the Fabulae Atellanae.--2. Early Latin Poets; Livius Andronicus, Naevius, and Ennius.--3. Roman Comedy.--4. Comic Poets; Plautus, Terence, and Statius.--5. Roman Tragedy.--6. Tragic Poets; Pacuvius and Attius.--7. Satire; Lucilius.--8. History and Oratory; Fabius Pictor; Cencius Alimentus; Cato; Varro; M. Antonius; Crassus; Hortensius.--9. Roman Jurisprudence.--10. Grammarians.

PERIOD SECOND.--1. Development of the Roman Literature.--2. Mimes, Mimographers, Pantomime; Laberius and P. Lyrus.--3. Epic Poetry; Virgil; The Aeneid.--4. Didactic Poetry; the Bucolics; the Georgics; Lucretius.--5. Lyric Poetry; Catullus; Horace.--6. Elegy; Tibullus; Propertius; Ovid. --7. Oratory and Philosophy; Cicero.--8. History; J. Caesar; Sallust; Livy.--9. Other Prose Writers.

PERIOD THIRD.--1. Decline of Roman Literature.--2. Fable; Phaedrus.--3. Satire and Epigram; Persius, Juvenal, Martial.--4. Dramatic Literature; the Tragedies of Seneca.--5. Epic Poetry; Lucan; Silius Italicus; Valerius Flaccus; P. Statius.--6. History; Paterculus; Tacitus; Suetonius; Q. Curtius; Valerius Maximus.--7. Rhetoric and Eloquence; Quintilian; Pliny the Younger.--8. Philosophy and Science; Seneca; Pliny the Elder; Celsus; P. Mela; Columella; Frontinus.--9. Roman Literature from Hadrian to Theodoric; Claudian; Eutropius; A. Marcellinus; S. Sulpicius; Gellius; Macrobius; L. Apuleius; Boethius; the Latin Fathers.--10. Roman Jurisprudence.

INTRODUCTION.

1. ROMAN LITERATURE AND ITS DIVISIONS.--Inferior to Greece in the genius of its inhabitants, and, perhaps, in the intrinsic greatness of the events of which it was the theatre, unquestionably inferior in the fruits of intellectual activity, Italy holds the second place in the classic literature of antiquity. Etruria could boast of arts, legislation, scientific knowledge, a fanciful mythology, and a form of dramatic spectacle, before the foundations of Rome were laid. But, like the ancient Egyptians, the Etrurians made no progress in composition. Verses of an irregular structure and rude in sense and harmony appear to have formed the highest limit of their literary achievements. Nor did even the opulent and luxurious Greeks of Southern Italy, while they retained their independence, contribute much to the glory of letters in the West. It was only in their fall that they did good service to the cause, when they redeemed the disgrace of their political humiliation by the honor of communicating the first impulse towards intellectual refinement to the bosoms of their conquerors. When, in the process of time, Sicily, Macedonia, and Achaia had become Roman provinces, some acquaintance with the language of their new subjects proved to be a matter almost of necessity to the victorious people; but the first impression made at Rome by the productions of the Grecian Muse, and the first efforts to create a similar literature, must be traced to the conquest of Tarentum (272 B.C.). >From that memorable period, the versatile talents which distinguished the Greeks in every stage of national decline began to exercise a powerful influence on the Roman mind, which was particularly felt in the departments of education and amusement. The instruction of the Roman youth was committed to the skill and learning of Greek slaves; the spirit of the Greek drama was transferred into the Latin tongue, and, somewhat later, Roman genius and ambition devoted their united energies to the study of Greek rhetoric, which long continued to be the guide and model of those schools, in whose exercises the abilities of Cicero himself were trained. Prejudice and patriotism were powerless to resist this flood of foreign innovation; and for more than a century after the Tarentine war, legislative influence strove in vain to counteract the predominance of Greek philosophy and eloquence. But this imitative tendency was tempered by the pride of Roman citizenship. That sentiment breaks out, not merely in the works of great statesmen and warriors, but quite as strikingly in the productions of those in whom the literary character was all in all. It is as prominent in Virgil and Horace as in Cicero and Caesar; and if the language of Rome, in other respects so inferior to that of Greece, has any advantage over the sister tongue, it lies in that accent of dignity and command which seems inherent in its tones. The austerity of power is not shaded down by those graceful softening so agreeable to the disposition of the most polished Grecian communities. In the Latin forms and syntax we are everywhere conscious of a certain energetic majesty and forcible compression. We hear, as it were, the voice of one who claims to be respected, and resolves to be obeyed. The Roman classical literature may be divided into three periods. The first embraces its rise and progress, oral and traditional compositions, the rude elements of the drama, the introduction of Greek literature, and the construction and perfection of comedy. To this period the first five centuries of the republic may be considered as introductory, for Rome had, properly speaking, no literature until the conclusion of the first Punic war (241 B.C.), and the first period, commencing at that time, extends through 160 years--that is, to the first appearance of Cicero in public life, 74 B.C. The second period ends with the death of Augustus, 14 A.D. It comprehends the age of which Cicero is the representative as the most accomplished orator, philosopher, and prose-writer of his time, as well as that of Augustus, which is commonly called the Golden Age of Latin poetry. The third and last period terminates with the death of Theodoric, 526 A.D. Notwithstanding the numerous excellences which distinguished the literature of this time, its decline had evidently commenced, and, as the age of Augustus has been distinguished by the epithet "golden," the succeeding period, to the death of Hadrian, 138 A.D., on account of its comparative inferiority, has been designated "the Silver Age." From this time to the close of the reign of Theodoric, only a few distinguished names are to be found.

2. THE LANGUAGE.--The origin of the Latin language is necessarily connected with that of the Romans themselves. In the most distant ages to which tradition extends, Italy appears to have been inhabited by three stocks or tribes of the great Indo-European family. One of these is commonly known by the name of Oscans; another consisted of two branches, the Sabelians or Sabines, and the Umbrians; the third was called Sikeli, sometimes Vituli or Itali. The original settlements of the Umbrians extended over the district bounded on one side by the Tiber, and on the other by the Po. All the country to the south was in possession of the Oscans, with the exception of Latium, which was inhabited by the Sikeli. But, in process of time, the Oscans, pressed upon by the Sabines, invaded the abodes of this peaceful and rural people, some of whom submitted, and amalgamated with their conquerors; the rest were driven across the narrow sea into Sicily, and gave their name to the island. These tribes were not left in undisturbed possession of their rich inheritance. More than 1000 B.C. there arrived in the northern part of Italy the Pelasgians (or dark Asiatics), an enterprising race, famed for their warlike spirit and their skill in the arts of peace, who became the civilizers of Italy. They were far advanced in the arts of civilization and refinement, and in the science of politics and social life. They enriched their newly acquired country with commerce, and filled it with

strongly fortified and populous cities, and their dominion rapidly spread over the whole peninsula. Entering the territory of the Umbrians, they drove them into the mountainous districts, or compelled them to live among them as a subject people, while they possessed themselves of the rich and fertile plains. The headquarters of the invaders was Etruria, and that portion of them who settled there were known as Etrurians. Marching southward, they vanquished the Oscans and occupied the plains of Latium. They did not, however, remain long at peace in the districts which they had conquered. The old inhabitants returned from the neighboring highlands to which they had been driven, and subjugated the northern part of Latium, and established a federal union between the towns of the north, of which Alba was the capital, while of the southern confederacy the chief city was Lavinium. At a later period, a Latin tribe, belonging to the Alban federation, established itself on the Mount Palatine, and founded Rome, while a Sabine community occupied the neighboring heights of the Quirinal. Mutual jealousy of race kept them, for some time, separate from each other; but at length the two communities became one people, called the Romans. These were, at an early period, subjected to Etruscan rule, and when the Etruscan dynasty passed away, its influence still remained, and permanently affected the Roman language. The Etruscan tongue being a compound of Pelasgian and Umbrian, the language of Latium may be considered as the result of those two elements combined with the Oscan, and brought together by the mingling of those different tribes. These elements, which entered into the formation of the Latin, may be classified under two heads: the one which has, the other which has not a resemblance to the Greek. All Latin words which resemble the Greek are Pelasgian, and all which do not are Etruscan, Oscan, or Umbrian. From the first of these classes must be excepted those words which are directly derived from the Greek, the origin of which dates partly from the time when Rome began to have intercourse with the Greek colonies of Magna Graecia, partly after the Greeks exercised a direct influence on Roman literature. Of the ancient languages of Italy, which concurred in the formation of the Latin, little is known. The Eugubine Tables are the only extant fragments of the Umbrian language. These were found in the neighborhood of Ugubio, in the year 1414 A.D.; they date as early as 354 B.C., and contain prayers and rules for religious ceremonies. Some of these tables were engraved in Etruscan or Umbrian characters, others in Latin letters. The remains which have come down to us of the Oscan language belong to a composite idiom made up of the Sabine and Oscan, and consist chiefly of an inscription engraved on a brass plate, discovered in 1793 A.D. As the word *Bansae* occurs in this inscription, it has been supposed to refer to the town of Bantia, which was situated not far from the spot where the tablet was found, and it is, therefore, called the Bantine Table. The similarity between some of the words found in the Eugubine Tables and in Etruscan inscriptions, shows that the Etruscan language was composed of the Pelasgian and Umbrian, and from the examples given by ethnographers, it is evident that the Etruscan element was most influential in the formation of the Latin language. The old Roman tongue, or *lingua prisca*, as it was composed of these materials, and as it existed previous to coming in contact with the Greek, has almost entirely perished; it did not grow into the new, like the Greek, by a process of intrinsic development, but it was remoulded by external and foreign influences. So different was the old Roman from the classical Latin, that some of those ancient fragments were with difficulty intelligible to the cleverest and best educated scholars of the Augustan age. An example of the oldest Latin extant is contained in the sacred chant of the *Fratres Arvales*. These were a college of priests, whose function was to offer prayers for plentiful harvests, in solemn dances and processions at the opening of spring. Their song was chanted in the temple with closed doors, accompanied by that peculiar dance which was termed the *tripudium*, from its containing three beats. The inscription which embodied this litany was discovered in Rome in 1778 A.D. The monument belongs to the reign of Heliogabalus, 218 A.D., but although the date is so recent, the permanence of religious formulas renders it probable that the inscription contains the exact words sung by this priesthood in the earliest times. The "*Carmen Saliare*," or the Salian hymn, the *leges regiae*, the Tiburtine inscription, the inscription on the sarcophagus of L. Cornelius Scipio Barbatus, the great-grandfather of the conqueror of Hannibal, the epitaph of Lucius Scipio, his son, and, above all, the Twelve Tables, are the other principal extant monuments of ancient Latin. The laws of the Twelve Tables were engraven on tablets of brass, and publicly set up in the *comitium*; they were first made public 449 B.C. Most of these literary monuments were written in Saturnian verse, the oldest measure used by the Latin poets. It was probably derived from the Etruscans, and until Ennius introduced the heroic hexameter, the strains of the Italian bards flowed in this metre. The structure of the Saturnian is very simple, and its rhythmical arrangement is found in the poetry of every age and country. Macaulay adduces, as an example of this measure, the following line from the well-known nursery song,--- "The queen was in her parlour, | eating bread and honey." >From this species of verse, which probably prevailed among the natives of Provence (the Roman *Provincia*), and into which, at a later period, rhyme was introduced as an embellishment, the Troubadours derived the metre of their ballad poetry, and thence introduced it into the rest of Europe. A wide gap separates this old Latin from the Latin of Ennius, whose style was formed by Greek taste; another not so wide is interposed between the age of Ennius and that of Plautus and Terence, and lastly, Cicero and the Augustan poets mark another age. But in all its periods of development, the Latin bears a most intimate relation with the Greek. This similarity is the result both of their common origin from

the primitive Pelasgian and of the intercourse which the Romans at a later period held with the Greeks. Latin, however, had not the plastic property of the Greek, the faculty of transforming itself into every variety of form and shape conceived by the fancy and imagination; it partook of the spirit of Roman nationality, of the conscious dignity of the Roman citizen, of the indomitable will that led that people to the conquest of the world. In its construction, instead of conforming to the thought, it bends the thought to its own genius. It is a fit language for expressing the thoughts of an active and practical, but not of an imaginative and speculative people. It was propagated, like the dominion of Rome, by conquest. It either took the place of the language of the conquered nation, or became ingrafted upon it, and gradually pervaded its composition; hence its presence is discernible in all European languages.

3. THE RELIGION.--The religion and mythology of Etruria left an indelible stamp on the rites and ceremonies of the Roman people. At first they worshiped heaven and earth, personified in Saturn and Ops, by whom Juno, Vesta, and Ceres were generated, symbolizing marriage, family, and fertility; soon after, other Etruscan divinities were introduced, such as Jupiter, Minerva, and Janus; and Sylvanus and Faunus, who delighted in the simple occupations of rural and pastoral life. From the Etrurians the Romans borrowed, also, the institution of the Vestals, whose duty was to watch and keep alive the sacred fire of Vesta; the Lares and Penates, the domestic gods, which presided over the dwelling and family; Terminus, the god of property and the rites connected with possession; and the orders of Augurs and Aruspices, whose office was to consult the flight of birds or to inspect the entrails of animals offered in sacrifice, in order to ascertain future events. The family of the Roman gods continued to increase by adopting the divinities of the conquered nations, and more particularly by the introduction of those of Greece. The general division of the gods was twofold,--the superior and inferior deities. The first class contained the Consentes and the Selecti; the second, the Indigetes and Semones. The Consentes, so called because they were supposed to form the great council of heaven, consisted of twelve: Jupiter, Neptune, Apollo, Mars, Mercury, Vulcan, Juno, Minerva, Ceres, Diana, Venus, and Vesta. The Selecti were nearly equal to them in rank, and consisted of eight: Saturn, Pluto, Bacchus, Janus, Sol, Genius, Rhea, and Luna. The Indigetes were heroes who were ranked among the gods, and included particularly Hercules, Castor and Pollux, and Quirinus or Romulus. The Semones comprehended those deities that presided over particular objects, as Pan, the god of shepherds; Flora, the goddess of flowers, etc. Besides these, there were among the inferior gods a numerous class of deities, including the virtues and vices and other objects personified. The religion of the Romans was essentially political, and employed as a means of promoting the designs of the state. It was prosaic in its character, and in this respect differed essentially from the artistic and poetical religion of the Greeks. The Greeks conceived religion as a free and joyous worship of nature, a centre of individuality, beauty, and grace, as well as a source of poetry, art, and independence. With the Romans, on the contrary, religion conveyed a mysterious and hidden idea, which gave to this sentiment a gloomy and unattractive character, without either moral or artistic influence.

PERIOD FIRST.

FROM THE CONCLUSION OF THE FIRST PUNIC WAR TO THE AGE OF CICERO (241-74 B.C.)

1. EARLY LITERATURE OF THE ROMANS.--The Romans, like all other nations, had oral poetical compositions before they possessed any written literature. Cicero speaks of the banquet being enlivened by the songs of bards, in which the exploits of heroes were recited and celebrated. By these lays national pride and family vanity were gratified, and the anecdotes, thus preserved, furnished sources of early legendary history. But these legends must not be compared to those of Greece, in which the religious sentiment gave a supernatural glory to the effusions of the bard, painted men as heroes and heroes as deities, and, while it was the natural growth of the Greek intellect, twined itself around the affections of the people. The Roman religion was a ceremonial for the priests, and not for the people, and in Roman tradition there are no traces of elevated genius or poetical inspiration. The Romans possessed the germs of those faculties which admit of cultivation and improvement, such as taste and genius, and the appreciation of the beautiful; but they did not possess those natural gifts of fancy and imagination which formed part of the Greek mind, and which made that nation in a state of infancy, almost of barbarism, a poetical people. With them literature was not of spontaneous growth; it was chiefly the result of the influence exerted by the Etruscans, who were their teachers in everything mental and spiritual. The tendency of the Roman mind was essentially utilitarian. Even Cicero, with all his varied accomplishments, will recognize but one end and object of all study, namely, those sciences which will render man useful to his country, and the law of literary development is modified according to this ruling principle. From the very beginning, the first cause of Roman literature will be found to have

been a view to utility and not to the satisfaction of an impulsive feeling. In other nations, poetry has been the first spontaneous production. With the Romans, the first written literary effort was history; but even their early history was a simple record of facts, not of ideas or sentiments, and valuable only for its truth and accuracy. Their original documents, mere records of memorable events anterior to the capture of Rome by the Gauls, perished in the conflagration of the city. The earliest attempt at versification made by the rude inhabitants of Latium was satire in a somewhat dramatic form. The Fescennine songs were metrical, for the accompaniments of music and dancing necessarily restricted them to measure, and, like the dramatic exhibitions of the Greeks, they had their origin among the rural population, not like them in any religious ceremonial, but in the pastimes of the village festival. At first they were innocent and gay, but liberty at length degenerated into license, and gave birth to malicious and libelous attacks upon persons of irreproachable character. This infancy of song illustrates the character of the Romans in its rudest and coarsest form. They loved strife, both bodily and mental, and they thus early displayed that taste which, in more polished ages, and in the hands of cultivated poets, was developed in the sharp, cutting wit, and the lively but piercing points of Roman satire. In the Fescennine songs the Etruscans probably furnished the spectacle, all that which addresses itself to the eye, while the habits of Italian rural life supplied the sarcastic humor and ready extemporaneous gibe, which are the essence of the true comic. The next advance in point of art must be attributed to the Oscans, whose entertainments were most popular among the Italian nations. They represented in broad caricature national peculiarities. Their language was, originally, Oscan, as well as the characters represented. The principal one resembled the clown of modern pantomime; another was a kind of pantaloon or charlatan, and much of the rest consisted of practical jokes, like that of the Italian Polincinella. After their introduction at Rome, they received many improvements; they lost their native rusticity; their satire was good-natured; their jests were seemly, and kept in check by the laws of good taste. They were not acted by common professional performers, and even a Roman citizen might take part in them without disgrace. They were known by the name of "Fabulae Atellanae," from Attela, a town in Campania, where they were first performed. They remained in favor with the Roman people for centuries. Sylla amused his leisure hours in writing them, and Suetonius bears testimony to their having been a popular amusement under the empire. Towards the close of the fourth century, the Etruscan histriones were introduced, whose entertainments consisted of graceful national dances, accompanied with the music of the flute, but without either songs or dramatic action. With these dances the Romans combined the old Fescennine songs, and the varied metres, which their verse permitted to the vocal parts, gave to this mixed entertainment the name of *Satura* (a hodge-podge or potpourri), from which, in after times, the word satire was derived.

2. EARLY LATIN POETS.--At the conclusion, of the first Punic war, when the influence of Greek intellect, which had already long been felt in Italy, had extended to the capital, the Romans were prepared for the reception of a more regular drama. But not only did they owe to Greece the principles of literary taste; their earliest poet was one of that nation. Livius Andronicus (fl. 240 B.C.), though born in Italy, and educated at Rome, is supposed to have been a native of the Greek colony of Tarentum. He was at first a slave, probably a captive taken in war, but was finally emancipated by his master, in whose family he occupied the position of instructor to his children. He wrote a translation, or perhaps an imitation of the *Odyssey*, in the old Saturnian metre, and also a few hymns. His principal works, however, were tragedies; but, from the few fragments of his writings extant, it is impossible to form an estimate of his ability as a poet. According to Livy, Andronicus was the first who substituted, for the rude extemporaneous effusions of the Fescennine verse, plays with a regular plot and fable. In consequence of losing his voice, from being frequently encored, he obtained permission to introduce a boy to sing the ode or air to the accompaniment of the flute, while he himself represented the action of the song by his gestures and dancing. Naevius (fl. 235 B.C.) was the first poet who really deserves the name of Roman. He was not a servile imitator, but applied Greek taste and cultivation to the development of Roman sentiments, and was a true Roman in heart, unsparing in his censure of immorality and his admiration for heroic self-devotion. His honest principles cemented the strong friendship between him and the upright and unbending Cato, a friendship which probably contributed to form the political and literary character of that stern old Roman. The comedies of Naevius had undoubted pretensions to originality; he held up to public scorn the vices and follies of his day, and, being a warm supporter of the people against the encroachments of the nobility, and unable to resist indulgence in his satiric vein, he was exiled to Utica, where he died. He was the author of an epic poem on the Punic war. Ennius and Virgil unscrupulously copied and imitated him, and Horace writes that in his day the poems of Naevius were in the hands and hearts of everybody. The fragments of his writings extant are not more numerous than those of Livius. Naevius, the last of the older school of writers, by introducing new principles of taste to his countrymen, altered their standards; and Greek literature having now driven out its predecessor, a new school of poetry arose, of which Ennius (239-169 B.C.) was the founder. He earned a subsistence as a teacher of Greek, was the friend of Scipio, and, at his death, was buried in

the family tomb of the Scipio, at the request of the great conqueror of Hannibal, whose fame he contributed to hand down to posterity. Cicero always uses the appellation, "our own Ennius," when he quotes his poetry. Horace calls him "Father Ennius," a term which implies reverence and regard, and that he was the founder of Latin poetry. He was, like his friends Cato the censor, and Scipio Africanus the elder, a man of action as well as philosophical thought, and not only a poet, but a brave soldier, with all the singleness of heart and simplicity of manners which marked the old times of Roman virtue. Ennius possessed great power over words, and wielded that power skillfully. He improved the language in its harmony and its grammatical forms, and increased its copiousness and power. What he did was improved upon, but was never undone; and upon the foundations he laid, the taste of succeeding ages erected an elegant and beautiful superstructure. His great epic poem, the "Annals," gained him the attachment and admiration of his countrymen. In this he first introduced the hexameter to the notice of the Romans, and detailed the rise and progress of their national glory, from the earliest legendary period down to his own times. The fragments of this work which remain are amply sufficient to show that he possessed picturesque power, both in sketching his narratives and in portraying his characters, which seem to live and breathe; his language, dignified, chaste, and severe, rises as high as the most majestic eloquence, but it does not soar to the sublimity of poetry. As a dramatic poet, Ennius does not deserve a high reputation. In comedy, as in tragedy, he never emancipated himself from the Greek originals.

3. ROMAN COMEDY.--The rude comedy of the early Romans made little progress beyond personal satire, burlesque extravagance and licentious jesting, but upon this was ingrafted the new Greek comedy, and hence arose that phase of the drama, of which the representatives were Plautus, Stautius, and Terence. The Roman comedy was calculated to produce a moral result, although the morality it inculcated was extremely low. Its standard was worldly prudence, its lessons utilitarian, and its philosophy Epicurean. There is a want of variety in the plots, but this defect is owing to the social and political condition of ancient Greece, which was represented in the Greek comedies and copied by the Romans. There is also a sameness in the *dramatis personae*, the principal characters being always a morose or a gentle father, who is sometimes also the henpecked husband of a rich wife, an affectionate or domineering wife, a good-natured profligate, a roguish servant, a calculating slave-dealer and some others. The actors wore appropriate masks, the features of which were not only grotesque, but much exaggerated and magnified. This was rendered necessary by the immense size of the theatre and stage, and the mouth of the mask answered the purpose of a speaking trumpet, to assist in conveying the voice to every part of the vast building. The characters were known by a conventional costume; old men wore robes of white, young men were attired in gay clothes, rich men in purple, soldiers in scarlet, poor men and slaves in dark and scanty dresses. The comedy had always a musical accompaniment of flutes of different kinds. In order to understand the principles which regulated the Roman comic metres, it is necessary to observe the manner in which the language itself was affected by the common conversational pronunciation. Latin, as it was pronounced, was very different from Latin as it is written; this difference consisted in abbreviation, either by the omission of sounds altogether, or by the contraction of two sounds into one, and in this respect the conversational language of the Romans resembled that of modern nations; with them, as with us, the mark of good taste was ease and the absence of pedantry and affectation. In the comic writers we have a complete representation of Latin as it was commonly pronounced and spoken, and but little trammelled or confined by a rigid adhesion to Greek metrical laws.

4. COMIC POETS.--Plautus (227-184 B.C.) was a contemporary of Ennius; he was a native of Umbria, and of humble origin. Education did not overcome his vulgarity, although it produced a great effect upon his language and style. He must have lived and associated with the people whose manners he describes, hence his pictures are correct and truthful. The class from which his representations are taken consisted of clients, the sons of freedmen and the half-enfranchised natives of Italian towns. He had no aristocratic friends, like Ennius and Terence; the Roman public were his patrons, and notwithstanding their faults, his comedies retained their popularity even in the Augustan age, and were acted as late as the reign of Diocletian. Life, bustle, surprise, unexpected situations, sharp, sparkling raillery that knew no restraint nor bound, left his audience no time for dullness or weariness. Although Greek was the fountain from which he drew his stores, his wit, thought, and language were entirely Roman, and his style was Latin of the purest and most elegant kind--not, indeed, controlled by much deference to the laws of metrical harmony, but full of pith and sprightliness, bearing the stamp of colloquial vivacity, and suitable to the general briskness of his scenes. Yet in the tone of his dialogue we miss all symptoms of deference to the taste of the more polished classes of society. Almost all his comedies were adopted from the new comedy of the Greeks, and though he had studied both the old and the middle comedy, Menander and others of the same school furnished him the

originals of his plots. The popularity of Plautus was not confined to Rome, either republican or imperial. Dramatic writers of modern times, as Shakspeare, Dryden, and Molière, have recognized the effectiveness of his plots, and have adopted or imitated them. About twenty of his plays are extant, among which the *Captivi*, the *Epidicus*, the *Cistellaria*, the *Aulularia*, and the *Rudens* are considered the best. Terence (193-158 B.C.) was a slave in the family of a Roman senator, and was probably a native of Carthage. His genius presented the rare combination of all the fine and delicate qualities which characterized Attic sentiment, without corrupting the native purity of the Latin language. The elegance and gracefulness of his style show that the conversation of the accomplished society, in which he was a welcome guest, was not lost upon his correct ear and quick intuition. So far as it can be so, comedy was, in the hands of Terence, an instrument of moral teaching. Six of his comedies only remain, of which the *Andrian* and the *Adelphi* are the most interesting. If Terence was inferior to Plautus in life, bustle, and intrigue, and in the delineation of national character, he is superior in elegance of language and refinement of taste. The justness of his reflections more than compensates for the absence of his predecessor's humor; he touches the heart as well as gratifies the intellect. Of the few other writers of comedy among the Romans, Statius may be mentioned, who flourished between Plautus and Terence. He was an emancipated slave, born in Milan. Cicero and Varro have pronounced judgment upon his merits, the substance of which appears to be, that his excellences consisted in the conduct of the plot, in dignity, and in pathos, while his fault was too little care in preserving the purity of the Latin style. The fragments, however, of his works, which remain are not sufficient to test the opinion of the ancient critics.

5. ROMAN TRAGEDY.--While Roman comedy was brought to perfection under the influence of Greek literature, Roman tragedy, on the other hand, was transplanted from Athens, and, with few exceptions, was never anything more than translation or imitation. In the century during which, together with comedy, it flourished and decayed, it boasted of five distinguished writers, Livius, Naevius, Ennius (already spoken of), Pacuvius, and Attius. In after ages, Rome did not produce one tragic poet, unless Varius be considered an exception. The tragedies attributed to Seneca were never acted, and were only composed for reading and recitation. Among the causes which prevented tragedy from flourishing at Rome was the little influence the national legends exerted over the people. These legends were more often private than public property, and ministered more to the glory of private families than to that of the nation at large. They were embalmed by their poets as curious records of antiquity, but they did not, like the venerable traditions of Greece, twine themselves around the heart of the nation. Another reason why Roman legends had not the power to move the affections of the Roman populace is to be found in the changes the masses had undergone. The Roman people were no longer the descendants of those who had maintained the national glory in the early period; the patrician families were almost extinct; war and poverty had extinguished the middle classes and miserably thinned the lower orders. Into the vacancy thus caused, poured thousands of slaves, captives in the bloody wars of Gaul, Spain, Greece, and Africa. These and their descendants replaced the ancient people, and while many of them by their talents and energy arrived at wealth and station, they could not possibly be Romans at heart, or consider the past glories of their adopted country as their own. It was to the rise of this new element of population, and the displacement or absorption of the old race, that the decline of patriotism was owing, and the disregard of everything except daily sustenance and daily amusement, which paved the way for the empire and marked the downfall of liberty. With the people of Athens, tragedy formed a part of the national religion. By it the people were taught to sympathize with their heroic ancestors; the poet was held to be inspired, and poetry the tongue in which the natural held communion with the supernatural. With the Romans, the theatre was merely a place for secular amusement, and poetry only an exercise of the fancy. Again, the religion of the Romans was not ideal, like that of the Greeks. The old national faith of Italy, not being rooted in the heart, soon became obsolete, and readily admitted the ingrafting of foreign superstitions, which had no hold on the belief or love of the people. Nor was the genius of the Roman people such as to sympathize with the legends of the past; they lived only in the present and the future; they did not look back on their national heroes as demigods; they were pressing forward to extend the frontiers of their empire, to bring under their yoke nations which their forefathers had not known. If they regarded their ancestors at all, it was not in the light of men of heroic stature as compared with themselves, but as those whom they could equal or even surpass. The scenes of real life, the bloody combats of the gladiators, the captives, and malefactors stretched on crosses, expiring in excruciating agonies or mangled by wild beasts, were the tragedies which most deeply interested a Roman audience. The Romans were a rough people, full of physical rather than of intellectual energy, courting peril and setting no value on human life or suffering. Their very virtues were stern and severe; they were strangers to both the passions which it was the object of tragedy to excite--pity and terror. In the public games of Greece, the refinements of poetry mingled with those exercises which were calculated to invigorate the physical powers, and develop manly beauty. Those of Rome were sanguinary and brutalizing, the amusements of a nation to whom war was a pleasure and a pastime. It cannot be asserted, however, that tragedy was never to a

certain extent an acceptable entertainment at Rome, but only that it never flourished there as it did at Athens, and that no Roman tragedies can be compared with those of Greece.

6. TRAGIC POETS.--Three separate eras produced tragic poets. In the first flourished Livius Andronicus, Naevius, and Ennius; in the second, Pacuvius and Attius; in the third, Asinius Pollio wrote tragedies, the plots of which seem to have been taken from Roman history. Ovid attempted a "Medea," and even the Emperor Augustus, with other men of genius, tried his hand, though unsuccessfully, at tragedy. In the second of the eras mentioned, Roman tragedy reached its highest degree of perfection simultaneously with that of comedy. While Terence was successfully reproducing the wit and manners of the new Attic comedy, Pacuvius (220-130 B.C.) was enriching the Roman drama with free translations of the Greek tragedians. He was a native of Brundisium and a grandson of the poet Ennius. At Rome he distinguished himself as a painter as well as a dramatic poet. His tragedies were not mere translations, but adaptations of Greek tragedies to the Roman stage. The fragments which are extant are full of new and original thoughts, and the very roughness of his style and audacity of his expressions have somewhat of the solemn grandeur and picturesque boldness which distinguish the father of Attic tragedy. Attius (fl. 138 B.C.), though born later than Pacuvius, was almost his contemporary, and a competitor for popular applause. He is said to have written more than fifty tragedies, of which fragments only remain. His taste is chastened, his sentiments noble, and his versification elegant. With him, Latin tragedy disappeared. The tragedies of the third period were written expressly for reading and recitation, and not for the stage: they were dramatic poems, not dramas. Amidst the scenes of horror and violence which followed, the voice of the tragic muse was hushed. Massacre and rapine raged through the streets of Rome, itself a theatre where the most terrible scenes were daily enacted.

7. SATIRE.--The invention of satire is universally attributed to the Romans, and this is true as far as the external form is concerned, but the spirit is found in many parts of the literature of Greece. Ennius was the inventor of the name, but Lucilius (148-102 B.C.) was the father of satire, in the proper sense. His satires mark an era in Roman literature, and prove that a love for this species of poetry had already made great progress. Hitherto, literature, science, and art had been considered the province of slaves and freedmen. The stern old Roman virtue despised such sedentary employment as intellectual cultivation, and thought it unworthy of the warrior and statesman. Some of the higher classes loved literature and patronized it, but did not make it their pursuit. Lucilius was a Roman knight, as well as a poet. His satires were comprised in thirty books, numerous fragments of which are still extant. He was a man of high moral principle, though stern and stoical; a relentless enemy of vice and profligacy, and a gallant and fearless defender of truth and honesty. After the death of Lucilius satire languished, until half a century later, when it assumed a new garb in the descriptive scenes of Horace, and put forth its original vigor in the burning thoughts of Persius and Juvenal.

8. HISTORY AND ORATORY.--Prose was far more in accordance with the genius of the Romans than poetry. As a nation, they had little or no imaginative power, no enthusiastic love of natural beauty, and no acute perception of the sympathy between man and the external world. The favorite civil pursuit of an enlightened Roman was statesmanship, and the subjects akin to it, history, jurisprudence, and oratory, the natural language of which was prose, not poetry. And their practical statesmanship gave an early encouragement to oratory, which is peculiarly the literature of active life. As matter was more valued than manner by this utilitarian people, it was long before it was thought necessary to embellish prose composition with the graces of rhetoric. The fact that Roman literature was imitative rather than inventive, gave a historical bias to the Roman intellect, and a tendency to study subjects from an historical point of view. But even in history, they never attained that comprehensive and philosophical spirit which distinguished the Greek historians. The most ancient writer of Roman history was Fabius Pictor (fl. 219 B.C.). His principal work, written in Greek, was a history of the first and second Punic war, to which subsequent writers were much indebted. Contemporary with Fabius was Cincius Alimentus, also an annalist of the Punic war, in which he was personally engaged. He was a prisoner of Hannibal, who delighted in the society of literary men, and treated him with great kindness and consideration, and himself communicated to him the details of his passage across the Alps. Like Fabius, he wrote his work in Greek, and prefixed to it a brief abstract of Roman history. Though the works of these annalists are valuable as furnishing materials for more philosophical minds, they are such as could have existed only in the infancy of a national literature. They were a bare compilation of facts-- the mere framework of history--diversified by no critical remarks or political reflections, and meagre and insipid in style. The versatility of talent displayed by Cato the censor (224-144 B.C.) entitles him to a place among orators, jurists, economists, and historians. His life extends over a wide and important period of literary history, when everything

was in a state of change,—morals, social habits, and literary taste. Cato was born in Tusculum, and passed his boyhood in the pursuits of rural life at a small Sabine farm belonging to his father. The skill with which he pleaded the causes of his clients before the rural magistracy made his abilities known, and he rose rapidly to eminence as a pleader. He filled many high offices of state. His energies were not weakened by advancing age, and he was always ready as the advocate of virtue, the champion of the oppressed, and the punisher of vice. With many defects, Cato was morally and intellectually one of the greatest men Rome ever produced. He had the ability and the determination to excel in everything which he undertook. His style is rude, unpolished, ungraceful, because to him polish was superficial, and, therefore, unreal. His statements, however, were clear, his illustrations striking; the words with which he enriched his native tongue were full of meaning; his wit was keen and lively, and his arguments went straight to the intellect, and carried conviction with them. Cato's great historical and antiquarian work, "The Origins," was a history of Italy and Rome from the earliest times to the latest events which occurred in his own lifetime. It was a work of great research and originality, but only brief fragments of it remain. In the "De Re Rustica," which has come down to us in form and substance as it was written, Cato maintains, in the introduction, the superiority of agriculture over other modes of gaining a livelihood. The work itself is a commonplace book of agriculture and domestic economy; its object is utility, not science: it serves the purpose of a farmer's and gardener's manual, a domestic medicine, herbal, and cookery book. Cato teaches his readers, for example, how to plant osier beds, to cultivate vegetables, to preserve the health of cattle, to pickle pork, and to make savory dishes. Of the "Orations" of Cato, ninety titles are extant, together with numerous fragments. In style he despised art. He was too fearless and upright, too confident in the justness of his cause to be a rhetorician; he imitated no one, and no one was ever able to imitate him. Niebuhr pronounces him to be the only great man in his generation, and one of the greatest and most honorable characters in Roman history. Varro (116-28 B.C.) was an agriculturist, a grammarian, a critic, a theologian, a historian, a philosopher, a satirist. Of his miscellaneous works considerable portions are extant, sufficient to display his erudition and acuteness, yet, in themselves, more curious than attractive. Eloquence, though of a rude, unpolished kind, must have been, in the very earliest times, a characteristic of the Roman people. It is a plant indigenous to a free soil. As in modern times it has flourished especially in England and America, fostered by the unfettered freedom of debate, so it found a congenial home in free Greece and republican Rome. Oratory was, in Rome, the unwritten literature of active life, and recommended itself to a warlike and utilitarian people by its utility and its antagonistic spirit. Long before the art of the historian was sufficiently advanced to record a speech, the forum, the senate, the battlefield, and the threshold of the jurisconsult had been nurseries of Roman eloquence, or schools in which oratory attained a vigorous youth, and prepared for its subsequent maturity. While the legal and political constitution of the Roman people gave direct encouragement to deliberative and judicial oratory, respect for the illustrious dead furnished opportunities for panegyric. The song of the bard in honor of the departed warrior gave place to the funeral oration. Among the orators of this time were the two Scipios, and Galba, whom Cicero praises as having been the first Roman who understood how to apply the theoretical principles of Greek rhetoric. All periods of political disquiet are necessarily favorable to eloquence, and the era of the Gracchi was especially so. After a struggle of nearly four centuries the old distinction of plebeian and patrician no longer existed. Plebeians held high offices, and patricians, like the Gracchi, stood forward as champions of popular rights. These stirring times produced many celebrated orators. The Gracchi themselves were both eloquent and possessed of those qualities and endowments which would recommend their eloquence to their countrymen. Oratory began now to be studied more as an art, and the interval between the Gracchi and Cicero boasted of many distinguished names; the most illustrious among them are M. Antonius, Crassus, and Cicero's contemporary and most formidable rival, Hortensius. M. Antonius (fl. 119 B.C.) entered public life as a pleader, and thus laid the foundation of his brilliant career; but he was through life greater as a judicial than as a deliberative orator. He was indefatigable in preparing his case, and made every point tell. He was a great master of the pathetic, and knew the way to the heart. Although he did not himself give his speeches to posterity, some of his most pointed expressions and favorite passages left an indelible impression on the memories of his hearers, and many of them were preserved by Cicero. In the prime of life he fell a victim to political fury, and his bleeding head was placed upon the rostrum, which was so frequently the scene of his eloquent triumphs. L. Licinius Crassus was four years younger than Antonius, and acquired great reputation for his knowledge of jurisprudence, for his eminence as a pleader, and, above all, for his powerful and triumphant orations in support of the restoration of the judicial office to the senators. From among the crowd of orators, who were then flourishing in the last days of expiring Roman liberty, Cicero selected Crassus to be the representative of his sentiments in his imaginary conversation in "The Orator." Like Lord Chatham, Crassus almost died on the floor of the Senate house, and his last effort was in support of the aristocratic party. Q. Hortensius was born 114 B.C. He was only eight years senior to the greatest of all Roman orators. He early commenced his career as a pleader, and he was the acknowledged leader of the Roman bar, until the star of Cicero arose. His political connection with the faction of Sylla, and his unscrupulous support of the profligate corruption which characterized that administration,

both at home and abroad, enlisted his legal talents in defense of the infamous Verres; but the eloquence of Cicero, together with the justice of the cause which he espoused, prevailed; and from that time forward his superiority over Hortensius was established and complete. The style of Hortensius was Asiatic--more florid and ornate than polished and refined.

9. ROMAN JURISPRUDENCE.--The framework of their jurisprudence the Romans derived from Athens, but the complete structure was built up by their own hands. They were the authors of a system possessing such stability that they bequeathed it, as an inheritance, to modern Europe, and traces of Roman law are visible in the legal systems of the whole civilized world. The complicated principles of jurisprudence of the Roman constitution became, in Rome, a necessary part of a liberal education. When a Roman youth had completed his studies, under his teacher of rhetoric, he not only frequented the forum, in order to learn the application of the rhetorical principles he had acquired, and frequently took some celebrated orator as a model, but also studied the principles of jurisprudence under eminent jurists, and attended the consultations in which they gave to their clients their expositions of law. The earliest systematic works on Roman law were the "Manual" of Pomponius, and the "Institutes" of Gaius, who flourished in the time of Hadrian and the Antonines. Both of these works were, for a long time, lost, though fragments were preserved in the pandects of Justinian. In 1816, however, Niebuhr discovered a palimpsest MS., in which the epistles of St. Jerome were written over the erased "Institutes" of Gaius. From the numerous misunderstandings of the Roman historians respecting the laws and constitutional history of their country, the subject continued long in a state of confusion, until Vico, in his "Scienza nuova," dispelled the clouds of error, and reduced it to a system; and he was followed so successfully by Niebuhr, that modern students can have a more comprehensive and antiquarian knowledge of the subject than the writers of the Augustan age. The earliest Roman laws were the "Leges Regiae," which were collected and codified by Sextus Papirius, and were hence called the Papirian code; but these were rude and unconnected--simply a collection of isolated enactments. The laws of the "Twelve Tables" stand next in point of antiquity. They exhibited the first attempt at regular system, and embodied not only legislative enactments, but legal principles. So popular were they that when Cicero was a child every Roman boy committed them to memory, as our children do their catechism, and the great orator laments that in the course of his lifetime this practice had become obsolete. The oral traditional expositions of these laws formed the groundwork of the Roman civil law. To these were added, from time to time, the decrees of the people, the acts of the senate, and praetorian edicts, and from these various elements the whole body of Roman law was composed. So early was the subject diligently studied, that the age preceding the first two centuries of our era was rich in jurists whose powers are celebrated in history. The most eminent jurists who adorned this period were the Scaevolae, a family in whom the profession seems to have been hereditary. After them flourished Aelius Gallus (123-67 B.C.), eminent as a law reformer, C. Juventius, Sextus Papirius, and L. Lucilius Balbus, three distinguished jurists, who were a few years senior to Cicero.

10. GRAMMARIANS.--Towards the conclusion of this literary period a great increase took place in the numbers of those learned men whom the Romans at first termed literati, but afterwards, following the custom of the Greeks, grammarians. To them literature was under great obligations. Although few of them were authors, and all of them possessed acquired learning rather than original genius, they exercised a powerful influence over the public mind as professors, lecturers, critics, and schoolmasters. By them the youths of the best families not only were imbued with a taste for Greek philosophy and poetry, but were also taught to appreciate the literature of their own country. Livius Andronicus and Ennius may be placed at the head of this class, followed by Crates Mallotes, C. Octavius Lampadio, Laelius, Archelaus, and others, most of whom were emancipated slaves, either from Greece or from other foreign countries.

PERIOD SECOND.

FROM THE AGE OF CICERO TO THE DEATH OF AUGUSTUS (74 B.C.-14 A.D.)

1. DEVELOPMENT OF THE ROMAN LITERATURE.--Latin literature, at first rude, and, for five centuries, unable to reach any high excellence, was, as we have seen, gradually developed by the example and tendency of the Greek mind, which moulded Roman civilization anew. The earliest Latin poets, historians, and grammarians were Greeks. The metre which was brought to such perfection by the Latin poets was formed from the Greek, and the Latin language more and more assimilated to the Hellenic tongue.

As civilization advanced, the rude literature of Rome was compared with the great monuments of Greek genius, their superiority was acknowledged, and the study of them encouraged. The Roman youth not only attended the schools of the Greeks, in Rome, but their education was considered incomplete, unless they repaired to those of Athens, Rhodes, and Mytilene. Thus, whatever of national character existed in the literature was gradually obliterated, and what it gained in harmony and finish it lost in originality. The Roman writers imitated more particularly the writers of the Alexandrian school, who, being more artificial, were more congenial than the great writers of the age of Pericles.

Roman genius, serious, majestic, and perhaps more original than at a later period, was manifest even at the time of the Punic wars, but it had not yet taken form; and while thought was vigorous and powerful, expression remained weak and uncertain. But, under the Greek influence, and aided by the vigor imparted by free institutions, the union of thought and form was at length consummated, and the literature reached its culminating point in the great Roman orator. The fruits which had grown and matured in the centuries preceding were gathered by Augustus; but the influences that contributed to the splendor of his age belong rather to the republic than the empire, and with the fall of the liberties of Rome, Roman literature declined.

2. MIMES, MIMOGRAPHERS, AND PANTOMIME.--Amidst all the splendor of the Latin literature of this period, dramatic poetry never recovered from the trance into which it had fallen, though the stage had not altogether lost its popularity. Aesopus and Roscius, the former the great tragic actor, and the latter the favorite comedian, in the time of Cicero, enjoyed his friendship and that of other great men, and both amassed large fortunes. But although the standard Roman plays were constantly represented, dramatic literature had become extinct. The entertainments, which had now taken the place of comedy and tragedy, were termed mimes. These were laughable imitations of manners and persons, combining the features of comedy and farce, for comedy represents the characters of a class, farce those of individuals. Their essence was that of the modern pantomime, and their coarseness, and even indecency, gratified the love of broad humor which characterized the Roman people. After a time, when they became established as popular favorites, the dialogue occupied a more prominent position, and was written in verse, like that of tragedy and comedy.

During the dictatorship of Caesar, a Roman knight named Laberius (107-45 B.C.) became famous for his mimes. The profession of an actor of mimes was infamous, but Laberius was a writer, not an actor. On one occasion, Caesar offered him a large sum of money to enter the lists in a trial of his improvisatorial skill. Laberius did not submit to the degradation for the sake of the money, but he was afraid to refuse. The only method of retaliation in his power was sarcasm. His part was that of a slave; and when his master scourged him, he exclaimed: "Porro, Quirites, libertatem perdimus!" His words were received with a round of applause, and all eyes were fixed on Caesar. The dictator restored him to the rank of which his act had deprived him, but he could never recover the respect of his countrymen. As he passed the orchestra, on his way to the stalls of the knights, Cicero cried out: "If we were not so crowded, I would make room for you here." Laberius replied, alluding to Cicero's lukewarmness as a political partisan: "I am astonished that you should be crowded, as you generally sit on two stools."

Another writer and actor of mimes was Publius Syrus, originally a Syrian slave. Tradition has recorded a bon mot of his which is as witty as it is severe. Seeing an ill-tempered man named Mucius in low spirits, he exclaimed: "Either some ill fortune has happened to Mucius, or some good fortune to one of his friends!"

The Roman pantomime differed somewhat from the mime. It was a ballet of action, performed by a single dancer, who not only exhibited the human figure in its most graceful attitudes, but represented every passion and emotion with such truth that the spectators could, without difficulty, understand the story. The pantomime was licentious in its character, and the actors were forbidden by Tiberius to hold any intercourse with Romans of equestrian or senatorial dignity.

These were the exhibitions which threw such discredit on the stage, which called forth the well-deserved attacks of the early Christian fathers, and caused them to declare that whoever attended them was unworthy of the name of Christian. Had the drama not been so abused, had it retained its original purity, and carried out the object attributed to it by Aristotle, they would have seen it, not a nursery of vice, but a school of virtue; not only an innocent amusement, but a powerful engine to form the taste, to improve the morals, and to purify the feelings of a people.

3. EPIC POETRY.--The epic poets of this period selected their subjects either from the heroic age and the mythology of Greece, or from their own national history. The Augustan age abounds in representatives of these two

poetical schools, though possessing little merit. But the Romans, essentially practical and positive in their character, felt little interest in the descriptions of manners and events remote from their associations, and poetry, restrained within the limits of their history, could not rise to that height of imagination demanded by the epic muse. Virgil united the two forms by selecting his subject from the national history, and adorning the ancient traditions of Rome with the splendor of Greek imagination.

Virgil (70-19 B.C.) was born at Andes, near Mantua; he was educated at Cremona and at Naples, where he studied Greek literature and philosophy. After this he came to Rome, where, through Maecenas, he became known to Octavius, and basked in the sunshine of court favor. His favorite residence was Naples. On his return from Athens, in company with Augustus, he was seized with an illness of which he died. He was buried about a mile from Naples, on the road to Pozzuoli; and a tomb is still pointed out to the traveler which is said to be that of the poet. Virgil was deservedly popular both as a poet and as a man. The emperor esteemed him and people respected him; he was constitutionally pensive and melancholy, temperate, and pure-minded in a profligate age, and his popularity never spoiled his simplicity and modesty. In his last moments he was anxious to burn the whole manuscript of the Aeneid, and directed his executors either to improve it or commit it to the flames.

The idea and plan of the Aeneid are derived from Homer. As the wrath of Achilles is the mainspring of the Iliad, so the unity of the Aeneid results from the anger of Juno. The arrival of Aeneas in Italy after the destruction of Troy, the obstacles that opposed him through the intervention of Juno, and the adventures and the victories of the hero form the subject of the poem. Leaving Sicily for Latium, Aeneas is driven on the coast of Africa by a tempest raised against him by Juno; at Carthage he is welcomed by the queen, Dido, to whom he relates his past adventures and sufferings. By his narrative he wins her love, but at the command of Jupiter abandons her. Unable to retain him, Dido, in the despair of her passion, destroys herself. After passing through many dangers, under the guidance of the Sibyl of Cumae, he descends into the kingdom of the dead to consult the shade of his father. There appear to him the souls of the future heroes of Rome. On his return, he becomes a friend of the king of Latium, who promises to him the hand of his daughter, which is eagerly sought by King Turnus. A fearful war ensues between the rival lovers, which ends in the victory of Aeneas. Though the poem of Virgil is in many passages an imitation from the Iliad and the Odyssey, the Roman element predominates in it, and the Aeneid is the true national poem of Rome. There was no subject more adapted to flatter the vanity of the Romans, than the splendor and antiquity of their origin. Augustus is evidently typified under the character of Aeneas; Cleopatra is boldly sketched as Dido; and Turnus as the popular Antony. The love and death of Dido, the passionate victim of an unrequited love, give occasion to the poet to sing the victories of his countrymen over their Carthaginian rivals; the Pythagorean metempsychosis, which he adopts in the description of Elysium, affords an opportunity to exalt the heroes of Rome; and the wars of Aeneas allow him to describe the localities and the manners of ancient Latium with such truthfulness as to give to his verses the authority of historical quotations. In style, the Aeneid is a model of purity and elegance, and for the variety and the harmony of its incidents, for the power of its descriptions, and for the interest of its plot and episodes, second only to the Iliad. It has been observed that Virgil's descriptions are more like landscape painting than those of any of his predecessors, whether Greek or Roman, and it is a remarkable fact, that landscape painting was first introduced in his time.

4. DIDACTIC POETRY.--The poems, which first established the reputation of Virgil as a poet, belong to didactic poetry. They are his *Bucolics* and *Georgics*. The *Bucolics* are pastoral idyls; the characters are Italian in all their sentiments and feelings, acting, however, the unreal and assumed part of Greek shepherds. The Italians never possessed the elements of pastoral life, and could not furnish the poet with originals and models from which to draw his portraits. When represented as Virgil represents them in his *Bucolics*, they are in masquerade, and the drama in which they form the characters is of an allegorical kind. Even the scenery is Sicilian, and does not truthfully describe the tame neighborhood of Mantua. In fact, these poems are imitations of Theocritus; but, divesting ourselves of the idea of the outward form which the poet has chosen to adopt, we are touched by the simple narrative of disappointed loves and childlike woes; we appreciate the delicately-veiled compliments paid by the poet to his patron; we enjoy the inventive genius and poetical power which they display, and we are elevated by the exalted sentiments which they sometimes breathe. The *Georgics* are poems on the labors and enjoyments of rural life, a subject for which Rome offered a favorable field. Though in this style Hesiod was the model of Virgil, his system is perfectly Italian, so much so, that many of his rules may be traced in modern Italian husbandry, just as the descriptions of implements in the Greek poet are frequently found to agree with those in use in modern Greece. The great merit of the *Georgics* consists in their varied digressions, interesting episodes, and in the sublime bursts of descriptive vigor which are interspersed throughout them. They have frequently been taken as models for imitation by the didactic poets of all nations, and more particularly of England. The "Seasons," for instance, is a thoroughly Virgilian poem. Lucretius

(95-51 B.C.) belongs to the class of didactic poets. He might claim a place among philosophers as well as poets, for his poem marks an epoch both in poetry and philosophy. But his philosophy is a mere reflection from that of Greece, while his poetry is bright with the rays of original genius. His poem on "The Nature of Things" is in imitation of that of Empedocles. Its subject is philosophical and its purpose didactic; but its unity of design gives to it almost the rank of an epic. Its structure prevents it from being a complete and systematic survey of the whole Epicurean philosophy, but as far as the form of the poem permitted, it presents an accurate view of the philosophy which then enjoyed the highest popularity. The object of the poem of Lucretius is to emancipate mankind from the debasing effects of superstition by an exposition of philosophy, and though a follower of Epicurus, he is not entirely destitute of the religious sentiment, for he deifies nature and has a veneration for her laws. His infidelity must be viewed rather in the light of a philosophical protest against the results of heathen superstition, than a total rejection of the principles of religious faith. Lucretius valued the capabilities of the Latin language. He wielded at will its power of embodying the noblest thoughts, and showed how its copious and flexible properties could overcome the hard technicalities of science. The great beauty of his poetry is its variety; his fancy is always lively, his imagination has always free scope. He is sublime, as a philosopher who penetrates the secrets of the natural world, and discloses to the eyes of man the hidden causes of its wonderful phenomena. His object was a lofty one; for although the absurdities of the national creed drove him into skepticism, his aim was to set the intellect free from the trammels of superstition. But besides grandeur and sublimity, we find the totally different qualities of softness and tenderness. Rome had long known nothing but war, and was now rent by civil dissension. Lucretius yearned for peace; and his prayer, that the fabled goddess of all that is beautiful in nature would heal the wounds which discord had made, is distinguished by tenderness and pathos even more than by sublimity. He is superior to Ovid in force, though inferior in facility; not so smooth or harmonious as Virgil, his poetry always falls upon the ear with a swelling and sonorous melody. Virgil appreciated his excellence, and imitated not only single expressions, but almost entire verses and passages; and Ovid exclaims, that the sublime strains of Lucretius shall never perish until the world shall be given up to destruction.

5. LYRIC POETRY.--The Romans had not the ideality and the enthusiasm which are the elements of lyric poetry, and in all the range of their literature there are only two poets who, greatly inferior to the lyric poets of Greece, have a positive claim to a place in this department, Catullus and Horace. Catullus (86-46 B.C.) was born near Verona. At an early age he went to Rome, where he plunged into all the excesses of the capital, and where his sole occupation was the cultivation of his literary tastes and talents. A career of extravagance and debauchery terminated in the ruin of his fortune, and he died at the age of forty. The works of Catullus consist of numerous short pieces of a lyrical character, elegies and other poems. He was one of the most popular of the Roman poets, because he possessed those qualities which the literary society at Rome most valued, polish and learning, and because, although an imitator, there was a truly Roman nationality in all that he wrote. His satire was the bitter resentment of a vindictive spirit; his love and his hate were both purely selfish, but his excellences were of the most alluring and captivating kind. He has never been surpassed in gracefulness, melody, and tenderness. Horace (65-8 B.C.), like Virgil and other poets of his time, enjoyed the friendship and intimacy of Maecenas, who procured for him the public grant of his Sabine farm, situated about fifteen miles from Tivoli. At Rome he occupied a house on the beautiful heights of the Esquiline. The rapid alternation of town and country life, which the fickle poet indulged in, gives a peculiar charm to his poetry. His "Satires" were followed by the publication of the "Odes" and the "Epistles." The satires of Horace occupied the position of the fashionable novel of our day. In them is sketched boldly, but good-humoredly, a picture of Roman social life, with its vices and follies. They have nothing of the bitterness of Lucilius, the love of purity and honor that adorns Persius, or the burning indignation of Juvenal at the loathsome corruption of morals. Vice, in his day, had not reached that appalling height which it attained in the time of the emperors who succeeded Augustus. Deficient in moral purity, nothing would strike him as deserving censure, except such excess as would actually defeat the object which he proposed to himself, namely, the utmost enjoyment of life. In the "Epistles," he lays aside the character of a moral teacher or censor, and writes with the freedom with which he would converse with an intimate friend. But it is in his inimitable "Odes" that the genius of Horace as a poet is especially displayed; they have never been equaled in beauty of sentiment, gracefulness of language, and melody of versification; they comprehend every variety of subject suitable to the lyric muse; they rise without effort to the most elevated topics; and they descend to the simplest joys and sorrows of every-day life. The life of Horace is especially instructive, as a mirror in which is reflected a faithful image of the manners of his day. He is the representative of Roman refined society, as Virgil is of the national mind. His morals were lax, but not worse than those of his contemporaries. He looked at virtue and vice from a worldly, not from a moral point of view, and with him the one was prudence and the other folly. In connection with Horace, we may mention Maecenas, who, by his good taste and munificence, exercised a great influence upon literature, and literary men of Rome were much indebted to him for the use he made of his friendship with Augustus, to whom, probably, his love of literature and of pleasure and his

imperturbable temper recommended him as an agreeable companion. He had wealth enough to gratify his utmost wishes, and his mind was so full of the delights of refined society, of palaces, gardens, wit, poetry, and art, that there was no room in it for ambition. All the most brilliant men of Rome were found at his table.--Virgil, Horace, Propertius, and Varius were among his friends and constant associates. He was a fair specimen of the man of pleasure and society,--liberal, kind-hearted, clever, refined, but luxurious, self-indulgent, indolent, and volatile, with good impulses, but without principle.

6. ELEGY.--Tibullus (b. 54 B.C.) was the father of the Roman elegy. He was a contemporary of Virgil and Horace. The style of his poems and their tone of thought are like his character, deficient in vigor and manliness, but sweet, smooth, polished, tender, and never disfigured by bad taste. He passed his short life in peaceful retirement, and died soon after Virgil. The poems ascribed to Tibullus consist of four books, of which only two are genuine. Propertius (b. 150 B.C.), although a contemporary and friend of the Augustan poets, may be considered as belonging to a somewhat different school of poetry. While Horace, Virgil, and Tibullus imitated the noblest poets of the Greek age, Propertius, like the minor Roman poets, aspired to nothing more than the imitation of the graceful, but feeble strains of the Alexandrian poets. If he excels Tibullus in vigor of fancy, expression, and coloring, he is inferior to him in grace, spontaneity, and delicacy; he cannot, also, be compared with Catullus, who greatly surpasses him in his easy and effective style. Ovid (43 B.C.-6 A.D.), the most fertile of the Latin poets, not only in elegy, but also in other kinds of poetry, was enabled by his rank, fortune, and talents to cultivate the society of men of congenial tastes. A skeptic and an epicurean, he lived a life of continual indulgence and intrigue. He was a universal admirer of the female sex, and a favorite among women. He was popular as a poet, successful in society, and possessed all the enjoyments that wealth could bestow; but later in life he incurred the anger of Augustus, and was banished to the very frontier of the Roman empire, where he lingered for a few years and died in great misery. The "Epistles to and from Women of the Heroic Age" are a series of love-letters; with the exception of the "Metamorphoses," they have been greater favorites than any other of his works. Love, in the days of Ovid, had in it nothing pure or chivalrous. The age in which he lived was morally polluted, and he was neither better nor worse than his contemporaries; hence grossness is the characteristic of his "Art of Love." His "Metamorphoses" contain a series of mythological narratives from the earliest times to the translation of the soul of Julius Caesar from earth to heaven, and his metamorphosis into a star. In this poem especially may be traced that study and learning by which the Roman poets made all the treasures of Greek literature their own. "The Fasti," a poem on the Roman calendar, is a beautiful specimen of simple narrative in verse, and displays, more than any of his works, his power of telling a story without the slightest effort, in poetry as well as prose. The five books of the "Tristia," and the "Epistles from Pontus," were the outpourings of his sorrowful heart during the gloomy evening of his days.

7. ORATORY AND PHILOSOPHY.--As oratory gave to Latin prose-writing its elegance and dignity, Cicero (106-43 B.C.) is not only the representative of the flourishing period of the language, but also the instrumental cause of its arriving at perfection. He gave a fixed character to the Latin tongue; showed his countrymen what vigor it possessed, and of what elegance and polish it was susceptible. The influence of Cicero on the language and literature of his day was not only extensive, but permanent, and it survived almost until the language was corrupted by barbarism. After traveling in Greece and Asia, and holding a high office in Sicily, he returned to Rome, resumed his forensic practice, and was made consul. The conspiracy of Catiline was the great event of his consulship. The prudence and tact with which he crushed this gained him the applause and gratitude of his fellow-citizens, who hailed him as the father of his country; but he was obliged, by the intrigues of his enemies, to fly from Rome; his exile was decreed, and his town and country houses given up to plunder. He was, however, recalled, and appointed to a seat in the college of Augurs. In the struggle between Pompey and Caesar, he followed the fortunes of the former; but Caesar, after his triumph, granted him a full and free pardon. After the assassination of Caesar, Cicero delivered that torrent of indignant and eloquent invective, his twelve Philippic orations, and became again the popular idol; but when the second triumvirate was formed, and each member gave up his friends to the vengeance of his colleagues, Octavius did not hesitate to sacrifice Cicero. Betrayed by a treacherous freedman, he would not permit his attendants to make any resistance, but courageously submitted to the sword of the assassins, who cut off his head and hands, and carried them to Antony, whose wife, Julia, gloated with inhuman delight upon the pallid features, and in petty spite pierced with a needle the once eloquent tongue. Cicero had numerous faults; he was vain, vacillating, inconstant, timid, and the victim of morbid sensibility; but he was candid, truthful, just, generous, pure-minded, and warm-hearted. Gentle, sympathizing, and affectionate, he lived as a patriot and died as a philosopher. The place which Cicero occupies in the history of Roman literature is that of an orator and philosopher. The effectiveness of his oratory was mainly owing to his knowledge of the human heart, and of the national peculiarities of his countrymen. Its charm was owing to his extensive acquaintance with the stores of literature and philosophy,

which his sprightly wit moulded at will; to the varied learning, which his unpedantic mind made so pleasant and popular; and to his fund of illustration, at once interesting and convincing. He carried his hearers with him; senate, judges, and people understood his arguments, and felt his passionate appeals. Compared with the dignified energy and majestic vigor of Demosthenes, the Asiatic exuberance of some of his orations may be fatiguing to the more sober and chaste taste of modern scholars; but in order to form a just appreciation, we must transport ourselves mentally to the excitements of the thronged forum, to the senate, composed of statesmen and warriors in the prime of life, maddened with the party-spirit of revolutionary times. Viewed in this light, his most florid passages will appear free from affectation--the natural flow of a speaker carried away with the torrent of his enthusiasm. Among his numerous orations, in which, according to the criticisms of Quintilian, he combined the force of Demosthenes, the copiousness of Plato, and the elegance of Isocrates, we mention the six celebrated Verrian harangues, which are considered masterpieces of Tullian eloquence. In the speech for the poet Archias, he had evidently expended all his resources of art, taste, and skill; and his oration in defense of Milo, for force, pathos, and the externals of eloquence, deserves to be reckoned among his most wonderful efforts. The oratory of Cicero was essentially judicial; even his political orations are rather judicial than deliberative. He was not born for a politician; he did not possess that analytical character of mind which penetrates into the remote causes of human action, nor the synthetical power which enables a man to follow them out to their farthest consequences. Of the three qualities necessary for a statesman, he possessed only two,--honesty and patriotism; he had not political wisdom. Hence, in the finest specimens of his political orations, his Catilinarians and Philippics, we look in vain for the calm, practical weighing of the subject which is necessary in addressing a deliberative assembly. Nevertheless, so irresistible was the influence which he exercised upon the minds of his hearers, that all his political speeches were triumphs. His panegyric on Pompey carried his appointment as commander-in-chief of the armies of the East; he crushed in Catiline one of the most formidable traitors that had ever menaced the safety of the republic, and Antony's fall followed the complete exposure of his debauchery in private life, and the factiousness of his public career. In his rhetorical works, Cicero left a legacy of practical instruction to posterity. The treatise "On Invention" is merely interesting as the juvenile production of a future great man. "The Orator," "Brutus, or the illustrious Orators," and "The Orator to Marius Brutus," are the results of his matured experience. They form together one series, in which the principles are laid down, and their development carried out and illustrated; and in the "Orator" he places before the eyes of Brutus the model of ideal perfection. In his treatment of that subject, he shows a mind imbued with the spirit of Plato; he invests it with dramatic interest, and transports the reader into the scene which he so graphically describes. Roman philosophy was neither the result of original investigation, nor the gradual development of the Greek system. It arose rather from a study of ancient philosophical literature, than from an emanation of philosophical principles. It consisted in a kind of eclecticism with an ethical tendency, bringing together doctrines and opinions scattered over a wide field in reference to the political and social relations of man. Greek philosophy was probably first introduced into Rome 166 B.C. But although the Romans could appreciate the majestic dignity and poetical beauty of the style of Plato, they were not equal to the task of penetrating his hidden meaning; neither did the peripatetic doctrines meet with much favor. The philosophical system which first arrested the attention of the Romans, and gained an influence over their minds, was the Epicurean. That of the Stoics also, the severe principles of which were in harmony with the stern old Roman virtues, had distinguished disciples. The part which Cicero's character qualified him to perform in the philosophical instruction of his countrymen was scarcely that of a guide; he could give them a lively interest in the subject, but he could not mould and form their belief, and train them in the work of original investigation. Not being devoutly attached to any system of philosophical belief, he would be cautious of offending the philosophical prejudices of others. He was essentially an eclectic in accumulating stores of Greek erudition, while his mind had a tendency, in the midst of a variety of inconsistent doctrines, to leave the conclusion undetermined. He brought everything to a practical standard; he admired the exalted purity of stoical morality, but he feared that it was impractical. He believed in the existence of one supreme creator, in his spiritual nature, and the immortality of the soul; but his belief was rather the result of instinctive conviction, than of proof derived from philosophy. The study of Cicero's philosophical works is invaluable, in order to understand the minds of those who came after him. Not only all Roman philosophy after his time, but a great part of that of the Middle Ages, was Greek philosophy filtered through Latin, and mainly founded on that of Cicero. Among his works on speculative philosophy are "The Academics, or a history and defense of the belief of the new Academy;" "Dialogues on the Supreme Good, the end of all moral action;" "The Tusculan Disputations," containing five treatises on the fear of death, the endurance of pain, power of wisdom over sorrow, the morbid passions, and the relation of virtue to happiness. His moral philosophy comprehends the "Duties," a stoical treatise on moral obligations, and the unequalled little essays on "Friendship and Old Age." His political works are "The Republic" and "The Law;" but these remains are fragmentary. The extent of Cicero's correspondence is almost incredible. Even those epistles which remain number more than eight hundred. In them we find the eloquence of the heart, not of the rhetorical

school. They are models of pure Latinity, elegant without stiffness, the natural outpourings of a mind which could not give birth to an ungraceful idea. In his letters to Atticus he lays bare the secret of his heart; he trusts his life in his hands; he is not only his friend but his confidant, his second self. In the letters of Cicero we have the description of the period of Roman history, and the portrait of the inner life of Roman society in his day.

8. HISTORY.--In their historical literature the Romans exhibited a faithful transcript of their mind and character. History at once gratified their patriotism, and its investigations were in accordance with their love of the real and the practical. In this department, they were enabled to emulate the Greeks and to be their rivals, and sometimes their superiors. The elegant simplicity of Caesar is as attractive as that of Herodotus; none of the Greek historians surpasses Livy in talent for the picturesque and in the charm with which he invests his spirited and living stories; while for condensation of thought, terseness of expression, and political and philosophical acumen, Tacitus is not inferior to Thucydides. The catalogue of Roman historians contains many writers whose works are lost; such as L. Lucretius, the friend and correspondent of Cicero, L. Lucullus, the illustrious conqueror of Mithridates, and Cornelius Nepos, of whom only one work was preserved, the "Lives of Eminent Generals." The authenticity of this work is, however, disputed. But at the head of this department, as the great representatives of Roman history, stand Julius Caesar, Sallust, Livy, and Tacitus, all of whom, except the last, belong to the Augustan age. Julius Caesar (100-44 B.C.) was descended from one of the oldest among the patrician families of Rome. He attached himself to the popular party, and his good taste, great tact, and pleasing manners contributed, together with his talents, to insure his popularity. He became a soldier in the nineteenth year of his age, and hence his works display all the best qualities which are fostered by a military education--frankness, simplicity, and brevity. His earliest literary triumph was as an orator, and, according to Quintilian, he was a worthy rival of Cicero. When he obtained the office of Pontifex Maximus, he diligently examined the history and nature of the Roman belief in augury, and published his investigations. When his career as a military commander began, whatever leisure his duties permitted him to enjoy he devoted to the composition of his memoirs, or commentaries of the Gallic and civil wars. He wrote, also, some minor works on different subjects, and he left behind him various letters, some of which are extant. But by far the most important of the works of Caesar is his "Commentaries," which have come down to us in a tolerably perfect state. They are sketches taken on the spot, in the midst of action, while the mind was full, and they have all the graphic power of a master-mind and the vigorous touches of a master-hand. The Commentaries are the materials for history, notes jotted down for future historians. The very faults which may justly be found with the style of Caesar are such as reflect the man himself. The majesty of his character consists chiefly in the imperturbable calmness and equanimity of his temper; he had no sudden bursts of energy and alternations of passion and inactivity. The elevation of his character was a high one, but it was a level table-land. This calmness and equability pervades his writings, and for this reason they have been thought to want life and energy. The beauty of his language is, as Cicero says, statuesque rather than picturesque. Simple and severe, it conveys the idea of perfect and well-proportioned beauty, while it banishes all thoughts of human passion. In relating his own deeds, he does not strive to add to his own reputation by detracting from the merits of those who served under him. He is honest, generous, and candid, not only towards them, but also towards his brave enemies. He recounts his successes without pretension or arrogance, though he has evidently no objection to be the hero of his own tale. His Commentaries are not confessions, although he is the subject of them; not a record of a weakness appears, nor even a defect, except that which the Romans would readily forgive, cruelty. His savage waste of human life he recounts with perfect self-complacency. Vanity, the crowning error in his career as a statesman, though hidden by the reserve with which he speaks of himself, sometimes discovers itself in the historian. The Commentaries of Caesar have been compared with the work of the great soldier-historian of Greece, Xenophon. Both are eminently simple and unaffected, but there the parallel ends. The severe contempt of ornament, which characterizes the stern Roman, is totally unlike the mellifluous sweetness of the Attic writer. Sallust (85-35 B.C.) was born of a plebeian family, but, having filled the offices of tribune and quaestor, attained senatorial rank. He was expelled from the Senate for his profligacy, but restored again to his rank through the influence of Caesar, whose party he espoused. He accompanied his patron in the African war, and was made governor of Numidia. While in that capacity, he accumulated by rapacity and extortion enormous wealth, which he lavished in expensive but tasteful luxury. The gardens on the Quirinal which bore his name were celebrated for their beauty; and there, surrounded by the choicest works of art, he devoted his retirement to composing the historical records which survived him. As a politician, he was a mere partisan of Caesar, and therefore a strenuous opponent of the higher classes and of the supporters of Pompey. The object of his hatred was not the old patrician blood of Rome, but the new aristocracy, which had of late years been rapidly rising up and displacing it. That new nobility was utterly corrupt, and its corruption was encouraged by the venality of the masses, whose poverty and destitution tempted them to be the tools of unscrupulous ambition. Sallust strove to place that party in the unfavorable light which it deserved; but, notwithstanding the truthfulness of the picture which he draws,

selfishness and not patriotism was the mainspring of his politics; he was not an honest champion of popular rights, but a vain and conceited man, who lived in an immoral and corrupt age, and had not the strength of principle to resist the force of example and temptation. If, however, we make some allowance for the political bias of Sallust, his histories have not only the charms of the historical romance, but are also valuable political studies. His characters are vigorously and naturally drawn, and the more his histories are read, the more obvious it is that he always writes with an object, and uses his facts as the means of enforcing a great political lesson. His first work is on the "Jugurthine War," the next related to the period from the consulship of Lepidus to the praetorship of Cicero, and is unfortunately lost. This was followed by a history of the conspiracy of Catiline, "The War of Catiline," in which he paints in vivid colors the depravity of that order of society which, bankrupt in fortune and honor, still plumes itself on its rank and exclusiveness. To Sallust must be conceded the praise of having first conceived the notion of a history, in the true sense of the term. He was the first Roman historian, and the guide of future historians. He had always an object to which he wished all his facts to converge, and he brought them forward as illustrations and developments of principles. He analyzed and exposed the motives of parties, and laid bare the inner life of those great actors on the public stage, in the interesting historical scenes which he describes. His style, although ostentatiously elaborate and artificial, is, upon the whole, pleasing, and almost always transparently clear. Following Thucydides, whom he evidently took as his model, he strives to imitate his brevity; but while this quality with the Greek historian is natural and involuntary, with the Roman it is intentional and studied. The brevity of Thucydides is the result of condensation, that of Sallust is elliptical expression. Livy (59-18 B.C.) was born in Padua, and came to Rome during the reign of Augustus, where he resided in the enjoyment of the imperial favor and patronage. He was a warm and open admirer of the ancient institutions of the country, and esteemed Pompey as one of its greatest heroes; but Augustus did not allow political opinions to interfere with the regard which he entertained for the historian. His great work is a history of Rome, which he modestly terms "Annals," in one hundred and forty-two books, of which thirty-five are extant. Besides his history, Livy is said to have written treatises and dialogues, which were partly philosophical and partly historical. The great object of Livy's history was to celebrate the glories of his native country, to which he was devotedly attached. He was a patriot: his sympathy was with Pompey, called forth by the disinterestedness of that great man, and perhaps by his sad end. He delights to put forth his powers in those passages which relate to the affections. He is a biographer quite as much as a historian; he anatomizes the moral nature of his heroes, and shows the motive springs of their noble exploits. His characters stand before us like epic heroes, and he tells his story like a bard singing his lay at a joyous festive meeting, checkered by alternate successes and reverses, though all tending to a happy result at last. But while these features constitute his charm as a narrator, they render him less valuable as a historian. Although he would not be willfully inaccurate, if the legend he was about to tell was interesting, he would not stop to inquire whether or not it was true. Taking upon trust the traditions which had been handed down from generation to generation, the more flattering and popular they were, the more suitable would he deem them for his purposes. He loved his country, and he would scarcely believe anything derogatory to the national glory. Whenever Rome was false to treaties, unmerciful in victory, or unsuccessful in arms, he either ignores the facts or is anxious to find excuses. He does not appear to have made researches into the many original documents which were extant at his time, but he trusted to the annalists, and took advantage of the investigations of preceding historians. His descriptions of military affairs are often vague and indistinct, and he often shows himself ignorant of the localities which he describes. Such are the principal defects of Livy, who otherwise charms his readers with his romantic narratives, and his lively, fresh, and fascinating style.

9. OTHER PROSE WRITERS.--Though the grammarians of this period were numerous, they added little or nothing to its literary reputation. The most conspicuous among them were Attius, a friend of Sallust; Epirota, the correspondent of Cicero; Julius Hyginus, a friend of Ovid; and Nigidius Figulus, an orator as well as grammarian. M. Vitruvius Pollio, the celebrated architect, deserves to be mentioned for his treatise on architecture. He was probably native of Verona, and served under Julius Caesar in Africa, as a military engineer. Notwithstanding the defects of his style, the language of Vitruvius is vigorous, and his descriptions bold; his work is valuable as exhibiting the principles of Greek architectural taste and beauty, of which he was a devoted admirer.

PERIOD THIRD.

FROM THE DEATH OF AUGUSTUS TO THE CLOSE OF THE REIGN OF THEODORIC (14-526 A.D.).

1. DECLINE OF ROMAN LITERATURE.--With the death of Augustus began the decline of Roman literature, and a few names only rescue the first years of this period from the charge of a corrupt and vitiated taste. After a while, indeed, political circumstances again became more favorable; the dangers, which paralyzed genius and talent, and

prevented their free exercise under Tiberius and his tyrannical successors, diminished, and a more liberal system of administration ensued under Vespasian and Titus. Juvenal and Tacitus then stood forth, as the representatives of the old Roman independence. Vigor of thought communicated itself to the language; a taste for the sublime and beautiful, to a certain extent, revived, although it did not attain to the perfection which shed a lustre over the Augustan age. Between the ages of Horace and Juvenal, Cicero and Tacitus, there was a gap of half a century, in which Roman genius was slumbering. The gradual growth of a spirit of adulation deterred all who were qualified for the task of the historian from attempting it. Fear, during the lifetime of Tiberius and Caligula, Claudius and Nero, and hatred, still fresh after their deaths, rendered all accounts of their reigns false. And the same causes which silenced the voice of history extinguished the genius of poetry and oratory. As liberty declined, natural eloquence decayed; the orator sought only to please the corrupt taste of his audiences with strange and exaggerated statements; the poet aimed to win public admiration through a style over-laden with ornament, and florid and diffuse descriptions. Literature, in order to flourish, requires the genial sunshine of human sympathy; it needs either the patronage of the great, or the favor of the people. Immediately after the death of Augustus, patronage was withdrawn, and there was no public sympathy to supply its place. In the reign of Nero, literature partially revived; for, though the bloodiest of tyrants, he had a taste for art and poetry, and an ambition to excel in refinement.

2. FABLE.--In fable, as in other fields of literature, Rome was an imitator of Greece, but nevertheless Phaedrus struck out a new line for himself, and, through his fables, became not only a moral instructor, but a political satirist. Phaedrus (fl. 16 A.D.), the originator and only author of Roman fable, though born in the reign of Augustus, wrote when the Augustan age had passed away. His works are, as it were, isolated; he had no contemporaries. Nevertheless, his solitary voice was lifted up when those of the poet, the historian, and the philosopher were silenced. The moral and political lessons conveyed in his fables were suggested by the evils of the times in which he lived. Some of them illustrate the danger of riches and the comparative safety of obscurity and poverty, in an age when the rich were marked for destruction, in order that the confiscation of their property might glut the avarice of the emperor and of his servants; others were suggested by historical events, being nevertheless satirical strictures on individuals. The style of Phaedrus is pure and classical, and combines the simple neatness and graceful elegance of the golden age with the vigor and terseness of the silver one. He has the facility of Ovid and the brevity of Tacitus. In the construction of his fables, he displays observation and ingenuity; but he is deficient in imagination. He makes his animals the vehicles of his wisdom, but he does not throw himself into them, or identify himself with them; while they look and act like animals, they talk like human beings. In this consists the great superiority of Aesop to his Roman imitator; his brutes are a superior race, but they are still brutes, and it would seem that the fabulist had lived among them as one of themselves, had adopted their mode of life, and conversed with them in their own language. In Phaedrus we have human sentiments translated into the language of beasts, while in Aesop we have beasts giving utterance to such sentiments as would be naturally theirs if they were placed in the position of men.

3. SATIRE AND EPIGRAM.--Roman satire, subsequently to Horace, is represented by Persius and Juvenal. Persius (34-62 A.D.) early attached himself to the Stoic philosophy. He was pure in mind, and free from the corrupt taint of an immoral age. Although Lucilius was, to a certain extent, his model, he does not attack vice with the biting severity of the old satirist, nor do we find in his writings the enthusiastic indignation which burns in the verses of Juvenal. His purity of mind and kindness of heart disinclined him to portray vice in its hideous and loathsome forms, and to indulge in that bitterness of invective which the prevalent enormities of his times deserved. His uprightness and love of virtue are shown by the uncompromising severity with which he rebukes sins of not so deep a dye; and the heart which was capable of being moulded by his example, and influenced by his purity, would have shrunk from the fearful crimes which deform the pages of Juvenal. The greatest defect in Persius, as a satirist, is that the Stoic philosophy in which he was educated rendered him indifferent to the affairs of the world. His contemplative habits led him to criticise, as his favorite subjects, false taste in poetry and empty pretensions to philosophy. Horace mingled in the society of the profligate and considering them as fools, laughed their folly to scorn. Juvenal looked down upon the corruption of the age from the eminence of his virtue, and punished it like an avenging deity. Persius, pure in heart and passionless by education, while he lashes wickedness in the abstract, almost ignores its existence, and shrinks from probing to the bottom the vileness of the human heart. His works comprise six satires, all of which breathe the natural amiability and placid cheerfulness of his temper. Juvenal flourished in the reign of Domitian, towards the close of the first century A.D., a dark period, which saw the utter moral degradation of the people, and the bloodiest tyranny and oppression on the part of their rulers. The picture of Roman manners, as painted by his glowing pencil, is truly appalling. The fabric of society was in ruins, the popular religion was rejected with scorn, and the creed of natural religion had not occupied its place. The emperors took part in public scenes of folly and profligacy, and exposed themselves as charioteers, as dancers, and as actors. Nothing

was respected but wealth, nothing provoked contempt but poverty. Players and dancers had all honors and offices at their disposal; the city swarmed with informers, who made the rich their prey; every man feared his most intimate friend, and the only bond of friendship was to be an accomplice in crime. The teacher would corrupt his pupil, and the guardian defraud his ward. Crimes which cannot be named were common, and the streets of Rome were the constant scene of robbery, assault, and assassination. The morals of women were as depraved as those of men, and there was no public amusement so immoral or so cruel as not to be countenanced by their presence. In this period of moral dearth, the fountains of genius and literature were dried up. There was criticism, declamation, panegyric, and verse writing, but no oratory, history, or poetry. Juvenal, though himself not free from the declamatory affectation of the day, attacked the false literary taste of his contemporaries as unsparingly as he did their depraved morality. His sixteen satires exhibit an enlightened, truthful, and comprehensive view of Roman manners, and of the inevitable result of such depravity. The two finest of them are those which Dr. Johnson has thought worthy of imitation. The historical value of these satires must not be forgotten. Tacitus lived in the same perilous times as Juvenal, and when they had come to an end and it was not unsafe to speak, he wrote their public history, which the poet illustrates by displaying the social and inner life of the Romans. Their works are parallel, and each forms a commentary upon the other. The style of Juvenal is vigorous and lucid; his morals were pure in the midst of a debased age, and his language shines forth in classic elegance, in the midst of specimens of declining and degenerate taste. Juvenal closes the list of Roman satirists, properly speaking. The satirical spirit animates the piquant epigrams of his friend Martial, but their purpose is not moral or didactic. They sting the individual, and render him an object of scorn and disgust, but they do not hold up vice itself to ridicule and detestation. Martial (43-104 A.D.) was born in Spain. He early emigrated to Rome, where he became a favorite of Titus and Domitian, and in the reign of the latter he was appointed to the office of court-poet. During thirty-five years, he lived at Rome the life of a flatterer and a dependent, and then he returned to his native town, where his death was hastened by his distaste for provincial life. Measured by the corrupt standard of morals which disgraced the age in which he lived, Martial was probably not worse than most of his contemporaries; for the fearful profligacy, which his powerful pen describes in such hideous terms, had spread through Rome its loathsome infection. Had he lived in better times, his talents might have been devoted to a purer object; as it was, no language is strong enough to denounce the impurities of his page, and his moral taste must have been thoroughly depraved not to have turned with disgust from the contemplation of such subjects. But not all his poems are of this character. Amidst some obscurity of style and want of finish, many are redolent of Greek sweetness and elegance. Here and there are pleasing descriptions of the beauties of nature, and many are kind-hearted and full of varied wit, poetical imagination, and graceful expression. To the original characteristics of the Greek epigram, Martial, more than any other poet, added that which constitutes an epigram in the modern sense of the term: pointedness either in jest or earnest, and the bitterness of personal satire.

4. DRAMATIC LITERATURE.--Dramatic literature never flourished in Rome, and still less under the empire. During this period there were not wanting some imitators of Greece in this noble branch of poetry, but their productions were rather literary than dramatic; they were poems composed in a dramatic form, intended to be read, not acted. They contain noble philosophical sentiments, lively descriptions, and passages full of tenderness and pathos, but they are deficient in dramatic effect, and positively offend against those laws of good taste which regulated the Athenian stage. In the Augustan age, a few writers attained some excellence in tragedy, at least in the opinion of ancient critics. Under the tyrant Nero, dramatic literature reappeared, specimens of which are extant in the ten tragedies attributed to Seneca. But the genius of the author never grasps, in their wholeness, the characters which he attempts to copy; they are distorted images of the Greek originals, and the shadowy grandeur of the godlike heroes of Aeschylus stands forth in corporeal vastness, and appears childish and unnatural, like the giants of a story-book. The Greeks believed in the gods and heroes whose agency and exploits constituted the machinery of tragedy, but the Romans did not, and we cannot sympathize with them, because we see that they are insincere. An awful belief in destiny, and the hopeless yet patient struggle of a great and good man against this all-ruling power, are the mainspring of Greek tragedy. This belief the Romans did not transfer into their imitations, but they supplied its place with the stern fatalism of the Stoics. The principle of destiny entertained by the Greek poets is a mythological, even a religious one. It is the irresistible will of God. God is at the commencement of the chain of causes and effects, by which the event is brought about which God has ordained; his inspired prophets have power to foretell, and mortals cannot resist or avoid. It is rather predestination than destiny. The fatalism of the Stoics, on the other hand, is the doctrine of practical necessity. It ignores the almighty power of the Supreme Being, and although it does not deny his existence, it strips him of his attributes as the moral governor of the universe. These doctrines, expressed equally in the writings of Seneca the philosopher, and in the tragedies attributed to him, lead to the probability, amounting almost to certainty, that he was their author. But whatever be the case in regard to their authorship, it is certain that, notwithstanding their false rhetorical taste and the absence of all ideal and creative

genius, they have found many admirers and imitators in modern times. The French school of tragic poets took them for their model; Corneille evidently considered them the ideal of tragedy, and Racine servilely imitated them.

5. EPIC POETRY.--At the head of the epic poets who flourished during the Silver Age, stands Lucan (39-66 A.D.). He was born at Cordova, in Spain, and probably came to Rome when very young, where his literary reputation was soon established. But Nero, who could not bear the idea of a rival, forbade him to recite his poems, then the common mode of publication. Neither would he allow him to plead as an advocate. Smarting under this provocation, he joined in a conspiracy against the emperor's life. The plot failed, but Lucan was pardoned on condition of pointing out his confederates, and in the vain hope of saving himself from the monster's vengeance, he actually impeached his mother. This noble woman was incapable of treason. Tacitus says, "the scourge, the flames, the rage of the executioners who tortured her the more savagely, lest they should be scorned by a woman, were powerless to extort a false confession." Lucan never received the reward which he purchased by treachery. When the warrant for his death was issued, he caused his veins to be cut asunder, and expired in the twenty-seventh year of his age. The only one of his works which survives is the "Pharsalia," an epic poem on the subject of the civil war between Caesar and Pompey. It bears evident marks of having been left unfinished; it has great faults and at the same time great beauties. The sentiments contained in this poem breathe a love of freedom and an attachment to the old Roman republicanism. Its subject is a noble one, full of historic interest, and it is treated with spirit, brilliancy, and animation. The characters of Caesar and Pompey are masterpieces; but while some passages are scarcely inferior to any written by the best Latin poets, others have neither the dignity of prose, nor the melody of poetry. Description forms the principal feature in the poetry of Lucan; in fact, it constitutes one of the characteristic features of Roman literature in its decline, because poetry had become more than ever an art, and the epoch one of erudition. Silius Italicus (fl. 54 A.D.) was the favorite and intimate of two emperors, Nero and Vitellius. He left a poem, the "Punica," which contains the history in heroic verse of the second Punic war. The Aeneid of Virgil was his model, and the narrative of Livy furnished his materials. It is considered the dullest and most tedious poem in the Latin language though its versification is harmonious, and will often, in point of smoothness, bear comparison with that of Virgil. Valerius Flaccus flourished in the reign of Vespasian. He is author of the "Argonautica," an imitation and in some parts a translation of the Greek poem of Apollonius Rhodius on the same subject. He evidently did not live to complete his original design. In the Argonautica there are no glaring faults or blemishes, but there is also no genius, no inspiration. He has some talents as a descriptive poet; his versification is harmonious and his style graceful. P. Statius (61-95 A.D.) was the author of the *Silviae*, *Thebaid*, and *Achilleid*. The "*Silviae*" are the rude materials of thought springing up spontaneously in all their wild luxuriance, from the rich, natural soil of the imagination of the poet. The subject of the "*Thebaid*" is the ancient Greek legend respecting the war of the Seven against Thebes, and the "*Achilleid*" was intended to embrace all the exploits of Achilles, but only two books were completed. The poems of Statius contain many poetical incidents, which might stand by themselves as perfect fugitive pieces. In these we see his natural and unaffected elegance, his harmonious ear, and the truthfulness of his perceptions. But, as an epic poet, he has neither grasp of mind nor vigor of conception; his imaginary heroes do not inspire and warm his imagination; and his genius was unable to rise to the highest departments of art.

6. HISTORY.--For the reasons already stated, Rome for a long period could boast of no historian; the perilous nature of the times, and the personal obligations under which learned men frequently were to the emperors, rendered contemporary history a means of adulation and servility. To this class of historians belongs Paterculus (fl. 30 A.D.), who wrote a history of Rome which is partial, prejudiced, and adulatory. He was a man of lively talents, and his taste was formed after the model of Sallust, of whom he was an imitator. His style is often overstrained and unnatural. Under the genial and fostering influence of the Emperor Trajan, the fine arts, especially architecture, flourished, and literature revived. The same taste and execution which are visible in the bas-reliefs on the column of Trajan adorn the literature of his age as illustrated by its two great lights, Tacitus and the younger Pliny. There is not the rich, graceful manner which invests with such a charm the writings of the Golden Age, but the absence of these qualities is amply compensated by dignity, gravity, and honesty. Truthfulness beams throughout the writings of these two great contemporaries, and incorruptible virtue is as visible in the pages of Tacitus as benevolence and tenderness are in the letters of Pliny. They mutually influenced each other's characters and principles; their tastes and pursuits were similar; they loved each other dearly, corresponded regularly, corrected each other's works, and accepted patiently and gratefully each other's criticism. Tacitus (60-135 A.D.) was of equestrian rank, and served in several important offices of the empire. His works now extant are a life of his father-in-law, Agricola, a tract on the manners and nations of the Germans, a small portion of a voluminous work entitled "Histories," about two thirds of another historical work, entitled "Annals," and a dialogue on the decline of eloquence. The life of Agricola, though a panegyric rather than a biography, is a beautiful specimen of the vigor and force of expression with which this

greatest painter of antiquity could throw off any portrait which he attempted. Even if the likeness be somewhat flattered, the qualities which the writer possessed, his insight into character, his pathetic power, and his affectionate heart, render this short piece one of the most attractive biographies extant. The treatise on the "Geography, Manners, and Nations of Germany," though containing geographical descriptions often vague and inaccurate, and accounts evidently founded on mere tales of travelers, bears the impress of truth in the salient points and characteristic features of the national manners and institutions of Teutonic nations. The "Histories," his earliest historical work, of which only four books and a portion of the fifth are extant, extended from the year 69 to 96 A.D., and it was his intention to include the reigns of Nero and Trajan. In this work he proposed to investigate the political state of the commonwealth, the feeling of its armies, the sentiments of its provinces, the elements of its strength and weakness, and the causes and reasons for each historical phenomenon. The principal fault which diminishes the value of his history as a record of events is his too great readiness to accept evidence unhesitatingly, and to record popular rumors without taking sufficient pains to examine into their truth. His incorrect account of the history, constitution, and manners of the Jewish people is one among the few instances of this fault, scattered over a vast field of faithful history. The "Annals" consist of sixteen books; they begin with the death of Augustus, and conclude with that of Nero (14-68 A.D.). The object of Tacitus was to describe the influence which the establishment of tyranny on the ruins of liberty exercised for good or for evil in bringing out the character of the individual. In the extinction of freedom there still existed in Rome bright examples of heroism and courage, and instances not less prominent of corruption and degradation. In the annals of Tacitus these individuals stand out in bold relief, either singly or in groups upon the stage, while the emperor forms the principal figure, and the moral sense of the reader is awakened to admire instances of patient suffering and determined bravery, or to witness abject slavery and remorseless despotism. Full of sagacious observation and descriptive power, Tacitus engages the most serious attention of the reader by the gravity of his condensed and comprehensive style, as he does by the wisdom and dignity of his reflections. Living amidst the influences of a corrupt age, he was uncontaminated. By his virtue and integrity, and his chastened political liberality, he commands our admiration as a man, while his love of truth is reflected in his character as a historian. In his style, the form is always subordinate to the matter; his sentences are suggestive of far more than they express, and his brevity is enlivened by copiousness, variety, and poetry; his language is highly figurative; his descriptions of scenery and incidents are eminently picturesque, his characters dramatic, and the expression of his own sentiments almost lyrical. Suetonius was born about 69 A.D. His principal extant works are the "Lives of the Twelve Caesars," "Notices of Illustrious Grammarians and Rhetoricians," and the Lives of the Poets Terence, Horace, Persius, Lucan, and Juvenal. The use which he makes of historical documents proves that he was a man of diligent research, and, as a biographer, industrious and careful. He indulges neither in ornament of style nor in romantic exaggeration. The pictures which he draws of some of the Caesars are indeed terrible, but they are fully supported by the contemporary authority of Juvenal and Tacitus. As a historian, Suetonius had not that comprehensive and philosophical mind which would qualify him for taking an enlarged view of his subject; he has no definite plan or method, and wanders at will from one subject to another just as the idea seizes him. Curtius is considered by some writers as belonging to the Silver Age, and by others to a later period. His biography of Alexander the Great is deeply interesting. It is a romance rather than a history. He never loses an opportunity, by the coloring which he gives to historical facts, of elevating the Macedonian conqueror to a super-human standard. His florid and ornamented style is suitable to the imaginary orations which are introduced in the narrative, and which constitute the most striking portions of the work. Valerius Maximus flourished during the reign of Tiberius. His work is a collection of anecdotes entitled "Memorable Sayings and Deeds," the object of which was to illustrate by examples the beauty of virtue and the deformity of vice. The style is prolix and declamatory, and characterized by awkward affectation and involved obscurity.

7. RHETORIC AND ELOQUENCE.--Under the empire, schools of rhetoric were multiplied, as harmless as tyranny could desire. In these the Roman youth learned the means by which the absence of natural endowments could be compensated. The students composed their speeches according to the rules of rhetoric; they were then corrected, committed to memory, and recited, partly with a view to practice, partly in order to amuse an admiring audience. Nor were these declamations confined to mere students. Public recitations had, since the days of Juvenal, been one of the crying nuisances of the times. Seneca, the father of the philosopher of the same name, a famous rhetorician himself, left two works containing a series of exercises in oratory, which show the hollow and artificial system of those schools. He was born in Cordova in Spain (61 A.D.), and as a professional rhetorician amassed a considerable fortune. Quintilian (40-118 A.D.) was the most distinguished teacher of rhetoric of this age. He attempted to restore a purer and more classical taste, but, although to a certain extent he was successful, the effect which he produced was only temporary. For the instruction of his elder son he wrote his great work, "Institutes of Oratory," a complete system of instruction in the art of oratory; and in it he shows himself far superior to Cicero as a teacher, though he

was inferior to him as an orator. His work is divided into twelve books, in which he traces the progress of the orator from the very cradle until he arrives at perfection. In this monument of his taste and genius he fully and completely exhausted the subject, and left a text-book of the science and art of nations, as well as a masterly sketch of the eloquence of antiquity. The disposition of Quintilian was as affectionate and tender as his genius was brilliant and his taste pure; few passages throughout the whole range of Latin literature can be compared to that in which he mourns the loss of his wife and children. It is the touching eloquence of one who could not write otherwise than gracefully. Among the pupils of Quintilian, Pliny the younger took the highest place in the literature of his age. He was born in Como, 61 A.D., and adopted and educated by his maternal uncle, the elder Pliny. He attained great celebrity as a pleader, and stood high in favor with the emperor. His works consist of a panegyric on Trajan, and a collection of letters in ten books. The panegyric is a piece of courtly flattery in accordance with the cringing and fawning manners of the times. The letters are very valuable, not only for the insight which they give into his own character, but also into the manners and modes of thought of his illustrious contemporaries, as well as the politics of the day. For liveliness, descriptive power, elegance, and simplicity of style, they are scarcely inferior to those of Cicero, whom he evidently took for his model. These letters show how accurate and judicious was the mind of Pliny, how prudent his administration in the high offices which he filled under the reign of Trajan, and how refined his taste for the beautiful. The tenth book, which consists of the letters to Trajan, together with the emperor's rescripts, will be read with the greatest interest. The following passages from his dispatch respecting the Christians, written while he was procurator of the province of Bithynia, and the emperor's answer, are worthy of being transcribed, both because reference is so often made to them, and because they throw light upon the marvelous and rapid propagation of the gospel, the manners of the early Christians, the treatment to which their constancy exposed them, and the severe jealousy with which they were regarded:-- "It is my constant practice, sire, to refer to you all subjects on which I entertain doubt. For who is better able to direct my hesitation, or to instruct my ignorance? I have never been present at the trials of Christians, and, therefore, I do not know in what way, or to what extent it is usual to question or to punish them. I have also felt no small difficulty in deciding whether age should make any difference, or whether those of the tenderest and those of mature years should be treated alike; whether pardon should be accorded to repentance, or whether, where a man has once been a Christian, recantation should profit him; whether, if the name of Christian does not imply criminality, still the crimes peculiarly belonging to the name should be punished. Meanwhile, in the case of those against whom informations have been laid before me, I have pursued the following line of conduct: I have put to them, personally, the question whether they were Christians. If they confessed, I interrogated them a second and third time, and threatened them with punishment. If they still persevered, I ordered their commitment; for I had no doubt whatever, that whatever they confessed, at any rate, dogged and inflexible obstinacy deserved to be punished. There were others who displayed similar madness; but, as they were Roman citizens, I ordered them to be sent back to the city. Soon, persecution itself, as is generally the case, caused the crime to spread, and it appeared in new forms. An anonymous information was laid against a large number of persons, but they deny that they are, or ever have been, Christians. As they invoked the gods, repeating the form after me, and offered prayer with incense and wine, to your image, which I had ordered to be brought together with those of the deities, and besides, cursed Christ, while those who are true Christians, it is said, cannot be compelled to do any one of these things, I thought it right to set them at liberty. Others, when accused by an informer, confessed that they were Christians, and soon after denied the fact. They said they had been, but had ceased to be, some three, some more, not a few even twenty years previously. All these worshiped your image and those of the gods, and cursed Christ. But they affirmed that the sum-total of their fault, or their error, was that they were accustomed to assemble on a fixed day, before dawn, and sing an antiphonal hymn to Christ as God; that they bound themselves by an oath, not to the commission of any wickedness, but to abstain from theft, robbery, and adultery; never to break a promise, or to deny a deposit, when it was demanded back. When these ceremonies were concluded, it was their custom to depart, and again assemble together to take food harmlessly and in common. That after my proclamation, in which, in obedience to your command, I had forbidden associations, they had desisted from this practice. For these reasons, I the more thought it necessary to investigate the real truth, by putting to the torture two maidens who were called deaconesses; but I discovered nothing, but a perverse and excessive superstition. I have, therefore, deferred taking cognizance of the matter until I had consulted you; for it seemed to me a case requiring advice, especially on account of the number of those in peril. For many of every age, sex, and rank are, and will continue to be called in question. The infection, in fact, has spread not only through the cities, but also through the villages and open country; but it seems that its progress can be arrested. At any rate, it is clear that the temples, which were almost deserted, begin to be frequented; and solemn sacrifices, which had been long intermitted, are again performed, and victims are being sold everywhere, for which, up to this time, a purchaser could rarely be found. It is, therefore, easy to conceive that crowds might be reclaimed, if an opportunity for repentance were given." Trajan to Pliny: "In sifting the cases of those who have been indicted on the charge of

Christianity, you have adopted, my dear Secundus, the right course of proceeding; for no certain rule can be laid down which will meet all cases. They must not be sought after, but if they are informed against, and convicted, they must be punished; with this proviso, however, that if any deny that he is a Christian, and proves the point by offering prayers to our deities, notwithstanding the suspicions under which he has labored, he shall be pardoned on his repentance. On no account should any anonymous charges be attended to, for it would be the worst possible precedent, and is inconsistent with the habits of our time."

8. PHILOSOPHY AND SCIENCE.--Philosophy, and particularly moral philosophy, became a necessary study at this time, when the popular religion had lost its influence. In the general ruin of public and private morals, virtuous men found in this science a guide in the dangers by which they were continually threatened, and a consolation in all their sorrows. The Stoic among the other schools met with most favor from this class of men, for it offered better security against the evils of life, and taught men how to take shelter from baseness and profligacy under the influence of virtue and courage. The doctrines of the Stoics suited the rigid sternness of the Roman character. They embodied that spirit of self-devotion and self-denial with which the Roman patriot, in the old times of simple republican virtue, threw himself into his public duties, and they enabled him to meet death with a courageous spirit in this degenerate age, in which many of the best and noblest willingly died by their own hands, at the imperial mandate, in order to save their name from infamy, and their inheritance from confiscation. Seneca, (12-69 A.D.), a native of Cordova in Spain, was the greatest philosopher of this age. He early displayed great talent as a pleader, but in the reign of Claudius he was banished to Corsica, where he solaced his exile with the study of the Stoic philosophy; and though its severe precepts exercised no moral influence on his conduct, he not only professed himself a Stoic, but imagined that he was one. A few years after, he was recalled by Agrippina, to become tutor to her son Nero. He was too unscrupulous a man of the world to attempt the correction of the vicious propensities of his pupil, or to instill into him high principles. After the accession of Nero, he endeavored to arrest his depraved career, but it was too late. Seneca had, by usury and legacy-hunting, amassed one of those large fortunes of which so many instances are met with in Roman history; feeling the dangers of wealth, he offered his property to Nero, who refused it, but resolved to rid himself of his former tutor, and easily found a pretext for his destruction. In adversity the character of Seneca shone with brighter lustre. Though he had lived ill, he could die well. He met the messengers of death without trembling. His noble wife, Paulina, determined to die with him. The veins of both were opened at the same time, but the little blood which remained in his emaciated frame refused to flow. He suffered excruciating agony. A warm bath was tried, but in vain; and a draught of poison was equally ineffectual. At last he was suffocated by the vapor of a stove. Seneca lived in a perilous atmosphere. He had not firmness to act up to the high moral standard which he proposed to himself. He was avaricious, but avarice was the great sin of his times. The education of one who was a brute rather than a man was a task to which no one would have been equal; he therefore retained the influence which he had not the uprightness to command, by miserable and sinful expedients. He had great abilities, and some of the noble qualities of the old Romans; and had he lived in the days of the republic, he would have been a great man. Seneca was the author of twelve ethical treatises, the best of which are entitled, "On Providence," "On Consolation," and "On the Perseverance of Wise Men." He cared little for abstract speculation, and delighted to inculcate precepts rather than to investigate principles. He was always a favorite with Christian writers, and some of his sentiments are truly Christian. There is even a tradition that he was acquainted with St. Paul. He may unconsciously have imbibed some of the principles of Christianity. The gospel had already made great and rapid strides over the civilized world, and thoughtful minds may have been enlightened by some of the rays of divine truth dispersed by the moral atmosphere, just as we are benefited by the light of the sun, even when its disk is obscured by clouds. His epistles, of which there are one hundred and twenty-four, are moral essays, and are the most delightful of his works. They are evidently written for the public eye; they are rich in varied thought, and their reflections flow naturally, and without effort. They contain a free and unconstrained picture of his mind, and we see in them how he despised verbal subtleties, the external badges of a sect or creed, and insisted that the great end of science is to learn how to live and how to die. The style of Seneca is too elaborate to please. It is affected, often florid, and bombastic; there is too much sparkle and glitter, too little repose and simplicity. Pliny the elder (A.D. 23-79) was born probably at Como, the family residence. He was educated at Rome, where he practiced at the bar, and filled different civil offices. He perished a martyr to the cause of science, in the eruption of Vesuvius, which took place in the reign of Titus, the first of which there is any record in history. The circumstances of his death are described by his nephew, Pliny the younger, in two letters to Tacitus. He was at Misenum, in command of the fleet, when, observing the first indications of the eruption, and wishing to investigate it more closely, he fitted out a light galley, and sailed towards the villa of a friend at Stabiae. He found his friend in great alarm, but Pliny remained tranquil and retired to rest. Meanwhile, broad flames burst forth from the volcano, the blaze was reflected from the sky, and the brightness was enhanced by the darkness of the night. Repeated shocks of an earthquake made the

houses rock to and fro, while in the air the fall of half burnt pumice-stones menaced danger. He was awakened, and he and his friend, with their attendants, tied cushions over their heads to protect them from the falling stones, and walked out to see if they might venture on the water. It was now day, but the darkness was denser than the darkest night, the sea was a waste of stormy waters, and when at last the flames and the sulphureous smell could no longer be endured, Pliny fell dead, suffocated by the dense vapor. The natural history of Pliny is an unequalled monument of studious diligence and persevering industry. It consists of thirty-seven books, and contains 20,000 facts (as he believed them to be) connected with nature and art, the result not of original research, but, as he honestly confessed, culled from the labors of other men. Owing to the extent of his reading, his love of the marvelous, and his want of judgment in comparing and selecting, he does not present us with a correct view of the science of his own age. He reproduces errors evidently obsolete and inconsistent with facts and theories which had afterwards replaced them. With him, mythological traditions appeared to have almost the same authority as modern discoveries; the earth teems with monsters, not exceptions to the regular order of nature, but specimens of her ingenuity. His peculiar pantheistic belief prepared him to consider nothing incredible, and his temper inclined him to admit all that was credible as true. He tells us of men whose feet were turned backwards, of others whose feet were so large as to shade them when they lay in the sun; others without mouths, who fed on the fragrance of fruits and flowers. Among the lower animals, he enumerates horned horses furnished with wings; the mantichora, with the face of a man, three rows of teeth, a lion's body, and a scorpion's tail; the basilisk, whose very glance is fatal; and an insect which cannot live except in the midst of the flames. But notwithstanding his credulity and his want of judgment, this elaborate work contains many valuable truths and much entertaining information. The prevailing character of his philosophical belief, though tinged with the stoicism of the day, is querulous and melancholy. Believing that nature is an all-powerful principle, and the universe instinct with deity, he saw more of evil than of good in the divine dispensation, and the result was a gloomy and discontented pantheism. Celsus probably lived in the reign of Tiberius. He was the author of many works, on various subjects, of which one, in eight books, on medicine, is now extant. The independence of his views, the practical, as well as the scientific nature of his instructions, and above all, his knowledge of surgery, and his clear exposition of surgical operations, have given his work great authority; the highest testimony is borne to its merits by the fact of its being used as a text-book, even in the present advanced state of medical science. The taste of the age in which he lived turned his attention also to polite literature, and to that may be ascribed the Augustan purity of his style. Pomponius Mela lived in the reign of Claudius. He is considered as the representative of the Roman geographers. Though his book, "The Place of the World," is but an epitome of former treatises, it is interesting for the simplicity of its style and the purity of its language. Columella flourished in the reigns of Claudius and Nero. He is author of an agricultural work, "De Re Rustica," in which he gives, in smooth and fluent, though somewhat too diffuse a style, the fullest and completest information on practical agriculture among the Romans in the first century of the Christian era. Frontinus (fl. 78 A.D.) left two valuable works, one on military tactics, the other a descriptive architectural treatise on those wonderful monuments of Roman art, the aqueducts. Besides these, there are extant fragments of other works on surveying, and on the laws and customs relating to landed property, which assign Frontinus an important place in the estimation of the students of Roman history.

9. ROMAN LITERATURE FROM HADRIAN TO THEODORIC (138-526 A.D.).--From the death of Augustus, Roman literature had gradually declined, and though it shone forth for a time with classic radiance in the writings of Persius, Juvenal, Quintilian, Tacitus, and the Plinies, with the death of freedom, the extinction of patriotism, and the decay of the national spirit, nothing could avert its fall. Poetry had become declamation; history had degenerated either into fulsome panegyric or the fleshless skeletons of epitomes; and at length the Romans seemed to disdain the use of their native tongue, and wrote again in Greek, as they had in the infancy of the national literature. The Emperor Hadrian resided long at Athens, and became imbued with a taste and admiration for Greek; and thus the literature of Rome became Hellenized. From this epoch the term classical can no longer be applied to it, for it no longer retained its purity. To Greek influence succeeded the still more corrupting one of foreign nations. With the death of Nerva, the uninterrupted succession of emperors of Roman or Italian birth ceased. Trajan himself was a Spaniard, and after him not only foreigners of every European race, but even Orientals and Africans were invested with the imperial purple, and the huge empire over which they ruled was one unwieldy mass of heterogeneous materials. The literary influence of the capital was not felt in the interior portions of the Roman dominions. Schools were established in the very heart of nations just emerging from barbarism; and though the blessings of civilization and intellectual culture were thus distributed far and wide, still literary taste, as it flowed through the minds of foreigners, became corrupted, and the language of the imperial city, exposed to the infecting contact of barbarous idioms, lost its purity. The Latin authors of this age were numerous, but few had taste to appreciate and imitate the literature of the Augustan age. They may be classified according to their departments of poetry, history, grammar

and oratory, philosophy and science. The brightest star of the poetry of this period was Claudian (365-404 A.D.), in whom the graceful imagination of classical antiquity seems to have revived. He enjoyed the patronage of Stilicho, the guardian and minister of Honorius, and in the praise and honor of him and of his pupil, he wrote "The Rape of Proserpine," the "War of the Giants," and several other poems. His descriptions indicate a rich and powerful imagination, but, neglecting substance for form, his style is often declamatory and affected. Among the earliest authors of Christian hymns were Hilarius and Prudentius, Those of the former were expressly designed to be sung, and are said to have been set to music by the author himself. Prudentius (fl. 348 A.D.) wrote many hymns and poems in defense of the Christian faith, more distinguished for their pious and devotional character than for their lyric sublimity or parity of language. To this age belong also the hymns of Damasus and of Ambrose. Among the historians are Flavius Eutropius, who lived in the fourth century, and by the direction of the Emperor Valens composed an "Epitome of Roman History," which was a favorite book in the Middle Ages. Ammianus Marcellinus, his contemporary, wrote a Roman history in continuation of Tacitus and Suetonius. Though his style is affected and often rough and inaccurate, his work is interesting for its digressions and observations. Severus Sulpicius wrote the history of the Hebrews, and of the four centuries of the church. His "Sacred History," for its language and style, is one of the best works of that age. In the department of oratory may be mentioned Cornelius Fronto, who flourished under Domitian and Nerva, and was endowed with a rich imagination and a mind stored with vast erudition in Greek and Latin literature, Symmachus, distinguished for his opposition to Christianity, and Cassiodorus, minister and secretary of the Emperor Theodoric. In the decline of Roman, as of Greek literature, grammarians took the place of poets and of historians; they commented on and interpreted the ancient classics, and transmitted to us valuable information concerning the Augustan writers. Among the most important works of this kind are the "Attic Nights" of Gellius, who was born in Rome, and lived under Hadrian and the Antonines. In this work are preserved many valuable passages of the classics which would otherwise have been lost. Macrobius, who flourished in the middle of the fifth century, was the author of different works in which the doctrines of the Neo-Platonic school are expounded. His style, however, is very defective. A striking characteristic of the writings, both in Greek and Latin, of the last ages of the empire, is the prevalence of principles and opinions imported from the East. The Neo-Platonic school, imbued with Oriental mysticism, had diffused the belief in spirits and magic, and the philosophy of this age was a mixture of ancient wisdom with new superstitions belonging to the ages of transition between the decadence of the ancient faith and the development of a new religion. The best representative of the philosophy of this age is Apuleius, born in Africa in the reign of Hadrian. After having received his education in Carthage and Athens, he came to Rome, where he acquired great reputation as a literary man, and as the possessor of extraordinary supernatural powers. To this extensive philosophical knowledge and immense erudition he united great polish of manner and remarkable beauty of person. He wrote much on philosophy; but his most important work is a romance known as "Metamorphoses, or the Golden Ass," containing his philosophical and mystic doctrines. In this book, the object of which is to encourage the belief in mysticism, the writer describes the transformation of a young man into an ass, who is allowed to take his primitive human form only through a knowledge of the mysteries of Isis. The story is well told, and the romance is full of interest and sprightliness; but its style is incorrect, florid, and bombastic. Boethius (470-524), the last of the Roman philosophers, was the descendant of an illustrious family. He made Greek philosophy the principal object of his meditations. He was raised to the highest honors and offices in the empire by Theodoric, but finally, through the artifices of enemies who envied his reputation, he lost the favor of his patron, was imprisoned, and at length beheaded. Of his numerous works, founded on the peripatetic philosophy, that which has gained him the greatest celebrity is entitled "On the Consolations of Philosophy," composed while he was in prison. It is in the form of a dialogue, in which philosophy appears to console him with the idea of Divine Providence. The poetical part of the book is written with elegance and grace, and his prose, though not pure, is fluent and full of tranquil dignity. The work of Boethius, which is known in all modern languages, was translated into Anglo-Saxon by King Alfred, 900 A.D. The fathers of the church followed more particularly the philosophy of Plato, which was united and adapted to Christianity. St. Augustine is the most illustrious among the Christian Platonists. The most eloquent orators and writers of this period were found among the advocates of Christianity; and among the most celebrated of these Latin fathers of the Christian church we may mention the following names. Tertullian (160-285), in his apology for the Christians, gives much information on the manners and conduct of the early Christians; his style is concise and figurative, but harsh, unpolished, and obscure. St. Cyprian (200-258), beheaded at Carthage for preaching the gospel contrary to the orders of the government, wrote an explanation of the Lord's Prayer, which affords a valuable illustration of the ecclesiastical history of the time. Arnobius (fl. 300) refuted the objections of the heathen against Christianity with spirit and learning, in his "Disputes with the Gentiles," a work rich in materials for the understanding of Greek and Roman mythology. Lactantius (d. 335), on account of his fine and eloquent language, is frequently called the Christian Cicero; his "Divine Institutes" are particularly celebrated. St. Ambrose (340-397) obtained great honor by his conduct as Bishop of Milan, and his writings bear the

stamp of his high Christian character. St. Augustine (360-430) was one of the most renowned of all the Latin fathers. Though others may have been more learned or masters of a purer style, none more powerfully touched and warmed the heart towards religion. His "City of God" is one of the great monuments of human genius. St. Jerome (330-420) wrote many epistles full of energy and affection, as well as of religious zeal. He made a Latin version of the Old Testament, which was the foundation of the Vulgate, and which gave a new impulse to the study of the Holy Scriptures. Leo the Great (fl. 440) is the first pope whose writings have been preserved. They consist of sermons and letters. His style is finished and rhetorical.

10. ROMAN JURISPRUDENCE.--In the period which followed, from the death of Augustus to the time of the Antonines, Roman civilians and legal writers continued to be numerous, and as a professional body they seem to have enjoyed high consideration until the close of the reign of Alexander Severus, 385* A.D. After that time they were held in much less estimation, as the science fell into the hands of freedmen and plebeians, who practiced it as a sordid and pernicious trade. With the reign of Constantine, the credit of the profession revived, and the youth of the empire were stimulated to pursue the study of the law by the hope of being ultimately rewarded by honorable and lucrative offices, the magistrates being almost wholly taken from the class of lawyers. Two jurists of this reign, Gregorianus and Hermogenianus, are particularly distinguished as authors of codes which are known by their names, and which were recognized as standard authorities in courts of justice. The "Code of Theodosius" was a collection of laws reduced by that emperor, and promulgated in both empires 438 A.D. It retained its authority in the western empire until its final overthrow, 476 A.D., and even after this, though modified by the institutions of the conquerors. In the eastern empire, it was only superseded by the code of Justinian. This emperor undertook the task of reducing to order and system the great confusion and perplexity in which the whole subject of Roman jurisprudence was involved. For this purpose he employed the most eminent lawyers, with the celebrated Tribonian at their head, to whom he intrusted the work of forming and publishing a complete collection of the preceding laws and edicts, and who devoted several years of unwearied labor and research to this object. They first collected and reduced the imperial constitutions from the time of Hadrian downwards, which was promulgated as the "Justinian Code." Their next labor was to reduce the writings of the jurisconsults of the preceding ages, especially those who had lived under the empire, and whose works are said to have amounted to two thousand volumes. This work was published 533 A.D., under the title of "Pandects," or "Digest," the former title referring to their completeness as comprehending the whole of Roman jurisprudence, and the latter to their methodical arrangement. At the same time, a work prepared by Tribonian was published by the order of the emperor, on the elements or first principles of Roman law, entitled "Institutes," and another collection consisting of constitutions and edicts, under the title of "Novels," chiefly written in Greek, but known to the moderns by a Latin translation. These four works, the Code, the Pandects, the Institutes, and the Novels, constituted what is now called the Body of Roman Law. The system of jurisprudence established by Justinian remained in force in the eastern empire until the taking of Constantinople, 1453 A.D. After the fall of the western empire, these laws had little sway until the twelfth century, when Irnerius, a German lawyer who had studied at Constantinople, opened a school at Bologna, and thus revived and propagated in the West a knowledge of Roman civil law. Students flocked to this school from all parts, and by them Roman jurisprudence, as embodied in the system of Justinian, was transmitted to most of the countries of Europe. During the fourth and fifth centuries, the process of the debasement of the Roman tongue went on with great rapidity. The influence of the provincials began what the irruptions of the northern tribes consummated. In many scattered parts of the empire it is probable that separate Latin dialects arose, and the strain upon the whole structure of the tongue was prodigious, when the Goths poured into Italy, established themselves in the capital, and began to speak and write in a language previously foreign to them. With the close of the reign of Theodoric the curtain falls upon ancient literature.

ARABIAN LITERATURE.

1. European Literature in the Dark Ages.--2. The Arabian language.--3. Arabian Mythology and the Koran.--4. Historical Development of Arabian Literature.--5. Grammar and Rhetoric.--6. Poetry.--7. The Arabian Tales.-- 8. History and Science.--9. Education.

1. EUROPEAN LITERATURE IN THE DARK AGES.--The literature, arts, and sciences of the Arabs formed the connecting link between the civilizations of ancient and modern times. To them we owe the revival of learning in Western Europe, and many of the inventions and useful arts perfected by later nations. From the middle of the sixth

century A.D. to the beginning of the eleventh, the interval between the decline of ancient and the development of modern literature is known in history as the Dark Ages. The sudden rise of the Arabian Empire and the rapid development of its literature were the great events which characterize the period. At the beginning of this epoch classical genius was already extinct, and the purity of the classical tongues was yielding rapidly to the corruptions of the provinces and of the new dialects. Many other causes conspired to work great changes in the fabric of society, and in the manifestations of human intellect. Throughout this period the treasures of Greek and Latin literature, exposed to the danger of perishing and impaired by much actual loss, exerted no influence on the minds of those who still used the tongues to which they belong. Greek letters, as we have seen, decayed with the Byzantine power, and the vital principle in both became extinct long before the sword of the Turkish conqueror inflicted the final blow. The fate of Latin literature was not less deplorable. When province after province of the Roman dominions was overrun by the northern hordes, when the imperial schools were suppressed and the monuments of ancient genius destroyed, an enfeebled people and a debased language could not withstand such adverse circumstances. During the seventh and eighth centuries Latin composition degenerated into the rudeness of the monkish style. The care bestowed by Charlemagne upon education in the ninth century produced some purifying effect upon the writings of the cloister; the tenth was distinguished by an increased zeal in the task of transcribing the classical authors, and in the eleventh the Latin works of the Normans display some masculine force and freedom. Latin was the repository of such knowledge as the times could boast; it was used in the service of the church, and in the chronicles that supplied the place of history, but it was not the vehicle of any great production stamped with true genius and impressing the minds of posterity. Still, genius was not altogether extinguished in every part of Europe. The north, which sent out its daring tribes to change the aspect of civil life, furnished a fresh source of mental inspiration, which was destined, with the recovered influence of the classic spirit and other prolific causes, to give birth to some of the best portions of modern literature. At the memorable epoch of the overthrow of the Roman dominion in the West (476 A.D.), the seats of the Teutonic race extended from the banks of the Rhine and the Danube to the rock-bound coasts of Norway. The victorious invaders who occupied the southern provinces of Europe speedily lost their own forms of speech, which were broken down, together with those of the vanquished, into a jargon unfit for composition. But in Germany and Scandinavia, where the old language retained its purity, song continued to flourish. There, from the most distant eras described by Tacitus and other Latin writers, the favorite attendants of kings and chiefs were those celebrated bards who preserved in their traditionary strains the memory of great events, the praises of the gods, the glory of warriors, and the laws and customs of their countrymen. Intrusted, like the Grecian heroic minstrelsy, to oral recitation, it was not until the propitious reign of Charlemagne that these verses were collected. But, through the bigotry of his successor or the ravages of time, not a fragment of this collection remains. We are enabled, however, to form an idea of the general tone and tenor of this early Teutonic poetry from other interesting remains. The "Nibelungen-Lied" (Lay of the Nibelungen) and "Heldenbuch" (Book of Heroes) may be regarded as the Homeric poems of Germany. After an examination of their monuments, the ability of the ancient bards, the honor in which they were held, and the enthusiasm which they produced, will not be surprising. Equally distinguished were the Scalds of Scandinavia. Ever in the train of princes and gallant adventurers, they chanted their rhymeless verse for the encouragement and solace of heroes. Their oldest songs, or sagas, are mostly of a historical import. In the Icelandic Edda, however, the richest monument of this species of composition, the theological element of their poetry is shadowed out in the most picturesque and fanciful legends. Such was the intellectual state of Europe down to the age of Charlemagne. While in the once famous seats of arts and arms scarcely a ray of native genius or courage was visible, the light of human intellect still burned in lands whose barbarism had furnished matter for the sarcasm of classical writers. Charlemagne encouraged learning, established schools, and filled his court with men of letters; while in England, the illustrious Alfred, himself a scholar and an author, improved and enriched the Anglo-Saxon dialect, and exerted the most beneficial influence on his contemporaries. The confusion and debasement of language in the south of Europe has already been alluded to. But the force and activity of mind, that formed an essential characteristic of the conquering race, were destined ultimately to evolve regularity and harmony out of the concussion of discordant elements. The Latin and Teutonic tongues were blended together, and hence proceeded all the chief dialects of modern Europe. Over the south, from Portugal to Italy, the Latin element prevailed; but even where the Teutonic was the chief ingredient, as in the English and German, there has also been a large infusion of the Latin. To these two languages, and to the Provençal, French, Italian, Spanish, and Portuguese, called, from their Roman origin, the Romance or Romanic languages, all that is prominent and precious in modern letters belongs. But it is not until the eleventh century that their progress becomes identified with the history of literature. Up to this period there had been little repose, freedom, or peaceful enjoyment of property. The independence and industry of the middle classes were almost unknown, and the chieftain, the vassal, and the slave were the characters which stood out in the highest relief. Throughout the whole of the eleventh century, the social chaos seemed resolving itself into some approach to order and tranquillity. The

gradual abolition of personal servitude, hardly accomplished in three successive centuries, now began. A third estate arose. The rights of cities, and the corporation-spirit, the result of the necessity that drove men to combine for mutual defense, led to intercourse among them and to consequent improvement in language. Chivalry, also, served to mitigate the oppressions of the nobles, and to soften and refine their manners. From the date of the first crusade (1093 A.D.) down to the close of the twelfth century, was the golden age of chivalry. The principal thrones of Europe were occupied by her foremost knights. The East formed a point of union for the ardent and adventurous of different countries, whose courteous rivalry stimulated the growth of generous sentiments and the passion for brave deeds. The genius of Europe was roused by the passage of thousands of her sons through Greece into Asia and Egypt, amidst the ancient seats of art, science, and refinement; and the minds of men received a fresh and powerful impulse. It was during the eleventh century that the brilliancy of the Arabian literature reached its culminating point, and, through the intercourse of the Troubadours with the Moors of the peninsula, and of the Crusaders with the Arabs in the East, began to influence the progress of letters in Europe.

2. THE ARABIAN LANGUAGE.--The Arabian language belongs to the Semitic family; it has two principal dialects--the northern, which has, for centuries, been the general tongue of the empire, and is best represented in literature, and the southern, a branch of which is supposed to be the mother of the Ethiopian language. The former, in degenerated dialects, is still spoken in Arabia, in parts of western Asia, and throughout northern Africa, and forms an important part of the Turkish, Persian, and other Oriental languages. The Arabic is characterized by its guttural sounds, by the richness and pliability of its vowels, by its dignity, volume of sound, and vigor of accentuation and pronunciation. Like all Semitic languages, it is written from right to left; the characters are of Syrian origin, and were introduced into Arabia before the time of Mohammed. They are of two kinds, the Cufic, which were first used, and the Neski, which superseded them, and which continue in use at the present day. The Arabic alphabet was, with a few modifications, early adopted by the Persians and Turks.

3. ARABIAN MYTHOLOGY AND THE KORAN.--Before the time of Mohammed, the Arabians were gross idolaters. They had some traditionary idea of the unity and perfections of the Deity, but their creed embraced an immense number of subordinate divinities, represented by images of men and women, beasts and birds. The essential basis of their religion was Sabeism, or star-worship. The number and beauty of the heavenly luminaries, and the silent regularity of their motions, could not fail deeply to impress the minds of this imaginative people, living in the open air, under the clear and serene sky, and wandering among the deserts, oases, and picturesque mountains of Arabia. They had seven celebrated temples dedicated to the seven planets. Some tribes exclusively revered the moon; others the dog-star. Some had received the religion of the Magi, or fire-worshippers, while others had become converts to Judaism. Ishmael is one of the most venerated progenitors of the nation; and it is the common faith that Mecca, then an arid wilderness, was the spot where his life was providentially saved, and where Hagar, his mother, was buried. The well pointed out by the angel, they believe to be the famous Zemzem, of which all pious Mohammedans drink to this day. To commemorate the miraculous preservation of Ishmael, God commanded Abraham to build a temple, and he erected and consecrated the Caaba, or sacred house, which is still venerated in Mecca; and the black stone incased within its walls is the same on which Abraham stood. Mohammed (569-632 A.D.) did not pretend to introduce a new religion; his professed object was merely to restore the primitive and only true faith, such as it had been in the days of the patriarchs; the fundamental idea of which was the unity of God. He made the revelations of the Old and New Testaments the basis of his preaching. He maintained the authority of the books of Moses, admitted the divine mission of Jesus, and he enrolled himself in the catalogue of inspired teachers. This doctrine was proclaimed in the memorable words, which for so many centuries constituted the war-cry of the Saracens,--_There is no God but God, and Mohammed is his prophet_. Mohammed preached no dogmas substantially new, but he adorned, amplified, and adapted to the ideas, prejudices, and inclinations of the Orientals, doctrines which were as old as the race. He enjoined the ablutions suited to the manners and necessities of hot climates. He ordained five daily prayers, that man might learn habitually to elevate his thoughts above the outward world. He instituted the festival of the Ramadan, and the pilgrimage to Mecca, and commanded that every man should bestow in alms the hundredth part of his possessions; observances which, for the most part, already existed in the established customs of the country. The Koran (Reading), the sacred book of the Mohammedans, is, according to their belief, the revelation of God to their prophet Mohammed. It contains not only their religious belief, but their civil, military, and political code. It is divided into 114 chapters, and 1,666 verses. It is written in rhythmical prose, and its materials are borrowed from the Jewish and Christian scriptures, the legends of the Talmud, and the traditions and fables of the Arabian and Persian mythologies. Confusion of ideas, obscurity, and contradictions destroy the unity and even the interest of this work. The chapters are preposterously distributed, not according to their date or connection, but according to their length, beginning with the longest, and ending with the

shortest; and thus the work becomes often the more unintelligible by its singular arrangement. But notwithstanding this, there is scarcely a volume in the Arabic language which contains passages breathing more sublime poetry, or more enchanting eloquence; and the Koran is so far important in the history of Arabian letters, that when the scattered leaves were collected by Abubeker, the successor of Mohammed (635 A.D.) and afterwards revised, in the thirtieth year of the Hegira, they fixed at once the classic language of the Arabs, and became their standard in style as well as in religion. This work and its commentaries are held in the highest reverence by the Mohammedans. It is the principal book taught in their schools; they never touch it without kissing it, and carrying it to the forehead, in token of their reverence; oaths before the courts are taken upon it; it is learned by heart, and repeated every forty days; many believers copy it several times in their lives, and often possess one or more copies ornamented with gold and precious stones. The Koran treats of death, resurrection, the judgment, paradise, and the place of torment, in a style calculated powerfully to affect the imagination of the believer. The joys of paradise, promised to all who fall in the cause of religion, are those most captivating to an Arabian fancy. When Al Sirat, or the Bridge of Judgment, which is as slender as the thread of a famished spider, and as sharp as the edge of a sword, shall be passed by the believer, he will be welcomed into the gardens of delight by black-eyed Houris, beautiful nymphs, not made of common clay, but of pure essence and odors, free from all blemish, and subject to no decay of virtue or of beauty, and who await their destined lovers in rosy bowers, or in pavilions formed of a single hollow pearl. The soil of paradise is composed of musk and saffron, sprinkled with pearls and hyacinths. The walls of its mansions are of gold and silver; the fruits, which bend spontaneously to him who would gather them, are of a flavor and delicacy unknown to mortals. Numerous rivers flow through this blissful abode; some of wine, others of milk, honey, and water, the pebbly beds of which are rubies and emeralds, and their banks of musk, camphor, and saffron. In paradise the enjoyment of the believers, which is subject neither to satiety nor diminution, will be greater than the human understanding can compass. The meanest among them will have eighty thousand servants, and seventy-two wives. Wine, though forbidden on earth, will there be freely allowed, and will not hurt or inebriate. The ravishing songs of the angels and of the Houris will render all the groves vocal with harmony, such as mortal ear never heard. At whatever age they may have died, at their resurrection all will be in the prime of manly and eternal vigor. It would be a journey of a thousand years for a true Mohammedan to travel through paradise, and behold all the wives, servants, gardens, robes, jewels, horses, camels, and other things, which belong exclusively to him. The hell of Mohammed is as full of terror as his heaven is of delight. The wicked, who fall into the gulf of torture from the bridge of Al Sirat, will suffer alternately from cold and heat; when they are thirsty, boiling water will be given them to drink; and they will be shod with shoes of fire. The dark mansions of the Christians, Jews, Sabians, Magians, and idolaters are sunk below each other with increasing horrors, in the order of their names. The seventh or lowest hell is reserved for the faithless hypocrites of every religion. Into this dismal receptacle the unhappy sufferer will be dragged by seventy thousand halts, each pulled by seventy thousand angels, and exposed to the scourge of demons, whose pastime is cruelty and pain. It is a portion of the faith inculcated in the Koran, that both angels and demons exist, having pure and subtle bodies, created of fire, and free from human appetites and desires. The four principal angels are Gabriel, the angel of revelation; Michael, the friend and protector of the Jews; Azrael, the angel of death; and Izrafel, whose office it will be to sound the trumpet at the last day. Every man has two guardian angels to attend him and record his actions, good and evil. The doctrine of the angels, demons, and jins or genii, the Arabians probably derived from the Hebrews. The demons are fallen angels, the prince of whom is Eblis; he was at first one of the angels nearest to God's presence, and was called Azazel. He was cast out of heaven, according to the Koran, for refusing to pay homage to Adam at the time of the creation. The genii are intermediate creatures, neither wholly spiritual nor wholly earthly, some of whom are good and entitled to salvation, and others infidels and devoted to eternal torture. Among them are several ranks and degrees, as the Peris, or fairies, beautiful female spirits, who seek to do good upon the earth, and the Deev, or giants, who frequently make war upon the Peris, take them captive, and shut them up in cages. The genii, both good and bad, have the power of making themselves invisible at pleasure. Besides the mountain of Kaf, which is their chief place of resort, they dwell in ruined cities, uninhabited houses, at the bottom of wells, in woods, pools of water, and among the rocks and sandhills of the desert. Shooting stars are still believed by the people of the East to be arrows shot by the angels against the genii, who transgress these limits and approach too near the forbidden regions of bliss. Many of the genii delight in mischief; they surprise and mislead travelers, raise whirlwinds, and dry up springs in the desert. The Ghoul lives on the flesh of men and women, whom he decoys to his haunts in wild and barren places, in order to kill and devour them, and when he cannot thus obtain food, he enters the graveyards and feeds upon the bodies of the dead. The fairy mythology of the Arabians was introduced into Europe in the eleventh century by the Troubadours and writers of the romances of chivalry, and through them it became an important element in the literature of Europe. It constituted the machinery of the Fabliaux of the Trouvères, and of the romantic epics of Boccaccio, Ariosto, Tasso, Spenser, Shakspeare, and others. The three leading Mohammedan sects are the Sunnees, the Sheahs, and the

Wahabees. The Sunnees acknowledge the authority of the first Caliphs, from whom most of the traditions were derived. The Sheahs assert the divine right of Ali to succeed to the prophet; consequently they consider the first Caliphs, and all their successors, as usurpers. The Wahabees are a sect of religious reformers, who took their name from Abd al Wahab (1700- 1750), the Luther of the Mohammedans. They became a formidable power in Arabia, but they were finally overcome by Ibrahim Pacha in 1816.

4. HISTORICAL DEVELOPMENT OF THE ARABIAN LITERATURE.--The literature of the Arabians has, properly speaking, but one period; although from remote antiquity poetry was with them a favorite occupation, and long before the time of Mohammed the roving tribes of the desert had their annual conventions, where they defended their honor and celebrated their heroic deeds. As early as the fifth century A.D., at the fair of Ochadh, thirty days every year were employed not only in the exchange of merchandise, but in the nobler display of rival talents. A place was set apart for the competitions of the bards, whose highest ambition was to conquer in this literary arena, and the victorious compositions were inscribed in golden letters upon Egyptian paper, and suspended upon the doors of the Caaba, the ancient national sanctuary of Mecca. Seven of the most famous of these ancient poets have been celebrated by Oriental writers under the title of the Arabian Pleiades, and their songs, still preserved, are full of passion, manly pride, and intensity of imagination and feeling. These and similar effusions constituted the entire literature of Arabia, and were the only archives of the nation previous to the age of Mohammed. The peninsula of Arabia, hitherto restricted to its natural boundaries, and peopled by wandering tribes, had occupied but a subordinate place in the history of the world. But the success of Mohammed and the preaching of the Koran were followed by the union of the tribes who, inspired by the feelings of national pride and religious fervor, in less than a century made the Arabian power, tongue, and religion predominant over a third part of Asia, almost one half of Africa, and a part of Spain; and, from the ninth to the sixteenth century, the literature of the Arabians far surpassed that of any contemporary nation. After the fall of the Roman empire in the fifth century A.D., when the western world sank into barbarism, and the inhabitants, ever menaced by famine or the sword, found full occupation in struggling against civil wars, feudal tyranny, and the invasion of barbarians; when poetry was unknown, philosophy was proscribed as rebellion against religion, and barbarous dialects had usurped the place of that beautiful Latin language which had so long connected the nations of the West, and preserved to them so many treasures of thought and taste, the Arabians, who by their conquests and fanaticism had contributed more than any other nation to abolish the cultivation of science and literature, having at length established their empire, in turn devoted themselves to letters. Masters of the country of the magi and the Chaldeans, of Egypt, the first storehouse of human science, of Asia Minor, where poetry and the fine arts had their birth, and of Africa, the country of impetuous eloquence and subtle intellect--they seemed to unite in themselves the advantages of all the nations which they had thus subjugated. Innumerable treasures had been the fruit of their conquests, and this hitherto rude and uncultivated nation now began to indulge in the most unbounded luxury. Possessed of all the delights that human industry, quickened by boundless riches, could procure, with all that could flatter the senses and attach the heart to life, they now attempted to mingle with these the pleasures of the intellect, the cultivation of the arts and sciences, and all that is most excellent in human knowledge. In this new career, their conquests were not less rapid than they had been in the field; nor was the empire which they founded less extended. With a celerity equally surprising, it rose to a gigantic height, but it rested on a foundation no less insecure, and it was quite as transitory in its duration. The Hegira, or flight of Mohammed from Mecca to Medina, corresponds with the year 622 of our era, and the supposed burning of the Alexandrian library by Amrou, the general of the Caliph Omar, with the year 641. This is the period of the deepest barbarism among the Saracens, and this event, doubtful as it is, has left a melancholy proof of their contempt for letters. A century had scarcely elapsed from the period to which this barbarian outrage is referred, when the family of the Abassides, who mounted the throne of the Caliphs in 750, introduced a passionate love of art, of science, and of poetry. In the literature of Greece, nearly eight centuries of progressive cultivation succeeding the Trojan war had prepared the way for the age of Pericles. In that of Rome, the age of Augustus was also in the eighth century after the foundation of the city. In French literature, the age of Louis XIV. was twelve centuries subsequent to Clovis, and eight after the development of the first rudiments of the language. But, in the rapid progress of the Arabian empire, the age of Al Mamoun, the Augustus of Bagdad, was not removed more than one hundred and fifty years from the foundation of the monarchy. All the literature of the Arabians bears the marks of this rapid development. Ali, the fourth Caliph from Mohammed, was the first who extended any protection to letters. His rival and successor, Moawyah, the first of the Ommyiades (661-680), assembled at his court all who were most distinguished by scientific acquirements; he surrounded himself with poets; and as he had subjected to his dominion many of the Grecian islands and provinces, the sciences of Greece under him first began to obtain any influence over the Arabians. After the extinction of the dynasty of the Ommyiades, that of the Abassides bestowed a still more powerful patronage on letters. The celebrated Haroun al Raschid (786-809) acquired a glorious reputation by the

protection he afforded to letters. He never undertook a journey without carrying with him at least a hundred men of science in his train, and he never built a mosque without attaching to it a school. But the true protector and father of Arabic literature was Al Mamoun, the son of Haroun al Raschid (813-833), who rendered Bagdad the centre of literature. He invited to his court from every part of the world all the learned men with whose existence he was acquainted, and he retained them by rewards, honors, and distinctions of every kind. He exacted, as the most precious tribute from the conquered provinces, all the important books and literary relics that could be discovered. Hundreds of camels might be seen entering Bagdad, loaded with nothing but manuscripts and papers, and those most proper for instruction were translated into Arabic. Instructors, translators, and commentators formed the court of Al Mamoun, which appeared to be rather a learned academy, than the seat of government in a warlike empire. The Caliph himself was much attached to the study of mathematics, which he pursued with brilliant success. He conceived the grand design of measuring the earth, which was accomplished by his mathematicians, at his own expense. Not less generous than enlightened, Al Mamoun, when he pardoned one of his relatives who had revolted against him, exclaimed, "If it were known what pleasure I experience in granting pardon, all who have offended against me would come and confess their crimes." The progress of the Arabians in science was proportioned to the zeal of the sovereign. In every town of the empire schools, colleges, and academies were established. Bagdad was the capital of letters as well as of the Caliphs, but Bassora and Cufa almost equaled that city in reputation, and in the number of celebrated poems and treatises that they produced. Balkh, Ispahan, and Samarcand were equally the homes of science. Cairo contained a great number of colleges; in the towns of Fez and Morocco the most magnificent buildings were appropriated to the purposes of instruction, and in their rich libraries were preserved those precious volumes which had been lost in other places. What Bagdad was to Asia, Cordova was to Europe, where, particularly in the tenth and eleventh centuries, the Arabs were the pillars of literature. At this period, when learning found scarcely anywhere either rest or encouragement, the Arabians were employed in collecting and diffusing it in the three great divisions of the world. Students traveled from France and other European countries to the Arabian schools in Spain, particularly to learn medicine and mathematics. Besides the academy at Cordova, there were established fourteen others in different parts of Spain, exclusive of the higher schools. The Arabians made the most rapid advancement in all the departments of learning, especially in arithmetic, geometry, and astronomy. In the various cities of Spain, seventy libraries were opened for public instruction at the period when all the rest of Europe, without books, without learning, without cultivation, was plunged in the most disgraceful ignorance. The number of Arabic authors which Spain produced was so prodigious, that many Arabian bibliographers wrote learned treatises on the authors born in particular towns, or on those among the Spaniards who devoted themselves to a single branch of study, as philosophy, medicine, mathematics, or poetry. Thus, throughout the vast extent of the Arabian empire, the progress of letters had followed that of arms, and for five centuries this literature preserved all its brilliancy.

5. GRAMMAR AND RHETORIC.--The perfection of the language was one of the first objects of the Arabian scholars, and from the rival schools of Cufa and Bassora a number of distinguished men proceeded, who analyzed with the greatest subtlety all its rules and aided in perfecting it. As early as in the age of Ali, the fourth Caliph, Arabian literature boasted of a number of scientific grammarians. Prosody and the metric art were reduced to systems. Dictionaries of the language were composed, some of which are highly esteemed at the present day. Among these may be mentioned the "Al Sehad," or Purity, and "El Kamus," or the Ocean, which is considered the best dictionary of the Arabian language. The study of rhetoric was united to that of grammar, and the most celebrated works of the Greeks on this art were translated and adapted to the Arabic. After the age of Mohammed and his immediate successors, popular eloquence was no longer cultivated. Eastern despotism having supplanted the liberty of the desert, the heads of the state or army regarded it beneath them to harangue the people or the soldiers; they called upon them only for obedience. But though political eloquence was of short duration among the Arabians, on the other hand they were the inventors of that species of rhetoric most cultivated at the present day, that of the academy and the pulpit. Their philosophers in these learned assemblies displayed all the measured harmony of which their language was susceptible. Mohammed had ordained that his faith should be preached in the mosques;--many of the harangues of these sacred orators are still preserved in the Escorial, and the style of them is very similar to that of the Christian orators.

6. POETRY.--Poetry still more than eloquence was the favorite occupation of the Arabians from their origin as a nation. It is said that this people alone have produced more poets than all others united. Mohammed himself, as well as some of his first companions, cultivated this art, but it was under Haroun al Raschid and his successor, Al Mamoun, and more especially under the Ommiyades of Spain that Arabic poetry attained its highest splendor. But the ancient impetuosity of expression, the passionate feeling, and the spirit of individual independence no longer

characterized the productions of this period, nor is there among the numerous constellations of Arabic poets any star of distinguished magnitude. With the exception of Mohammed and a few of the Saracen conquerors and sovereigns, there is scarcely an individual of this nation whose name is familiar to the nations of Christendom. The Arabians possess many heroic poems composed for the purpose of celebrating the praises of distinguished men, and of animating the courage of their soldiers. They do not, however, boast of any epics; their poetry is entirely lyric and didactic. They have been inexhaustible in their love poems, their elegies, their moral verses,--among which their fables may be reckoned,--their eulogistic, satirical, descriptive, and above all, their didactic poems, which have graced even the most abstruse science, as grammar, rhetoric, and arithmetic. But among all their poems, the catalogue alone of which, in the Escorial, consists of twenty-four volumes, there is not a single epic, comedy, or tragedy. In those branches of poetry which they cultivated they displayed surprising subtlety and great refinement of thought, but the fame of their compositions rests, in some degree, on their bold metaphors, their extravagant allegories, and their excessive hyperboles. The Arabs despised the poetry of the Greeks, which appeared to them timid, cold, and constrained, and among all the books, which, with almost superstitious veneration, they borrowed from them, there is scarcely a single poem which they judged worthy of translation. The object of the Arabian poets was to make a brilliant use of the boldest and most gigantic images, and to astonish the reader by the abruptness of their expressions. They burdened their compositions with riches, under the idea that nothing which was beautiful could be superfluous. They neglected natural sentiment, and the more they could multiply the ornaments of art, the more admirable in their eyes did the work appear. The nations who possessed a classical poetry, in imitating nature, had discovered the use of the epic and the drama, in which the poet endeavors to express the true language of the human heart. The people of the East, with the exception of the Hindus, never made this attempt--their poetry is entirely lyric; but under whatever name it may be known, it is always found to be the language of the passions. The poetry of the Arabians is rhymed like our own, and the rhyming is often carried still farther in the construction of the verse, while the uniformity of sound is frequently echoed throughout the whole expression. The collection made by Aboul Teman (fl. 845 A.D.) containing the Arabian poems of the age anterior to Mohammed, and that of Taoleti, which embraces the poems of the subsequent periods, are considered the richest and most complete anthologies of Arabian poetry. Montanebbi, a poet who lived about 1050, has been compared to the Persian Hafiz.

7. THE ARABIAN TALES.--If the Arabs have neither the epic nor the drama, they have been, on the other hand, the inventors of a style of composition which is related to the epic, and which supplies among them the place of the drama. We owe to them those tales, the conception of which is so brilliant and the imagination so rich and varied: tales which have been the delight of our infancy, and which at a more advanced age we can never read without feeling their enchantment anew. Every one is acquainted with the "Arabian Nights Entertainments;" but in our translation we possess but a very small part of the Arabian collection, which is not confined merely to books, but forms the treasure of a numerous class of men and women, who, throughout the East, find a livelihood in reciting these tales to crowds, who delight to forget the present, in the pleasing dreams of imagination. In the coffee-houses of the Levant, one of these men will gather a silent crowd around him, and picture to his audience those brilliant and fantastic visions which are the patrimony of Eastern imaginations. The public squares abound with men of this class, and their recitations supply the place of our dramatic representations. The physicians frequently recommend them to their patients in order to soothe pain, to calm agitation, or to produce sleep; and these story-tellers, accustomed to sickness, modulate their voices, soften their tones, and gently suspend them as sleep steals over the sufferer. The imagination of the Arabs in these tales is easily distinguished from that of the chivalric nations. The supernatural world is the same in both, but the moral world is different. The Arabian tales, like the romances of chivalry, convey us to the fairy realms, but the human personages which they introduce are very dissimilar. They had their birth after the Arabians had devoted themselves to commerce, literature, and the arts, and we recognize in them the style of a mercantile people, as we do that of a warlike nation in the romances of chivalry. Valor and military achievements here inspire terror but no enthusiasm, and on this account the Arabian tales are often less noble and heroic than we usually expect in compositions of this nature. But, on the other hand, the Arabians are our masters in the art of producing and sustaining this kind of fiction. They are the creators of that brilliant mythology of fairies and genii which extends the bounds of the world, and carries us into the realms of marvels and prodigies. It is from them that European nations have derived that intoxication of love, that tenderness and delicacy of sentiment, and that reverential awe of women, by turns slaves and divinities, which have operated so powerfully on their chivalrous feelings. We trace their effects in all the literature of the south, which owes to this cause its mental character. Many of these tales had separately found their way into the poetic literature of Europe, long before the translation of the Arabian Nights. Some are to be met with in the old *fabliaux*, in Boccaccio, and in Ariosto, and these very tales which have charmed our infancy, passing from nation to nation through channels frequently unknown, are now familiar to the memory and form the delight of the imagination of half the inhabitants of the globe. The author of the

original Arabic work is unknown, as is also the period at which it was composed. It was first introduced into Europe from Syria, where it was obtained, in the latter part of the seventeenth century, by Galland, a French traveler, who was sent to the East by the celebrated Colbert, to collect manuscripts, and by him first translated and published.

8. HISTORY AND SCIENCE.--As early as the eighth century A.D., history became an important department in Arabian literature. At later periods, historians who wrote on all subjects were numerous. Several authors wrote universal history from the beginning of the world to their own time; every state, province, and city possessed its individual chronicle. Many, in imitation of Plutarch, wrote the lives of distinguished men; and there was such a passion for every species of composition, and such a desire to leave no subject untouched, that there was a serious history written of celebrated horses, and another of camels that had risen to distinction. They possessed historical dictionaries, and made use of all those inventions which curtail labor and dispense with the necessity of research. Every art and science had its history, and of these this nation possessed a more complete collection than any other, either ancient or modern. The style of the Arabian historians is simple and unadorned. Philosophy was passionately cultivated by the Arabians, and upon it was founded the fame of many ingenious and sagacious men, whose names are still revered in Europe. Among them were Averrhoes of Cordova (d. 1198), the great commentator on the works of Aristotle, and Avicenna (d. 1037), a profound philosopher as well as a celebrated writer on medicine. Arabian philosophy penetrated rapidly into the West, and had greater influence on the schools of Europe than any branch of Arabic literature; and yet it was the one in which the progress was, in fact, the least real. The Arabians, more ingenious than profound, attached themselves rather to the subtleties than to the connection of ideas; their object was more to dazzle than to instruct, and they exhausted their imaginations in search of mysteries. Aristotle was worshiped by them, as a sort of divinity. In their opinion all philosophy was to be found in his writings, and they explained every metaphysical question according to the scholastic standard. The interpretation of the Koran formed another important part of their speculative studies, and their literature abounds with exegetic works on their sacred book, as well as with commentaries on Mohammedan law. The learned Arabians did not confine themselves to the studies which they could only prosecute in their closets; they undertook, for the advancement of science, the most perilous journeys, and we owe to Aboul Feda (1273- 1331) and other Arabian travelers the best works on geography written in the Middle Ages. The natural sciences were cultivated by them with great ardor, and many naturalists among them merit the gratitude of posterity. Botany and chemistry, of which they were in some sort the inventors, gave them a better acquaintance with nature than the Greeks or Romans ever possessed, and the latter science was applied by them to all the necessary arts of life. Above all, agriculture was studied by them with a perfect knowledge of the climate, soil, and growth of plants. From the eighth to the eleventh century, they established medical schools in the principal cities of their dominions, and published valuable works on medical science. They introduced more simple principles into mathematics, and extended the use and application of that science. They added to arithmetic the decimal system, and the Arabic numerals, which, however, are of Hindu origin; they simplified the trigonometry of the Greeks, and gave algebra more useful and general applications. Bagdad and Cordova had celebrated schools of astronomy, and observatories, and their astronomers made important discoveries; a great number of scientific words are evidently Arabic, such as algebra, alcohol, zenith, nadir, etc., and many of the inventions, which at the present day add to the comforts of life, are due to the Arabians. Paper, now so necessary to the progress of intellect, was brought by them from Asia. In China, from all antiquity, it had been manufactured from silk, but about the year 30 of the Hegira (649 A.D.) the manufacture of it was introduced at Samarcand, and when that city was conquered by the Arabians, they first employed cotton in the place of silk, and the invention spread with rapidity throughout their dominions. The Spaniards, in fabricating paper, substituted flax for cotton, which was more scarce and dear; but it was not till the end of the thirteenth century that paper mills were established in the Christian states of Spain, from whence the invention passed, in the fourteenth century only, to Treviso and Padua. Tournaments were first instituted among the Arabians, from whom they were introduced into Italy and France. Gunpowder, the discovery of which is generally attributed to a German chemist, was known to the Arabians at least a century before any trace of it appeared in European history. The compass, also, the invention of which has been given alternately to the Italians and French in the thirteenth century, was known to the Arabians in the eleventh. The number of Arabic inventions, of which we enjoy the benefit without suspecting it, is prodigious. Such, then, was the brilliant light which literature and science displayed from the ninth to the fourteenth century of our era in those vast countries which had submitted to the yoke of Islamism. In this immense extent of territory, twice or thrice as large as Europe, nothing is now found but ignorance, slavery, terror, and death. Few men are there capable of reading the works of their illustrious ancestors, and few who could comprehend them are able to procure them. The prodigious literary riches of the Arabians no longer exist in any of the countries where the Arabians or Mussulmans rule. It is not there that we must seek for the fame of their great men or for their writings. What has been preserved is in the hands of their enemies, in the convents of the monks, or in the royal libraries of Europe.

9. EDUCATION.--At present there is little education, in our sense of the word, in Arabia. In the few instances where public schools exist, writing, grammar, and rhetoric sum up the teaching. The Bedouin children learn from their parents much more than is common in other countries. Great attention is paid to accuracy of grammar and purity of diction throughout the country, and of late literary institutions have been established at Beyrout, Damascus, Bagdad, and Hefar. Such is the extent of Arabic literature, that, notwithstanding the labors of European scholars and the productions of native presses, in Boulak and Cairo, in India, and recently in England, where Hassam, an Arabian poet, has devoted himself to the production of standard works, the greater part of what has been preserved is still in manuscript and still more has perished.

ITALIAN LITERATURE.

INTRODUCTION.--1. Italian Literature and its Divisions.--2. The Dialects. --3. The Italian Language.

PERIOD FIRST.--1. Latin Influence.--2. Early Italian Poetry and Prose.--3. Dante.--4. Petrarch.--5. Boccaccio and other Prose Writers.--6. First Decline of Italian Literature.

PERIOD SECOND.--1. The Close of the Fifteenth Century; Lorenzo de' Medici.--2. The Origin of the Drama and Romantic Epic; Poliziano, Pulci, Boiardo.--3. Romantic Epic Poetry; Ariosto.--4. Heroic Epic Poetry; Tasso.--5. Lyric Poetry; Bembo, Molza, Tarsia, V. Colonna.--6. Dramatic Poetry; Trissino, Rucellai; the Writers of Comedy.--7. Pastoral Drama and Didactic Poetry; Beccari, Sannazzaro, Tasso, Guarini, Rucellai, Alamanni. --8. Satirical Poetry, Novels, and Tales; Berni, Grazzini, Firenzuola, Bandello, and others.--9. History; Machiavelli, Guicciardini, Nardi, and others.--10. Grammar and Rhetoric; the Academy della Crusca, Della Casa, Speroni, and others.--11. Science, Philosophy, and Politics; the Academy del Cimento, Galileo, Torricelli, Borelli, Patrizi, Telesio, Campanella, Bruno, Castiglione, Machiavelli, and others.--12. Decline of the Literature in the Seventeenth Century.--13. Epic and Lyric Poetry; Marini, Filicaja.--14. Mock Heroic Poetry, the Drama, and Satire; Tassoni, Bracciolini, Andreini, and others.--15. History and Epistolary Writings; Davila, Bentivoglio, Sarpi, Redi.

PERIOD THIRD.--1. Historical Development of the Third Period.--2. The Melodrama; Rinuccini, Zeno, Metastasio.--3. Comedy; Goldoni, C. Gozzi, and others.--4. Tragedy; Maffei, Alfieri, Monti, Manzoni, Nicolini, and others.--5. Lyric, Epic, and Didactic Poetry; Parini, Monti, Ugo Foscolo, Leopardi, Grossi, Lorenzi, and others.--6. Heroic-Comic Poetry, Satire, and Fable; Fortiguerra, Passeroni, G. Gozzi, Parini, Giusti, and others. --7. Romances; Verri, Manzoni, D'Azeglio, Cantù, Guerrazzi, and others.--8. History; Muratori, Vico, Giannone, Botta, Colletta, Tiraboschi, and others.--9. Aesthetics, Criticism, Philology, and Philosophy; Baretti, Parini, Giordani, Gioja, Romagnosi, Gallupi, Rosmini, Gioberti.--From 1860 to 1885.

INTRODUCTION.

1. ITALIAN LITERATURE AND ITS DIVISIONS.--The fall of the Western Empire, the invasions of the northern tribes, and the subsequent wars and calamities, did not entirely extinguish the fire of genius in Italy. As we have seen, the Crusades had opened the East and revealed to Europe its literary and artistic treasures; the Arabs had established a celebrated school of medicine in Salerno, and had made known the ancient classics; a school of jurisprudence was opened in Bologna, where Roman law was expounded by eminent lecturers; and the spirit of chivalry, while it softened and refined human character, awoke the desire of distinction in arms and poetry. The origin of the Italian republics, giving scope to individual agency, marked another era in civilization; while the appearance of the Italian language quickened the national mind and led to a new literature. The spirit of freedom, awakened as early as the eleventh century, received new life in the twelfth, when the Lombard cities, becoming independent, formed a powerful league against Frederick Barbarossa. The instinct of self-defense thus developed increased the necessity of education. In the thirteenth and fourteenth centuries, Italian literature acquired its national character and rose to its highest splendor, through the writings of Dante, Petrarch, and Boccaccio, whose influence has been more or less felt in succeeding centuries. The literary history of Italy may be divided into three periods, each of which presents two distinct phases, one of progress and one of decline. The first period, extending from 1100 to 1475, embraces the origin of the literature, its development through the works of Dante, Petrarch, and Boccaccio, in the thirteenth and fourteenth centuries, and its first decline in the fifteenth, when it was supplanted by the absorbing study of the Greek and Latin classics. The second period, commencing 1475, embraces the age of

Lorenzo de' Medici and Leo X., when literature began to revive; the age of Ariosto, Tasso, Machiavelli, and Galileo, when it reached its meridian splendor; its subsequent decline, through the school of Marini; and its last revival towards the close of the seventeenth century. The third period, extending from the close of the seventeenth century to the present time, includes the development of Italian literature, its decline under French influence, and its subsequent national tendency, through the writings of Metastasio, Goldoni, Alfieri, Parini, Monti, Manzoni, and Leopardi.

2. THE DIALECTS.--The dialects of the ancient tribes inhabiting the peninsula early came in contact with the rustic Latin, and were moulded into new tongues, which, at a later period, were again modified by the influence of the barbarians who successively invaded the country. These tongues, elaborated by the action of centuries, are still in use, especially with the lower classes, and many of them have a literature of their own, with grammars and dictionaries. The more important of these dialects are divided into three groups: 1st. The Northern, including the Ligurian, Piedmontese, Lombard, Venetian, and Emilian. 2d. The Central, containing the Tuscan, Umbrian, the dialects of the Marches and of the Roman Provinces. 3d. The Southern, embracing those of the Neapolitan provinces and of Sicily. Each is distinguished from the other and from the true Italian, although they all rest on a common basis, the rustic Latin, the plebeian tongue of the Romans, as distinct from the official and literary tongue.

3. THE ITALIAN LANGUAGE.--The Tuscan or Florentine dialect, which early became the literary language of Italy, was the result of the natural development of the popular Latin and a native dialect probably akin to the rustic Roman idiom. Tuscany suffering comparatively little from foreign invasion, the language lost none of its purity, and remained free from heterogeneous elements. The great writers, Dante, Petrarch, and Boccaccio, who appeared so early, promoted its perfection, secured its prevailing influence, and gave it a national character. Hence, in the literature there is no old Italian as distinct from the modern; the language of Dante continues to be that of modern writers, and becomes more perfect the more it approaches the standard fixed by the great masters of the fourteenth century. Of this language it may be said that for flexibility, copiousness, freedom of construction, and harmony and beauty of sound, it is the most perfect of all the idioms of the Neo-Latin or Romanic tongues.

PERIOD FIRST.

FROM THE ORIGIN OF ITALIAN LITERATURE TO ITS FIRST DECLINE (1100-1475).

1. LATIN INFLUENCE.--During the early part of the Middle Ages Latin was the literary language of Italy, and the aim of the best writers of the time was to restore Roman culture. The Gothic kingdom of Ravenna, established by Theodoric, was the centre of this movement, under the influence of Cassiodorus, Boethius, and Symmachus. It was due to the prevailing affection for the memories of Rome, that through all the Dark Ages the Italian mind kept alive a spirit of freedom unknown in other countries of Europe, a spirit active, later, in the establishment of the Italian republics, and showing itself in the heroic resistance of the communes of Lombardy to the empire of the Hohenstaufens. While the literatures of other countries were drawn almost exclusively from sacred and chivalric legends, the Italians devoted themselves to the study of Roman law and history, to translations from the philosophers of Greece, and, above all, to the establishment of those great universities which were so powerful in extending science and culture throughout the Peninsula. While the Latin language was used in prose, the poets wrote in Provençal and in French, and many Italian troubadours appeared at the courts of Europe.

2. EARLY ITALIAN POETRY AND PROSE.--The French element became gradually lessened, and towards the close of the thirteenth century there arose the Tuscan school of lyric poetry, the true beginning of Italian art, of which Lapo Gianni, Guido Cavalcanti, Cino da Pistoia, and Dante Alighieri were the masters. It is mainly inspired by love, and takes a popular courtly or scholastic form. The style of Gianni had many of the faults of his predecessors. That of Cavalcanti, the friend and precursor of Dante, showed a tendency to stifle poetic imagery under the dead weight of philosophy. But the love poems of Cino are so mellow, so sweet, so musical, that they are only surpassed by those of Dante, who, as the author of the "Vita Nuova," belongs to this lyric school. In this book he tells the story of his love for Beatrice, which was from the first a high idealization in which there was apparently nothing human or earthly. Everything is super-sensual, aerial, heavenly, and the real Beatrice melts more and more into the symbolic, passing out of her human nature into the divine. Italian prose writing is of a later date, and also succeeded a period when Italian authors wrote in Latin and French. It consists chiefly of chronicles, tales, and translations.

3. DANTE (1265-1331).--No poet had yet arisen gifted with absolute power over the empire of the soul; no philosopher had pierced into the depths of feeling and of thought, when Dante, the greatest name of Italy and the father of Italian literature, appeared in the might of his genius, and availing himself of the rude and imperfect materials within his reach, constructed his magnificent work. Dante was born in Florence, of the noble family of Alighieri, which was attached to the papal, or Guelph party, in opposition to the imperial, or Ghibelline. He was but a child when death deprived him of his father; but his mother took the greatest pains with his education, placing him under the tuition of Brunetto Latini, and other masters of eminence. He early made great progress, not only in an acquaintance with classical literature and politics, but in music, drawing, horsemanship, and other accomplishments suitable to his station. As he grew up, he pursued his studies in the universities of Padua, Bologna, and Paris. He became an accomplished scholar, and at the same time appeared in public as a gallant and high-bred man of the world. At the age of twenty-five, he took arms on the side of the Florentine Guelphs, and distinguished himself in two battles against the Ghibellines of Arezzo and Pisa. But before Dante was either a student or a soldier, he had become a lover; and this character, above all others, was impressed upon him for life. At a May-day festival, when only nine years of age, he had singled out a girl of his own age, by the name of Bice, or Beatrice, who thenceforward became the object of his constant and passionate affection, or the symbol of all human wisdom and perfection. Before his twenty-fifth year she was separated from him by death, but his passion was refined, not extinguished by this event; not buried with her body but translated with her soul, which was its object. On the other hand, the affection of Beatrice for the poet troubled her spirit amid the bliss of Paradise, and the visions of the eternal world with which he was favored were a device of hers for reclaiming him from sin, and preparing him for everlasting companionship with herself. At the age of thirty-five he was elected prior, or supreme magistrate of Florence, an honor from which he dates all his subsequent misfortunes. During his priorship, the citizens were divided into two factions called the Neri and Bianchi, as bitterly opposed to each other as both had been to the Ghibellines. In the absence of Dante on an embassy to Rome, a pretext was found by the Neri, his opponents, for exciting the populace against him. His dwelling was demolished, his property confiscated, himself and his friends condemned to perpetual exile, with the provision that, if taken, they should be burned alive. After a fruitless attempt, by himself and his party, to surprise Florence, he quitted his companions in disgust, and passed the remainder of his life in wandering from one court of Italy to another, eating the bitter bread of dependence, which was granted him often as an alms. The greater part of his poem was composed during this period; but it appears that till the end of his life he continued to retouch the work. The last and most generous patron of Dante was Guido di Polenta, lord of Ravenna, and father of Francesca da Rimini, whose fatal love forms one of the most beautiful episodes of this poem. Polenta treated him, not as a dependent but as an honored guest, and in a dispute with the Republic of Venice he employed the poet as his ambassador, to effect a reconciliation; but he was refused even an audience, and, returning disappointed and broken-hearted to Ravenna, he died soon after at the age of fifty-six, having been in exile nineteen years. His fellow-citizens, who had closed their hearts and their gates against him while living, now deeply bewailed his death; and, during the two succeeding centuries, embassy after embassy was vainly sent from Florence to recover his honored remains. Not long after his death, those who had exiled him and confiscated his property provided that his poem should be read and expounded to the people in a church. Boccaccio was appointed to this professorship. Before the end of the sixteenth century, the "Divine Comedy" had gone through sixty editions. The Divine Comedy is one of the greatest monuments of human genius. It is an allegory conceived in the form of a vision, which was the most popular style of poetry at that age. At the close of the year 1300 Dante represents himself as lost in a forest at the foot of a hill, near Jerusalem. He wishes to ascend it, but is prevented by a panther, a lion, and a she-wolf which beset the way. He is met by Virgil, who tells him that he is sent by Beatrice as a guide through the realm of shadows, hell, and purgatory, and that she will afterwards lead him up to heaven. They pass the gates of hell, and penetrate into the dismal region beyond. This, as represented by Dante, consists of nine circles, forming an inverted cone, of the size of the earth, each succeeding circle being lower and narrower than the former, while Lucifer is chained in the centre and at the bottom of the dreadful crater. Each circle contains various cavities, where the punishments vary in proportion to the guilt, and the suffering increases in intensity as the circles descend and contract. In the first circle were neither cries nor tears, but the eternal sighs of those who, having never received Christian baptism, were, according to the poet's creed, forever excluded from the abodes of bliss. In the next circle, appropriated to those whose souls had been lost by the indulgence of guilty love, the poet recognizes the unhappy Francesca da Rimini, whose history forms one of the most beautiful episodes of the poem. The third circle includes gluttons; the fourth misers and spendthrifts; each succeeding circle embracing what the poet deems a deeper shade of guilt, and inflicting appropriate punishment. The Christian and heathen systems of theology are here freely interwoven. We have Minos visiting the Stygian Lake, where heretics are burning; we meet Cerberus and the harpies, and we accompany the poet across several of the fabulous rivers of Erebus. A fearful scene appears in the deepest circle of the infernal abodes. Here, among those who have betrayed their country, and are entombed in

eternal ice, is Count Ugolino, who, by a series of treasons, had made himself master of Pisa. He is gnawing with savage ferocity the skull of the archbishop of that state, who had condemned him and his children to die by starvation. The arch-traitor, Satan, stands fixed in the centre of hell and of the earth. All the streams of guilt keep flowing back to him as their source, and from beneath his threefold visage issue six gigantic wings with which he vainly struggles to raise himself, and thus produces winds which freeze him more firmly in the marsh. After leaving the infernal regions, and entering purgatory, they find an immense cone divided into seven circles, each of which is devoted to the expiation of one of the seven mortal sins. The proud are overwhelmed with enormous weights; the envious are clothed in garments of horse-hair, their eye-lids closed; the choleric are suffocated with smoke; the indolent are compelled to run about continually; the avaricious are prostrated upon the earth; epicures are afflicted with hunger and thirst; and the incontinent expiate their crimes in fire. In this portion of the work, however, while there is much to admire, there is less to excite and sustain the interest. On the summit of the purgatorial mountain is the terrestrial paradise, whence is the only ascent to the celestial. Beatrice, the object of his early and constant affection, descends hither to meet the poet. Virgil disappears, and she becomes his only guide. She conducts him through the nine heavens, and makes him acquainted with the great men who, by their virtuous lives, have deserved the highest enjoyments of eternity. In the ninth celestial sphere, Dante is favored with a manifestation of divinity, veiled, however, by three hierarchies of attending angels. He sees the Virgin Mary, and the saints of the Old and New Testament, and by these personages, and by Beatrice, all his doubts and difficulties are finally solved, and the conclusion leaves him absorbed in the beatific vision. The allegorical meaning of the poem is hidden under the literal one. Dante, traveling through the invisible world, is a symbol of mankind aiming at the double object of temporal and eternal happiness. The forest typifies the civil and religious confusion of society deprived of its two judges, the pope and the emperor. The three beasts are the powers which offered the greatest obstacles to Dante's designs, Florence, France, and the papal court. Virgil represents reason and the empire, and Beatrice symbolizes the supernatural aid, without which man cannot attain the supreme end, which is God. But the merit of the poem is that for the first time classic art is transferred into a Romance form. Dante is, above all, a great artist. Whether he describes nature, analyzes passions, curses the vices, or sings hymns to the virtues, he is always wonderful for the grandeur and delicacy of his art. He took his materials from mythology, history, and philosophy, but more especially from his own passions of hatred and love, breathed into them the breath of genius and produced the greatest work of modern times. The personal interest that he brings to bear on the historical representation of the three worlds is that which most interests and stirs us. The Divine Comedy is not only the most lifelike drama of the thoughts and feelings that moved men at that time, but it is also the most spontaneous and clear reflection of the individual feelings of the poet, who remakes history after his own passions, and who is the real chastiser of the sins and rewarder of the virtues. He defined the destiny of Italian literature in the Middle Ages, and began the great era of the Renaissance.

4. PETRARCH.--Petrarch (1304-1374) belonged to a respected Florentine family. His father was the personal friend of Dante, and a partaker of the same exile. While at Avignon, then the seat of the papal court, on one occasion he made an excursion to the fountain of Vaucluse, taking with him his son, the future poet, then in the tenth year of his age. The wild and solitary aspect of the place inspired the boy with an enthusiasm beyond his years, leaving an impression which was never afterwards effaced, and which affected his future life and writings. As Petrarch grew up, unlike the haughty, taciturn, and sarcastic Dante, he seems to have made friends wherever he went. With splendid talents, engaging manners, a handsome person, and an affectionate and generous disposition, he became the darling of his age, a man whom princes delighted to honor. At the age of twenty-three, he first met Laura de Sade in a church at Avignon. She was only twenty years of age, and had been for three years the wife of a patrician of that city. Laura was not more distinguished for her beauty and fortune than for the unsullied purity of her manners in a licentious court, where she was one of the chief ornaments. The sight of her beauty inspired the young poet with an affection which was as pure and virtuous as it was tender and passionate. He poured forth in song the fervor of his love and the bitterness of his grief. Upwards of three hundred sonnets, written at various times, commemorate all the little circumstances of this attachment, and describe the favors which, during an acquaintance of fifteen or twenty years, never exceeded a kind word, a look less severe than usual, or a passing expression of regret at parting. He was not permitted to visit at Laura's house; he had no opportunity of seeing her except at mass, at the brilliant levees of the pope, or in private assemblies of beauty and fashion: but she forever remained the dominant object of his existence. He purchased a house at Vaucluse, and there, shut in by lofty and craggy heights, the river Sorgue traversing the valley on one side, amidst hills clothed with umbrageous trees, cheered only by the song of birds, the poet passed his lonely days. Again and again he made tours through Italy, Spain, and Flanders, during one of which he was crowned with the poet's laurel at Rome, but he always returned to Vaucluse, to Avignon, to Laura. Thus years passed away. Laura became the mother of a numerous family, and time and care made havoc of her youthful

beauty. Meanwhile, the sonnets of Petrarch had spread her fame throughout France and Italy, and attracted many to the court of Avignon, who were surprised and disappointed at the sight of her whom they had believed to be the loveliest of mortals. In 1347, during the absence of the poet from Avignon, Laura fell a victim to the plague, just twenty-one years from the day that Petrarch first met her. Now all his love was deepened and consecrated, and the effusions of his poetic genius became more melancholy, more passionate, and more beautiful than ever. He declined the offices and honors that his countrymen offered him, and passed his life in retirement. He was found one morning by his attendants dead in his library, his head resting on a book. The celebrity of Petrarch at the present day depends chiefly on his lyrical poems, which served as models to all the distinguished poets of southern Europe. They are restricted to two forms: the sonnet, borrowed from the Sicilians, and the canzone, from the Provençals. The subject of almost all these poems is the same--the hopeless affection of the poet for the high-minded Laura. This love was a kind of religious and enthusiastic passion, such as mystics imagine they feel towards the Deity, or such as Plato believes to be the bond of union between elevated minds. There is no poet in any language more perfectly pure than Petrarch--more completely above all reproach of laxity or immorality. This merit, which is equally due to the poet and to his Laura, is the more remarkable, considering the models which he followed and the court at which Laura lived. The labor of Petrarch in polishing his poems did much towards perfecting the language, which through him became more elegant and more melodious. He introduced into the lyric poetry of Italy the pathos and the touching sweetness of Ovid and Tibullus, as well as the simplicity of Anacreon. Petrarch attached little value to his Italian poems; it was on his Latin works that he founded his hopes of renown. But his highest title to immortal fame is his prodigious labor to promote the study of ancient authors. Wherever he traveled, he sought with the utmost avidity for classic manuscripts, and it is difficult to estimate the effect produced by his enthusiasm. He corresponded with all the eminent literati of his day, and inspired them with his own tastes. Now for the first time there appeared a kind of literary republic in Europe united by the magic bond of Petrarch's influence, and he was better known and exercised a more extensive and powerful influence than many of the sovereigns of the day. He treated with various princes rather in the character of an arbitrator than an ambassador, and he not only directed the tastes of his own age, but he determined those of succeeding generations.

5. BOCCACCIO AND OTHER PROSE WRITERS.--The fourteenth century forms a brilliant era in Italian literature, distinguished beyond any other period for the creative powers of genius which it exhibited. In this century, Dante gave to Europe his great epic poem, the lyric muse awoke at the call of Petrarch, while Boccaccio created a style of prose, harmonious, flexible, and engaging, and alike suitable to the most elevated and to the most playful subjects. Boccaccio (1313-1875) was the son of a Florentine merchant; he early gave evidence of superior talents, and his father vainly attempted to educate him to follow his own profession. He resided at Naples, where he became acquainted with a lady celebrated in his writings under the name of Fiammetta. It was at her desire that most of his early pieces were written, and the very exceptionable moral character which attaches to them must be attributed, in part, to her depraved tastes. The source of Boccaccio's highest reputation, and that which entitles him to rank as the third founder of the national literature, is his "Decameron," a collection of tales written during the period when the plague desolated the south of Europe, with a view to amuse the ladies of the court during that dreadful visitation. The tales are united under the supposition of a party of ten who had retired to one of the villas in the environs of Naples to strive, in the enjoyment of innocent amusement, to escape the danger of contagion. It was agreed that each person should tell a new story during the space of ten days, whence the title Decameron. The description of the plague, in the introduction, is considered not only the finest piece of writing from Boccaccio's pen, but one of the best historical descriptions that have descended to us. The stories, a hundred in number, are varied with considerable art, both in subject and in style, from the most pathetic and sportive to the most licentious. The great merit of Boccaccio's composition consists in his easy elegance, his *naïveté*, and, above all, in the correctness of his language. The groundwork of the Decameron has been traced to an old Hindu romance, which, after passing through all the languages of the East, was translated into Latin as early as the twelfth century; the originals of several of these tales have been found in the ancient French *Fabliaux*, while others are believed to have been borrowed from popular recitation or from real occurrences. But if Boccaccio cannot boast of being the inventor of all, or even any of these tales, he is still the father of this class of modern Italian literature, since he was the first to transplant into the world of letters what had hitherto been only the subject of social mirth. These tales have in their turn been repeated anew in almost every language of Europe, and have afforded reputations to numerous imitators. One of the most beautiful and unexceptionable tales in the Decameron is that of "Griselda," the last in the collection. It is to be regretted that the author did not prescribe to himself the same purity in his images that he did in his phraseology. Many of these tales are not only immoral but grossly indecent, though but too faithful a representation of the manners of the age in which they were written. The Decameron was published towards the middle of the fourteenth century; and, from the first invention of printing, it was freely circulated in Italy, until the Council of

Trent proscribed it in the middle of the sixteenth century. It was, however, again published in 1570, purified and abridged. Boccaccio is the author of two romances, one called "Fiammetta," the other the "Filocopo;" the former distinguished for the fervor of its expression, the latter for the variety of its adventures and incidents. He wrote also two romantic poems, in which he first introduced the *ottava rima*, or the stanza composed of six lines, which rhyme interchangeably with each other, and are followed by a couplet. In these he strove to revive ancient mythology, and to identify it with modern literature. His Latin compositions are voluminous, and materially contributed to the advancement of letters. While Boccaccio labored so successfully to reduce the language to elegant and harmonious forms, he strove like Petrarch to excite his contemporaries to the study of the ancient classics. He induced the senate of Florence to establish a professorship of Greek, entered his name among the first of the students, and procured manuscripts at his own expense. Thus Hellenic literature was introduced into Tuscany, and thence into the rest of Europe. Boccaccio, late in life, assumed the ecclesiastical habit, and entered on the study of theology. When the Florentines founded a professorship for the reading and exposition of the Divine Comedy, Boccaccio was made the first incumbent. The result of his labors was a life of Dante, and a commentary on the first seventeen cantos of the *Inferno*. With the death of Petrarch, who had been his most intimate friend, his last tie to earth was loosed; he died at Certaldo a few months later, in the sixty-third year of his age. His dwelling is still to be seen, situated on a hill, and looking down on the fertile and beautiful valley watered by the river Elsa. Of the other prose writers of the fourteenth century the most remarkable are the three Florentine historians named Villani, the eldest of whom (1310-1348) wrote a history of Florence, which was continued afterwards by his brother and by his nephew; a work highly esteemed for its historical interest, and for its purity of language and style; and Franco Sacchetti (1335-1400), who approaches nearest to Boccaccio. His "Novels and Tales" are valuable for the purity and eloquence of their style, and for the picture they afford of the manners of his age. Among the ascetic writers of this age St. Catherine of Siena occupies an important place, as one who aided in preparing the way for the great religious movement of the sixteenth century. The writings of this extraordinary woman, who strove to bring back the Church of Rome to evangelical virtue, are the strongest, clearest, most exalted religious utterance that made itself heard in Italy in the fourteenth century.

6. THE FIRST DECLINE OF ITALIAN LITERATURE.--The passionate study of the ancients, of which Petrarch and Boccaccio had given an example, suspended the progress of Italian literature in the latter part of the fourteenth century, and through almost all the fifteenth. The attention of the literary men of this time was wholly engrossed by the study of the dead languages, and of manners, customs, and religious systems equally extinct. They present to our observation boundless erudition, a just spirit of criticism, and nice sensibility to the beauties and defects of the great authors of antiquity; but we look in vain for that true eloquence which is more the fruit of an intercourse with the world than of a knowledge of books. They were still more unsuccessful in poetry, in which their attempts, all in Latin, are few in number, and their verses harsh and heavy, without originality or vigor. It was not until the period when Italian poetry began to be again cultivated, that Latin verse acquired any of the characteristics of genuine inspiration. But towards the close of the fifteenth century the dawn of a new literary era appeared, which soon shone with meridian light. At this time, the universities had become more and more the subjects of attention to the governments; the appointment of eminent professors, and the privileges connected with these institutions, attracted to them large numbers of students, and the concourse was often so great that the lectures were delivered in the churches and in public squares. Those republics which still existed, and the princes who had risen on the ruins of the more ephemeral ones, rivaled each other in their patronage of literary men; the popes, who in the preceding ages had denounced all secular learning, now became its munificent patrons; and two of them, Nicholas V. and Pius II., were themselves scholars of high distinction. The Dukes of Milan, and the Marquises of Mantua and Ferrara, surrounded themselves in their capitals with men illustrious in science and letters, and seemed to vie with each other in the favors which they lavished upon them. In the hitherto free republic of Florence, which had given birth to Dante, Petrarch, and Boccaccio, literature found support in a family which, at no distant period, employed it to augment their power, and to rule the city with an almost despotic sway. The Medici had been long distinguished for the wealth they had acquired by commercial enterprise, and for the high offices which they held in the republic. Cosmo de' Medici had acquired a degree of power which shook the very foundations of the state. He was master of the moneyed credit of Europe, and almost the equal of the kings with whom he negotiated; but in the midst of the projects of his ambition he opened his palace as an asylum to the scholars and artists of the age, turned its gardens into an academy, and effected a revolution in philosophy by setting up the authority of Plato against that of Aristotle. His banks, which were scattered over Europe, were placed at the service of literature as well as commerce. His agents abroad sold spices and bought manuscripts; the vessels which returned to him from Constantinople, Alexandria, and Smyrna were often laden with volumes in the Greek, Syriac, and Chaldaic languages. Being banished to Venice, he continued his protection of letters, and on his return to Florence he devoted himself more

than ever to the cause of literature. In the south of Italy, Alphonso V., and, indeed, all the sovereigns of that age, pursued the same course, and chose for their chancellors and ambassadors the same scholars who educated their sons and expounded the classics in their literary circles. This patronage, however, was confined to the progress of ancient letters, while the native literature, instead of redeeming the promise of its infancy, remained at this time mute and inglorious. Yet the resources of poets and orators were multiplying a thousand fold. The exalted characters, the austere laws, the energetic virtues, the graceful mythology, the thrilling eloquence of antiquity, were annihilating the puerilities of the old Italian rhymes, and creating purer and nobler tastes. The clay which was destined for the formation of great men was undergoing a new process; a fresh mould was cast, the forms at first appeared lifeless, but ere the end of the fifteenth century the breath of genius entered into them, and a new era of life began.

PERIOD SECOND.

REVIVAL OF ITALIAN LITERATURE AND ITS SECOND DECLINE (1476-1675).

1. THE CLOSE OF THE FIFTEENTH CENTURY.--The first man who contributed to the restoration of Italian poetry was Lorenzo de' Medici (1448-1492), the grandson of Cosmo. In the brilliant society that he gathered around him, a new era was opened in Italian literature. Himself a poet, he attempted to restore poetry to the condition in which Petrarch had left it; although superior in some respects to that poet, he had less power of versification, less sweetness, and harmony, but his ideas were more natural, and his style was more simple. He attempted all kinds of poetical composition, and in all he displayed the versatility of his talents and the exuberance of his imagination. But to Lorenzo poetry was but an amusement, scarcely regarded in his brilliant political career. He concentrated in himself all the power of the republic--he was the arbiter of the whole political state of Italy, and from the splendor with which he surrounded himself, and his celebrity, he received the title of Lorenzo the Magnificent. He continued to collect manuscripts, and to employ learned men to prepare them for printing. His Platonic Academy extended its researches into new paths of study. The collection of antique sculpture, the germ of the gallery of Florence, which had been established by Cosmo, he enriched, and gave to it a new destination, which was the occasion of imparting fresh life and vigor to the liberal arts. He appropriated a part of his gardens to serve as a school for the study of the antique, and placed his statues, busts, and other models of art in the shrubberies, terraces, and buildings. Young men were liberally paid for the copies which they made while pursuing their studies. It was this institution that kindled the flame of genius in the breast of Michael Angelo, and to it must be attributed the splendor which was shed by the fine arts over the close of the fifteenth century, and which extended rapidly from Florence throughout Italy, and over a great part of Europe. Among the friends of Lorenzo may be mentioned Pico della Mirandola (1463- 1494), one of the most prominent men of his age, who left in his Latin and Italian works monuments of his vast erudition and exuberant talent. The fifteenth century closed brightly on Florence, but it was otherwise throughout Italy. Some of its princes still patronized the sciences, but most of them were engaged in the intrigues of ambition; and the storms which were gathering soon burst on Florence itself. Shortly after the death of Lorenzo, nearly the whole of Italy fell under the rule of Charles VIII., and the voice of science and literature was drowned in the clash of arms; military violence dispersed the learned men, and pillage destroyed or scattered the literary treasures. Literature and the arts, banished from their long-loved home, sought another asylum. We find them again at Rome, cherished by a more powerful and fortunate protector, Pope Leo X., the son of Lorenzo (1475-1521). Though his patronage was confined to the fine arts and to the lighter kinds of composition, yet owing to the influence of the newly-invented art of printing, the discovery of Columbus, and the Reformation, new energies were imparted to the age, the Italian mind was awakened from its slumber, and prepared for a new era in literature.

2. THE ORIGIN OF THE DRAMA AND ROMANTIC EPIC.--Among the gifted individuals in the circle of Lorenzo, the highest rank may be assigned to Poliziano (1454-1494). He revived on the modern stage the tragedies of the ancients, or rather created a new kind of pastoral tragedy, on which Tasso did not disdain to employ his genius. His "Orpheus," composed within ten days, was performed at the Mantuan court in 1483, and may be considered as the first dramatic composition in Italian. The universal homage paid to Virgil had a decided influence on this kind of poetry. His Bucolics were looked upon as dramas more poetical than those of Terence and Seneca. The comedies of Plautus were represented, and the taste for theatrical performances was eagerly renewed. In these representations, however, the object in view was the restoration of the classics rather than the amusement of the public; and the new dramatists confined themselves to a faithful copy of the ancients. But the Orpheus of Poliziano caused a revolution. The beauty of the verse, the charm of the music, and the decorations which accompanied its recital, produced an excitement of feeling and intellect that combined to open the way for the true dramatic art. At

the same time, several eminent poets devoted their attention to that style of composition which was destined to form the glory of Ariosto. The trouvères chose Charlemagne and his paladins as the heroes of their poems and romances, and these, composed for the most part in French in the twelfth and thirteenth centuries, were early circulated in Italy. Their origin accorded with the vivacity of the prevailing religious sentiment, the violence of the passions and the taste for adventures which distinguished the first crusades; while from the general ignorance of the times, their supernatural agency was readily admitted. But at the close of the fifteenth century, when the poets possessed themselves of these old romances, in order to give a variety to the adventures of their heroes, the belief in the marvelous was much diminished, and they could not be recounted without a mixture of mockery. The spirit of the age did not admit in the Italian language a subject entirely serious. He who made pretensions to fame was compelled to write in Latin, and the choice of the vulgar tongue was the indication of a humorous subject. The language had developed since the time of Boccaccio a character of *naïveté* mingled with satire, which still remains, and which is particularly remarkable in Ariosto. The "Morgante Maggiore" of Pulci (1431-1470) is the first of these romantic poems. It is alternately burlesque and serious, and it abounds with passages of great pathos and beauty. The "Orlando Innamorato" of Boiardo (1430-1494) is a poem somewhat similar to that of Pulci. It was, however, remodeled by Berni, sixty years after the death of the author, and from the variety and novelty of the adventures, the richness of its descriptions, the interest excited by its hero, and the honor rendered to the female sex, it excels the Morgante.

3. ROMANTIC EPIC POETRY.--The romances of chivalry, which had been thus versified by Pulci and Boiardo, were elevated to the rank of epic poetry by the genius of Ariosto (1474-1533). He was born at Reggio, of which place his father was governor. As the means of improving his resources, he early attached himself to the service of Cardinal D'Este, and afterwards to that of the Duke of Ferrara. At the age of thirty years he commenced his "Orlando Furioso," and continued the composition for eleven years. While the work was in progress, he was in the habit of reading the cantos, as they were finished, at the courts of the cardinal and duke, which may account for the manner in which this hundred-fold tale is told, as if delivered spontaneously before scholars and princes, who assembled to listen to the marvelous adventures of knights and ladies, giants and magicians, from the lips of the story-teller. Ariosto excelled in the practice of reading aloud with distinct utterance and animated elocution, an accomplishment of peculiar value at a time when books were scarce, and the emoluments of authors depended more on the gratuities of their patrons than the sale of their works. In each of the four editions which he published, he improved, corrected, and enlarged the original. No poet, perhaps, ever evinced more fastidious taste in adjusting the nicer points that affected the harmony, dignity, and fluency of his composition, yet the whole seems as natural as if it had flowed extemporaneously from his pen. Throughout life it was the lot of Ariosto to struggle against the difficulties inseparable from narrow and precarious circumstances. His patrons, among them Leo X., were often culpable in exciting expectations, and afterwards disappointing them. The earliest and latest works of Ariosto, though not his best, were dramatic. He wrote also some satires in the form of epistles. He died in the fifty-eighth year of his age, and his ashes now rest under the magnificent monument in the new church of the Benedictines in Ferrara. The house in which the poet lived, the chair in which he was wont to study, and the inkstand whence he filled his pen, are still shown as interesting memorials of his life and labors. Ariosto, like Pulci and Boiardo, undertook to sing the paladins and their amours at the court of Charlemagne, during the fabulous wars of this emperor against the Moors. In his poem he seems to have designedly thrown off the embarrassment of a unity of action. The Orlando Furioso is founded on three principal narratives, distinct but often intermingled; the history of the war between Charlemagne and the Saracens, Orlando's love for Angelica, his madness on hearing of her infidelity, and Ruggiero's attachment to Bradamante. These stories are interwoven with so many incidents and episodes, and there is in the poem such a prodigious quantity of action, that it is difficult to assign it a central point. Indeed, Ariosto, playing with his readers, seems to delight in continually misleading them, and allows them no opportunity of viewing the general subject of the poem. This want of unity is essentially detrimental to the general impression of the work, and the author has succeeded in throwing around its individual parts an interest which does not attach to it as a whole. The world to which the poet transports his readers is truly poetic; all the factitious wants of common life, its cold calculations and its imaginary distinctions, disappear; love and honor reign supreme, and the prompting of the one and the laws of the other are alone permitted to stimulate and regulate a life, of which war is the only business and gallantry the only pastime. The magic and sorcery, borrowed from the East, which pervade these chivalric fictions, lead us still farther from the world of realities. Nor is it the least charm that all the wonders and prodigies here related are made to appear quite probable from the apparently artless, truthful style of the narration. The versification of the Orlando is more distinguished for sweetness and elegance than for strength; but, in point of harmony, and in the beauty, pathos, and grace of his descriptions, no poet surpasses Ariosto.

4. HEROIC EPIC POETRY.--While, in the romantic epic of the Middle Ages, unity of design was considered unnecessary, and truthfulness of detail, fertility of imagination, strength of coloring, and vivacity of narration were alone required, heroic poetry was expected to exhibit, on the most extensive scale, those laws of symmetry which adapt all the parts to one object, which combine variety with unity, and, as it were, initiate us into the secrets of creation, by disclosing the single idea which governs the most dissimilar actions, and harmonizes the most opposite interests. It was reserved to Torquato Tasso to raise the Italian language to this kind of epic poetry. Tasso (1544-1595) was born in Sorrento, and many marvels are told by his biographers of the precocity of his genius. Political convulsions early drove his father into exile. He went to Rome and sent for his son, then ten years of age. When the exiles were no longer safe at Rome, an asylum was offered them at Pesaro by the Duke of Urbino. Here young Tasso pursued his studies in all the learning and accomplishments of the age. In his seventeenth year he had completed the composition of an epic poem on the adventures of Rinaldo, which was received with passionate admiration throughout Italy. The appearance of this poem proved not only the beginning of the author's fame, but the dawn of a new day in Italian literature. In 1565, Tasso was nominated by the Cardinal D'Este as gentleman of his household, and his reception at the court was in every respect most pleasing to his youthful ambition. He was honored by the intimate acquaintance of the accomplished princesses Lucretia and Leonora, and to this dangerous friendship must be attributed most of his subsequent misfortunes, if it be true that he cherished a secret attachment for Leonora. During this prosperous period of his life, Tasso prosecuted his great epic poem, the "Jerusalem Delivered," and as canto after canto was completed and recited to the princesses, he found in their applause repeated stimulus to proceed. While steadily engaged in his great work, his fancy gave birth to numerous fugitive poems, the most remarkable of which is the "Aminta." After its representation at the court of Ferrara, all Italy resounded with the poet's fame. It was translated into all the languages of Europe, and the name of Tasso would have been immortal even though he had never composed an epic. The various vexations he endured regarding the publication of his work at its conclusion, the wrongs he suffered from both patrons and rivals, together with disappointed ambition, rendered him the subject of feverish anxiety and afterwards the prey of restless fear and continual suspicion. His mental malady increased, and he wandered from place to place without finding any permanent home. Assuming the disguise of a shepherd, he traveled to Sorrento, to visit his sister; but soon, tired of seclusion, he obtained permission to return to the court of Ferrara. He was coldly received by the duke, and was refused an interview with the princesses. He left the place in indignation, and wandered from one city of Italy to another, reduced to the appearance of a wretched itinerant, sometimes kindly received, sometimes driven away as a vagabond, always restless, suspicious, and unhappy. In this mood he again returned to Ferrara, at a moment when the duke was too much occupied with the solemnities of his own marriage to attend to the complaints of the poet. Tasso became infuriated, retracted all the praises he had bestowed on the house of Este, and indulged in the bitterest invectives against the duke, by whose orders he was afterwards committed to the hospital for lunatics, where he was closely confined, and treated with extreme rigor. If he had never been insane before, he certainly now became so. To add to his misfortune, his poem was printed without his permission, from an imperfect copy, and while editors and printers enriched themselves with the fruit of his labors, the poet himself was languishing in a dungeon, despised, neglected, sick, and destitute of the common conveniences of life, and above all, deafened by the frantic cries with which the hospital continually resounded. When the first rigors of his imprisonment were relaxed, Tasso pursued his studies, and poured forth his emotions in every form of verse. Some of his most beautiful minor poems were composed during this period. After more than seven years' confinement, the poet was liberated at the intercession of the Duke of Mantua. From this time he wandered from city to city; the hallucinations of his mind never entirely ceased. Towards the close of the year 1594 he took up his residence at Rome, where he died at the age of fifty-two. Tasso was particularly happy in choosing the most engaging subject that could inspire a modern poet--the struggle between the Christians and the Saracens. The Saracens considered themselves called on to subjugate the earth to the faith of Mohammed; the Christians to enfranchise the sacred spot where their divine founder suffered death. The religion of the age was wholly warlike. It was a profound, disinterested, enthusiastic, and poetic sentiment, and no period has beheld such a brilliant display of valor. The belief in the supernatural, which formed a striking characteristic of the time, seemed to have usurped the laws of nature and the common course of events. The faith against which the crusaders fought appeared to them the worship of the powers of darkness. They believed that a contest might exist between invisible beings as between different nations, and when Tasso armed the dark powers of enchantment against the Christian knights, he only developed and embellished a popular idea. The scene of the Jerusalem Delivered, so rich in recollections and associations with all our religious feelings, is one in which nature displays her riches and treasures, and where descriptions, in turn the most lovely and the most austere, attract the pen of the poet. All the nations of Christendom send forth their warriors to the army of the cross, and the whole world thus becomes his patrimony. Whatever interest the taking of Troy might possess for the Greeks, or the vanity of the Romans might attach to the adventures of Aeneas, whom they adopted as their progenitor, it may be asserted that neither the Iliad

nor the Aeneid possesses the dignity of subject, the interest at the same time divine and human, and the varied dramatic action which are peculiar to the Jerusalem Delivered. The whole course of the poem is comprised in the campaign of 1093, when the Christian army, assembled on the plain of Tortosa, marched towards Jerusalem, which they besieged and captured. From the commencement of the poem, the most tender sentiments are combined with the action, and love has been assigned a nobler part than had been given to it in any other epic poem. Love, enthusiastic, respectful, and full of homage, was an essential characteristic of chivalry and the source of the noblest actions. While with the heroes of the classic epic it was a weakness, with the Christian knights it was a devotion. In this work are happily combined the classic and romantic styles. It is classic in its plan, romantic in its heroes; it is conceived in the spirit of antiquity, and executed in the spirit of medieval romance. It has the beauty which results from unity of design and from the harmony of all its parts, united with the romantic form, which falls in with the feelings, the passions, and the recollections of Europeans. Notwithstanding some defects, which must be attributed rather to the taste of his age than to his genius, in the history of literature Tasso may be placed by the side of Homer and Virgil.

5. LYRIC POETRY.--Lyric poetry, which had been brought to such perfection by Petrarch in the fourteenth century, but almost lost sight of in the fifteenth, was cultivated by all the Italian poets of this period. Petrarch became the model, which every aspirant endeavored to imitate. Hence arose a host of poetasters, who wrote with considerable elegance, but without the least power of imagination. We must not, however, confound with the servile imitators of Petrarch those who took nothing from his school but purity of language and elegance of style, and who consecrated the lyre not to love alone, but to patriotism and religion. First of these are Poliziano and Lorenzo de' Medici, in whose ballads and stanzas the language of Petrarch reappeared with all its beauty and harmony. Later, Cardinal Bembo (1470-1547), Molza (1489-1544), Tarsia (1476-1535), Guidiccioni (1480-1541), Della Casa (1503-1556), Costanzo (1507-1585), and later still, Chiabrera (1552-1637), attempted to restore Italian poetry to its primitive elegance. Their sonnets and canzoni contributed much to the revival of a purer style, although their elegance is often too elaborate and their thoughts and feelings too artificial. Besides these, Ariosto, Tasso, Machiavelli, and Michael Angelo, whose genius was practiced in more ambitious tasks, did not disdain to shape and polish such diminutive gems as the canzone, the madrigal, and the sonnet. This reform of taste in lyric composition was also promoted by several women, among whom the most distinguished at once for beauty, virtue, and talent was Vittoria Colonna (1490-1547). She was daughter of the high constable of Naples, and married to the Marquis of Pescara. Early left a widow, she abandoned herself to sorrow. That fidelity which made her refuse the hand of princes in her youth, rendered her incapable of a second attachment in her widowhood. The solace of her life was to mourn the loss and cherish the memory of Pescara. After passing several years in retirement, Vittoria took up her residence at Rome, and became the intimate friend of the distinguished men of her time. Her verses, though deficient in poetic fancy, are full of tenderness and absorbing passion. Vittoria Colonna was reckoned by her contemporaries as a being almost more than human, and the epithet divine was usually prefixed to her name. By her death-bed stood Michael Angelo, who was considerably her junior, but who enjoyed her friendship and regarded her with enthusiastic veneration. He wrote several sonnets in her praise. Veronica Gambara, Tullia d'Aragona, and Giulia Gonzaga may also be named as possessing superior genius to many literary men of their time.

6. DRAMATIC POETRY.--Tragedy, in the hands of the Romans, had exhibited no national characteristics, and disappeared with the decline of their literature. When Europe began to breathe again, the natural taste of the multitude for games and spectacles revived; the church entertained the people with its representations, which, however, were destitute of all literary character. At the commencement of the fourteenth century we find traces of Latin tragedies, and these, during the fifteenth century, were frequently represented, as we have seen, more as a branch of ancient art and learning than as matter of recreation. After the "Orpheus" of Poliziano had appeared on the stage, the first drama in the Italian tongue, Latin tragedies and comedies were translated into the Italian, but as yet no one had ventured beyond mere translation. Leo X. shed over the dramatic art the same favor which he bestowed on the other liberal arts, and the theatricals of the Vatican were of the most splendid description. During his pontificate, Trissino (1478-1550) dedicated to him the tragedy of "Sofonisba," formed on the Greek model, the first regular tragedy which had appeared since the revival of letters. Its subject is found entire in the work of Livy, and the invention of the poet has added little to the records of the historian. The piece is not divided into acts and scenes, and the only repose given to the action is by the chorus, who sing odes and lyric stanzas. The story is well conducted, the characters are all dramatic, and the incidents arise spontaneously out of each other; but the style of the tragedy has neither the sublimity nor the originality which becomes this kind of composition, and which distinguished the genius of the dramatic poets of Athens. The example of Trissino was followed by Rucellai (1475-1525), who left two dramas, "Rosamunda" and "Orestes," written in blank verse, with a chorus, much resembling the

Greek tragedies. This poet used much more license with his subject than Trissino; his plot is less simple and pathetic, but abounds in horror, and his style is florid and rhetorical. Tasso, Speroni (1500-1588), Giraldi (1504-1573), and others, attempted also this species of composition, and their dramas are considered the best of the age. As the tragic poets of this century servilely imitated Sophocles and Euripides, the comic writers copied Plautus and Terence. The comedies of Ariosto, of which there are five, display considerable ingenuity of invention and an elegant vivacity of language. The dramatic works of Machiavelli approach more nearly to the middle comedy of the Greeks. They depict and satirize contemporaneous rather than obsolete manners, but the characters and plots awaken little interest. Bentivoglio (1506-1573), Salviati (1540-1589), Firenzuola (1493-1547), Caro (1507-1566), Cardinal Bibiena, (1470-1520), Aretino (1492-1556), and others, are among the principal comic writers of the age, who displayed more or less dramatic talent. Of all the Italian comedies composed in the sixteenth century, however, scarcely one was the work of eminent genius. A species of comic drama, known under the name of *Commedia dell'arte*, took its rise in this century. The characteristic of these plays is that the story only belongs to the poet, the dialogue being improvised by the actors. The four principal characters, denominated masks, were *Pantaloon*, a merchant of Venice, a doctor of laws from Bologna, and two servants, known to us as *Harlequin* and *Columbine*. When we add to these a couple of sons, one virtuous and the other profligate; a couple of daughters, and a pert, intriguing chambermaid, we have nearly the whole *dramatis personae* of these plays. The extempore dialogue by which the plot was developed was replete with drollery and wit, and there was no end to the novelty of the jests.

7. PASTORAL DRAMA AND DIDACTIC POETRY.--The pastoral drama, which describes characters and passions in their primitive simplicity, is thus distinguished from tragedy and comedy. It is probable that the idyls of the Greeks afforded the first germ of this species of composition, but Beccari, a poet of Ferrara (1510-1590), is considered the father of the genuine pastoral drama. Before him Sannazzaro (1458-1530) had written the "Arcadia," which, however, bears the character of an eclogue rather than that of a drama. It is written in the choicest Italian; its versification is melodious, and it abounds with beautiful descriptions; as an imitation of the ancients, it is entitled to the highest rank. The beauty of the Italian landscape and the softness of the Italian climate seem naturally fitted to dispose the poetic soul to the dreams of rural life, and the language seems, by its graceful simplicity, peculiarly adapted to express the feelings of a class of people whom we picture to ourselves as ingenuous and infantine in their natures. The manners of the Italian peasantry are more truly pastoral than those of any other people, and a bucolic poet in that fair region need not wander to Arcadia. But Sannazzaro, like all the early pastoral poets of Italy, proposed to himself, as the highest excellence, a close imitation of Virgil; he took his shepherds from the fabulous ages of antiquity, borrowed the mythology of the Greeks, and completed the machinery with fauns, nymphs, and satyrs. Like Sannazzaro, Beccari places his shepherds in Arcadia, and invests them with ancient manners; but he goes beyond mere dialogue; he connects their conversations by a series of dramatic actions. The representation of one of these poems incited Tasso to the composition of his "Aminta," the success of which was due less to the interest of the story than to the sweetness of the poetry, and the soft voluptuousness which breathes in every line. It is written in flowing verse of various measures, without rhyme, and enriched with lyric choruses of uncommon beauty. The imitations of the Aminta were numerous, but, with one exception, which has disputed the palm with its model, they had an ephemeral existence. Guarini (1537-1612) was the author of the "Pastor Fido," which is the principal monument of his genius; its chief merit lies in the poetry in which the tale is embodied, the simplicity and clearness of the diction, the tenderness of the sentiments, and the vehement passion which gives life to the whole. This drama was first performed in 1585, at Turin, during the nuptial festivities of the Prince of Savoy. Its success was triumphant, and Guarini was justly considered as second only to Tasso among the poets of the age. Theatrical music, which was now beginning to be cultivated, found its way into the acts of the pastoral drama, and in one scene of the Pastor Fido it is united with dancing; thus was opened the way for the Italian opera. Among the didactic poets, Rucellai may be first mentioned. His poem of "The Bees" is an imitation of the fourth book of the Georgics; he does not, however, servilely follow his model, but gives an original coloring to that which he borrowed. Alamanni (1495-1556) occupies a secondary rank among epic, tragic, and comic poets, but merits a distinguished place in didactic poetry. His poem entitled "Cultivation" is pure and elegant in its style.

8. SATIRICAL POETRY, NOVELS, AND TALES.--In an age when every kind of poetry that had flourished among the Greeks and Romans appeared again with new lustre, satire was not wanting. There is much that is satirical in the "Divine Comedy" of Dante. Three of Petrarch's sonnets are satires on the court of Rome; those of Ariosto are valuable not only for their flowing style, but for the details they afford of his character, taste, and circumstances. The satires of Alamanni are chiefly political, and in general are characterized by purity of diction and by a high moral tendency. There is a kind of jocose or burlesque satire peculiar to Italy, in which the literature is

extremely rich. If it serves the cause of wisdom, it is always in the mask of folly. The poet who carried this kind of writing to the highest perfection was Berni (1499-1536). Comic poetry, hitherto known in Italy as burlesque, of which Burchiello was the representative in the fifteenth century, received from Berni the name of Bernesque, in its more refined and elegant character. His satirical poems are full of light and elegant mockery, and his style possesses nature and comic truth. In his hand, everything was transformed into ridicule; his satire is almost always personal, and his laughter is not always restrained by respect for morals or for decency. To burlesque poetry may be referred also the Macaronic style, a ludicrous mixture of Latin and Italian, introduced by Merlino Coccajo (1491-1544). His poems are as full of lively descriptions and piquant satire as they are wanting in decorum and morality. The story-tellers of the sixteenth century are numerous. Sometimes they appear as followers of Boccaccio; sometimes they attempt to open new paths for themselves. The class of productions, of which the "Decameron" was the earliest example in the fourteenth century, is called by the Italians "Novelle." In general, the interest of the tale depends rather on a number of incidents slightly touched, than on a few carefully delineated; from the difficulty of developing character in a few isolated scenes, the story-teller trusts for effect to the combination of incident and style, and the delineation of character, which is the nobler part of fiction, is neglected. Italian novelists, too, have often regarded the incidents themselves but as a vehicle for fine writing. An interesting view of these productions is, that they form a vast repository of incident, in which we recognize the origin of much that has since appeared in our own and other languages. Machiavelli was one of the first novelists of this age. His little tale, "Belfagor," is pleasantly told, and has been translated into all languages. The celebrated "Giulietta" of Luigi da Porta is the sole production of the author, but it has served to give him a high place among Italian novelists. This is Shakspeare's Romeo and Juliet in another shape, though it is not probable that it was the immediate source from which the great dramatist collected the materials for his tragedy. The "Hundred Tales" of Cinzio Giraldi (1504-1573) are distinguished by great boldness of conception, and by a wild and tragic horror which commands the attention, while it is revolting to the feelings. He appears to have ransacked every age and country, and to have exhausted the catalogue of human crimes in procuring subjects for his novels. Grazzini, called Lasca (1503-1583), is perhaps the best of the Italian novelists after Boccaccio. His manner is light and graceful. His stories display much ingenuity, but are often improbable and cruel in their nature. The Fairy Tales of Strapparola (b. 1500) are the earliest specimens of the kind in the prose literature of Italy, and this work has been a perfect storehouse from which succeeding writers have derived a vast multitude of their tales. To this, also, we are indebted for the legend of "Fair Star," "Puss in Boots," "Fortunio," and others which adorn our nursery libraries. Firenzuola (1493-1547) occupies a high rank among the Italian novelists; his "Golden Ass," from Apuleius, and his "Discourses of Animals" are distinguished for their originality and purity of style. Bandello (1480-1562) is the novelist best known to foreigners after Boccaccio. Shakspeare and other English dramatists have drawn largely from his voluminous writings. His tales are founded upon history rather than fancy.

9. HISTORY.--Historical composition was cultivated with much success by the Italians of the sixteenth century; yet such was the altered state of things, that, except at Venice and Genoa, republics had been superseded by princes, and republican authority by the pomp of regal courts. Home was a nest of intrigue, luxury, and corruption; Tuscany had become the prey of a powerful family; Lombardy was but a battle-field for the rival powers of France and Germany, and the lot of the people was oppression and humiliation. High independence of mind, one of the most valuable qualities in connection with historical research, was impossible under these circumstances, and yet, some of the Italian writers of this age exhibit genius, strength of character, and a conscientious sense of the sacred commission of the historian. Machiavelli (1469-1527) was born in Florence of a family which had enjoyed the first offices in the republic. At the age of thirty, he was made chancellor of the state, and from that time he was constantly employed in public affairs, and particularly in embassies. Among those to the smaller princes of Italy, the one of the longest duration was to Caesar Borgia, whom he narrowly observed at the very important period when this illustrious villain was elevating himself by his crimes, and whose diabolical policy he had thus an opportunity of studying. He had a considerable share in directing the counsels of the republic, and the influence to which he owed his elevation was that of the free party, which censured the power of the Medici, and at that time held them in exile. When the latter were recalled, Machiavelli was deprived of all his offices and banished. He then entered into a conspiracy against the usurpers, which was discovered, and he was put to the torture, but without wresting from him any confession which could impeach either himself or those who had confided in his honor. Leo X., on his elevation to the pontificate, restored him to liberty. At this time he wrote his "History of Florence," in which he united eloquence of style with depth of reflection, and although an elegant, animated, and picturesque composition, it is not the fruit of much research or criticism. Besides this history, Machiavelli wrote his discourses on the first decade of Livy, considered his best work, and "The Art of War," which is an invaluable commentary on the history of the times. These works had the desired effect of inducing the Medici family to use the political services of the author, and at

the request of Leo X. he wrote his essay "On the Reform of the Florentine Government." Guicciardini (1483-1541), the friend of Machiavelli, is considered the greatest historian of this age. He attached himself to the service of Leo X., and was raised to high offices and honors by him and the two succeeding popes. On the expulsion of the Medici from Florence, the republican party having obtained the ascendancy, he was obliged to fly from the city. From this time he manifested an utter abhorrence of all popular institutions, and threw himself heart and soul into the interests of the Medici. He displayed his zeal at the expense of the lives and liberties of the most virtuous among his fellow-citizens. Having aided in the elevation of Cosmo, afterwards Grand Duke of Tuscany, and being requited with ingratitude and neglect, he retired in disgust from public life, and devoted himself wholly to the completion of his history of Italy. This work, which is a monument of his genius and industry, commences with the coming of Charles VIII. to Italy, and concludes with the year 1534, embracing one of the most important periods of Italian history. His powerfully-drawn pictures exhibit the men and the times so vividly, that they seem to pass before our eyes. His delineations of character, his masterly views of the course of events, the conduct of leaders, and the changes of war, claim our highest admiration. His language is pure and his style elegant, though sometimes too Latinized; his letters are considered as a most valuable contribution to the history of his times. Numberless historians, of more or less merit, stimulated by the renown of Machiavelli and Guicciardini, composed annals of the states to which they belonged, while others undertook to write the histories of foreign nations. Nardi (1496-1556), one of the most ardent and pure patriots of his age, takes the first place. He wrote the history of the Florentine Revolution of 1527, a work which, though defective in style, is distinguished for its truthfulness. The histories of Florence by Adriani, Varchi, and Segni (1499-1559), are considered the best works of their kind, for elegance of style and for interest of the narrative. Almost all the other cities of Italy had their historians, but the palm must be awarded to the Florentine writers, not only on account of their number, but for the elegance and purity of their style, for their impartiality and the sagacity of their research into matters of fact. Among the writers of the second class may be mentioned Davanzati (1519), the translator of Tacitus, who wrote, in the Florentine dialect, a history of the schism of England; Giambullari (1495-1564), who wrote a history of Europe; D'Anghiera (fl. 1536), who, after having examined the papers of Christopher Columbus, and the official reports transmitted from America to Spain, compiled an interesting work on "Ocean Navigation and the New World." His style is incorrect; but this is compensated for by the fidelity of his narration. Several of the German States, France, the Netherlands, Poland, Hungary, and the East Indies, found Italian authors in this age to digest and arrange their chronicles, and give them historical form. To this period belong also the "Lives of the Most Celebrated Artists," written by Vasari (1512-1574), himself a distinguished artist, a work highly interesting for its subject and style, and the Autobiography of Benvenuto Cellini (b. 1500), one of the most curious works which was ever written in any language.

10. GRAMMAR AND RHETORIC.--The Italian language was used both in writing and conversation for three centuries before its rules and principles were reduced to a scientific form. Bembo was the first scholar who established the grammar. Grammatical writings and researches were soon multiplied and extended. Salviati was one of the most prominent grammarians of the sixteenth century, and Buonmattei and Cinonio of the seventeenth. But the progress in this study was due less to the grammarians than to the Dictionary della Crusca. Among the scholars who took part in the exercises of the Florentine Academy, founded by Cosmo de' Medici, there were some who, dissatisfied with the philosophical disputations which were the object of this institution, organized another association for the purpose of giving a new impulse to the study of the language. This academy, inaugurated in 1587, was called della Crusca, literally, of the bran. The object of this new association being to sift all impurities from the language, a sieve, the emblem of the academy, was placed in the hall; the members at their meetings sat on flour-barrels, and the chair of the presiding officer stood on three mill-stones. The first work of the academy was to compile a universal dictionary of the Italian language, which was published in 1612. Though the Dictionary della Crusca was conceived in an exclusive spirit, and admitted, as linguistic authorities, only writers of the fourteenth century, belonging to Tuscany, it contributed greatly to the progress of the Italian tongue. Every university of Italy boasted in the sixteenth century of some celebrated rhetoricians, all of whom, however, were overshadowed by Vettori (1499-1585), distinguished for the editions of the Greek and Latin classics published under his superintendence, and for his commentaries on the rhetorical books of Aristotle. B. Cavalcanti (1503-1562) was also celebrated in this department, and his "Rhetoric" is the best work of the age on that subject. The oratory of this period is very imperfect. Orations were written in the style of Boccaccio, which, however suitable for the narration of merry tales, is entirely unfit for oratorical compositions. Among those who most distinguished themselves in this department are Della Casa (1503-1556), whose harangues against the Emperor Charles V. are full of eloquence; Speroni (1500-1588), whose style is more perfect than that of any other writer of the sixteenth century; and Lollio (d. 1568), whose orations are the most polished. At that time, in the forum of Venice, eloquent orators pleaded the causes of the citizens, and at the close of the preceding century, Savonarola (1452-1498), a preacher of Florence,

thundered against the abuses of the Roman church, and suffered death in consequence. Among the models of letter-writing, Caro takes the first place. His familiar letters are written with that graceful elegance which becomes this kind of composition. The letters of Tasso are full of eloquence and philosophy, and are written in the most select Italian.

11. SCIENCE, PHILOSOPHY, AND POLITICS.--The sciences, during this period, went hand in hand with poetry and history. Libraries and other aids to learning were multiplied, and academies were organized with other objects than those of enjoyment of mere poetical triumphs or dramatic amusements. The Academy del Cimento was founded at Florence in 1657 by Leopold de' Medici, for promoting the study of the natural sciences, and similar institutions were established in Rome, Bologna, and Naples, and other cities of Italy, besides the Royal Academy of London (1660), and the Academy of Sciences in Paris (1666). From the period of the first institution of universities, that of Bologna had maintained its preëminence. Padua, Ferrara, Pavia, Turin, Florence, Siena, Pisa, and Rome were also seats of learning. The men who directed the scientific studies of their country and of Europe were almost universally attached as professors to these institutions. Indeed, at this period, through the genius of Galileo and his school, European science first dawned in Italy. Galileo (1564-1641) was a native of Pisa, and professor of mathematics in the university of that city. Being obliged to leave it on account of scientific opinions, at that time at variance with universally received principles, he removed to the university of Padua, where for eighteen years he enjoyed the high consideration of his countrymen. He returned to Pisa, and at the age of seventy was summoned to Rome by the Inquisition, and required to renounce his doctrines relative to the Copernican system, of which he was a zealous defender, and his life was spared only on condition of his abjuring his opinions. It is said that on rising from his knees, after making the abjuration of his belief that the earth moved round the sun, he stamped his foot on the floor and said, "It does move, though." To Galileo science is indebted for the discovery of the laws of weight, the scientific construction of the system of Copernicus, the pendulum, the improvement of many scientific instruments, the invention of the hydrostatic balance, the thermometer, proportional compasses, and, above all, the telescope. He discovered the satellites of Jupiter, the phases of Venus, the mountains of the moon, the spots and the rotation of the sun. Science, which had consisted for centuries only of scholastic subtleties and barren dialectics, he established on an experimental basis. In his works he unites delicacy and purity with vivacity of style. Among the scholars of Galileo, who most efficaciously contributed to the progress of science, may be mentioned Torricelli (1608-1647), the inventor of the barometer, an elegant and profound writer; Borelli (1608-1679), the founder of animal mechanics, or the science of the movements of animals, distinguished for his works on astronomy, mathematics, anatomy, and natural philosophy; Cassini (1625-1712), a celebrated astronomer, to whom France is indebted for its meridian; Cavalieri (1598-1648), distinguished for his works on geometry, which paved the way to the discovery of the infinitesimal calculus. In the scientific department of the earlier part of this period may also be mentioned Tartaglia (d. 1657) and Cardano (1501-1576), celebrated for their researches on algebra and geometry; Vignola (1507-1573) and Palladio (1518-1580), whose works on architecture are still held in high estimation, as well as the work of Marchi (fl. 1550) on military construction. Later, Redi (1626-1697) distinguished himself as a natural philosopher, a physician and elegant writer, both in prose and verse, and Malpighi (1628-1694) and Bellini (1643-1704) were anatomists of high repute. Scamozzi (1550-1616) emulated the glory formerly won by Palladio in architecture, and Montecuccoli (1608-1681), a great general of the age, ably illustrated the art of strategy. The sixteenth century abounds in philosophers who, abandoning the doctrines of Plato, which had been in great favor in the fifteenth, adopted those of Aristotle. Some, however, dared to throw off the yoke of philosophical authority, and to walk in new paths of speculation. Patrizi (1529-1597) was one of the first who undertook to examine for himself the phenomena of nature, and to attack the authority of Aristotle. Telesio (1509-1588), a friend of Patrizi, joined him in the work of overthrowing the Peripatetic idols; but neither of them dared to renounce entirely the authority of antiquity. The glory of having claimed absolute freedom in philosophical speculation belongs to Cardano, already mentioned, to Campanella (1568-1639), who for the boldness of his opinions was put to the torture and spent thirty years in prison, and to Giordano Bruno (1550-1600), a sublime thinker and a bold champion of freedom, who was burned at the stake. Among the moral philosophers of this age may be mentioned Speroni, whose writings are distinguished by harmony, freedom, and eloquence of style; Tasso, whose dialogues unite loftiness of thought with elegance of style; Castiglione (1468-1529), whose "Cortigiano" is in equal estimation as a manual of elegance of manners and as a model of pure Italian; and Della Casa, whose "Galateo" is a complete system of politeness, couched in elegant language, and a work to which Lord Chesterfield was much indebted. Political science had its greatest representative in Machiavelli, who wrote on it with that profound knowledge of the human heart which he had acquired in public life, and with the habit of unweaving, in all its intricacies, the political perfidy which then prevailed in Italy. The "Prince" is the best known of his political works, and from the infamous principles which he has here developed, though probably with good intentions, his name is allied with everything false and perfidious in

politics. The object of the treatise is to show how a new prince may establish and consolidate his power, and how the Medici might not only confirm their authority in Florence, but extend it over the whole of the Peninsula. At the time that Machiavelli wrote, Italy had been for centuries a theatre where might was the only right. He was not a man given to illusive fancies, and throughout a long political career nothing had been permitted to escape his keen and penetrating eye. In all the affairs in which he had taken part he had seen that success was the only thing studied, and therefore to succeed in an enterprise, by whatever means, had become the fundamental idea of his political theory. His Prince reduced to a science the art, long before known and practiced by kings and tyrants, of attaining absolute power by deception and cruelty, and of maintaining it afterwards by the dissimulation of leniency and virtue. It does not appear that any exception was at first taken to the doctrines which have since called forth such severe reprehension, and from the moment of its appearance the Prince became a favorite at every court. But soon after the death of Machiavelli a violent outcry was raised against him, and although it was first heard with amazement, it soon became general, The Prince was laid under the ban of several successive popes, and the name of Machiavelli passed into a proverb of infamy. His bones lay undistinguished for nearly two centuries, when a monument was erected to his memory in the church of Santa Croce, through the influence of an English nobleman.

12. PERIOD OF DECADENCE.--The sixteenth century reaped the fruits that had been sown in the fifteenth, but it scattered no seeds for a harvest in the seventeenth, which was therefore doomed to general sterility. In the reigns of Charles V. and Philip II. the chains of civil and religious despotism were forged which subdued the intellect and arrested the genius of the people. The Spanish viceroys ruled with an iron hand over Milan, Naples, Sicily, and Sardinia. Poverty and superstition wasted and darkened the minds of the people, and indolence and love of pleasure introduced almost universal degeneracy. But the Spanish yoke, which weighed so heavily at both extremities of the Peninsula, did not extend to the republic of Venice, or to the duchy of Tuscany; and the heroic character of the princes of Savoy alone would have served to throw a lustre over this otherwise darkened period. In literature, too, there were a few who resisted the torrent of bad taste, amidst many who opened the way for a crowd of followers in the false route, and gave to the age that character of extravagance for which it is so peculiarly distinguished. The literary works of the seventeenth century may be divided into three classes, the first of which, under the guidance of Marini, attained the lowest degree of corruption, and remain in the annals of literature as monuments of bombastic style and bad taste. The second embraces those writers who were aware of the faults of the school to which they belonged, and who, aiming to bring about a reform in literature, while they endeavored to follow a better style, partook more or less of the character of the age. To this class may be referred Chiabrera already named, and more particularly Filicaja and other poets of the same school. The third class is composed of a few writers who preserved themselves faithful to the principles of true taste, and among them are Menzini, Salvator Rosa, Redi, and more particularly Tassoni.

13. EPIC AND LYRIC POETRY.--Marini (1569-1625), the celebrated innovator on classic Italian taste, is considered as the first who seduced the poets of the seventeenth century into a labored and affected style. He was born at Naples and educated for the legal profession, for which he had little taste, and on publishing a volume of poems, his indignant father turned him out of doors. But his popular qualities never left him without friends. He was invited to the Court of France, obtained the favor of Mary de' Medici, and the situation of gentleman to the king. He became exceedingly popular among the French nobility, many of whom learned Italian for the sole purpose of reading his works. It was here that he published the most celebrated of his poems, entitled "Adonis." He afterwards purchased a beautiful villa near Naples, to which he retired, and where he soon after died. The Adonis of Marini is a mixture of the epic and the romantic style, the subject being taken from the well-known story of Venus and Adonis. He renounced all keeping and probability, both in his incidents and descriptions; if he could present a series of enchanted pictures, he was little solicitous as to the manner of their arrangement. But the work has much beauty and imagination, and is often animated by the true spirit of poetry. Its principal faults are that it is sadly wire-drawn, and abounds in puns, endless antitheses, and inventions for surprising or bewildering the reader; graces which were greatly admired by the contemporaries of the poet. Marini was a voluminous writer, and was not only extolled in his own country above its classic authors, and in France, but the Spaniards held him in the highest esteem, and imitated and even surpassed him in his own eccentric career. He had also innumerable imitators in Italy, many of whom attained a high reputation during their lives, and afterwards sank into complete oblivion. Filicaja (1642-1709) stands at the head of the lyric poets of the seventeenth century. His inspiration seems first to have been awakened when Vienna was besieged by the Turks in 1683, and gallantly defended by the Christian powers. His verses on this occasion awoke the most enthusiastic admiration, and called forth the eulogies of princes and poets. The admiration which he excited in his day is scarcely to be wondered at; for, though this judgment has not been ratified by posterity, Filicaja has at least the merit of having raised the poetry of Italy from the abject service of mere amorous

imbecility to the noble office of embodying the more manly and virtuous sentiments; and though his style is infected with the bombastic spirit of the age, it is even in this respect singularly moderate, compared with that of his contemporaries.

14. MOCK-HEROIC POETRY, THE DRAMA, AND SATIRE.--The full maturity of the style of mock-heroic poetry is due to Tassoni (1565-1635). He first attracted public notice by disputing the authority of Aristotle, and the poetical merits of Petrarch. In 1622 he published his "Rape of the Bucket," a burlesque poem on the petty wars which were so common between the towns of Italy in the thirteenth and fourteenth centuries. The heroes of Modena had, in 1325, discomfited the Bolognese, and pursued them to the very heart of their city, whence they carried off, as a trophy of their victory, the bucket belonging to the public well. The expedition undertaken by the Bolognese for its recovery forms the basis of the twelve mock-heroic cantos of Tassoni. To understand this poem requires a knowledge of the vulgarisms and idioms which are frequently introduced in it. About the same period, Bracciolini (1566-1645) produced another comic- heroic poem, entitled the "Ridicule of the Gods," in which the ancient deities are introduced as mingling with the peasants, and declaiming in the low, vulgar dialect, and making themselves most agreeably ridiculous. Somewhat later appeared one more example of the same species of epic, "The Malmantile," by Lippi (1606-1664). This poem is considered a pure model of the dialect of the Florentines, which is so graceful and harmonious even in its homeliness. The seventeenth century was remarkable for the prodigious number of its dramatic authors, but few of them equaled and none excelled those of the preceding age. The opera, or melodrama, which had arisen out of the pastoral, seemed to monopolize whatever talent was at the disposal of the stage, and branches formerly cultivated sank below mediocrity. Amid the crowd of theatrical corrupters, the name of Andreini (1564-1652) deserves peculiar mention, not from any claim to exemption from the general censure, but because his comedy of "Adam" is believed to have been the foundation of Milton's "Paradise Lost." Andreini was but one of the common throng of dramatic writers, and it has been fiercely contended by some, that it is impossible that the idea of so sublime a poem should have been taken from so ordinary a composition as his Adam. His piece was represented at Milan as early as 1613, and so has at least a claim of priority, Menzini (1646-1708) and Salvator Rosa (1615-1675) were the representatives of the satire of this century; the former distinguished for the purity of his language and the harmony of his verse; the latter for his vivacity and sprightliness.

15. HISTORY AND EPISTOLARY WRITINGS.--The number of historical works in this century is much greater than in that of the preceding, but they are generally far from possessing the same merit or commanding the same interest. The historians seem to have lost all feeling of national dignity; they do not venture to unveil the causes of public events, or to indicate their results. Even those that dared treat of Italy or its provinces, confined themselves to the reigning dynasties, and overlooking the causes which most deeply affected the happiness of the people, described only the festivities, battles, and triumphs of their princes. A large number of historians chose foreign subjects; the history of France was remarkable for the number of Italians who endeavored to relate it in this age. The work of Davila (1576-1630) on "The Civil Wars of France," however, throws all the rest into the shade. What gives to it peculiar value is the carefulness with which the materials were collected, in connection with the opportunities its author enjoyed for gaining information. This history is considered as superior to that of Guicciardini in its matter, as the latter excels it in style. It is wanting in that elegance which characterized the Florentine historians of the sixteenth century. Bentivoglio (1579-1644) was an eminent rival of Davila; he wrote the history of the civil wars of Flanders; a work remarkable for the elegance and correctness of its style. Above all stand the works of Sarpi, who lived between 1552 and 1623, and who defended with great courage the authority of the Senate of Venice against the power of the Popes, notwithstanding their excommunication and continued persecution. His history of the Council of Trent contains a curious account of the intrigues of the Court of Rome at the period of the Reformation. It was chiefly in the more showy departments of literature that the extravagance of the Marinists was most conspicuous, and the decay of native genius was most apparent. But this genius had turned into other paths, which it pursued with a steady, though less brilliant course. Of all branches of prose composition, the epistolary was the most carefully cultivated. The talent for letter-writing was often the means of considerable emolument, as all the petty princes of Italy and the cardinals of Rome were ambitious of having secretaries who would give them *éclat* in their correspondence, and these situations, which were steps to higher preferment, were eagerly sought; hence the prodigious number of collections of letters which have at all times inundated Italy--specimens by which those who believed themselves elegant writers endeavored to make known their talent. The letters of Bentivoglio have obtained European celebrity. They are distinguished for elegance of style as well as for the interest of those historical recollections which they transmit; they are considered superior to his history. But of all the letters of this or of the preceding age, none are more rich, more varied, or more pleasing than those of Redi, who threw into this form his

discoveries in natural history. The driest subjects, even those of language and grammar, are here treated in an interesting and agreeable manner.

PERIOD THIRD.

THE SECOND REVIVAL OF ITALIAN LITERATURE, AND ITS PRESENT CONDITION (1675-1885).

1. HISTORICAL DEVELOPMENT OF THE THIRD PERIOD.--At the close of the seventeenth century, a new dawn arose in the history of Italian letters, and the general corruption which had extended to every branch of literature and paralyzed the Italian mind began to be arrested by the appearance of writers of better taste; the affectations of the Marinists and of the so-called Arcadian poets were banished from literature; science was elevated and its dominion extended, the melodrama, comedy, and tragedy recreated, and a new spirit infused into every branch of composition. Amidst the clash of arms and the vicissitudes of long and bloody wars, Italy began to awake from her lethargy to the aspiration for greater and better things, and her intellectual condition soon underwent important changes and improvements. In the eighteenth century, in Naples, Vico transformed history into a new science. Filangeri contended with Montesquieu for the palm of legislative philosophy; and new light was thrown on criminal science by Mario Pagano. In Rome, letters and science flourished under the patronage of Benedict XIV., Clement XIV., and Pius VI., under whose auspices Quirico Visconti undertook his "Pio Clementine Museum" and his "Greek and Roman Iconography," the two greatest archaeological works of all ages. Padua was immortalized by the works of Cesarotti, Belzoni, and Stratico; Venice by Goldoni; Verona by Maffei, the critic and the antiquarian, as well as the first reformer of Italian tragedy. Tuscany took the lead of the intellectual movement of the country under Leopold and his successor Ferdinand, when Florence, Pisa, and Siena again became seats of learning and of poetry and the arts. Maria Theresa and Joseph II. fostered the intellectual progress of Lombardy; Spallanzani published his researches on natural philosophy; Volta discovered the pile which bears his name; a new era in poetry was created by Parini; another in criminal jurisprudence by Beccaria; history was reconstructed by Muratori; mathematics promoted by Lagrange, and astronomy by Oriani; and Alfieri restored Italian letters to their primitive splendor. But at the close of the eighteenth century and the beginning of the nineteenth, Italy became the theatre of political and military revolutions, whose influence could not fail to arrest the development of the literature of the country. The galleries, museums, and libraries of Rome, Florence, and other cities suffered from the military occupation, and many of their treasures, manuscripts, and masterpieces of art were carried to Paris by command of Napoleon. The entire peninsula was subject to French influence, which, though beneficial to its material progress, could not fail to be detrimental to national literature. All new works were composed in French, and indifferent or bad translations from the French were widely circulated; the French language was substituted for the Italian, and the national literature seemed about to disappear. But Italian genius was not wholly extinguished; a few writers powerfully opposed this new tendency, and preserved in its purity the language of Dante and Petrarch. Gradually the national spirit revived, and literature was again moulded in accordance with the national character. Notwithstanding the political calamities of which, for some time after the treaty of Vienna in 1815, Italy was continually the victim, the literature of the country awakened and fostered a sentiment of nationality, and Italian independence is at this present moment already achieved.

2. THE MELODRAMA.--The first result of the revival of letters at the close of the seventeenth century was the reform of the theatre. The melodrama, or Italian opera, arose out of the pastoral drama, which it superseded. The astonishing progress of musical science succeeded that of poetry and sculpture, which fell into decline with the decay of literature. Music, rising into excellence and importance at a time when poetry was on the decline, acquired such superiority that verse, instead of being its mistress, became its handmaid. The first occasion of this inversion was in the year 1594, when Rinuccini, a Florentine poet, associated himself with three musicians to compose a mythological drama. This and several other pieces by the same author met with a brilliant reception. Poetry, written only in order to be sung, thus assumed a different character; Rinuccini abandoned the form of the canzone which had hitherto been used in the lyrical part of the drama, and adopted the Pindaric ode. Many poets followed in the same path; more action was given to the dramatic parts, and greater variety to the music, in which the airs were agreeably blended with the recitative duets; other harmonized pieces were also added, and after the lapse of a century Apostolo Zeno (1669-1750) still further improved the melodrama. But it was the spirit of Metastasio that breathed a soul of fire into this ingenious and happy form created by others. Metastasio (1698-1782) gave early indications of genius, and when only ten years of age used to collect an audience in his father's shop, by his talent

for improvisation. He thus attracted the notice of Gravina, a celebrated patron of letters, who adopted him as his son, changed his somewhat ignoble name of Trepassi to Metastasio, and had him educated in every branch necessary for a literary career. He still continued to improvise verses on any given subject for the amusement of company. His youth, his harmonious voice, and prepossessing appearance, added greatly to the charm of his talent. It was one generally cultivated in Italy at this time, and men of mature years often presented themselves as rivals of the hoy. This occupation becoming injurious to the youth, Gravina forbade him to compose extempore verses any more, and this rule, imposed on him at sixteen, he never afterwards infringed. When Metastasio was in his twentieth year Gravina died, leaving to him his fortune, most of which he squandered in two years. He afterwards went to Naples, where, under a severe master, he devoted himself to the closest study and for two years resisted every solicitation to compose verses. At length, under promise of secrecy, he wrote a drama. All Naples resounded with its praise, and the author was soon discovered. Metastasio from this time followed the career for which nature seemed to have formed him, and devoted himself to the opera, which he considered to be the natural drama of Italy. An invitation to become the court poet of Vienna made his future life both stable and prosperous. On the death of Charles VI., in 1740, several other European sovereigns made advantageous overtures to the poet, but as Maria Theresa was disposed to retain him, he would not leave her in her adverse circumstances. The remainder of his life he passed in Germany, and his latter years were as monotonous as they were prosperous. Metastasio seized with a daring hand the true spirit of the melodrama, and scorning to confine himself to unity of place, opened a wide field for the display of theatrical variety, on which the charm of the opera so much depends. The language in which he clothed the favorite passion of his drama exhibits all that is delicate and yet ardent, and he develops the most elevated sentiments of loyalty, patriotism, and filial love. The flow of his verse in the recitative is the most pure and harmonious known in any language, and the strophes at the close of each scene are scarcely surpassed by the first masters in lyric poetry. Metastasio is one of the most pleasing, at the same time one of the least difficult of the Italian poets, and the tyro in the study of Italian classics may begin with his works, and at once enjoy the pleasures of poetic harmony at their highest source.

3. COMEDY.--The revolution, so frequently attempted in Italian comedy by men whose genius was unequal to the task, was reserved for Goldoni (1707- 1772) to accomplish. His life, written by himself, presents a picture of Italian manners in their gayest colors. He was a native of Venice, and from his early youth was constantly surrounded by theatrical people. At eight years of age he composed a comedy, and at fourteen he ran away from school with a company of strolling players. He afterwards prepared for the medical, then for the legal profession, and finally, at the age of twenty- seven, he was installed poet to a company of players. He now attempted to introduce the reforms that he had long meditated; he attained a purer style, and became a censor of the manners and a satirist of the follies of his country. His dialogue is extremely animated, earnest, and full of meaning; with a thorough knowledge of national manners, he possessed the rare faculty of representing them in the most life-like manner on the stage. The language used by the inferior characters of his comedies is the Venetian dialect. In his latter days Goldoni was rivaled by Carlo Gozzi (1722-1806), who parodied his pieces, and, it is thought, was the cause of his retirement, in the decline of life, to Paris. Gozzi introduced a new style of comedy, by reviving the familiar fictions of childhood; he selected and dramatized the most brilliant fairy tales, such as "Blue Beard," "The King of the Genii," etc., and gave them to the public with magnificent decorations and surprising machinery. If his comedies display little resemblance to nature, they at least preserve the kind of probability which is looked for in a fairy tale. Many years elapsed after Goldoni and Gozzi disappeared from the arena before there was any successor to rival their compositions. Among those who contributed to the perfection of Italian comedy may be mentioned Albergati (fl. 1774), Gherardo de' Rossi (1754-1827), and above all, Nota (d. 1847), who is preeminent among the new race of comic authors; although somewhat cold and didactic, he at least fulfils the important office of holding the mirror up to nature. He exhibits a faithful picture of Italian society, and applies the scourge of satire to its most prevalent faults and follies.

4. TRAGEDY.--The reform of Italian tragedy was early attempted by Martelli (d. 1727) and by Scipione Maffei (1675-1755). But Martelli was only a tame imitator of French models, while Maffei, possessing real talent and feeling, deserved the extended reputation he acquired. His "Merope" is considered as the last and the best specimen of the elder school of Italian tragedy. The honor of raising tragedy to its highest standard was reserved for Alfieri (1749-1803), whose remarkable personal character exercised a powerful influence over his works. He was possessed of an impetuosity which continually urged him towards some indefinite object, a craving for something more free in politics, more elevated in character, more ardent in love, and more perfect in friendship; of desires for a better state of things, which drove him from one extremity of Europe to another, but without discovering it in the realities of this everyday world. Finally, he turned to the contemplation of a new universe in his own poetical creations, and calmed

his agitations by the production of those master-pieces which have secured his immortality. His aim in life, in the pursuit of which he never deviated, was that of founding a new and classic school of tragedy. He proposed to himself the severe simplicity of the Greeks with respect to the plot, while he rejected the pomp of poetry which compensates for interest among the classic writers of antiquity. Energy and conciseness are the distinguishing features of his style; and this, in his earlier dramas, is carried to the extreme. He brings the whole action into one focus; the passion he would exhibit is introduced into the first verse and kept in view to the last. No event, no character, no conversation unconnected with the advancement of the plot is permitted to appear; all confidants and secondary personages are, therefore, excluded, and there seldom appear more than four interlocutors. These tragedies breathe the spirit of patriotism and freedom, and for this, even independently of their intrinsic merit, Alfieri is considered as the reviver of the national character in modern times, as Dante was in the fourteenth century. "Saul" is regarded as his masterpiece; it represents a noble character suffering under those weaknesses which sometimes accompany great virtues, and are governed by the fatality, not of destiny, but of human nature. Among the earliest and most distinguished of those who followed in the path of Alfieri was Monti (1754-1828). Though endowed with a sublime imagination and exquisite taste, his character was weak and vain, and he, in turn, celebrated every party as it became the successful one. Educated in the school of Dante, he introduced into Italian poetry those bold and severe beauties which adorned its infancy. His "Aristodemus" is one of the most affecting tragedies in Italian literature. The story is founded on the narrative of Pausanias. It is simple in its construction, and its interest is confined almost entirely to the principal personage. In the loftiness of the characters of his tragedies, and the energy of sentiment and simplicity of action which characterize them, we recognize the school of Alfieri, while in harmony and elegance of style and poetical language, Monti is superior. Another follower of the school of Alfieri is Ugo Foscolo (1778-1827), one of the greatest writers of this age, in whom inspiration was derived from a lofty patriotism. At the time of the French revolution he joined the Italian army, with the object of restoring independence to his country. Disappointed in this hope, he left Italy for England, where he distinguished himself by his writings. The best of his tragedies, "Ricciarda," is founded on events supposed to have occurred in the Middle Ages. While some of its scenes and situations are forced and unnatural, some of the acts are wrought with consummate skill and effect, and the conception of the characters is tragic and original. Foscolo adopts in his tragedies a concise and pregnant style, and displays great mastery over his native language. Marengo (d. 1846) is distinguished for the noble and moral ideas, lofty images, and affections of his tragedies; but he lacks unity of design and vigor of style. Silvio Pellico (1789-1854) was born in Piedmont. As a writer he is best known as the author of "My Prisons," a narrative full of simplicity and resignation, in which he relates his sufferings during ten years in the fortress of Spielberg. His tragedies are good specimens of modern art; they abound in fine thoughts and tender affections, but they lack that liveliness of dialogue and rapidity of action which give reality to the situations, and that knowledge of the human heart and unity and grandeur of conception which are the characteristics of true genius. Manzoni (1785-1873) and Nicolini (1782-1861) are the last of the modern representatives of the tragic drama of Italy. The tragedies of Manzoni, and especially his "Conte di Carmagnola," and "Adelchi," abound in exquisite beauties. His style is simple and noble, his verse easy and harmonious, and his object elevated. The merits of these tragedies, however, belong rather to parts, and while the reading of them is always interesting, on the stage they fail to awaken the interest of the audience. After Manzoni, Nicolini was the most popular literary man of Italy of his time. Lofty ideas, generous passions, splendor and harmony of poetry, purity of language, variety of characters, and warmth of patriotism, constitute the merit of his tragedies; while his faults consist in a style somewhat too exuberant and lyrical, in ideas sometimes too vague, and characters often too ideal.

5. LYRIC, EPIC, AND DIDACTIC POETRY.--In the latter part of the eighteenth century, a class of poets who called themselves "The Arcadians" attempted to overthrow the artificial and bombastic school of Marini; but their frivolous and insipid productions had little effect on the literature. The first poets who gave a new impulse to letters were Parini and Monti. Parini (1729-1799) was a man of great genius, integrity, and taste; he contributed more than any other writer of his age to the progress of literature and the arts. His lyrical poems abound in noble thoughts, and breathe a pure patriotism and high morality. His style is forcible, chaste, and harmonious. The poems of Monti have much of the fire and elevation of Pindar. Whatever object employs his thoughts, his eyes immediately behold; and, as it stands before him, a flexible and harmonious language is ever at his command to paint it in the brightest colors. His "Basvilliana" is the most celebrated of his lyric poems, and, beyond every other, is remarkable for majesty, nobleness of expression, and richness of coloring. The poetical writings of Pindemonte (1753-1828) are stamped with the melancholy of his character. Their subjects are taken from contemporary events, and his inspiration is drawn from nature and rural life. His "Sepulchres" breathes the sweetest and most pathetic tenderness, and the brightest hopes of immortality. The poems of Foscolo have the grace and elegance of the Greek poets; but in his "Sepulchres" the gloom of his melancholy imagination throws a funereal light over the nothingness of all things, and

the silence of death is unbroken by any voice of hope in a future life. Torti (1774-1852), a pupil of Parini, rivaled his master in the simplicity of style and purity of his images; while Leopardi (1798- 1837) impressed upon his lyric poems the peculiarities of his own character. A sublime poet and a profound scholar, his muse was inspired by a deep sorrow, and his poems pour out a melancholy that is terrible and grand, the most agonizing cry in modern literature uttered with a solemn quietness that elevates and terrifies. The poetry of despair has never had a more powerful voice than his. He is not only the first poet since Dante, but perhaps the most perfect prose writer. Berchet (1790-1851) is considered as the Italian Béranger, and his songs glow with patriotic fire. Those of Silvio Pellico, always sweet and truthful, bear the stamp of a calm resignation, hope, and piety. The list of modern lyric poets closes with Manzoni, whose hymns are models of this style of poetry. In the epic department the third period does not afford any poems of a high order. But the translation of the Iliad by Monti, that of the Odyssey by Pindemonte, for their purity of language and beauty of style, may be considered as epic additions to Italian literature. "The Longobards of the First Crusade," written by Grossi (1791-1853), excels in beauty and splendor of poetry all the epic poems of this age, though it lacks unity of design and comprehensiveness of thought. Among the didactic poems may be mentioned the "Invitation of Lesbia," by Mascheroni (1750-1800), a distinguished poet as well as a celebrated mathematician. This poem, which describes the beautiful productions of nature in the Museum of Pavia, is considered a masterpiece of didactic poetry. The "Riseide," or cultivation of rice, by Spolverini (1695-1762), and the "Silkworm," by Betti (1732-1788), are characterized by poetical beauties. The poem on the "Immortality of the Soul," by Filorentino (1742- 1815), though defective in style, is distinguished by its elevation of ideas and sentiments. "The Cultivation of Mountains," by Lorenzi (1732- 1822), is rich in beautiful images and thoughts. "The Cultivation of Olive Trees," by Arici (1782-1836), his "Corals," and other poems, especially in their descriptions, are graceful and attractive. "The Seasons" of Barbieri (1774-1852), though bearing marks of imitation from Pope, is written in a pure and elegant style.

6. HEROIC-COMIC POETRY, SATIRE, AND FABLE.--The period of heroic-comic poetry closes in the eighteenth century. The "Ricciardetto" of Fortiguerra (1674-1735) is the last of the poems of chivalry, and with it terminated the long series of romances founded on the adventures of Charlemagne and his paladins. The "Cicero" of Passeroni (1713-1803) is a rambling composition in a style similar to Sterne's "Tristram Shandy," which, it appears, was suggested by this work. Satiric poetry, which had flourished in the preceding period, was enriched by new productions in the eighteenth and nineteenth centuries. G. Gozzi (1713-1789) attacked in his satires the vices and prejudices of his fellow-citizens, in a forcible and elegant style; and Parini, the great satirist of the eighteenth century, founded a school of satire, which proved most beneficial to the country. His poem, "The Day," is distinguished by fine irony and by the severity with which he attacks the effeminate habits of his age. He lashes the affectations and vices of the Milanese aristocracy with a sarcasm worthy of Juvenal. The satires of D'Elei, Guadagnali, and others are characterized by wit and beauty of versification. Those of Leopardi are bitter and contemptuous, while Giusti (1809-1850), the political satirist of his age, scourged the petty tyrants of his country with biting severity and pungent wit; the circulation of his satires throughout Italy, in defiance of its despotic governments, greatly contributed to the revolution of 1848. In the department of fable may be mentioned Roberti (1719-1786), Passeroni, Pignotti (1739-1812), and Clasio (1754-1825), distinguished for invention, purity, and simplicity of style.

7. ROMANCES.--Though the tales of Boccaccio and the story tellers of the sixteenth century paved the way to the romances of the present time, it was only at a late period that the Italians gave their attention to this kind of composition. In the eighteenth century we find only two specimens of romance, "The Congress of Citera," by Algarotti, of which Voltaire said that it was written with a feather drawn from the wings of love; and the "Roman Nights," by Alexander Verri (1741-1816). In his romance he introduces the shades of celebrated Romans, particularly of Cicero, and an ingenious comparison of ancient and modern institutions is made. The style is picturesque and poetical, though somewhat florid. This kind of composition has found more favor in the nineteenth century. First among the writers of this age is Manzoni, whose "Betrothed" is a model of romantic literature. The variety, originality, and truthfulness of the characters, the perfect knowledge of the human heart it displays, the simplicity and vivacity of its style, form the principal merits of this work. The "Marco Visconti" of Grossi is distinguished for its pathos and for the purity and elegance of its style. The "Ettore Fieramosca" of Massimo d'Azeglio is distinguished from the works already spoken of by its martial and national spirit. His "Nicolò de Lapi," though full of beauties, partakes in some degree of the faults common to the French school. After these, the "Margherita Pusterla" of Cantù, the "Luisa Strozzi" of Rosini, the "Lamberto Malatesta" of Rovani, the "Angiola Maria" of Carcano, are the best historical romances of Italian literature. Both in an artistic and moral point of view, they far excel those of Guerrazzi, which represent the French school of George Sand in Italy, and whose "Battle of

Benevento," "Isabella Orsini," "Siege of Florence," and "Beatrice Cenci," while they are written in pure language and abound in minor beauties, are exaggerated in their characters, bombastic and declamatory in style, and overloaded in description. The "Last Letters of Jacopo Ortis," by Foscolo, belongs to that kind of romance which is called sentimental. Overcome by the calamities of his country, with his soul full of fiery passion and sad disappointment, Foscolo wrote this romance, the protest of his heart against evils which he could not heal.

8. HISTORY.--Among the most prominent of the numerous historians of this period, a few only can be named. Muratori (1672-1750), for his vast erudition and profound criticism, has no rivals. He made the most accurate and extensive researches and discoveries relating to the history of Italy from the fifth to the sixteenth century, which he published in twenty-seven folio volumes; the most valuable collection of historical documents which ever appeared in Italy. He wrote, also, a work on "Italian Antiquities," illustrating the history of the Middle Ages through ancient monuments, and the "Annals of Italy," a history of the country from the beginning of the Christian era to his own age. Though its style is somewhat defective, the richness and abundance of its erudition, its clearness, and arrangement, impart to this work great value and interest. Maffei, already spoken of as the first reformer of Italian tragedy, surpassed Muratori in the purity of his style, and was only second to him in the extent and variety of his erudition. He wrote several works on the antiquities and monuments of Italy. Bianchini (1662-1729), a celebrated architect and scholar, wrote a "Universal History," which, though not complete, is characterized as a work of great genius. It is founded exclusively on the interpretations of ancient monuments in marble and metal. Vico (1670-1744), the founder of the philosophy of history, embraced with his comprehensive mind the history of all nations, and from the darkness of centuries he created the science of humanity, which he called "Scienza Nuova." Vico does not propose to illustrate any special historical epoch, but follows the general movement of mankind in the most remote and obscure times, and establishes the rules which must guide us in interpreting ancient historians. By gathering from different epochs, remote from each other, the songs, symbols, monuments, laws, etymologies, and religious and philosophical doctrines,--in a word, the infinite elements which form the life of mankind,--he establishes the unity of human history. The "Scienza Nuova" is one of the great monuments of human genius, and it has inspired many works on the philosophy of history, especially among the Germans, such as those of Hegel, Niebuhr, and others. Giannone (1676-1748) is the author of a "Civil History of the Kingdom of Naples," a work full of juridical science as well as of historical interest. Having attacked with much violence the encroachments of the Church of Rome on the rights of the state, he became the victim of a persecution which ended in his death in the fortress of Turin. Giannone, in his history, gave the first example in modern times of that intrepidity and courage which belong to the true historian. Botta (1766-1837) is among the first historians of the present age. He was a physician and a scholar, and devoted to the freedom of his country. He filled important political offices in Piedmont, under the administration of the French government. In 1809 he published, in Paris, his "History of the American Revolution," a work held in high estimation both in this country and in Italy. In the political changes which followed the fall of Napoleon, Botta suffered many pecuniary trials, and was even obliged to sell, by weight, to a druggist, the entire edition of his history, in order to pay for medicines for his sick wife. Meanwhile, he wrote a history of Italy, from 1789 to 1814, which was received with great enthusiasm through Italy, and for which the Academy della Crusca, in 1830, granted to him a pecuniary reward. This was followed by the "History of Italy," in continuation of Guicciardini, from the fall of the Florentine Republic to 1789, a gigantic work, with which he closed his historical career. The histories of Botta are distinguished by clearness of narrative, vividness and beauty of description, by the prominence he gives to the moral aspect of events and characters, and by purity, richness, and variety of style. Colletta (1775-1831) was born in Naples; under the government of Murat he rose to the rank of general, and fell with his patron. His "History of the Kingdom of Naples," from 1734 to 1825, is modeled after the annals of Tacitus. The style is simple, clear, and concise, the subject is treated without digressions or episodes; it is conceived in a partial spirit, and is a eulogium of the administration of Joachim; but no writer can rival Colletta in his descriptions of strategic movements, of sieges and battles. Balbo (1789-1853) was born in Turin; during the administration of Napoleon he filled many important political offices, and afterwards entered upon a military career. Devoted to the freedom of his country, he strove to promote the progress of Italian independence. In 1847 he published the "Hopes of Italy," the first political work that had appeared in the peninsula since the restoration of 1814; it was the spark which kindled the movements of 1848. In the events of that and of the succeeding year, he ranked among the most prominent leaders of the national party. His historical works are a "Life of Dante," considered the best on the subject; "Historical Contemplations," in which he developed the history of mankind from a philosophical point of view; and "The Compendium of the History of Italy," which embraces in a synthetic form all the history of the country from the earliest times to 1814. His style is pure, clear, and sometimes eloquent, though often concise and abrupt. Cantù, a living historian, has written a universal history, in which he attempts the philosophical style. Though vivid in his narratives, descriptions, and details, he is often incorrect in his statements, and rash in his

judgments; his work, though professing liberal views, is essentially conservative in its tendency. The same faults may be discovered in his more recent "History of the Italians." Tiraboschi (1731-1794) is the great historian of Italian literature; his work is biographical and critical, and is the most extensive literary history of Italy. His style is simple and elegant, and his criticism profound; but he gives greater prominence to the biographies of writers than to the consideration of their works. This history was continued by Corniani (1742-1813), and afterwards by Ugoni (1784-1855).

9. AESTHETICS, CRITICISM, PHILOLOGY, AND PHILOSOPHY.--Italian literature is comparatively deficient in aesthetics, the science of the beautiful. The treatise of Gioberti on the "Beautiful," the last work which has appeared on this subject, is distinguished for its profound doctrines and brilliant style. Philology and criticism first began to flourish at the close of the seventeenth century, and are well represented at the present time. The revival of letters was greatly promoted by the criticism of Gravina (1664-1718), one of the most celebrated jurisconsults and scholars of his age, who, through his work, "The Poetical Reason," greatly contributed to the reform of taste. Zeno, Maffei, and Muratori also distinguished themselves in the art of criticism, and by their works aided in overthrowing the school of Marini. At a later date, Gaspar Gozzi, through his "Observer," a periodical publication modeled after the "Spectator" of Addison, undertook to correct the literary taste of the country; for its invention, pungent wit, and satire, and the purity and correctness of its style, it is considered one of the best compositions of this kind. Baretti (1716-1789) propagated in England the taste for Italian literature, and at the same time published his "Literary Scourge," a criticism of the ancient and modern writers of Italy. His style, though always pure, is often caustic. He wrote several books in the English language, one of which is in defense of Shakspeare against Voltaire. Cesarotti (1730-1808), though eminent as a critic, introduced into the Italian language some innovations, which contributed to its corruption; while the nice judgment, good taste, and pure style of Parini place him at the head of this department. In the latter part of this period we find, in the criticisms of Monti, vigorous logic and a splendid and attractive style. Foscolo is distinguished for his acumen and pungent wit. The works of Perticari (1779-1822) are written with extreme polish, erudition, judgment, and dignity. In Leopardi, philosophical acumen equals the elegance of his style. Giordani (d. 1848), as a critic and an epigraphist, deserves notice for his fine judgment and pure taste, as do Tommaseo and Cattaneo, who are both epigrammatic, witty, and pungent. The golden age of philology dates from the time of Lorenzo de' Medici to the seventeenth century. It then declined until the eighteenth, but revived in the works of Maffei, Muratori, Zeno, and others. In the same century this study was greatly promoted by Foscolo, Monti, and Cesari (1760-1828), who, among other philological works, published a new edition of the Dictionary della Crusca, revised and augmented. Of the modern writers on philology, Gherardini, Tommaseo, and Ascoli are the most prominent. The revival of philosophy in Italy dates from the age of Galileo, when the authority of the Peripatetics was overthrown, and a new method introduced into scientific researches. From that time to the present, this science has been represented by opposite schools, the one characterized by sensualism and the other by rationalism. The experimental method of Galileo paved the way to the first, which holds that experience is the only source of knowledge, a doctrine which gained ground in the seventeenth century, became universally accepted in the eighteenth, through the influence of Locke and Condillac, and continued to prevail during the first part of the nineteenth. Gioja (1767-1829), and Romagnosi (1761-1835) are the greatest representatives of this system, in the last part of this period. But while the former developed sensualism in philosophy and economy, the latter applied it to political science and jurisprudence. The numerous Works of Gioja are distinguished for their practical value and clearness of style, though they lack eloquence and purity; those of Romagnosi are more abstract, and couched in obscure arid often incorrect language, but they are monuments of vast erudition, acute and profound judgment, and powerful dialectics. Galluppi (1773-1846), though unable to extricate himself entirely from the sensualistic school, attempted the reform of philosophy, which resulted in a movement in Italy similar to that produced by Reid and Dugald Stewart in Scotland. While sensualism was gaining ground in the seventeenth and eighteenth centuries, rationalism, having its roots in the Platonic system which had prevailed in the fifteenth and sixteenth, was remodeled under the influence of Descartes, Leibnitz, and Wolf, and opposed to the invading tendencies of its antagonist. From causes to be found in the spirit of the age and the political condition of the country, this system was unable to take the place to which it was entitled, though it succeeded in purifying sensualism from its more dangerous consequences, and infusing into it some of its own elements. But the overthrow of that system was completed only by the works of Rosmini and Gioberti. Rosmini (1795-1855) gave a new impulse to metaphysical researches, and created a new era in the history of Italian philosophy. His numerous works embrace all philosophical knowledge in its unity and universality, founded on a new basis, and developed with deep, broad, and original views. His philosophy, both inductive and deductive, rests on experimental method, reaches the highest problems of ideology and ontology, and infuses new life into all departments of science. This philosophical progress was greatly aided by Gioberti (1801-1851), whose life, however, was more particularly devoted to political pursuits. His work on "The

Regeneration of Italy" contains his latest and soundest views on Italian nationality. Another distinguished philosophical and political writer is Mamiani, whose work on "The Rights of Nations" deserves the attention of all students of history and political science. As a statesman, he belongs to the National party, of which Count Cavour (1810-1861), himself an eminent writer on political economy, was the great representative, and to whose commanding influence is to be attributed the rapid progress which the Italian nation was making towards unity and independence at the time of his death.

FROM 1860 TO 1885.

FRENCH LITERATURE.

INTRODUCTION.--1. French Literature and its Divisions.--2. The Language.

PERIOD FIRST.--1. The Troubadours.--2. The Trouvères French Literature in the Fifteenth Century.--4. The Mysteries and Moralities: Charles of Orleans, Villon, Ville-Hardouin, Joinville, Froissart, Philippe de Commines.

PERIOD SECOND.--1. The Renaissance and the Reformation: Marguerite de Valois, Marot, Rabelais, Calvin, Montaigne, Charron and others.--2. Light Literature: Ronsard, Jodelle, Hardy, Malherbe, Scarron, Madame de Rambouillet, and others.--3. The French Academy.--4. The Drama: Corneille.--5. Philosophy: Descartes, Pascal; Port Royal.--6. The Rise of the Golden Age of French Literature: Louis XIV.--7. Tragedy: Racine.--8. Comedy: Molière.--9. Fables, Satires, Mock-Heroic, and other Poetry: La Fontaine, Boileau.--10. Eloquence of the Pulpit and of the Bar: Bourdaloue, Bossuet, Massillon, Fléchier, Le Maître, D'Aguesseau, and others.--11. Moral Philosophy: Rochefoucault, La Bruyère, Nicole.--12. History and Memoirs: Mézeray, Fleury, Rollin, Brantôme the Duke of Sully, Cardinal de Retz.--13. Romance and Letter Writing: Fénelon, Madame de Sévigné.

PERIOD THIRD.--1. The Dawn of Skepticism: Bayle, J. B. Rousseau, Fontenelle, Lamotte.--2. Progress of Skepticism: Montesquieu, Voltaire. --3. French Literature during the Revolution: D'Holbach, D'Alembert, Diderot, J. J. Rousseau, Buffon, Beaumarchais, St. Pierre, and others.--4. French Literature under the Empire: Madame de Staël, Châteaubriand, Royer-Collard, De Maistre.--5. French Literature from the Age of the Restoration to the Present Time. History: Thierry, Sismondi, Thiers, Mignet, Martin, Michelet, and others. Poetry and the Drama; Rise of the Romantic School: Béranger, Lamartine, Victor Hugo, and others; Les Parnassiens. Fiction: Hugo, Gautier, Dumas, Mérimée, Balzac, Sand, Sandeau and others. Criticism: Sainte-Beuve, Taine, and others. Miscellaneous.

INTRODUCTION.

1. FRENCH LITERATURE AND ITS DIVISIONS.--Towards the middle of the fifth century the Franks commenced their invasions of Gaul, which ended in the conquest of the country, and the establishment of the French monarchy under Clovis. The period from Clovis to Charlemagne (487-768) is the most obscure of the Dark Ages. The principal writers, whose names have been preserved, are St. Rémy, the archbishop of Rheims (d. 535), distinguished for his eloquence, and Gregory of Tours (d. 595), whose contemporary history is valuable for the good faith in which it is written, in spite of the ignorance and credulity which it displays. The genius of Charlemagne (r. 768-814) gave a new impulse to learning. By his liberality he attracted the most distinguished scholars to his court, among others Alcuin, from England, whom he chose for his instructor; he established schools of theology and science, and appointed the most learned professors to preside over them. But in the century succeeding his death the country relapsed into barbarism. In the south of France, Provence early became an independent kingdom, and consolidating its language, laws, and manners, at the close of the eleventh century it gave birth to the literature of the Troubadours; while in the north, the language and literature of the Trouvères, which were the germs of the national literature of France, were not developed until a century later. In the schools established by Charlemagne for the education of the clergy, the scholastic philosophy originated, which prevailed throughout Europe in the Middle Ages. The most distinguished schoolmen or scholastics in France during this period are Roscellinus (fl. 1092), the originator of the controversy between the Nominalists and Realists, which occupied so prominent a place in the philosophy of the time; Abelard (1079-1142), equally celebrated for his learning, and for his unfortunate love for Héloïse; St. Bernard (1091-1153), one of the most influential ecclesiastics of the Middle Ages; and Thomas Aquinas

(1227-1274) and Bonaventure (1221-1274), Italians who taught theology and philosophy at Paris, and who powerfully influenced the intellect of the age. Beginning with the Middle Ages, the literary history of France may be divided into three periods. The first period extends from 1000 to 1500, and includes the literature of the Troubadours, the Trouvères, and of the fifteenth century. The second period extends from 1500 to 1700, and includes the revival of the study of classical literature, or the Renaissance, and the golden age of French literature under Louis XIV. The third period, extending from 1700 to 1885, comprises the age of skepticism introduced into French literature by Voltaire, the Encyclopaedists and others, the Revolutionary era, the literature of the Empire and of the Restoration, of the Second Empire, and of the present time.

2. THE LANGUAGE.--After the conquest of Gaul by Julius Caesar, Latin became the predominant language of the country; but on the overthrow of the Western Empire it was corrupted by the intermixture of elements derived from the northern invaders of the country, and from the general ignorance and barbarism of the times. At length a distinction was drawn between the language of the Gauls who called themselves Romans, and that of the Latin writers; and the Romance language arose from the former, while the Latin was perpetuated by the latter. At the commencement of the second race of monarchs, German was the language of Charlemagne and his court, Latin was the written language, and the Romance, still in a state of barbarism, was the dialect of the people. The subjects of Charlemagne were composed of two different races, the Germans, inhabiting along and beyond the Rhine, and the Wallons, who called themselves Romans. The name of Welsch or Wallons, given them by the Germans, was the same as Galli, which they had received from the Latins, and as Keltai or Celts, which they themselves acknowledged. The language which they spoke was called after them the Romance-Wallon, or rustic Romance, which was at first very much the same throughout France, except that as it extended southward the Latin prevailed, and in the north the German was more perceptible. These differences increased, and the languages rapidly grew more dissimilar. The people of the south called themselves Romans-provençaux, while the northern tribes added to the name of Romans, which they had assumed, that of Wallons, which they had received from the neighboring people. The Provençal was called the Langue d'oc, and the Wallon the Langue d'oui, from the affirmative word in each language, as the Italian was then called the Langue de sí, and the German the Langue de ya. The invasion of the Normans, in the tenth century, supplied new elements to the Romance Wallon. They adopted it as their language, and stamped upon it the impress of their own genius. It thus became Norman-French. In 1066, William the Conqueror introduced it into England, and enforced its use among his new subjects by rigorous laws; thus the popular French became there the language of the court and of the educated classes, while it was still the vulgar dialect in France. >From the beginning of the twelfth century, the two dialects were known as the Provençal and the French. The former, though much changed, is still the dialect of the common people in Provence, Languedoc, Catalonia, Valencia, Majorca, and Minorca. In the thirteenth century, the northern French dialect gained the ascendancy, chiefly in consequence of Paris becoming the centre of refinement and literature for all France. The Langue d'oui was, from its origin, deficient in that rhythm which exists in the Italian and Spanish languages. It was formed rather by an abbreviation than by a harmonious transformation of the Latin, and the metrical character of the language was gradually lost. The French became thus more accustomed to rhetorical measure than to poetical forms, and the language led them rather to eloquence than poetry. Francis I. established a professorship of the French language at Paris, and banished Latin from the public documents and courts of justice. The Academy, established by Cardinal Richelieu (1635), put an end to the arbitrary power of usage, and fixed the standard of pure French, though at the same time it restricted the power of genius over the language. Nothing was approved by the Academy unless it was received at court, and nothing was tolerated by the public that had not been sanctioned by the Academy. The language now acquired the most admirable precision, and thus recommended itself not only as the language of science and diplomacy, but of society, capable of conveying the most discriminating observations on character and manners, and the most delicate expressions of civility which involve no obligation. Hence its adoption as the court language in so many European countries. Among the dictionaries of the French language, that of the Academy holds the first rank.

PERIOD FIRST.

PROVENÇAL AND FRENCH LITERATURES IN THE MIDDLE AGES (1000-1500).

1. THE TROUBADOURS.--When, in the tenth century, the nations of the south of Europe attempted to give consistency to the rude dialects which had been produced by the mixture of the Latin with the northern tongues, the Provençal, or Langue d'oc, was the first to come to perfection. The study of this language became the favorite recreation of the higher classes during the tenth and eleventh centuries, and poetry the elegant occupation of those

whose time was not spent in the ruder pastimes of the field. Thousands of poets, who were called troubadours (from *_trobar_*, to find or invent), flourished in this new language almost contemporaneously, and spread their reputation from the extremity of Spain to that of Italy. All at once, however, this ephemeral reputation vanished. The voice of the troubadours was silent, the Provençal was abandoned and sank into a mere dialect, and after a brilliant existence of three centuries (950-1250), its productions were ranked among those of the dead languages. The high reputation of the Provençal poets, and the rapid decline of their language, are two phenomena equally striking in the history of human culture. This literature, which gave models to other nations, yet among its crowds of agreeable poems did not produce a single masterpiece destined to immortality, was entirely the offspring of the age, and not of individuals. It reveals to us the sentiments and imagination of modern nations in their infancy; it exhibits what was common to all and pervaded all, and not what genius superior to the age enabled a single individual to accomplish. Southern France, having been the inheritance of several of the successors of Charlemagne, was elevated to the rank of an independent kingdom in 879, by Bozon, and under his sovereignty, and that of his successors for 213 years, it enjoyed a paternal government. The accession of the Count of Barcelona to the crown, in 1092, introduced into Provence the spirit both of liberty and chivalry, and a taste for elegance and the arts, with all the sciences of the Arabians. The union of these noble sentiments added brilliancy to that poetical spirit which shone out at once over Provence and all the south of Europe, like an electric flash in the midst of profound darkness, illuminating all things with the splendor of its flame. At the same time with Provençal poetry, chivalry had its rise; it was, in a manner, the soul of the new literature, and gave to it a character different from anything in antiquity. Love, in this age, while it was not more tender and passionate than among the Greeks and Romans, was more respectful, and women were regarded with something of that religious veneration which the Germans evinced towards their prophetesses. To this was added that passionate ardor of feeling peculiar to the people of the South, the expression of which was borrowed from the Arabians. But although among individuals love preserved this pure and religious character, the license engendered by the feudal system, and the disorders of the time, produced a universal corruption of manners which found expression in the literature of the age. Neither the *_sirventes_* nor the *_chanzos_* of the troubadours, nor the *_fabliaux_* of the trouvères, nor the romances of chivalry, can be read without a blush. On every page the grossness of the language is only equaled by the shameful depravity of the characters and the immorality of the incidents. In the south of France, more particularly, an extreme laxity of manners prevailed among the nobility. Gallantry seems to have been the sole object of existence. Ladies were proud of the celebrity conferred upon their charms by the songs of the troubadours, and they themselves often professed the "Gay Science," as poetry was called. They instituted the Courts of Love where questions of gallantry were gravely discussed and decided by their suffrages; and they gave, in short, to the whole south of France the character of a carnival. No sooner had the Gay Science been established in Provence, than it became the fashion in surrounding countries. The sovereigns of Europe adopted the Provençal language, and enlisted themselves among the poets, and there was soon neither baron nor knight who did not feel himself bound to add to his fame as a warrior the reputation of a gentle troubadour. Monarchs were now the professors of the art, and the only patrons were the ladies. Women, no longer beautiful ciphers, acquired complete liberty of action, and the homage paid to them amounted almost to worship. At the festivals of the haughty barons, the lady of the castle, attended by youthful beauties, distributed crowns to the conquerors in the jousts and tournaments. She then, in turn, surrounded by her ladies, opened her Court of Love, and the candidates for poetical honors entered with their harps and contended for the prize in extempore verses called *_tensons_*. The Court of Love then entered upon a grave discussion of the merits of the question, and a judgment or *_arrêt d'amour_* was given, frequently in verse, by which the dispute was supposed to be decided. These courts often formally justified the abandonment of moral duty, and assuming the forms and exercising the power of ordinary tribunals, they defined and prescribed the duties of the sexes, and taught the arts of love and song according to the most depraved moral principles, mingled, however, with an affected display of refined sentimentality. Whatever may have been their utility in the advancement of the language and the cultivation of literary taste, these institutions extended a legal sanction to vice, and inculcated maxims of shameful profligacy. The songs of the Provençals were divided into *_chanzos_* and *_sirventes_*; the object of the former was love, and of the latter war, politics, or satire. The name of *_tenson_* was given to those poetical contests in verse which took place in the Courts of Love, or before illustrious princes. The songs were sung from *château* to *château*, either by the troubadours themselves, or by the *_jongleur_* or instrument player by whom they were attended; they often abounded in extravagant hyperboles, trivial conceits, and grossness of expression. Ladies, whose attractions were estimated by the number and desperation of their lovers, and the songs of their troubadours, were not offended if licentiousness mingled with gallantry in the songs composed in their praise. Authors addressed prayers to the saints for aid in their amorous intrigues, and men, seemingly rational, resigned themselves to the wildest transports of passion for individuals whom, in some cases, they had never seen. Thus, religious enthusiasm, martial bravery, and licentious love, so grotesquely mingled, formed the very life of the Middle Ages, and impossible as it is to transfuse into a translation

the harmony of Provençal verse, or to find in it, when stripped of this harmony, any poetical idea, these remains are valuable since they present us with a picture of the life and manners of the times. The intercourse of the Provençals with the Moors of Spain, which, as we have seen, was greatly increased by the union of Catalonia and Provence (1092), introduced into the North an acquaintance with the arts and learning of the Arabians. It was then that rhyme, the essential characteristic of Arabian poetry, was adopted by the troubadours into the Provençal language, and thence communicated to the nations of modern Europe. The poetry of the troubadours borrowed nothing from history, mythology, or from foreign manners, and no reference to the sciences or the learning of the schools mingled with their simple effusions of sentiment. This fact enables us to comprehend how it was possible for princes and knights, who were often unable to read, to be yet ranked among the most ingenious troubadours. Several public events, however, materially contributed to enlarge the sphere of intellect of the knights of the *_Languedoc_*. The first was the conquest of Toledo and Castile by Alphonso VI., in which he was seconded by the Cid Rodriguez, the hero of Spain, and by a number of French Provençal knights; the second was the preaching of the Crusades. Of all the events recorded in the history of the world, there is, perhaps, not one of a nature so highly poetical as these holy wars; not one which presents a more powerful picture of the grand effects of enthusiasm, of noble sacrifices of self-interest to faith, sentiment, and passion, which are essentially poetical. Many of the troubadours assumed the cross; others were detained in Europe by the bonds of love, and the conflict between passion and religious enthusiasm lent its influence to the poems they composed. The third event was the succession of the kings of England to the sovereignty of a large part of the countries where the *_Languedoc_* prevailed, which influenced the manners and opinions of the troubadours, and introduced them to the courts of the most powerful monarchs; while the encouragement given to them by the kings of the house of Plantagenet had a great influence on the formation of the English language, and furnished Chaucer, the father of English literature, with his first models for imitation. The troubadours numbered among their ranks the most illustrious sovereigns and heroes of the age. Among others, Richard Coeur de Lion, who, as a poet and knight, united in his own person all the brilliant qualities of the time. A story is told of him, that when he was detained a prisoner in Germany, the place of his imprisonment was discovered by Blondel, his minstrel, who sang beneath the fortress a *_tenson_* which he and Richard had composed in common, and to which Richard responded. Bertrand de Born, who was intimately connected with Richard, and who exercised a powerful influence over the destinies of the royal family of England, has left a number of original poems; Sordello of Mantua was the first to adopt the ballad form of writing, and many of his love songs are expressed in a pure and delicate style. Both of these poets are immortalized in the Divine Comedy of Dante. The history of Geoffrey Rudel illustrates the wildness of the imagination and manners of the troubadours. He was a gentleman of Provence, and hearing the knights who had returned from the Holy Land speak with enthusiasm of the Countess of Tripoli, who had extended to them the most generous hospitality, and whose grace and beauty equaled her virtues, he fell in love with her without ever having seen her, and, leaving the Court of England, he embarked for the Holy Land, to offer to her the homage of his heart. During the voyage he was attacked by a severe illness, and lost the power of speech. On his arrival in the harbor, the countess, being informed that a celebrated poet was dying of love for her, visited him on shipboard, took him kindly by the hand, and attempted to cheer his spirits. Rudel revived sufficiently to thank the lady for her humanity and to declare his passion, when his voice was silenced by the convulsions of death. He was buried at Tripoli, and, by the orders of the countess, a tomb of porphyry was erected to his memory. It is unnecessary to mention other names among the multitude of these poets, who all hold nearly the same rank. An extreme monotony reigns throughout their works, which offer little individuality of character. After the thirteenth century, the troubadours were heard no more, and the efforts of the counts of Provence, the magistrates of Toulouse, and the kings of Arragon to awaken, their genius by the Courts of Love and the Floral Games were vain. They themselves attributed their decline to the degradation into which the jongleurs, with whom at last they were confounded, had fallen. But their art contained within itself a more immediate principle of decay in the profound ignorance of its professors. They had no other models than the songs of the Arabians, which perverted their taste. They made no attempt at epic or dramatic poetry; they had no classical allusions, no mythology, nor even a romantic imagination, and, deprived of the riches of antiquity, they had few resources within themselves. The poetry of Provence was a beautiful flower springing up on a sterile soil, and no cultivation could avail in the absence of its natural nourishment. From the close of the twelfth century the language began to decline, and public events occurred which hastened its downfall, and reduced it to the condition of a provincial dialect. Among the numerous sects which sprang up in Christendom during the Middle Ages, there was one which, though bearing different names at different times, more or less resembled what is now known as Protestantism; in the twelfth and thirteenth centuries it was called the faith of the Albigenses, as it prevailed most widely in the district of Albi. It easily came to be identified with the Provençal language, as this was the chosen vehicle of its religious services. This sect was tolerated and protected by the Court of Toulouse. It augmented its numbers; it devoted itself to commerce and the arts, and added much to the prosperity which had long distinguished the south of France. The Albigenses had lived

long and peaceably side by side with the Catholics in the cities and villages; but Innocent III. sent legates to Provence, who preached, discussed, and threatened, and met a freedom of thought and resistance to authority which Rome was not willing to brook. Bitter controversy was now substituted for the amiable frivolity of the *tensons*, and theological disputes superseded those on points of gallantry. The long struggle between the poetry of the troubadours and the preaching of the monks came to a crisis; the severe satires which the disorderly lives of the clergy called forth became severer still, and the songs of the troubadours wounded the power and pride of Rome more deeply than ever, while they stimulated the Albigenses to a valiant resistance or a glorious death. A crusade followed, and when the dreadful strife was over, Provençal poetry had received its death-blow. The language of Provence was destined to share the fate of its poetry; it became identified in the minds of the orthodox with heresy and rebellion. When Charles of Anjou acquired the kingdom of Naples, he drew thither the Provençal nobility, and thus drained the kingdom of those who had formerly maintained its chivalrous manners. In the beginning of the fourteenth century, when the Court of Rome was removed to Avignon, the retinues of the three successive popes were Italians, and the Tuscan language entirely superseded the Provençal among the higher classes.

2. THE TROUVÈRES.--While the Provençal was thus relapsing into a mere dialect, the north of France was maturing a new language and literature of an entirely different character. Normandy, a province of France, was invaded in the tenth century by a new northern tribe, who, under the command of Rollo or Raoul the Dane, incorporated themselves with the ancient inhabitants. The victors adopted the language of the vanquished, stamped upon it the impress of their own genius, and gave it a fixed form. It was from Normandy that the first writers and poets in the French language sprang. While the Romance Provençal spoken in the South was sweet, and expressive of effeminate manners, the Romance-Wallon was energetic and warlike, and represented the severer manners of the Germans. Its poetry, too, was widely different from the Provençal. It was no longer the idle baron sighing for his lady-love, but the songs of a nation of hardy warriors, celebrating the prowess of their ancestors with all the exaggerations that fancy could supply. The *Langue d'ouï* became the vehicle of literature only in the twelfth century,--a hundred years subsequent to the Romance Provençal. The poets and reciters of tales, giving the name of Troubadour a French termination, called themselves Trouvères. They originated the brilliant romances of chivalry, the *fabliaux* or tales of amusement, and the dramatic invention of the Mysteries. The first literary work in this tongue is the versified romance of a fabulous history of the early kings of England, beginning with Brutus, the grandson of Aeneas, who, after passing many enchanted isles, at length establishes himself in England, where he finds King Arthur, the chivalric institution of the Round Table, and the enchanter Merlin, one of the most popular personages of the Middle Ages. Out of this legend arose some of the boldest creations of the human fancy. The word "romance," now synonymous with fictitious composition, originally meant only a work in the modern dialect, as distinguished from the scholastic Latin. There is little doubt that these tales were originally believed to be strictly true. One of the first romances of chivalry was "Tristram de Léonois," written in 1190. This was soon followed by that of the "San Graal" and "Lancelot;" and previously to 1213 Ville-Hardouin had written in the French language a "History of the Conquest of Constantinople." The poem of "Alexander," however, which appeared about the same time, has enjoyed the greatest reputation. It is a series of romances and marvelous histories, said to be the result of the labors of nine celebrated poets of the time. Alexander is introduced, surrounded not by the pomp of antiquity, but by the splendors of chivalry. The high renown of this poem has given the name of *Alexandrine verse* to the measure in which it is written. The spirit of chivalry which burst forth in the romances of the trouvères, the heroism of honor and love, the devotion of the powerful to the weak, the supernatural fictions, so novel and so dissimilar to everything in antiquity or in later times, the force and brilliancy of imagination which they display, have been variously attributed to the Arabians and the Germans, but they were undoubtedly the invention of the Normans. Of all the people of ancient Europe, they were the most adventurous and intrepid. They established a dynasty in Russia; they cut their way through a perfidious and sanguinary nation to Constantinople; they landed on the coasts of England and France, and surprised nations who were ignorant of their existence; they conquered Sicily, and established a principality in the heart of Syria. A people so active, so enterprising, and so intrepid, found no greater delight in their leisure hours than listening to tales of adventures, dangers, and battles. The romances of chivalry are divided into three distinct classes. They relate to three different epochs in the early part of the Middle Ages, and represent three bands of fabulous heroes. In the romances of the first class, the exploits of Arthur, son of Pendragon, the last British king who defended England against the invasion of the Anglo-Saxons, are celebrated. In the second we find the Amadis, but whether they belong to French literature has been reasonably disputed. The scene is placed nearly in the same countries as in the romances of the Round Table, but there is a want of locality about them, and the name and the times are absolutely fabulous. "Amadis of Gaul," the first of these romances, and the model of all the rest, is claimed as the work of Vasco Lobeira, a Portuguese (1290-1325); but no doubt exists with regard to the continuations and numerous imitations of this work, which are incontestably of Spanish origin, and

were in their highest repute when Cervantes produced his inimitable "Don Quixote." The third class of chivalric romances, relating to the court of Charlemagne and his Paladins, is entirely French, although their celebrity is chiefly due to the renowned Italian poet who availed himself of their fictions. The most ancient monument of the marvelous history of Charlemagne is the chronicle of Turpin, of uncertain date, and which, though fabulous, can scarcely be considered as a romance. This and other similar narratives furnished materials for the romances, which appeared at the conclusion of the Crusades, when a knowledge of the East had enriched the French imagination with all the treasures of the Arabian. The trouvères were not only the inventors of the romances of chivalry, but they originated the allegories, and the dramatic compositions of southern Europe. Although none of their works have obtained a high reputation or deserve to be ranked among the masterpieces of human intellect, they are still worthy of attention as monuments of the progress of mind. The French possessed, above every other nation of modern times, an inventive spirit, but they were, at the same time, the originators of those tedious allegorical poems which have been imitated by all the romantic nations. The most ancient and celebrated of these is the "Romance of the Rose," though not a romance in the present sense of the word. At the period of its composition, the French language was still called the Romance, and all its more voluminous productions Romances. The "Romance of the Rose" was the work of two authors, Guillaume de Lorris, who commenced it in the early part of the thirteenth century, and Jean de Meun (b. 1280), by whom it was continued. Although it reached the appalling length of twenty thousand verses, no book was ever more popular. It was admired as a masterpiece of wit, invention, and philosophy; the highest mysteries of theology were believed to be concealed in this poetical form, and learned commentaries were written upon its veiled meaning by preachers, who did not scruple to cite passages from it in the pulpit. But the tedious poem and its numberless imitations are nothing but rhymed prose, which it would be impossible to recognize as poetry, if the measure of the verse were taken away. In considering the popularity of these long, didactic works, it must not be forgotten that the people of that day were almost entirely without books. A single volume was the treasure of a whole household. In unfavorable weather it was read to a circle around the fire, and when it was finished the perusal was again commenced. No comparison with other books enabled men to form a judgment upon its merits. It was revered like holy writ, and they accounted themselves happy in being able to comprehend it. Another species of poetry peculiar to this period had at least the merit of being exceedingly amusing. This was the fabliaux, tales written in verse in the twelfth and thirteenth centuries. They are treasures of invention, simplicity, and gayety, of which other nations can furnish no instances, except by borrowing from the French. A collection of Indian tales, translated into Latin in the tenth or eleventh century, was the first storehouse of the trouvères. The Arabian tales, transmitted by the Moors to the Castilians, and by the latter to the French, were in turn versified. But above all, the anecdotes collected in the towns and castles of France, the adventures of lovers, the tricks of gallants, and the numerous subjects gathered from the manners of the age, afforded inexhaustible materials for ludicrous narratives to the writers of these tales. They were treasures common to all. We seldom know the name of the trouvère by whom these anecdotes were versified. As they were related, each one varied them according to the impression he wished to produce. At this period there were neither theatrical entertainments nor games at cards to fill up the leisure hours of society, and the trouvères or relators of the tales were welcomed at the courts, castles, and private houses with an eagerness proportioned to the store of anecdotes which they brought with them to enliven conversation. Whatever was the subject of their verse, legends, miracles, or licentious anecdotes, they were equally acceptable. These tales were the models of those of Boccaccio, La Fontaine, and others. Some of them have had great fame, and have passed from tongue to tongue, and from age to age, down to our own times. Several of them have been introduced upon the stage, and others formed the originals of Parnell's "Hermit," of the "Zaïre" of Voltaire, and of the "Renard," which Goethe has converted into a long poem. But perhaps the most interesting and celebrated of all the fabliaux is that of "Aucassin and Nicolette," which has furnished the subject for a well-known opera. It was at this period, when the ancient drama was entirely forgotten, that a dramatic form was given to the great events which accompanied the establishment of the Christian religion. The first to introduce this grotesque species of composition, were the pilgrims who had returned from the Holy Land. In the twelfth or thirteenth centuries, their dramatic representations were first exhibited in the open streets; but it was only at the conclusion of the fourteenth that a company of pilgrims undertook to amuse the public by regular dramatic entertainments. They were called the Fraternity of the Passion, from the passion of our Saviour being one of their most celebrated representations. This mystery, the most ancient dramatic work of modern Europe, comprehends the whole history of our Lord, from his baptism to his death. The piece was too long for one representation, and was therefore continued from day to day. Eighty-seven characters successively appear in this mystery, among whom are the three persons of the Trinity, angels, apostles, devils, and a host of other personages, the invention of the poet's brain. To fill the comic parts, the dialogues of the devils were introduced, and their eagerness to maltreat one another always produced much laughter in the assembly. Extravagant machinery was employed to give to the representation the pomp which we find in the modern opera; and this drama, placing before the eyes of a Christian assembly all those

incidents for which they felt the highest veneration, must have affected them much more powerfully than even the finest tragedies can do at the present day. The mystery of the Passion was followed by a crowd of imitations. The whole of the Old Testament, and the lives of all the saints, were brought upon the stage. The theatre on which these mysteries were represented was always composed of an elevated scaffold divided into three parts,--heaven, hell, and the earth between them. The proceedings of the Deity and Lucifer might be discerned in their respective abodes, and angels descended and devils ascended, as their interference in mundane affairs was required. The pomp of these representations went on increasing for two centuries, and, as great value was set upon the length of the piece, some mysteries could not be represented in less than forty days. The "Clerks of the Revels," an incorporated society at Paris, whose duty it was to regulate the public festivities, resolved to amuse the people with dramatic representations themselves, but as the Fraternity of the Passion had obtained a royal license to represent the mysteries, they were compelled to abstain from that kind of exhibition. They therefore invented a new one, to which they gave the name of "Moralities," and which differed little from the mysteries, except in name. They were borrowed from the Parables, or the historical parts of the Bible, or they were purely allegorical. To the Clerks of the Revels we also owe the invention of modern comedy. They mingled their moralities with farces, the sole object of which was to excite laughter, and in which all the gayety and vivacity of the French character were displayed. Some of these plays still retain their place upon the French stage. At the commencement of the fifteenth century another comic company was established, who introduced personal and even political satire upon the stage. Thus every species of dramatic representation was revived by the French. This was the result of the talent for imitation so peculiar to the French people, and of that pliancy of thought and correctness of intellect which enables them to conceive new characters. All these inventions, which led to the establishment of the Romantic drama in other countries, were known in France more than a century before the rise of the Spanish or Italian theatre, and even before the classical authors were first studied and imitated. At the end of the sixteenth century, these new pursuits acquired a more immediate influence over the literature of France, and wrought a change in its spirit and rules, without, however, altering the national character and taste which had been manifested in the earliest productions of the *trouvères*.

3. FRENCH LITERATURE IN THE FIFTEENTH CENTURY.--French had as yet been merely a popular language; it varied from province to province, and from author to author, because no masterpiece had inaugurated any one of its numerous dialects. It was disdained by the more serious writers, who continued to employ the Latin. In the fifteenth century literature assumed a somewhat wider range, and the language began to take precision and force. But with much general improvement and literary industry there was still nothing great or original, nothing to mark an epoch in the history of letters. The only poets worthy of notice were Charles, Duke of Orleans (1391-1465), and Villon, a low ruffian of Paris (1431-1500). Charles was taken prisoner at the battle of Agincourt, and carried to England, where he was detained for twenty-five years, and where he wrote a volume of poems in which he imitated the allegorical style of the *Romance of the Rose*. The verses of Villon were inspired by the events of his not very creditable life. Again and again he suffered imprisonment for petty larcenies, and at the age of twenty-five was condemned to be hanged. His language is not that of the court, but of the people; and his poetry marks the first sensible progress after the *Romance of the Rose*. It has been well said that literature begins with poetry; but it is established by prose, which fixes the language. The earliest work in French prose is the chronicle of Ville-Hardouin (1150-1213), written in the thirteenth century. It is a personal narrative and relates with graphic particularity the conquest of Constantinople by the knights of Christendom. This ancient chronicle traces out for us some of the realities, of which the mediaeval romances were the ideal, and enables us to judge in a measure how far these romances embody substantial truth. A great improvement in style is apparent in Joinville (1223-1317), the amiable and light-hearted ecclesiastic who wrote the *Life of St. Louis*, whom he had accompanied to the Holy Land, and whose pious adventures he affectionately records. Notwithstanding the anarchy which prevailed in France during the fourteenth century, some social progress was made; but while public events were hostile to poetry, they gave inspiration to the historic muse, and Froissart arose to impart vivacity of coloring to historic narrative. Froissart (1337-1410) was an ecclesiastic of the day, but little in his life or writings bespeaks the sacred calling. Having little taste for the duties of his profession, he was employed by the Lord of Montfort to compose a chronicle of the wars of the time; but there were no books to tell him of the past, no regular communication between nations to inform him of the present; so he followed the fashion of knights errant, and set out on horseback, not to seek adventures, but, as an itinerant historian, to find materials for his chronicle. He wandered from town to town, and from castle to castle, to see the places of which he would write, and to learn events on the spot where they occurred. His first journey was to England; here he was employed by Queen Philippa of Hainault to accompany the Duke of Clarence to Milan, where he met Boccaccio and Chaucer. He afterwards passed into the service of several of the princes of Europe, to whom he acted as secretary and poet, always gleaning material for historic record. His book is an almost universal history of the different states of Europe, from 1322 to the end of the fourteenth century. He troubles

himself with no explanations or theories of cause and effect, nor with the philosophy of state policy; he is simply a graphic story-teller. Sir Walter Scott called Froissart his master. Philippe de Commines (1445-1509) was a man of his age, but in advance of it, combining the simplicity of the fifteenth century with the sagacity of a later period. An annalist, like Froissart, he was also a statesman, and a political philosopher; embracing, like Machiavelli and Montesquieu, the remoter consequences which flowed from the events he narrated and the principles he unfolded. He was an unscrupulous diplomat in the service of Louis XI., and his description of the last years of that monarch is a striking piece of history, whence poets and novelists have borrowed themes in later times. But neither the romance of Sir Walter Scott nor the song of Béranger does justice to the reality, as presented by the faithful Commines.

PERIOD SECOND.

THE RENAISSANCE AND THE GOLDEN AGE OF FRENCH LITERATURE (1500-1700).

1. THE RENAISSANCE AND THE REFORMATION.--During the preceding ages, erudition and civilization had not gone hand-in-hand. On the one side there was the bold, chivalric mind of young Europe, speaking with the tongues of yesterday, while on the other was the ecclesiastical mind, expressing itself in degenerate Latin. The one was a life of gayety and rude disorder--the life of court and castle as depicted in the literature just scanned; the other, that of men separated from the world, who had been studying the literary remains of antiquity, and transcribing and treasuring them for future generations. Hitherto these two sections had held their courses apart; now they were to meet and blend in harmony. The vernacular poets, on the one hand, borrowing thought and expression from the classics, and the clergy, on the other, becoming purveyors of light literature to the court circles. The fifteenth century, though somewhat barren, had prepared for the fecundity of succeeding ages. The revival of the study of ancient literature, which was promoted by the downfall of Constantinople, the invention of printing, the discovery of the new world, the decline of feudalism, and the consequent elevation of the middle classes,--all concurred to promote a rapid improvement of the human intellect. During the early part of the sixteenth century, all the ardor of the French mind was turned to the study of the dead languages; men of genius had no higher ambition than to excel in them, and many in their declining years went in their gray hairs to the schools where the languages of Homer and Cicero were taught. In civil and political society, the same enthusiasm manifested itself in the imitation of antique manners; people dressed in the Greek and Roman fashions, borrowed from them the usages of life, and made a point of dying like the heroes of Plutarch. The religious reformation came soon after to restore the Christian, as the revival of letters had brought back the pagan antiquity. Ignorance was dissipated, and religion was disengaged from philosophy. The Renaissance, as the revival of antique learning was called, and the Reformation, at first made common cause. One of those who most eagerly imbibed the spirit of both was the Princess Marguerite de Valois (1492-1549), elder sister of Francis I., who obtained the credit of many generous actions which were truly hers. The principal work of this lady was "L'Heptaméron," or the History of the Fortunate Lovers, written on the plan and in the spirit of the Decameron of Boccaccio, a work which a lady of our times would be unwilling to own acquaintance with, much more to adopt as a model; but the apology for Marguerite must be found in the manners of the times. L'Heptaméron is the earliest French prose that can be read without a glossary. In 1518, when Margaret was twenty-six years of age, she received from her brother a gifted poet as valet-de-chambre; this was Marot (1495-1544), between whom and the learned princess a poetical intercourse was maintained. Marot had imbibed the principles of Calvin, and had also drunk deeply of the spirit of the Renaissance; but he displayed the poet more truly before he was either a theologian or a classical scholar. He may be considered the last type of the old French school, of that combination of grace and archness, of elegance and simplicity, of familiarity and propriety, which is a national characteristic of French poetic literature, and in which they have never been imitated. Francis Rabelais (1483-1553) was one of the most remarkable persons that figured in the Renaissance, a learned scholar, physician, and philosopher, though known to posterity chiefly as an obscene humorist. He is called by Lord Bacon "the great jester of France." He was at first a monk of the Franciscan order, but he afterwards threw off the sacerdotal character, and studied medicine. From about the year 1534, Rabelais was in the service of the Cardinal Dubellay, and a favorite in the court circles of Paris and Rome. It was probably during this period that he published, in successive parts, the work on which his popular fame has rested, the "Lives of Gargantua and Pantagruel." It consists of the lives and adventures of these two gigantic heroes, father and son, with the waggeries and practical jokes of Panurge, their jongleur, and the blasphemies and obscenities of Friar John, a fighting, swaggering, drinking monk. With these are mingled dissertations, sophistries, and allegorical satires in abundance. The publication of the work created a perfect uproar at the Sorbonne, and among the monks who were its principal victims; but the cardinals enjoyed its humor, and protected its author, while the king, Francis I., pronounced it innocent and delectable. It became the book of the day, and passed through countless editions and endless commentaries; and yet it is agreed on all hands that there

exists not another work, admitted as literature, that would bear a moment's comparison with it, for indecency, profanity, and repulsive and disgusting coarseness. His work is now a mere curiosity for the student of antique literature. As Rabelais was the leading type of the Renaissance, so was Calvin (1509- 1564) of the Reformation. Having embraced the principles of Luther, he went considerably farther in his views. In 1532 he established himself at Geneva, where he organized a church according to his own ideas. In 1535 he published his "Institutes of the Christian Religion," distinguished for great severity of doctrine. His next most celebrated work is a commentary on the Scriptures. Intellect continued to struggle with its fetters. Many, like Rabelais, mistrusted the whole system of ecclesiastical polity established by law, and yet did not pin their faith on the dictates of the austere Calvin. The almost inevitable consequence was a wide and universal skepticism, replacing the former implicit subjection to Romanism. The most eminent type of this school was Montaigne (1533-1592), who, in his "Essays," shook the foundations of all the creeds of his day, without offering anything to replace them. He is considered the earliest philosophical writer in French prose, the first of those who contributed to direct the minds of his countrymen to the study of human nature. In doing so, he takes himself as his subject; he dissects his feelings, emotions, and tendencies with the coolness of an operating surgeon. To a singular power of self-investigation and an acute observation of the actions of men, he added great affluence of thought and excursiveness of fancy, which render him, in spite of his egotism, a most attractive writer. As he would have considered it dishonest to conceal anything about himself, he has told much that our modern ideas of decorum would deem better untold. Charron (1541-1603), the friend and disciple of Montaigne, was as bold a thinker, though inferior as a writer. In his book, "De la Sagesse," he treats religion as a mere matter of speculation, a system of dogmas without practical influence. Other writers followed in the same steps, and affected, like him, to place skepticism at the service of good morals. "License," says a French writer, "had to come before liberty, skepticism before philosophical inquiry, the school of Montaigne before that of Descartes." On the other hand, St. Francis de Sales (1567-1622), in his "Introduction to a Devout Life," and other works, taught that the only cure for the evils of human nature was to be found in the grace which was revealed by Christianity. In these struggles of thought, in this conflict of creeds, the language acquired vigor and precision. In the works of Calvin, it manifested a seriousness of tone, and a severe purity of style which commanded general respect. An easy, natural tone was imparted to it by Amyot (1513-1593), professor of Greek and Latin at the University of Paris, who enriched the literature with elegant translations, in which he blended Hellenic graces with those strictly French.

2. LIGHT LITERATURE.--Ronsard (1524-1585), the favorite poet of Mary Queen of Scots, flourished at the time that the rage for ancient literature was at its height. He traced the first outlines of modern French poetry, and introduced a higher style of poetic thought and feeling than had hitherto been known. To him France owes the first attempt at the ode and the heroic epic; in the former, he is regarded as the precursor of Malherbe, who is still looked on as a model in this style, But Ronsard, and the numerous school which he formed, not only imitated the spirit and form of the ancients, but aimed to subject his own language to combinations and inversions like those of the Greek and Latin, and foreign roots and phrases began to overpower the reviving flexibility of the French idiom. Under this influence, the drama was restored by Jodelle (1532-1573) and others, in the shape of imitations and translations. Towards the end of the century, however, there appeared a reaction against this learned tragedy, led by Alexander Hardy (1560-1631), who, with little or no original genius, produced about twelve hundred plays. He borrowed in every direction, and imitated the styles of all nations. But the general taste, however, soon returned to the Greek and Roman school. The glorious reign of Henry IV. had been succeeded by the stormy minority of Louis XIII., when Malherbe (1556-1628), the tyrant of words and syllables, appeared as the reformer of poetry. He attracted attention by ridiculing the style of Ronsard. He became the laureate of the court, and furnished for it that literature in which it was beginning to take delight. In the place of Latin and Greek French, he inaugurated the extreme of formality; the matter of his verse was made subordinate to the manner; he substituted polish for native beauty, and effect for genuine feeling. I. de Balzac (1594-1624), in his frivolous epistles, used prose as Malherbe did verse, and a numerous school of the same character was soon formed. The works of Voiture (1598-1648) abound in the pleasantries and affected simplicity which best befit such compositions. The most trifling adventure--the death of a cat or a dog--was transformed into a poem, in which there was no poetry, but only a graceful facility, which was considered perfectly charming. Then, as though native affectation were not enough, the borrowed wit of Italian Marinism, which had been eagerly adopted in Spain, made its way thence into France, with Spanish exaggeration superadded. A disciple of this school declares that the eyes of his mistress are as "large as his grief, and as black as his fate." Malherbe and his school fell afterwards into neglect, for fashionable caprice had turned its attention to burlesque, and every one believed himself capable of writing in this style, from the lords and ladies of the court down to the valets and maid-servants. It was men like Scarron (1610- 1660), familiar with literary study, and, from choice, with the lowest society, who introduced this form, the pleantry of which was increased by contrast with

the finical taste that had been in vogue. Fashion ruled the light literature of France during the first half of the seventeenth century, and through all its diversities, its great characteristic is the absence of all true and serious feeling, and of that inspiration which is drawn from realities. In the productions of half a century, we find not one truly elevated, energetic, or pathetic work. It is during this time, that is, between the death of Henry IV (1610), and that of Richelieu (1642), that we mark the beginning of literary societies in France. The earliest in point of date was headed by Madame de Rambouillet (1610-1642), whose hotel became a seminary of female authors and factious politicians. This lady was of Italian origin, of fine taste and education. She had turned away in disgust from the rude manners of the court of Henry IV, and devoted herself to the study of the classics. After the death of the king, she gathered a distinguished circle round herself, combining the elegances of high life with the cultivation of literary taste. While yet young, Madame de Rambouillet was attacked with a malady which obliged her to keep her bed the greater part of every year. An elegant alcove was formed in the great salon of the house, where her bed was placed, and here she received her friends. The choicest wits of Paris flocked to her levées; the Hotel de Rambouillet became the fashionable rendezvous of literature and taste, and bas-bleu -ism was the rage. Even the infirmities of this accomplished lady were imitated. An alcove was essential to every fashionable belle, who, attired in a coquettish dishabille, and reclining on satin pillows, fringed with lace, gave audience to whispered gossip in the ruelle, as the space around the bed was called. Among the personages renowned in their day, who frequented the Hotel de Rambouillet, were Mademoiselle de Scudery (1607-1701), then in the zenith of her fame, Madame de Sévigné (1627-1696), Mademoiselle de la Vergne, afterwards Madame de Lafayette (1655-1693), eminent as literary characters; the Duchess de Longueville, the Duchess de Chevreuse, and Madame Deshoulières, afterwards distinguished for their political ability. At the feet of these noble ladies reclined a number of young seigneurs, dangling their little hats surcharged with plumes, while their mantles of silk and gold were spread loosely on the floor. And there, in more grave attire, were the professional littérateurs, such as Balzac, Voiture, Ménage, Scudery, Chaplain, Costart, Conrad, and the Abbé Bossuet. The Cupid of the hotel was strictly Platonic. The romances of Mademoiselle de Scudery were long-spun disquisitions on love; her characters were drawn from the individuals around her, who in turn attempted to sustain the characters and adopt the language suggested in her books. One folly led on another, till at last the vocabulary of the salon became so artificial, that none but the initiated could understand it. As for Mademoiselle de Scudery herself, applying, it would seem, the impracticable tests she had invented for sounding the depths of the tender passion, though not without suitors, she died an old maid, at the advanced age of ninety-four. The civil wars of the Fronde (1649-1654) were unfavorable to literary meetings. The women who took the most distinguished part in these troubles had graduated, so to say, from the Hotel de Rambouillet, which, perhaps for this reason, declined with the ascendancy of Louis XIV. The agitations of the Fronde taught him to distrust clever women, and he always showed a marked dislike for female authorship.

3. THE FRENCH ACADEMY.--The taste for literature, which had become so generally diffused, rendered the men whose province it was to define its laws the chiefs of a brilliant empire. Scholars, therefore, frequently met together for critical discussion. About the year 1629 a certain number of men of letters agreed to assemble one day in each week. It was a union of friendship, a companionship of men of kindred tastes and occupations; and to prevent intrusion, the meetings were for some time kept secret. When Richelieu came to hear of the existence of the society, desirous to make literature subservient to his political glory, he proposed to these gentlemen to form themselves into a corporation, established by letters patent, at the same time hinting that he had the power to put a stop to their secret meetings. The argument was irresistible, and the little society consented to receive from his highness the title of the French Academy, in 1635. The members of the Academy were to occupy themselves in establishing rules for the French language, and to take cognizance of whatever books were written by its members, and by others who desired its opinions.

4. THE DRAMA.--The endeavor to imitate the ancients in the tragic art displayed itself at a very early period among the French, and they considered that the surest method of succeeding in this endeavor was to observe the strictest outward regularity of form, of which they derived their ideas more from Aristotle, and especially from Seneca, than from any intimate acquaintance with the Greek models themselves. Three of the most celebrated of the French tragic poets, Corneille, Racine, and Voltaire, have given, it would seem, an immutable shape to the tragic stage of France by adopting this system, which has been considered by the French critics universally as alone entitled to any authority, and who have viewed every deviation from it as a sin against good taste. The treatise of Aristotle, from which they have derived the idea of the far-famed three unities, of action, time, and place, which have given rise to so many critical wars, is a mere fragment, and some scholars have been of the opinion that it is not even a fragment of the true original, but of an extract which some person made for his own improvement. From this anxious observance of the Greek rules, under totally different circumstances, it is obvious that great inconveniences and

incongruities must arise; and the criticism of the Academy on a tragedy of Corneille, "that the poet, from the fear of sinning against the rules of art, had chosen rather to sin against the rules of nature," is often applicable to the dramatic writers of France. Corneille (1606-1684) ushered in a new era in the French drama. It has been said of him that he was a man greater in himself than in his works, his genius being fettered by the rules of the French drama and the conventional state of French verse. The day of mysteries and moralities was past, and the comedies of Hardy, the court poet of Henry IV., had, in their turn, been consigned to oblivion, yet there was an increasing taste for the drama. The first comedy of Corneille, "Mélite," was followed by many others, which, though now considered unreadable, were better than anything then known. The appearance of the "Cid," in 1635, a drama constructed on the foundation of the old Spanish romances, constituted an era in the dramatic history of France. Although not without great faults, resulting from strict adherence to the rules, it was the first time that the depths of passion had been stirred on the stage, and its success was unprecedented. For years after, his pieces followed each other in rapid succession, and the history of the stage was that of Corneille's works. In the "Cid," the triumph of love was exhibited; in "Les Horaces," love was represented as punished for its rebellion against the laws of honor; in "Cinna," all more tender considerations are sacrificed to the implacable duty of avenging a father; while in "Polyeucte," duty triumphs alone. Corneille did not boldly abandon himself to the guidance of his genius; he feared criticism, although he defied it. His success proved the signal for envy and detraction; he became angry at being obliged to fight his way, and therefore withdrew from the path in which he was likely to meet enemies. His decline was as rapid as his success had been brilliant. "The fall of the great Corneille," says Fontenelle, "may be reckoned as among the most remarkable examples of the vicissitudes of human affairs. Even that of Belisarius asking alms is not more striking." As his years increased, he became more anxious for popularity; having been so long in possession of undisputed superiority, he could not behold without dissatisfaction the rising glory of his successors; and, towards the close of his life, this weakness was greatly increased by the decay of his bodily organs.

5. PHILOSOPHY.--During this period, in a region far above court favor, Descartes (1596-1650) elaborated his system of philosophy, in creating a new method of philosophizing. The leading peculiarity of his system was the attempt to deduce all moral and religious truth from self-consciousness. *"I think, therefore I am,"* was the famous axiom on which the whole was built. From this he inferred the existence of two distinct natures in man, the mental and the physical, and the existence of certain ideas which he called innate in the mind, and serving to connect it with the spiritual and invisible. Besides these new views in metaphysics, Descartes made valuable contributions to mathematical and physical science; and though his philosophy is now generally discarded, it is not forgotten that he opened the way for Locke, Newton, and Leibnitz, and that his system was in reality the base of all those that superseded it. There is scarcely a name on record, the bearer of which has given a greater impulse to mathematical and philosophical inquiry than Descartes, and he embodied his thoughts in such masterly language, that it has been justly said of him, that his fame as a writer would have been greater if his celebrity as a thinker had been less. The age of Descartes was an interesting era in the annals of the human mind. The darkness of scholastic philosophy was gradually clearing away before the light which an improved method of study was shedding over the natural sciences. A system of philosophy, founded on observation, was preparing the downfall of those traditional errors which had long held the mastery in the schools. Geometricians, physicians, and astronomers taught, by their example, the severe process of reasoning which was to regenerate all the sciences; and minds of the first order, scattered in various parts of Europe, communicated to each other the results of their labors, and stimulated each other to new exertions. One of the most eminent contemporaries of Descartes was Pascal (1628- 1662). At the age of sixteen he wrote a treatise on conic sections, which was followed by several important discoveries in arithmetic and geometry. His experiments in natural science added to his fame, and he was recognized as one of the most eminent geometricians of modern times. But he soon formed the design of abandoning science for pursuits exclusively religious, and circumstances arose which became the occasion of those "Provincial Letters," which, with the "Pensées de la Religion," are considered among the finest specimens of French literature. The abbey of Port Royal occupied a lonely situation about six leagues from Paris. Its internal discipline had recently undergone a thorough reformation, and the abbey rose to such a high reputation, that men of piety and learning took up their abode in its vicinity, to enjoy literary leisure. The establishment received pupils, and its system of education became celebrated in a religious and intellectual point of view. The great rivals of the Port Royalists were the Jesuits. Pascal, though not a member of the establishment, was a frequent visitor, and one of his friends there, having been drawn into a controversy with the Sorbonne on the doctrines of the Jansenists, had recourse to his aid in replying. Pascal published a series of letters in a dramatic form, in which he brought his adversaries on the stage with himself, and fairly cut them up for the public amusement. These letters, combining the comic pleasantry of Molière with the eloquence of Demosthenes, so elegant and attractive in style, and so clear and popular that a child might understand them, gained immediate attention; but the Jesuits, whose policy and doctrines they attacked, finally induced the

parliament of Provence to condemn them to be burned by the common hangman; and the Port Royalists, refusing to renounce their opinions, were driven from their retreat, and the establishment broken up. Pascal's masterpiece is the "Pensées de la Religion;" it consists of fragments of thought, without apparent connection or unity of design. These thoughts are in some places obscure; they contain repetitions, and even contradictions, and require that arrangement that could only have been supplied by the hand of the writer. It has often been lamented that the author never constructed the edifice which it is believed he had designed, and of which these thoughts were the splendid materials.

6. THE RISE OF THE GOLDEN AGE OF FRENCH LITERATURE.--When Louis XIV. came to the throne (1638-1715), France was already subject to conditions certain to produce a brilliant period in literature. She had been brought into close relations with Spain and Italy, the countries then the most advanced in intellectual culture; and she had received from the study of the ancient masters the best correctives of whatever might have been extravagant in the national genius. She had learned some useful lessons from the polemical distractions of the sixteenth century. The religious earnestness excited by controversy was gratified by preachers of high endowments, and the political ascendancy of France, among the kingdoms of Europe, imparted a general freedom and buoyancy. But of all the influences which contributed to perfect the literature of France in the latter half of the seventeenth century, none was so powerful as that of the monarch himself, who, by his personal power, rendered his court a centre of knowledge, and, by his government, imparted a feeling of security to those who lived under it. The predominance of the sovereign became the most prominent feature in the social character of the age, and the whole circle of the literature bears its impress. Louis elevated and improved, in no small degree, the position of literary men, by granting pensions to some, while he raised others to high offices of state; or they were recompensed by the public, through the general taste, which the monarch so largely contributed to diffuse. The age, unlike that which followed it, was one of order and specialty in literature; and in classifying its literary riches, we shall find the principal authors presenting themselves under the different subjects: Racine with tragedy, Molière with comedy, Boileau with satirical and mock- heroic, La Fontaine with narrative poetry, Bossuet, Bourdaloue, and Massillon with pulpit eloquence; Patru, Pellisson, and some others with that of the bar; Bossuet, de Retz, and St. Simon with history and memoirs; Rochefoucauld and La Bruyère with moral philosophy; Fénelon and Madame de Lafayette with romance; and Madame de Sévigné with letter-writing. The personal influence of the king was most marked on pulpit eloquence and dramatic poetry. Other branches found less favor, from his dislike to those who chiefly treated them. The recollections of the Fronde had left in his mind a distrust of Rochefoucauld. A similar feeling of political jealousy, with a thorough hatred of *bel esprit*, especially in a woman, prevented him from appreciating Madame de Sévigné; and he seems not even to have observed La Bruyère, in his modest functions as teacher of history to the Duke of Burgundy. He had no taste for the pure mental speculations of Malebranche or Fénelon; and in metaphysics, as in religion, had little patience for what was beyond the good sense of ordinary individuals. The same hatred of excess rendered him equally the enemy of refiners and free- thinkers, so that the like exile fell to the lot of Arnauld and Bayle, the one carrying to the extreme the doctrines of grace, and the other those of skeptical inquiry. Nor did he relish the excessive simplicity of La Fontaine, or deem that his talent was a sufficient compensation for his slovenly manners and inaptitude for court life. Of all these writers it may be said, that they flourished rather in spite of the personal influence of the monarch than under his favor.

7. TRAGEDY.--The first dramas of Racine (1639-1699) were but feeble imitations of Corneille, who advised the young author to attempt no more tragedy. He replied by producing "Andromaque," which had a most powerful effect upon the stage. The poet had discovered that sympathy was a more powerful source of tragic effect than admiration, and he accordingly employed the powers of his genius in a truthful expression of feeling and character, and a thrilling alternation of hope and fear, anger and pity. "Andromaque" was followed almost every year by a work of similar character. Henrietta of England induced Corneille and Racine, unknown to each other, to produce a tragedy on Berenice, in order to contrast the powers of these illustrious rivals. They were represented in the year 1670; that of Corneille proved a failure, but Racine's was honored; by the tears of the court and the city. Soon after, partly disgusted at the intrigues against him, and partly from religious principle, Racine abandoned his career while yet in the full vigor of his life and genius. He was appointed historiographer to the king, conjointly with Boileau, and after twelve years of silence he was induced by Madame de Maintenon to compose the drama of "Esther" for the pupils in the Maison de St. Cyr, which met with prodigious success. "Athalie," considered the most perfect of his works, was composed with similar views; theatricals having been abandoned at the school, however, the play was published, but found no readers. Discouraged by this second injustice, Racine finally abandoned the drama. "Athalie" was but little known till the year 1716, since when its reputation has considerably augmented. Voltaire pronounced it the most perfect work of human genius. The subject of this drama is taken from the twenty-second

and twenty-third chapter of II. Chronicles, where it is written that Athaliah, to avenge the death of her son, destroyed all the seed royal of the house of Judah, but that the young Joash was stolen from among the rest by his aunt Jehoshabeath, the wife of the high-priest, and hidden with his nurse for six years in the temple. Besides numerous tragedies, Racine composed odes, epigrams, and spiritual songs. By a rare combination of talents he wrote as well in prose as in verse. His "History of the Reign of Louis XIV." was destroyed by a conflagration, but there remain the "History of Port Royal," some pleasing letters, and some academic discourses. The tragedies of Racine are more elegant than those of Corneille, though less bold and striking. Corneille's principal characters are heroes and heroines thrown into situations of extremity, and displaying strength of mind superior to their position. Racine's characters are men, not heroes,--men such as they are, not such as they might possibly be. France produced no other tragic dramatists of the first class in this age. Somewhat later, Crébillon (1674-1762), in such wild tragedies as "Atrea," "Electra," and "Rhadamiste," introduced a new element, that of terror, as a source of tragic effect. Cardinal Mazarin had brought from Italy the opera or lyric tragedy, which was cultivated with success by Quinault (1637-1688). He is said to have taken the bones out of the French language by cultivating an art in which thought, incident, and dialogue are made secondary to the development of tender and voluptuous feeling.

8. COMEDY.--The comic drama, which occupied the French stage till the middle of the seventeenth century, was the comedy of intrigue, borrowed from Spain, and turning on disguises, dark lanterns, and trap-doors to help or hinder the design of personages who were types, not of individual character, but of classes, as doctors, lawyers, lovers, and confidants. It was reserved for Molière (1622-1673) to demolish all this childishness, and enthroned the true Thalia on the French stage. Like Shakspeare, he was both an author and an actor. The appearance of the "Précieuses Ridicules" was the first of the comedies in which the gifted poet assailed the follies of his age. The object of this satire was the system of solemn sentimentality which at this time was considered the perfection of elegance. It will be remembered that there existed at Paris a coterie of fashionable women who pretended to the most exalted refinement both of feeling and expression, and that these were waited upon and worshiped by a set of nobles and littérateurs, who used towards them a peculiar strain of high-flown, pedantic gallantry. These ladies adopted fictitious names for themselves and gave enigmatical ones to the commonest things. They lavished upon each other the most tender appellations, as though in contrast to the frigid tone in which the Platonism of the Hotel required them to address the gentlemen of their circle. *Ma chère, ma précieuse*, were the terms most frequently used by the leaders of this world of folly, and a *précieuse* came to be synonymous with a lady of the clique; hence the title of the comedy. The piece was received with unanimous applause; a more signal victory could not have been gained by a comic poet, and from the time of its first representation this bombastic nonsense was given up. Molière, perceiving that he had struck the true vein, resolved to study human nature more and Plautus and Terence less. Comedy after comedy followed, which were true pictures of the follies of society; but whatever was the theme of his satire, all proved that he had a falcon's eye for detecting vice and folly in every shape, and talons for pouncing upon all as the natural prey of the satirist. On the boards he always took the principal character himself, and he was a comedian in every look and gesture. The "Malade Imaginaire" was the last of his works. When it was produced upon the stage, the poet himself was really ill, but repressing the voice of natural suffering, to affect that of the hypochondriac for public amusement, he was seized with a convulsive cough, and carried home dying. Though he was denied the last offices of the church, and his remains were with difficulty allowed Christian burial, in the following century his bust was placed in the Academy, and a monument erected to his memory in the cemetery of Père la Chaise. The best of Molière's works are, "Le Misanthrope," "Les Femmes Savantes," and "Tartuffe;" these are considered models of high comedy. Other comedians followed, but at a great distance from him in point of merit.

9. FABLE, SATIRE, MOCK-HEROIC, AND OTHER POETRY.--La Fontaine (1621-1695) was the prince of fabulists; his fables appeared successively in three collections, and although the subjects of some of these are borrowed, the dress is entirely new. His versification constitutes one of the greatest charms of his poetry, and seems to have been the result of an instinctive sense of harmony, a delicate taste, and rapidity of invention. There are few authors in France more popular, none so much the familiar genius of every fireside. La Fontaine himself was a mere child of nature, indolent, and led by the whim of the moment, rather than by any fixed principle. He was desired by his father to take charge of the domain of which he was the keeper, and to unite himself in marriage with a family relative. With unthinking docility he consented to both, but neglected alike his official duties and domestic obligations with an innocent unconsciousness of wrong. He was taken to Paris by the Duchess of Bouillon and passed his days in her coteries, and those of Racine and Boileau, utterly forgetful of his home and family, except when his pecuniary necessities obliged him to return to sell portions of his property to supply his wants. When this was exhausted, he became dependent on the kindness of female discerners of merit. Henrietta of England attached

him to her suite; and after her death, Madame de la Sablière gave him apartments at her house, supplied his wants, and indulged his humors for twenty years. When she retired to a convent, Madame d'Hervart, the wife of a rich financier, offered him a similar retreat. While on her way to make the proposal, she met him in the street, and said, "La Fontaine, will you come and live in my house?" "I was just going, madame," he replied, as if his doing so had been the simplest and most natural thing in the world. And here he remained the rest of his days. France has produced numerous writers of fables since the time of La Fontaine, but none worthy of comparison with him. The writings of Descartes and Pascal, with the precepts of the Academy and Port Royal, had established the art of prose composition, but the destiny of poetry continued doubtful. Corneille's masterpieces afforded models only in one department; there was no specific doctrine on the idea of what poetry ought to be. To supply this was the mission of Boileau (1636-1711); and he fulfilled it, first by satirizing the existing style, and then by composing an "Art of Poetry," after the manner of Horace. In the midst of men who made verses for the sake of making them, and composed languishing love-songs upon the perfections of mistresses who never existed except in their own imaginations, Boileau determined to write nothing but what interested his feelings, to break with this affected gallantry, and draw poetry only from the depths of his own heart. His début was made in unmerciful satires on the works of the poetasters, and he continued to plead the cause of reason against rhyme, of true poetry against false. Despite the anger of the poets and their friends, his satires enjoyed immense favor, and he consolidated his victory by writing the "Art of Poetry," in which he attempted to restore it to its true dignity. This work obtained for him the title of Legislator of Parnassus. The mock- heroic poem of the "Lutrin" is considered as the happiest effort of his muse, though inferior to the "Rape of the Lock," a composition of a similar kind. The occasion of this poem was a frivolous dispute between the treasurer and the chapter of a cathedral concerning the placing of a reading-desk (_lutrin_). A friend playfully challenged Boileau to write a heroic poem on the subject, to verify his own theory that the excellence of a heroic poem depended upon the power of the inventor to sustain and enlarge upon a slender groundwork. Boileau was the last of the great poets of the golden age. The horizon of the poets was at this time somewhat circumscribed. Confined to the conventional life of the court and the city, they enjoyed little opportunity for the contemplation of nature. The policy of Louis XIV. proscribed national recollections, so that the social life of the day was alone open to them. Poetry thus became abstract and ideal, or limited to the delineation of those passions which belong to a highly artificial state of society. Madame Deshoulières (1634-1694) indeed wrote some graceful idyls, but she by no means entered into the spirit of rural life and manners, like La Fontaine.

10. ELOQUENCE OF THE PULPIT AND OF THE BAR.--Louis XIV. afforded to religious eloquence the most efficacious kind of encouragement, that of personal attendance. The court preachers had no more attentive auditor than their royal master, who was singularly gifted with that tenderness of conscience which leads a man to condemn himself for his sins, yet indulge in their commission; to feel a certain pleasure in self-accusation, and to enjoy that reaction of mind which consists in occasionally holding his passions in abeyance. This attention on the part of a great monarch, the liberty of saying everything, the refined taste of the audience, who could on the same day attend a sermon of Bourdaloue and a tragedy of Racine, all tended to lead pulpit eloquence to a high degree of perfection; and, accordingly, we find the function of court preacher exercised successively by Bossuet (1627-1704), Bourdaloue (1632-1704), and Massillon (1663-1742), the greatest names that the Roman Catholic Church has boasted in any age or country. Bossuet addressed the conscience through the imagination, Bourdaloue through the judgment, and Massillon through the feelings. Fléchier (1632-1710), another court preacher, renowned chiefly as a rhetorician, was not free from the affectation of Les Précieuses; but Bossuet was perhaps the most distinguished type of the age of Louis XIV., in all save its vices. For the instruction of the Dauphin, to whom he had been appointed preceptor, he wrote his "Discourse upon Universal History," by which he is chiefly known to us. The Protestant controversy elicited his famous "Exposition of the Catholic Doctrine." A still more celebrated work is the "History of the Variations," the leading principle of which is, that to forsake the authority of the church leads one knows not whither, that there can be no new religious views except false ones, and that there can be no escape from the faith transmitted from age to age, save in the wastes of skepticism. In his controversy with Fénelon, in relation to the mystical doctrines of Madame Guyon, Bossuet showed himself irritated, and at last furious, at the moderate and submissive tone of his opponent. He procured the banishment of Fénelon from court, and the disgrace of his friends; and through his influence the pope condemned the "Maxims of the Saints," in which Fénelon endeavored to show that the views of Madame Guyon were those of others whom the church had canonized. The sermons of Bossuet were paternal and familiar exhortations; he seldom prepared them, but, abandoning himself to the inspiration of the moment, was now simple and touching, now energetic and sublime, His familiarity with the language of inspiration imparted to his discourses a tone of almost prophetic authority; his eloquence appeared as a native instinct, a gift direct from heaven, neither marred nor improved by the study of human rules. France does not acknowledge the Protestant Saurin (1677-1730), as the Revocation of the Edict of Nantes expatriated him in childhood; but his

sermons occupy a distinguished place in the theological literature of the French language. Political or parliamentary oratory was as yet unknown, for the parliament no sooner touched on matters of state and government, than Louis XIV entered, booted and spurred, with whip in hand, and not figuratively, but literally, lashed the refractory assembly into silence and obedience. But the eloquence of the bar enjoyed a considerable degree of freedom in this age. Law and reason, however, were too often overlaid by worthless conceits and a fantastic abuse of classic and scriptural citations. Le Maître (1608-1658), Patru (1604-1681), Pellisson (1624-1693), Cochin (1687-1749), and D'Aguesseau (1668-1751), successively purified and elevated the language of the tribunals.

11. MORAL PHILOSOPHY.--The most celebrated moralist of the age was the Duke de Rochefoucauld (1613-1680). He was early drawn into those conflicts known as the wars of the Fronde, though he seems to have had little motive for fighting or intriguing, except his restlessness of spirit and his attachment to the Duchess de Longueville. He soon quarreled with the duchess, dissolved his alliance with Condé, and being afterwards included in the amnesty, he took up his residence at Paris, where he was one of the brightest ornaments of the court of Louis XIV. His chosen friends, in his declining years, were Madame de Sévigné, one of the most accomplished women of the age, and Madame de Lafayette, who said of him, "He gave me intellect, and I reformed his heart." But if the taint was removed from his heart, it continued in the understanding. His famous "Maxims," published in 1665, gained for the author a lasting reputation, not less for the perfection of his style, than for the boldness of his paradoxes. The leading peculiarity of this work is the principle that self-interest is the ruling motive in human nature, placing every virtue, as well as every vice, under contribution to itself. It is generally agreed that Rochefoucauld's views of human nature were perverted by the specimens of it which he had known in the wars of the Fronde, which were stimulated by vice, folly, and a restless desire of power. His "Memoirs of the Reign of Anne of Austria" embody the story of the Fronde, and his "Maxims" the moral philosophy he deduced from it. While Pascal, in proving all human remedies unworthy of confidence, had sought to drive men upon faith by pursuing them with despair, and Rochefoucauld, by his pitiless analysis of the disguises of the human heart, led his readers to suspect their most natural emotions, and well-nigh took away the desire of virtue by proving its impossibility, La Bruyère (1639-1696) endeavored to make the most of our nature, such as it is, to render men better, even with their imperfections, to assist them by a moral code suited to their strength, or rather to their weakness. His "Characters of our Age" is distinguished for the exactness and variety of the portraits, as well as for the excellence of its style. The philosophy of La Bruyère is unquestionably based on reason, and not on revelation. In the moral works of Nicole, the Port Royalist (1611-1645), we find a system of truly Christian ethics, derived from the precepts of revelation; they are elegant in style, though they display little originality. The only speculative philosopher of this age, worthy of mention, is Malebranche (1631-1715), a disciple of Descartes; but, unlike his master, instead of admitting innate ideas, he held that we see all in Deity, and that it is only by our spiritual union with the Being who knows all things that we know anything. He professed optimism, and explained the existence of evil by saying that the Deity acts only as a universal cause. His object was to reconcile philosophy with revelation; his works, though models of style, are now little read.

12. HISTORY AND MEMOIRS.--History attained no degree of excellence during this period. Bossuet's "Discourse on Universal History" was a sermon, with general history as the text. At a somewhat earlier date, Mézeray (1610-1683) compiled a history of France. The style is clear and nervous, and the spirit which pervades it is bold and independent, but the facts are not always to be relied on. The "History of Christianity," by the Abbé Fleury (1640-1723), was pronounced by Voltaire to be the best work of the kind that had ever appeared. Rollin (1661-1741) devoted his declining years to the composition of historical works for the instruction of young people. His "Ancient History" is more remarkable for the excellence of his intentions than for the display of historical talent. Indeed, the historical writers of this period may be said to have marked, rather than filled a void. The writers of memoirs were more happy. At an earlier period, Brantôme (1527-1614), a gentleman attached to the suite of Charles IX. and Henry III., employed his declining years in describing men and manners as he had observed them; and his memoirs are admitted to embody too faithfully a representation of that singular mixture of elegance and grossness, of superstition and impiety, of chivalrous feelings and licentious morals, which characterized the sixteenth century. The Duke of Sully (1559-1641), the skillful financier of Henry IV., left valuable memoirs of the stirring events of his day. The "Memoirs" of the Cardinal de Betz (1614-1679), who took so active a part in the agitations of the Fronde, embody the enlarged views of the true historian, and breathe the impetuous spirit of a man whose native element is civil commotion, and who looks on the chieftainship of a party as worthy to engage the best powers of his head and heart; but his style abounds with negligences and irregularities which would have shocked the *littérateurs* of the day. The Duke de St. Simon (1675-1755) is another of those who made no pretensions to classical writing. All the styles of the seventeenth century are found in him. His language has been compared to a torrent, which appears somewhat

incumbered by the debris which it carries, yet makes its way with no less rapidity. Count Hamilton (1646-1720) narrates the adventures of his brother-in-law, Count de Grammont, of which La Harpe says, "Of all frivolous books, it is the most diverting and ingenious." Much lively narration is here expended on incidents better forgotten.

13. ROMANCE AND LETTER-WRITING.--The growth of kingly power, the order which it established, and the civilization which followed in its train, restrained the development of public life and increased the interests of the social relations. From this new state of things arose a modified kind of romance, in which elevated sentiments replaced the achievements of mediaeval fiction and the military exploits of Mademoiselle de Scudery's tales. Madame de Lafayette introduced that kind of romance in which the absorbing interest is that of conflicting passion, and external events were the occasion of developing the inward life of thought and feeling. She first depicted manners as they really were, relating natural events with gracefulness, instead of narrating those that never could have had existence. The illustrious Fénelon (1651-1715) was one of the few authors of this period who belonged exclusively to no one class. He appears as a divine in his "Sermons" and "Maxims;" as a rhetorician in his "Dialogues on Eloquence;" as a moralist in his "Education of Girls;" as a politician in his "Examination of the Conscience of a King;" and it may be said that all these characters are combined in "Telemachus," which has procured for him a widespread fame, and which classes him among the romancers. Telemachus was composed with the intention of its becoming a manual for his pupil, the young Duke of Burgundy, on his entrance into manhood. Though its publication caused him the loss of the king's favor, it went through numerous editions, and was translated into every language of Europe. It was considered, in its day, a manual for kings, and it became a standard book, on account of the elegance of its style, the purity of its morals, and the classic taste it was likely to foster in the youthful mind. Madame de Sévigné made no pretensions to authorship. Her letters were written to her daughter, without the slightest idea that they would be read, except by those to whom they were addressed; but they have immortalized their gifted author, and have been pronounced worthy to occupy an eminent place among the classics of French literature. The matter which these celebrated letters contain is multifarious; they are sketches of Madame de Sévigné's friends, Madame de Lafayette, Madame Scarron, and all the principal personages of that brilliant court, from which, however, she was excluded, in consequence of her early alliance with the Fronde, her friendship for Fouquet, and her Jansenist opinions. All the occurrences, as well as the characters of the day, are touched in these letters; and so graphic is the pen, so clear and easy the style, that we seem to live in those brilliant days, and to see all that was going on. Great events are detailed in the same tone as court gossip; Louis XIV., Turenne, Condé, the wars of France and of the empire are freely mingled with details of housewifery, projects of marriage,--in short, the seventeenth century is depicted in the correspondence of two women who knew nothing so important as their own affairs. Considerable interest attaches also to the letters of Madame de Maintenon (1635-1719), a lady whose life presents singular contrasts, worthy of the time. To her influence on the king, after her private marriage to him, is attributed much that is inauspicious in the latter part of his reign, the combination of ascetic devotion and religious bigotry with the most flagrant immorality, the appointment of unskillful generals and weak-minded ministers, the persecution of the Jansenists, and, above all, the revocation of the Edict of Nantes, which had secured religious freedom to the Protestants.

PERIOD THIRD.

LITERATURE OF THE AGE OF THE REVOLUTION AND OF THE NINETEENTH CENTURY (1700-1885).

1. THE DAWN OF SKEPTICISM.--In the age just past we have seen religion, antiquity, and the monarchy of Louis XIV., each exercising a distinct and powerful influence over the buoyancy of French genius, which cheerfully submitted to their restraining power. A school of taste and elegance had been formed, under these circumstances, which gave law to the rest of Europe and constituted France the leading spirit of the age. On the other hand, the dominant influences of the eighteenth century were a skeptical philosophy, a preference for modern literature, and a rage for political reform. The transition, however, was not sudden nor immediate, and we come now to the consideration of those works which occupy the midway position between the submissive age of Louis XIV. and the daring infidelity and republicanism of the eighteenth century. The eighteenth century began with the first timid protestation against the splendid monarchy of Louis XIV., the domination of the Catholic Church, and the classical authority of antiquity, and it ended when words came to deeds, in the sanguinary revolution of 1789. When the first generation of great men who sunned themselves in the glance of Louis XIV. had passed away, there were none to succeed them; the glory of the monarch began to fade as the noble *cortège* disappeared, and admiration and

enthusiasm were no more. The new generation, which had not shared the glory and prosperity of the old monarch, was not subjugated by the recollections of his early splendor, and was not, like the preceding, proud to wear his yoke. A certain indifference to principle began to prevail; men ventured to doubt opinions once unquestioned; the habit of jesting with everything and unblushing cynicism appeared almost under the eyes of the aged Louis; even Massillon, who exhorted the people to obedience, at the same time reminded the king that it was necessary to merit it by respecting their rights. The Protestants, exiled by the revocation of the Edict of Nantes, revenged themselves by pamphlets against the monarch and the church, and these works found their way into France, and fostered there the rising discontent and contempt for the authority of the government. Among these refugees was Bayle (1647-1706), the coolest and boldest of doubters. He wrote openly against the intolerance of Louis XIV., and he affords the first announcement of the characteristics of the century. His "Historical and Critical Dictionary," a vast magazine of knowledge and incredulity, was calculated to supersede the necessity of study to a lively and thoughtless age. His skepticism is learned and philosophical, and he ridicules those who reject without examination still more than those who believe with docile credulity. Jean Baptiste Rousseau (1670- 1741), the lyric poet of this age, displayed in his odes considerable energy, and a kind of pompous harmony, which no other had imparted to the language, yet he fails to excite the sympathy. In his writings we find that free commingling of licentious morals with a taste for religious sublimities which characterized the last years of Louis XIV. The Abbé Chaulieu (1639-1720) earned the appellation of the Anacreon of the Temple, but he did not, like Rousseau, prostitute poetry in strains of low debauchery. The tragedians followed in the footsteps of Racine with more or less success, and comedy continued, with some vigor, to represent the corrupt manners of the age. Le Sage (1668-1747) applied his talent to romance; and, like Molière, appreciated human folly without analyzing it. "Gil Blas" is a picture of the human heart under the aspect at once of the vicious and the ridiculous. Fontenelle (1657-1757), a nephew of the great Corneille, is regarded as the link between the seventeenth and eighteenth centuries, he having witnessed the splendor of the best days of Louis XIV., and lived long enough to see the greatest men of the eighteenth century. He made his début in tragedy, in which, however, he found little encouragement. In his "Plurality of Worlds," and "Dialogues of the Dead," there is much that indicates the man of science. His other works are valued rather for their delicacy and impartiality than for striking originality. Lamotte (1672-1731) was more distinguished in criticism than in any other sphere of authorship. He raised the standard of revolt against the worship of antiquity, and would have dethroned poetry itself on the ground of its inutility. Thus skepticism began by making established literary doctrines matters of doubt and controversy. Before attacking more serious creeds it fastened on literary ones. Such is the picture presented by the earlier part of the eighteenth century. Part of the generation had remained attached to the traditions of the great age. Others opened the path into which the whole country was about to throw itself. The faith of the nation in its political institutions, its religious and literary creed, was shaken to its foundation; the positive and palpable began to engross every interest hitherto occupied by the ideal; and this disposition, so favorable to the cultivation of science, brought with it a universal spirit of criticism. The habit of reflecting was generally diffused, people were not afraid to exercise their own judgment, every man had begun to have a higher estimate of his own opinions, and to care less for those hitherto received as undoubted authority. Still, literature had not taken any positive direction, nor had there yet appeared men of sufficiently powerful genius to give it a decisive impulse.

2. PROGRESS OF SKEPTICISM.--The first powerful attack on the manners, institutions, and establishments of France, and indeed of Europe in general, is that contained in the "Persian Letters" of the Baron de Montesquieu (1689-1755); in which, under the transparent veil of pleasantries aimed at the Moslem religion, he sought to consign to ridicule the belief in every species of dogma. But the celebrity of Montesquieu is founded on his "Spirit of Laws," the greatest monument of human genius in the eighteenth century. It is a profound analysis of law in its relation with government, customs, climate, religion, and commerce. The book is inspired with a spirit of justice and humanity; but it places the mind too much under the dominion of matter, and argues for necessity rather than liberty, thus depriving moral obligation of much of its absolute character. It is an extraordinary specimen of argument, terseness, and erudition. The maturity of the eighteenth century is found in Voltaire (1694-1778); he was the personification of its rashness, its zeal, its derision, its ardor, and its universality. In him nature had, so to speak, identified the individual with the nation, bestowing on him a character in the highest degree elastic, having lively sensibility but no depth of passion, little system of principle or conduct, but that promptitude of self-direction which supplies its place, a quickness of perception amounting almost to intuition, and an unexampled degree of activity, by which he was in some sort many men at once. No writer, even in the eighteenth century, knew so many things or treated so many subjects. That which was the ruin of some minds was the strength of his. Rich in diversified talent and in the gifts of fortune, he proceeded to the conquest of his age with the combined power of the highest endowments under the most favorable circumstances. He was driven again and again, as a moral pest, from the capital of France by the powers that fain would have preserved the people from his opinions, yet ever gaining ground, his wit always

welcome, and his opinions gradually prevailing, one audacious sentiment after another broached, and branded with infamy, yet secretly entertained, till the futile struggle was at length given in, and the nation, as with one voice, avowed itself his disciple. It has been said that Voltaire showed symptoms of infidelity from infancy. When at college he gave way to sallies of wit, mirth, and profanity which astonished his companions and terrified his preceptors. He was twice imprisoned in the Bastille, and many times obliged to fly from the country. In England he became acquainted with Bolingbroke and all the most distinguished men of the time, and in the school of English philosophy he learned to use argument, as well as ridicule, in his war with religion. In 1740 we find him assisting Frederick the Great to get up a refutation of Machiavelli; again, he is appointed historiographer of France, Gentleman of the Bed-chamber, and Member of the Academy; then he accepts an invitation to reside at the Court of Prussia, where he soon quarrels with the king. After many vicissitudes he finally purchased the estate of Ferney, near the Lake of Geneva, where he resided during the rest of his days. From this retreat he poured out an exhaustless variety of books, which were extensively circulated and eagerly perused. He had the admiration of all the wits and philosophers of Europe, and included among his pupils and correspondents some of the greatest sovereigns of the age. At the age of eighty-four he again visited Paris. Here his levees were more crowded than those of any emperor; princes and peers thronged his ante-chamber, and when he rode through the streets a train attended him which stretched far over the city. He was made president of the Academy, and crowned with laurel at the theatre, where his bust was placed on the stage and adorned with palms and garlands. He died soon after, without the rites of the church, and was interred secretly at a Benedictine abbey. The national enthusiasm which decreed Voltaire, as he descended to the tomb, such a triumph as might have honored a benefactor of the race, gave place to doubt and disputation as to his merits. In tragedy he is admitted to rank after Corneille and Racine; in "Zaïre," which is his masterpiece, there is neither the lofty conception of the one, nor the perfect versification of the other, but there is a warmth of passion, an enthusiasm of feeling, and a gracefulness of expression which fascinate and subdue. As an epic poet he has least sustained his renown; though the "Henriade" has unquestionably some great beauties, its machinery is tame, and the want of poetic illusion is severely felt. His poetry, especially that of his later years, is by no means so disgraceful to the author as the witticisms in prose, the tales, dialogues, romances, and pasquinades which were eagerly sought for and readily furnished, and which are, with little exception, totally unworthy of an honorable man. As a historian, Voltaire lacked reflection and patience for investigation. His "History of Charles XII.," however, was deservedly successful; the reason being that he chose for his hero the most romantic and adventurous of sovereigns, to describe whom there was more need of rapid narrative and brilliant coloring than of profound knowledge and a just appreciation of human nature. In his history of the age of Louis XIV., Voltaire sought not only to present a picture, but a series of researches destined to instruct the memory and exercise the judgment. The English historians, imitating his mode, have surpassed him in erudition and philosophic impartiality. Still later, his own countrymen have carried this species of writing to a high degree of perfection. Throughout the "Essay on the Manners of Nations" we find traces of that hatred of religion which he openly cherished in the latter part of his life. The style, however, is pleasing, the facts well arranged, and the portraits traced with originality and vivacity. Some have attributed to Voltaire the serious design of overturning the three great bases of society, religion, morality, and civil government, but he had not the genius of a philosopher, and there is no system of philosophy in his works. That he had a design to amuse and influence his age, and to avenge himself on his enemies, is obvious enough. Envy and hatred employed against him the weapons of religion, hence he viewed it only as an instrument of persecution. His great powers of mind were continually directed by the opinions of the times, and the desire of popularity was his ruling motive. The character of his earlier writings shows that he did not bring into the world a very independent spirit; they display the lightness and frivolity of the time with the submission of a courtier for every kind of authority, but as his success increased everything encouraged him to imbue his works with that spirit which found so general a welcome. In vain the authority of the civil government endeavored to arrest the impulse which was gaining strength from day to day; in vain this director of the public mind was imprisoned and exiled; the farther he advanced in his career and the more audaciously he propagated his views on religion and government, the more he was rewarded with the renown which he sought. Monarchs became his friends and his flatterers; opposition only increased his energy, and made him often forget moderation and good taste.

3. FRENCH LITERATURE DURING THE REVOLUTION.--The names of Voltaire and Montesquieu eclipse all others in the first half of the eighteenth century, but the influence of Voltaire was by far the most immediate and extensive. After he had reached the zenith of his glory, about the middle of the century, there appeared in France a display of various talent, evoked by his example and trained by his instructions, yet boasting an independent existence. In the works of these men was consummated the literary revolution of which we have marked the beginnings, a revolution more striking than any other ever witnessed in the same space of time. It was no longer a few eminent men that surrendered themselves boldly to the skeptical philosophy which is the grand characteristic of

the eighteenth century; writers of inferior note followed in the same path; the new opinions took entire possession of all literature and cooperated with the state of the morals and the government to bring about a fearful revolution. The whole strength of the literature of this age being directed towards the subversion of the national institutions and religion, formed a homogeneous body of science, literature, and the arts, and a compact phalanx of all writers under the common name of philosophers. Women had their share in the maintenance of this league; the salons of Mesdames du Deffand (1696-1780), Geoffrin (b. 1777), and De l'Espinasse (1732-1776) were its favorite resorts; but the great rendezvous was that of the Baron d'Holbach, whence its doctrines spread far and wide, blasting, like a malaria, whatever it met with on its way that had any connection with religion, morals, or venerable social customs. Besides Voltaire, who presided over this coterie, at least in spirit, the daily company included Diderot, an enthusiast by nature and a cynic and sophist by profession; D'Alembert, a genius of the first order in mathematics, though less distinguished in literature; the malicious Marmontel, the philosopher Helvétius, the Abbé Raynal, the furious enemy of all modern institutions; the would-be sentimentalist Grimm, and D'Holbach himself. Hume, Gibbon, Bolingbroke, and others were affiliated members. Their plan was to write a book which would in some sense supersede all others, itself forming a library containing the most recent discoveries in philosophy, and the best explanations and details on every topic, literary and scientific. The project of this great enterprise of an Encyclopaedia as an immense vehicle for the development of the opinions of the philosophers, alarmed the government, and the parliament and the clergy pronounced its condemnation. The philosophy of Descartes and the eminent thinkers of the seventeenth century assumed the soul of man as the starting-point in the investigation of physical science. The men of the eighteenth century had become tired of following out the sublimities and abstractions of the Cartesians, and they took the opposite course; beginning from sensation, they did not stop short of the grossest materialism and positive atheism. Such were the principles of the Encyclopaedia, more fully developed and explained in the writings of Condillac (1715-1780), the head of this school of philosophy. His first work, "On the Origin of Human Knowledge," contains the germ of all that he afterwards published. In his "Treatise on Sensation," he endeavored, but in vain, to derive the notion of duty from sensation, and expert as he was in logic, he could not conceal the great gulf which his theory left between these two terms. Few writers have enjoyed more success; he brought the science of thought within the reach of the vulgar by stripping it of everything elevated, and every one was surprised and delighted to find that philosophy was so easy a thing. Having determined not to establish morality on any innate principles of the soul, these philosophers founded it on the fact common to all animated nature, the feeling of self-interest. Already deism had rejected the evidence of a divine revelation. Now atheism raised a more audacious front, and proclaimed that all religious sentiment was but the reverie of a disordered mind. The works in which this opinion is most expressly announced, date from the period of the Encyclopaedia. D'Alembert (1717-1773) is now chiefly known as the author of the preliminary discourse of the Encyclopaedia, which is ranked among the principal works of the age. Diderot (1714-1784), had he devoted himself to any one sphere, instead of wandering about in the chaos of opinions which rose and perished around him, might have left a lasting reputation, and posterity, instead of merely repeating his name, would have spoken of his works. He may be regarded as a writer injurious at once to literature and to morals. The most faithful disciple of the philosophy of this period was Helvétius (1715-1771), known chiefly by his work, "On the Mind," the object of which is to prove that physical sensibility is the origin of all our thoughts. Of all the writers who maintained this opinion, none have represented it in so gross a manner. His work was condemned by the Sorbonne, the pope, and the parliament; it was burned by the hand of the hangman, and the author was compelled to retract it. Jean Jacques Rousseau (1712-1778) was a writer who marched under none of the recognized banners of the day. The Encyclopaedists had flattered themselves that they had tuned the opinion of all Europe to their philosophical strain, when suddenly they heard his discordant note. Without family, without friends, without home, wandering from place to place, from one condition in life to another, he conceived a species of revolt against society, and a feeling of bitterness against those civil organizations in which he could never find a suitable place. He combated the atheism of the Encyclopaedists, their materialism and contempt for moral virtue, for pure deism was his creed. He believed in a Supreme Being, a future state, and the excellence of virtue, but denying all revealed religion, he would have men advance in the paths of virtue, freely and proudly, from love of virtue itself, and not from any sense of duty or obligation. In the "Social Contract" he traced the principles of government and laws in the nature of man, and endeavored to show the end which they proposed to themselves by living in communities, and the best means of attaining this end. The two most notable works of Rousseau are "Julie," or the "Nouvelle Héloïse," and "Emile." The former is a kind of romance, owing its interest mainly to development of character, and not to incident or plot. Emile embodies a system of education in which the author's thoughts are digested and arranged. He gives himself an imaginary pupil, the representative of that life of spontaneous development which was the writer's ideal. In this work there is an episode, the "Savoyard Vicar's Confession of Faith," which is a declaration of pure deism, leveled especially against the errors of Catholicism. It raised a perfect tempest against the author from every quarter. The council of Geneva caused his book to be burned by the executioner, and the parliament of Paris

threatened him with imprisonment. Under these circumstances he wrote his "Confessions," which he believed would vindicate him before the world. The reader, who may expect to find this book abounding with at least as much virtue as a man may possess without Christian principle, will find in it not a single feature of greatness; it is a proclamation of disagreeable faults; and yet he would persuade us that he was virtuous, by giving the clearest proofs that he was not. To the names of Montesquieu, Voltaire, and Rousseau, must be added that of Buffon (1707-1788), and we have the four writers of this age who left all their contemporaries far behind. Buffon having been appointed superintendent of the Jardin des Plantes, and having enriched this fine establishment, and gathered into it, from all parts of the world, various productions of nature, conceived the project of composing a natural history, which should embrace the whole immensity of being, animate and inanimate. He first laid down the theory of the earth, then treated the natural history of man, afterwards that of viviparous quadrupeds and birds. The first volumes of his work appeared in 1749; the most important of the supplementary matter which followed was the "Epochs of Nature." He gave incredible attention to his style, and is one of the most brilliant writers of the eighteenth century. No naturalist has ever equaled him in the magnificence of his theories, or the animation of his descriptions of the manners and habits of animals. It is said that he wrote the "Epochs of Nature" eleven times over. He not only recited his compositions aloud, in order to judge of the rhythm and cadence, but he made a point of being in full dress before he sat down to write, believing that the splendor of his habiliments impressed his language with that pomp and elegance which he so much admired, and which is his distinguishing characteristic. Buffon, while maintaining friendship with the celebrated men of his age, did not identify himself with the party of the encyclopaedists, or the sects into which they were divided. But he lived among men who deemed physical nature alone worthy of study, and the wits of the age who had succeeded in discovering how a Supreme Being might be dispensed with. Buffon evaded the subject entirely, and amid all his lofty soarings showed no disposition to rise to the Great First Cause. After his time, science lost its contemplative and poetical character, and acquired that of intelligent observation. It became a practical thing, and entered into close alliance with the arts. The arts and sciences, thus combined, became the glory of France, as literature had been in the preceding age. The declining years of Voltaire and Rousseau witnessed no rising genius of similar power, but some authors of a secondary rank deserve notice. Marmontel (1728-1799) is distinguished as the writer of "Belisarius," a philosophical romance, "Moral Tales," and "Elements of Literature." He endeavors to lead his readers to the enjoyments of literature, instead of detaining them with frigid criticisms. La Harpe (1739-1803) displayed great eloquence in literary criticism, and some of his works maintain their place, though they have little claim to originality. Many writers devoted themselves to history, but the spirit of French philosophy was uncongenial to this species of composition, and the age does not afford one remarkable historian. The fame of the Abbé Raynal (1718-1796) rests chiefly on his "History of the Two Indies." It is difficult to conceive how a sober man could have arrived at such delirium of opinion, and how he could so complacently exhibit principles which tended to overthrow the whole system of society. Scarcely a crime was committed during the revolution, with which this century closes, but could find its advocate in this declaimer. When, however, Raynal found himself in the midst of the turmoils he had suggested, he behaved with justice, moderation, and courage; thus proving that his opinions were not the result of experience. The days of true religious eloquence were past; faith was extinct among the greater part of the community, and cold and timid among the rest. Preachers, in deference to their audience, kept out of view whatever was purely religious, and enlarged on those topics which coincided with mere human morality. Religion was introduced only as an accessory which it was necessary to disguise skillfully, in order to escape derision. Genuine pulpit eloquence was out of the question under these circumstances. Forensic eloquence had been improving in simplicity and seriousness since the commencement of the eighteenth century, and men of the law were now led by the circumstances of the times to trace out universal principles, rather than to discuss isolated facts. The eloquence of the bar thus acquired more extensive influence; the measures of the government converted it into a hostile power, and it furnished itself with weapons of reason and erudition which had not been thought of before. We come now close upon the epoch when the national spirit was no longer to be traced in books, but in actions. The reign of Louis XV. had been marked with general disorder, and while he was sinking into the grave, amid the scorn of the people, the magistrates were punished for opposing the royal authority, and the public were indignant at the arbitrary proceeding. Beaumarchais (1732-1799) became the organ of this feeling, and his memoirs, like his comedies, are replete with enthusiasm, cynicism, and buffoonery. Literature was never so popular; it was regarded as the universal and powerful instrument which it behooved every man to possess. All grades of society were filled with authors and philosophers; the public mind was tending towards some change, without knowing what it would have; from the monarch on the throne to the lowest of the people, all perceived the utter discordance that prevailed between existing opinions and existing institutions. In the midst of the dull murmur which announced the approaching storm, literature, as though its work of agitation had been completed, took up the shepherd's reed for public amusement. "Posterity would scarcely believe," says an eminent historian, "that 'Paul and Virginia' and the 'Indian Cottage' were composed at this juncture by Bernardin de St. Pierre, (1737-1814), as also the

'Fables of Florian' which are the only ones that have been considered readable since those of La Fontaine." About the same time appeared the "Voyage of Anacharsis," in which the Abbé Barthélemy (1716-1795) embodied his erudition in an attractive form, presenting a lively picture of Greece in the time of Pericles. Among the more moral writers of this age was Necker (1732-1804), the financial minister of Louis XVI., who maintained the cause of religion against the torrent of public opinion in works distinguished for delicacy and elevation, seriousness and elegance. When the storm at length burst, the country was exposed to every kind of revolutionary tyranny. The first actors in the work of destruction were, for the most part, actuated by good intentions; but these were soon superseded by men of a lower class, envious of all distinctions of rank and deeply imbued with the spirit of the philosophers. Some derived, from the writings of Rousseau, a hatred of everything above them; others had taken from Mably his admiration of the ancient republics of Greece and Rome, and would reproduce them in France; others had borrowed from Raynal the revolutionary torch which he had lighted for the destruction of all institutions; others, educated in the atheistic fanaticism of Diderot, trembled with rage at the very name of a priest or religion; and thus the Revolution was gradually handed over to the guidance of passion and personal interest. In hurrying past these years of anarchy and bloodshed, we cast a glance upon the poet, André Chénier (1762-1794), who dared to write against the excesses of his countrymen, in consequence of which he was cited before the revolutionary tribunal, condemned, and executed.

4. FRENCH LITERATURE UNDER THE EMPIRE.--Napoleon, on the establishment of the empire, gave great encouragement to the arts, but none to literature. Books were in little request; old editions were sold for a fraction of their original price; but new works were dear, because the demand for them was so limited. When literature again lifted its head, it appeared that in the chaos of events a new order of thought had been generated. The feelings of the people were for the freer forms of modern literature, introduced by Madame de Staël and Châteaubriand, rather than the ancient classics and the French models of the seventeenth century. Madame de Staël (1766-1817) has been pronounced by the general voice to be among the greatest of all female authors. She was early introduced to the society of the cleverest men in Paris, with whom her father's house was a favorite resort; and before she was twelve years of age, such men as Raynal, Marmontel, and Grimm used to converse with her as though she were twenty, calling out her ready eloquence, inquiring into her studies, and recommending new books. She thus imbibed a taste for society and distinction, and for bearing her part in the brilliant conversation of the salon. At the age of twenty she became the wife of the Baron de Staël, the Swedish minister at Paris. On her return, after the Reign of Terror, Madame de Staël became the centre of a political society, and her drawing-rooms were the resort of distinguished foreigners, ambassadors, and authors. On the accession of Napoleon, a mutual hostility arose between him and this celebrated woman, which ended in her banishment and the suppression of her works. "The Six Years of Exile" is the most simple and interesting of her productions. Her "Considerations on the French Revolution" is the most valuable of her political articles. Among her works of fiction, "Corinne" and "Delphine" have had the highest popularity. But of all her writings, that on "Germany" is considered worthy of the highest rank, and it was calculated to influence most beneficially the literature of her country, by opening to the rising generation of France unknown treasures of literature and philosophy. Writers like Delavigne, Lamartine, Béranger, De Vigny, and Victor Hugo, though in no respect imitators of Madame de Staël, are probably much indebted to her for the stimulus to originality which her writings afforded. Another female author, who lived, like Madame de Staël through the Revolution, and exercised an influence on public events, was Madame de Genlis (1746-1830). Her works, which extend to at least eighty volumes, are chiefly educational treatises, moral tales, and historical romances. Her political power depended rather on her private influence in the Orleans family than upon her pen. Châteaubriand (1769-1848) must be placed side by side with Madame de Staël, as another of those brilliant and versatile geniuses who have dazzled the eyes of their countrymen, and exerted a permanent influence on French literature. While the eighteenth century had used against religion all the weapons of ridicule, he defended it by poetry and romance. Christianity he considered the most poetical of all religions, the most attractive, the most fertile in literary, social, and artistic results, and he develops his theme with every advantage of language and style in the "Genius of Christianity" and the "Martyrs." Some of the characteristics of Châteaubriand, however, have produced a seriously injurious effect on French literature, and of these the most contagious and corrupting is his passion for the glitter of words and the pageantry of high-sounding phrases. The salutary reaction against skepticism, produced in literature by Madame de Staël and Châteaubriand was carried into philosophy by Maine de Biran (1766-1824), and more particularly by Royer-Collard (1763-1846) who took a decided stand against the school of Condillac and the materialists of the eighteenth century. Royer-Collard restored its spiritual character to the science of the human mind, by introducing into it the psychological discoveries of the Scotch school. Benjamin Constant (1767-1830) infused into political science a spirit of freedom before quite unknown. In his works he attempted to limit the authority of the government, to build up society on personal freedom, and on the guaranties of individual right. His writings combine extraordinary power of logic with great

variety and beauty of style. Proceeding in another direction, Bonald (1753-1846) opposed the spirit of the French Revolution, by establishing the authority of the church as the only criterion of truth and morality. As Rousseau had placed sovereign power in the will of the people, Bonald placed it in that of God, as it is manifested to man through language and revelation, and of this revelation he regarded the Catholic church as the interpreter. He develops his doctrines in numerous works, especially in his "Primitive Legislation," which is characterized by boldness, dogmatism, sophistry in argument, and by severity and purity of style. The peculiarities of Bonald were carried still farther by De Maistre (1755-1852), whose hatred of the Revolution led him into the system of an absolute theocracy, such as was dreamed of by Gregory VII. and Innocent III.

5. FRENCH LITERATURE FROM THE RESTORATION TO THE PRESENT TIME.--The influences already spoken of, in connection with the literary progress which began in Germany and England towards the close of the eighteenth century, produced in the beginning of the nineteenth century a revival in French literature; but the conflict of opinions, the immense number of authors, and their extraordinary fecundity, render it difficult to examine or classify them. We first notice the great advances in history and biography. Among the earlier specimens may be mentioned the voluminous works of Sismondi and the "Biographie Universelle," in fifty-two closely printed volumes, the most valuable body of biography that any modern literature can boast. Since 1830, historians and literary critics have occupied the foreground in French literature. The historians have divided themselves into two schools, the descriptive and the philosophical. With the one class history consists of a narration of facts in connection with a picture of manners, bringing scenes of the past vividly before the mind of the reader, leaving him to deduce general truths from the particular ones brought before him. The style of these writers is simple and manly, and no opinions of their own shine through their statements. The chief representatives of this class, who regard Sir Walter Scott as their master, are Thierry, Villemain, Barante, and in historical sketches and novels, Dumas and De Vigny. The philosophical school, on the other hand, consider this scenic narrative more suitable to romance than to history; they seek in the events of the past the chain of causes and effects in order to arrive at general conclusions which may direct the conduct of men in the future. At the head of this school is Guizot (1787-1876), who has developed his historical views in his essays on the "History of France," and more particularly in his "History of European Civilization," in which he points out the origin of modern civilization, and follows the progress of the human mind from the fall of the Roman Empire. The philosophical historians have been again divided according to their different theories, but the most eminent of them are those whom Châteaubriand calls fatalists; men who, having surveyed the course of public events, have come to the conclusion that individual character has had little influence on the political destinies of mankind, that there is a general and inevitable series of events which regularly succeed each other with the certainty of cause and effect, and that it is as easy to trace it as it is impossible to resist or divert it from its course. A tendency to these views is visible in almost every French historian and philosopher of the present time. The philosophy of history thus grounded has, in their hands, assumed the aspect of a science.

HISTORY.--Among the celebrated writers who have combined the philosophical and narrative styles are the brothers Amadée and Augustine Thierry (1787- 1873), (1795-1856), who produced a "History of the Gauls," of "The Norman Conquest," and other excellent works; Sismondi (1773-1842), whose history of the "Italian Republics" and of the "French People" are characterized by immense erudition; Thiers (1797-1877), whose clearness of style is combined with comprehensiveness and eloquence; Mignet (1796-1884), celebrated for his history of the French Revolution. The voluminous "History of France," by Henri Martin (1810-1884), is perhaps the best and most important work treating the whole subject in detail. The downfall of the July Monarchy brought forth works of importance on this subject, the most noted of which are those by Lamartine, Michelet, and Louis Blanc. Lamartine's "History of the Girondins" was written from a constitutional and republican point of view, and was not without influence in producing the Revolution of 1848, but it is the work of an orator and poet rather than that of a historian. The historical and political works of Michelet (1778-1873) are of a more original character; his imaginative powers are of the highest order, and his style is striking and picturesque. The work of Louis Blanc (1813-1883) is that of a sincere and ardent republican, and is useful from that point of view, as is that of Quinet (1803-1875). Lanfrey places the character of Napoleon in a new and far from favorable light. Taine, so distinguished in literary criticism, has discussed elaborately the causes of the Revolution.

POETRY AND THE DRAMA; RISE OF THE ROMANTIC SCHOOL.--During the Middle Ages men of letters followed each other in the cultivation of certain literary forms, often with little regard to their adaptation to the subject. The vast extension of thought and knowledge in the sixteenth century broke up the old forms and introduced the practice of treating each subject in a manner more or less appropriate to it. The seventeenth and eighteenth centuries witnessed a return to the observance of arbitrary rules, though the evil effects were somewhat counterbalanced by the enlargement of thought and the increasing knowledge of other literature, ancient and modern. The great Romantic movement, which began in the second quarter of the nineteenth century, repeated on a larger scale the movement of the sixteenth to break up and discard

many stiff and useless literary forms, to give strength and variety to such as were retained, and to enrich the language by new inventions and revivals. The supporters of this reform long maintained an animated controversy with the adherents of the classical school, and it was only after several years that the younger combatants came out victorious. The objects of the school were so violently opposed that the king was petitioned to forbid the admission of any Romantic drama at the Théâtre Français, the petitioners asserting that the object of their adversaries was to burn everything that had been adored and to adore everything that had been burned. The representation of Victor Hugo's "Hernani" was the culmination of the struggle, and since that time all the greatest men of letters in France have been on the innovating side. In *_belles-lettres_* and history the result has been most remarkable. Obsolete rules which had so long regulated the French stage have been abolished; poetry not dramatic has been revived; prose romance and literary criticism have been brought to a degree of perfection previously unknown; and in history more various and remarkable works have been produced than ever before, while the modern French language, if it lacks the precision and elegance to which from 1680 to 1800 all else had been sacrificed, has become a much more suitable instrument for the accurate and copious treatment of scientific subjects. At the time of the accession of Charles X. (1824), the only writers of eminence were Béranger (1780-1857), Lamartine (1790-1869), and Lamennais (1782-1854), and they mark the transition between the old and new. Béranger was the poet of the people; most of his earlier compositions were political, extolling the greatness of the fallen empire or bewailing the low state of France under the restored dynasty. They were received with enthusiasm and sung from one end of the country to the other. His later songs exhibit a not unpleasing change from the audacious and too often licentious tone of his earlier days. In the hands of Lamartine the language, softened and harmonized, loses that clear epigrammatic expression which, before him, had appeared inseparable from French poetry. His works are pervaded by an earnest religious feeling and a rare delicacy of expression. "Jocelyn," a romance in verse, the "Meditations," and "Harmonies" are among his best works. Victor Hugo (b. 1800) at the age of twenty-five was the acknowledged master in poetry as in the drama, and this position he still holds. In him all the Romantic characteristics are expressed and embodied,--disregard of arbitrary rules, free choice of subjects, variety and vigor of metre, and beauty of diction. His poetical influence has been represented in three different schools, corresponding in point of time with the first outburst of the movement, a brief period of reaction, and the closing years of the second empire. Of the first, Théophile Gautier (1811-1872) was the most distinguished member. The next generation produced those remarkable poets, Theodore de Banville (b. 1820), who composed a large amount of verse faultless in form and exquisite in shade and color, but so neutral in tone that it has found few admirers, and Charles Baudelaire (1821-1867), who offends by the choice of unpopular subjects and the terrible truth of his analysis. The poems of De Vigny are sweet and elegant, though somewhat lacking in the energy belonging to lyric composition. Those of Alfred de Musset (1800-1857) are among the finest in the language. The Gascon poet Jasmin has produced a good deal of verse in the western dialect of the *_Langue d'oc_*, and recently a more cultivated and literary school of poets has arisen in Provence, the chief of whom is Mistral. The effect of the Romantic movement on the drama has been the introduction of a species of play called the *_drame_*, as opposed to regular comedy and tragedy, and admitting of freer treatment. Victor Hugo, Alexandre Dumas (1803-1874), Victorien Sardou (b. 1831), Alexandre Dumas *_fils_* (b. 1821), Legouvé (b. 1807), Scribe (1791-1861), Octave Feuillet (b. 1812), have produced works of this class. The literature of France during the last generation has been prolific in dramas and romances, all of which indicate a chaos of opinion. It is not professedly infidel, like that of the eighteenth century, nor professedly pietistic, like that of the seventeenth. It seems to have no general aim, the opinions and efforts of the authors being seldom consistent with themselves for any length of time. No one can deny that this literature engages the reader's most intense interest by the seductive sagacity of the movement, the variety of incident, and the most perfect command of those means calculated to produce certain ends. In 1866 appeared a collection of poems, "Le Parnasse Contemporain," which included contributions of many poets already named, and of others unknown. Two other collections followed, one in 1869 and one in 1876, by numerous contributors, who have mostly published separate works. They are called collectively, half seriously and half in derision, "Les Parnassiens." Their cardinal principle is a devotion to poetry as an art, with diversity of aim and subject. Of these, Coppée devotes himself to domestic and social subjects; Louise Siefert indulges in the poetry of despair; Glatigny excels all in individuality of poetical treatment. The Parnassiens number three or four score poets; the average of their work is high, though to none can be assigned the first rank.

FICTION.--Previous to 1830 no writer of fiction had formed a school, nor had this form of literature been cultivated to any great extent. From the immense influence of Walter Scott, or from other causes, there suddenly appeared a remarkable group of novelists, Hugo, Gautier, Dumas, Mérimée, Balzac, George Sand, Sandeau, Charles de Bernard, and others scarcely inferior. It is remarkable that the excellence of the first group has been maintained by a new generation, Murger, About, Feuillet, Flaubert, Erckmann-Chatrian, Droz, Daudet, Cherbulliez, Gaboriau, Dumas *_fils_*, and others. During this period the romance-writing of France has taken two different directions. The first, that of the novel of incident, of which Scott was the model; the second, that of analysis and character,

illustrated by the genius of Balzac and George Sand. The stories of Hugo are novels of incident with ideal character painting. Dumas's works are dramatic in character and charming for their brilliancy and wit. His "Trois Mousquetaires" and "Monte Christo" are considered his best novels. Of a similar kind are the novels of Eugene Sue. Both writers were followed by a crowd of companions and imitators. The taste for the novel of incident, which had nearly died out, was renewed in another form, with the admixture of domestic interest, by the literary partners, Erckmann-Chatrian. Théophile Gautier modified the incident novel in many short tales, a kind of writing for which the French have always been famous, and of which the writings of Gautier were masterpieces. With him may be classed Prosper Mérimée (1803-1871), one of the most exquisite masters of the language. Since 1830 the tendency has been towards novels of contemporary life. The two great masters of the novel of character and manners, as opposed to that of history and incident, are Honoré de Balzac (1799-1850) and Aurore Dudevant, commonly called George Sand (d. 1876), whose early writings are strongly tinged with the spirit of revolt against moral and social arrangements: later she devoted herself to studies of country life and manners, involving bold sketches of character and dramatic situations. One of the most remarkable characteristics of her work is the apparently inexhaustible imagination with which she continued to the close of her long life to pour forth many volumes of fiction year after year. Balzac, as a writer, was equally productive. In the "Comédie Humaine" he attempted to cover the whole ground of human, or at least of French life, and the success he attained was remarkable. The influence of these two writers affected the entire body of those who succeeded them with very few exceptions. Among these are Jules Sandeau, whose novels are distinguished by minute character-drawing in tones of a sombre hue. Saintine, the author of "Picciola," Mme. Craven (Reçit d'une Soeur), Henri Beyle, who, under the _nom de plume_ of _Stendhal_, wrote the "Chartreuse de Parme," a powerful novel of the analytical kind, and Henri Murger, a painter of Bohemian life. Octave Feuillet has attained great popularity in romances of fashionable life. Gustave Flaubert (b. 1821), with great acuteness and knowledge of human nature, combines scholarship and a power over the language not surpassed by any writer of the century. Edmond About (b. 1828) is distinguished by his refined wit. One of the most popular writers of the second empire is Ernest Feydeau (1821-1874), a writer of great ability, but morbid and affected in the choice and treatment of his subjects. Of late, many writers of the realist school have striven to outdo their predecessors in carrying out the principles of Balzac; among these are Gaboriau, Cherbulliez, Droz, BÉlot, Alphonse Daudet. CRITICISM.--Previous to the Romantic movement in France the office of criticism had been to compare all literary productions with certain established rules, and to judge them accordingly. The theory of the new school was, that a work should be judged by itself alone or by the author's ideal. The great master of this school was Sainte-Beuve (1804- 1869), who possessed a rare combination of great and accurate learning, compass and profundity of thought, and above all sympathy in judgment. Hippolyte Taine (b. 1828), the most brilliant of living French critics, Théophile Gautier, Arsène Houssaye, Jules Janin (d. 1874), Sarcey, and others, are distinguished in this branch of letters. MISCELLANEOUS.--Among earlier writers of the nineteenth century are Sismondi, whose "Literature of Southern Europe" remains without a rival, the work of Ginguené on "Italian Literature," and of Renouard on "Provençal Poetry." In intellectual philosophy Jouffroy and Damiron continued the work begun by Royer-Collard, that of destroying the influence of sensualism and materialism. The philosophical writings of Cousin (1792-1867) are models of didactic prose, and in his work on "The Beautiful, True, and Good" he raises the science of aesthetics to its highest dignity. Lamennais (1782-1854) exhibits in his writings various phases of religious thought, ending in rationalism. Comte (1798-1857), in his "Positive Philosophy," shows power of generalization and force of logic, though tending to atheism and socialism. De Tocqueville and Chevalier are distinguished in political science, the former particularly for his able work on "Democracy in America." Renan (b. 1823) is a prominent name in theological writing, and Montalembert (1810-1870) a historian with strong religious tendencies. Among the orators Lacordaire, Père Felix, Père Hyacinthe, and Coquerel are best known. Among the women of France distinguished for their literary abilities are Mme. Durant, who, under the name of Henri Greville, has given, in a series of tales, many charming pictures of Russian life, Mlle. Clarisse Bader, who has produced valuable historical works on the condition of women in all ages, and Mme. Adam, a brilliant writer and journalist. In science, Pasteur and Milne-Edwards hold the first rank in biology, Paul Bert in physiology, and Quatrefages in anthropology of races.

SPANISH LITERATURE.

INTRODUCTION.--1. Spanish Literature and its Divisions.--2. The Language.

PERIOD FIRST.--1. Early National Literature; the Poem of the Cid; Berceo, Alfonso the Wise, Segura; Don Juan Manuel, the Archpriest of Hita, Santob, Ayala.--2. Old Ballads.--3. The Chronicles.--4. Romances of Chivalry.--5.

The Drama.--6. Provençal Literature in Spain.--7. The Influence of Italian Literature in Spain.--8. The Cancioneros and Prose Writing.--9. The Inquisition.

PERIOD SECOND.--1. The Effect of Intolerance on Letters.--2. Influence of Italy on Spanish Literature; Boscan, Garcilasso de la Vega, Diego de Mendoza.--3. History; Cortez, Gomara, Oviedo, Las Casas.--4. The Drama, Rueda, Lope de Vega, Calderon de la Barca.--5. Romances and Tales; Cervantes, and other Writers of Fiction.--6. Historical Narrative Poems; Ercilla.--7. Lyric Poetry; the Argensolas; Luis de Leon, Quevedo, Herrera, Gongora, and others.--8. Satirical and other Poetry.--9. History and other Prose Writing; Zurita, Mariana, Sandoval, and others.

PERIOD THIRD.--1. French Influence on the Literature of Spain.--2. The Dawn of Spanish Literature in the Eighteenth Century; Feyjoo, Isla, Moratin the elder, Yriarte, Melendez, Gonzalez, Quintana, Moratin the younger.--3. Spanish Literature in the Nineteenth Century.

INTRODUCTION.

1. SPANISH LITERATURE AND ITS DIVISIONS.--At the period of the subversion of the Empire of the West, in the fifth century, Spain was invaded by the Suevi, the Alans, the Vandals, and the Visigoths. The country which had for six centuries been subjected to the dominion of the Romans, and had, adopted the language and arts of its masters, now experienced those changes in manners, opinions, military spirit, and language, which took place in the other provinces of the empire, and which, were, in fact, the origin of the nations which arose on the overthrow of the Roman power. Among the conquerors of Spain, the Visigoths were the most numerous; the ancient Roman subjects were speedily confounded with them, and their dominion soon extended over nearly the whole country. In the year 710 the peninsula was invaded by the Arabs or Moors, and from that time the active and incessant struggles of the Spanish Christians against the invaders, and their necessary contact with Arabian civilization, began to elicit sparks of intellectual energy. Indeed, the first utterance of that popular feeling which became the foundation of the national literature was heard in the midst of that extraordinary contest, which lasted for more than seven centuries, so that the earliest Spanish poetry seems but a breathing of the energy and heroism which, at the time it appeared, animated the Spanish Christians throughout the peninsula. Overwhelmed by the Moors, they did not entirely yield; a small but valiant band, retreating before the fiery pursuit of their enemies, established themselves in the extreme northwestern portion of their native land, amidst the mountains and the fastnesses of Biscay and Asturias, while the others remained under the yoke of the conquerors, adopting, in some degree, the manners and habits of the Arabians. On the destruction of the caliphate of Cordova, in the year 1031, the dismemberment of the Moslem territories into petty Independent kingdoms, often at variance with each other, afforded the Christians a favorable opportunity of reconquering their country. One after another the Moorish states fell before them. The Moors were driven farther and farther to the south, and by the middle of the thirteenth century they had no dominion in Spain except the kingdom of Granada, which for two centuries longer continued the splendid abode of luxury and magnificence. As victory inclined more and more to the Spanish arms, the Castilian dialect rapidly grew into a vehicle adequate to express the pride and dignity of the prevailing people, and that enthusiasm for liberty which was long their finest characteristic. The poem of the Cid early appeared, and in the thirteenth century a numerous family of romantic ballads followed, all glowing with heroic ardor. As another epoch drew near, the lyric form began to predominate, in which, however, the warm expressions of the Spanish heart were restricted by a fondness for conceit and allegory. The rudiments of the drama, religious, pastoral, and satiric, soon followed, marked by many traits of original thought and talent. Thus the course of Spanish literature proceeded, animated and controlled by the national character, to the end of the fifteenth century. In the sixteenth, the original genius of the Spaniards, and their proud consciousness of national greatness, contributed to the maintenance and improvement of their literature in the face of the Inquisition itself. Released by the conquest of Granada (1492) from the presence of internal foes, prosperous at home and powerful abroad, Spain naturally rose to high mental dignity; and with all that she gathered from foreign contributions, her writers kept much of their native vein, more free than at first from Orientalism, but still breathing of their own romantic land. A close connection, however, for more than one hundred years with Italy, familiarized the Spanish mind with eminent Italian authors and with the ancient classics. During the seventeenth

century, especially from the middle to the close, the decay of letters kept pace with the decline of Spanish power, until the humiliation of both seemed completed in the reign of Charles II. About that time, however, the Spanish drama received a full development and attained its perfection. In the eighteenth century, under the government of the Bourbons, and partly through the patronage of Philip V., there was a certain revival of literature; but unfortunately, parties divided, and many of the educated Spaniards were so much attracted by French glitter as to turn with disgust from their own writers. The political convulsions, of which Spain has been the victim since the time of Ferdinand VII., have greatly retarded the progress of national literature, and the nineteenth century has thus far produced little which is worthy of mention. The literary history of Spain may be divided into three periods:-- The first, extending from the close of the twelfth century to the beginning of the sixteenth, will contain the literature of the country from the first appearance of the present written language to the early part of the reign of Charles V., and will include the genuinely national literature, and that portion which, by imitating the refinement of Provence or of Italy, was, during the same interval, more or less separated from the popular spirit and genius. The second, the period of literary success and national glory, extending from the beginning of the sixteenth century to the close of the seventeenth, will embrace the literature from the accession of the Austrian family to its extinction. The third, the period of decline, extends from the beginning of the eighteenth to the middle of the nineteenth century, or from the accession of the Bourbon family to the present time.

2. THE LANGUAGE.--The Spanish Christians who, after the Moorish conquest, had retreated to the mountains of Asturias, carried with them the Latin language as they had received it corrupted from the Romans, and still more by the elements introduced into it by the invasion of the northern tribes. In their retreat they found themselves amidst the descendants of the Iberians, the earliest race which had inhabited Spain, who appeared to have shaken off little of the barbarism that had resisted alike the invasion of the Romans and of the Goths, and who retained the original Iberian or Basque tongue. Coming in contact with this, the language of those Christians underwent new modifications; later, when they advanced in their conquest toward the south and the east, and found themselves surrounded by those portions of their race that had remained among the Arabs, known as Muçárabes, they felt that they were in the presence of a civilization and refinement altogether superior to their own. As the Goths, between the fifth and eighth centuries, had received a vast number of words from the Latin, because it was the language of a people with whom they were intimately mingled, and who were much more intellectual and advanced than themselves, so, for the same reason, the whole nation, between the eighth and thirteenth centuries, received another increase of their vocabulary from the Arabic, and accommodated themselves in a remarkable degree to the advanced culture of their southern countrymen, and of their new Moorish subjects. It appears that about the middle of the twelfth century this new dialect had risen to the dignity of being a written language; and it spread gradually through the country. It differed from the pure or the corrupted Latin, and still more from the Arabic; yet it was obviously formed by a union of both, modified by the analogies and spirit of the Gothic constructions and dialects, and containing some remains of the vocabularies of the Iberians, the Celts, the Phoenicians, and of the German tribes, who at different periods had occupied the peninsula. This, like the other languages of Southern Europe, was called originally the Romance, from the prevalence of the Roman and Latin elements. The territories of the Christian Spaniards were divided into three longitudinal sections, having each a separate dialect, arising from the mixture of different primitive elements. The Catalan was spoken in the east, the Castilian in the centre, while the Galician, which originated the Portuguese, prevailed in the west. The Catalan or Limousin, the earliest dialect cultivated in the peninsula, bore a strong resemblance to the Provençal, and when the bards were driven from Provence they found a home in the east of Spain, and numerous celebrated troubadours arose in Aragon and Catalonia. But many elements concurred to produce a decay of the Catalan, and from the beginning of the sixteenth century it rapidly declined. It is still spoken in the Balearic Islands and among the lower classes of some of the eastern parts of Spain, but since the sixteenth century the Castilian alone has been the vehicle of literature. The Castilian dialect followed the fortune of the Castilian arms, until it finally became the established language, even of the most southern provinces, where it had been longest withstood by the Arabic. Its clear, sonorous vowels and the beautiful articulation of its syllables, give it a greater resemblance to the Italian than any other idiom of the peninsula. But amidst this euphony the ear is struck with the sound of the German and Arabic guttural, which is unknown in the other languages in which Latin roots predominate.

PERIOD FIRST.

FROM THE FIRST APPEARANCE OF THE WRITTEN LANGUAGE TO THE EARLY PART OF THE REIGN OF CHARLES V. (1200-1500).

1. EARLY NATIONAL LITERATURE.--There are two traits of the earliest Spanish literature which so peculiarly distinguish it that they deserve to be noticed from the outset--religious faith and knightly loyalty. The Spanish

national character, as it has existed from the earliest times to the present day, was formed in that solemn contest which began when the Moors landed beneath the rock of Gibraltar, and which did not end until eight centuries after, when the last remnants of the race were driven from the shores of Spain. During this contest, especially that part of it when the earliest Spanish poetry appeared, nothing but an invincible faith and a not less invincible loyalty to their own princes could have sustained the Christian Spaniards in their struggles against their infidel oppressors. It was, therefore, a stern necessity which made these two high qualities elements of the Spanish national character, and it is not surprising that we find submission to the church and loyalty to the king constantly breathing through every portion of Spanish literature. The first monument of the Spanish, or, as it was oftener called, the Castilian tongue, the most ancient epic in any of the Romance languages, is "The Poem of the Cid." It consists of more than three thousand lines, and was probably not composed later than the year 1200. This poem celebrates the achievements of the great hero of the chivalrous age of Spain, Rodrigo Diaz (1020-1099), who obtained from five Moorish kings, whom he had vanquished in battle, the title of El Seid, or my lord. He was also called by the Spaniards El Campeador or El Cid Campeador, the Champion or the Lord Champion, and he well deserved the honorable title, for he passed almost the whole of his life in the field against the oppressors of his country, and led the conquering arms of the Christians over nearly a quarter of Spain. No hero has been so universally celebrated by his countrymen, and poetry and tradition have delighted to attach to his name a long series of fabulous achievements, which remind us as often of Amadis and Arthur, as they do of the sober heroes of history. His memory is so sacredly dear to the Spanish nation, that to say "by the faith of Rodrigo," is still considered the strongest vow of loyalty. The poem of the Cid is valuable mainly for the living picture it presents of manners and character in the eleventh century. It is a contemporary and spirited exhibition of the chivalrous times of Spain, given occasionally with an admirable and Homeric simplicity. It is the history of the most romantic hero of Spanish tradition, continually mingled with domestic and personal details, that bring the character of the Cid and his age very near to our own sympathies and interests. The language is the same which he himself spoke--still only imperfectly developed--it expresses the bold and original spirit of the time, and the metre and rhyme are rude and unsettled; but the poem throughout is striking and original, and breathes everywhere the true Castilian spirit. During the thousand years which elapsed from the time of the decay of Greek and Roman culture down to the appearance of the Divine Comedy, no poetry was produced so original in its tone, or so full of natural feeling, picturesqueness, and energy. There are a few other poems, anonymous, like that of the Cid, whose language and style carry them back to the thirteenth century. The next poetry we meet is by a known author, Gonzalo (1220-1260), a priest commonly called Berceo, from the place of his birth. His works, all on religious subjects, amount to more than thirteen thousand lines. His language shows some advance from that in which the Cid was written, but the power and movement of that remarkable legend are entirely wanting in these poems. There is a simple-hearted piety in them, however, that is very attractive, and in some of them a story-telling spirit that is occasionally vivid and graphic. Alfonso, surnamed the Wise (1221-1284), united the crowns of Leon and Castile, and attracted to his court many of the philosophers and learned men of the East. He was a poet closely connected with the Provençal troubadours of his time, and so skilled in astronomy and the occult sciences that his fame spread throughout Europe. He had more political, philosophical, and elegant learning than any man of his age, and made further advances in some of the exact sciences. At one period his consideration was so great, that he was elected Emperor of Germany; but his claims were set aside by the subsequent election of Rudolph of Hapsburg. The last great work undertaken by Alfonso was a kind of code known as "Las Siete Partidas," or The Seven Parts, from the divisions of the work itself. This is the most important legislative monument of the age, and forms a sort of Spanish common law, which, with the decisions under it, has been the basis of Spanish jurisprudence ever since. Becoming a part of the Constitution of the State in all Spanish colonies, it has, from the time Louisiana and Florida were added to the United States, become in some cases the law in our own country. The life of Alfonso was full of painful vicissitudes. He was driven from his throne by factious nobles and a rebellious son, and died in exile, leaving behind him the reputation of being the wisest fool in Christendom. Mariana says of him: "He was more fit for letters than for the government of his subjects; he studied the heavens and watched the stars, but forgot the earth and lost his kingdom." Yet Alfonso is among the chief founders of his country's intellectual fame, and he is to be remembered alike for the great advancement Castilian prose composition made in his hands, for his poetry, for his astronomical tables--which all the progress of modern science has not deprived of their value--and for his great work on legislation, which is at this moment an authority in both hemispheres. Juan Lorenzo Segura (1176-1250) was the author of a poem containing more than ten thousand lines, on the history of Alexander the Great. In this poem the manners and customs of Spain in the thirteenth century are substituted for those of ancient Greece, and the Macedonian hero is invested with all the virtues and even equipments of European chivalry. Don Juan Manuel, (1282-1347), a nephew of Alfonso the Wise, was one of the most turbulent and dangerous Spanish barons of his time. His life was full of intrigue and violence, and for thirty years he disturbed his country by his military and rebellious enterprises. But in all these circumstances, so adverse to

intellectual pursuits, he showed himself worthy of the family in which for more than a century letters had been honored and cultivated. Don Juan is known to have written twelve works, but it is uncertain how many of these are still in existence; only one, "Count Lucanor," has been placed beyond the reach of accident by being printed. The Count Lucanor is the most valuable monument of Spanish literature in the fourteenth century, and one of the earliest prose works in the Castilian tongue, as the Decameron, which appeared about the same time, was the first in the Italian. Both are collections of tales; but the object of the Decameron is to amuse, while the Count Lucanor is the production of a statesman, instructing a grave and serious nation in lessons of policy and morality in the form of apologues. These stories have suggested many subjects for the Spanish stage, and one of them contains the groundwork of Shakspeare's "Taming of the Shrew." Juan Ruiz, arch-priest of Hita (1292-1351), was a contemporary of Don Manuel. His works consist of nearly seven thousand verses, forming a series of stories which appear to be sketches from his own history, mingled with fictions and allegories. The most curious is "The Battle of Don Carnival with Madame Lent," in which Don Bacon, Madame Hungbeef, and a train of other savory personages, are marshaled in mortal combat. The cause of Madame Lent triumphs, and Don Carnival is condemned to solitary imprisonment and one spare meal each day. At the end of forty days the allegorical prisoner escapes, raises new followers, Don Breakfast and others, and re-appears in alliance with Don Amor. The poetry of the arch-priest is very various in tone. In general, it is satirical and pervaded by a quiet humor. His happiest success is in the tales and apologues which illustrate the adventures that constitute a framework for his poetry, which is natural and spirited; and in this, as in other points, he strikingly resembles Chaucer. Both often sought their materials in Northern French poetry, and both have that mixture of devotion and of licentiousness belonging to their age, as well as to the personal character of each. Rabbi Santob, a Jew of Carrion (fl. 1350), was the author of many poems, the most important of which is "The Dance of Death," a favorite subject of the painters and poets of the Middle Ages, representing a kind of spiritual masquerade, in which persons of every rank and age appear dancing with the skeleton form of Death. In this Spanish version it is perhaps more striking and picturesque than in any other--the ghastly nature of the subject being brought into very lively contrast with the festive tone of the verses. This grim fiction had for several centuries great success throughout Europe. Pedro Lopez Ayala (1332-1407), grand chancellor of Castile under four successive sovereigns, was both a poet and a historian. His poem, "Court Rhymes," is the most remarkable of his productions. His style is grave, gentle, and didactic, with occasional expressions of poetic feeling, which seem, however, to belong as much to their age as to their author.

2. OLD BALLADS.--From the thirteenth to the fifteenth century, the period we have just gone over, the courts of the different sovereigns of Europe were the principal centres of refinement and civilization, and this was peculiarly the case in Spain during this period, when literature was produced or encouraged by the sovereigns and other distinguished men. But this was not the only literature of Spain. The spirit of poetry diffused throughout the peninsula, excited by the romantic events of Spanish history, now began to assume the form of a popular literature, and to assert for itself a place which in some particulars it has maintained ever since. This popular literature may be distributed into four different classes. The first contains the Ballads, or the narrative and lyrical poetry of the common people from the earliest times; the second, the Chronicles, or the half-genuine, half-fabulous histories of the great events and heroes of the national annals; the third class comprises the Romances of Chivalry, intimately connected with both the others, and, after a time, as passionately admired by the whole nation; and the fourth includes the Drama, which in its origin has always been a popular and religious amusement, and was hardly less so in Spain than it was in Greece or in France. These four classes compose what was generally most valued in Spanish literature during the latter part of the fourteenth century, the whole of the fifteenth, and much of the sixteenth. They rested on the deep foundations of the national character, and therefore by their very nature were opposed to the Provençal, the Italian, and the courtly schools, which flourished during the same period. The metrical structure of the old Spanish ballad was extremely simple, consisting of eight-syllable lines, which are composed with great facility in other languages as well as the Castilian. Sometimes they were broken into stanzas of four lines each, thence called redondillas, or roundelays, but their prominent peculiarity is that of the asonante, an imperfect rhyme that echoes the same vowel, but not the same final consonant in the terminating syllables. This metrical form was at a later period adopted by the dramatists, and is now used in every department of Spanish poetry. The old Spanish ballads comprise more than a thousand poems, first collected in the sixteenth century, whose authors and dates are alike unknown. Indeed, until after the middle of that century, it is difficult to find ballads written by known authors. These collections, arranged without regard to chronological order, relate to the fictions of chivalry, especially to Charlemagne and his peers, to the traditions and history of Spain, to Moorish adventures, and to the private life and manners of the Spaniards themselves; they belong to the unchronicled popular life and character of the age which gave them birth. The ballads of chivalry, with the exception of those relating to Charlemagne, occupy a less important place than those founded on national subjects. The historical ballads are by

far the most numerous and the most interesting; and of those the first in the order of time are those relating to Bernardo del Carpio, concerning whom there are about forty. Bernardo (fl. 800) was the offspring of a secret marriage between the Count de Saldaña and a sister of Alfonso the Chaste, at which the king was so much offended that he sent the Infanta to a convent, and kept the Count in perpetual imprisonment, educating Bernardo as his own son, and keeping him in ignorance of his birth. The achievements of Bernardo ending with the victory of Roncesvalles, his efforts to procure the release of his father, the falsehood of the king, and the despair and rebellion of Bernardo after the death of the Count in prison, constitute the romantic incidents of these ballads. The next series is that on Fernan Gonzalez, a chieftain who, in the middle of the tenth century, recovered Castile from the Moors and became its first sovereign count. The most romantic are those which describe his being twice rescued from prison by his heroic wife, and his contest with King Sancho, in which he displayed all the turbulence and cunning of a robber baron of the Middle Ages. The Seven Lords of Lara form the next group; some of them are beautiful, and the story they contain is one of the most romantic in Spanish history. The Seven Lords of Lara are betrayed by their uncle into the hands of the Moors, and put to death, while their father, by the basest treason, is confined in a Moorish prison. An eighth son, the famous Mudarra, whose mother is a noble Moorish lady, at last avenges all the wrongs of his race. But from the earliest period, the Cid has been the occasion of more ballads than any other of the great heroes of Spanish history or fable. They were first collected in 1612, and have been continually republished to the present day. There are at least a hundred and sixty of them, forming a more complete series than any other, all strongly marked with the spirit of their age and country. The Moorish ballads form a large and brilliant class by themselves. The period when this style of poetry came into favor was the century after the fall of Granada, when the south, with its refinement and effeminacy, its magnificent and fantastic architecture, the foreign yet not strange manners of its people, and the stories of their warlike achievements, all took strong hold of the Spanish imagination, and made of Granada a fairy land. Of the ballads relating to private life, most of them are effusions of love, others are satirical, pastoral, and burlesque, and many descriptive of the manners and amusements of the people at large; but all of them are true representations of Spanish life. They are marked by an attractive simplicity of thought and expression, united to a sort of mischievous shrewdness. No such popular poetry exists in any other language, and no other exhibits in so great a degree that nationality which is the truest element of such poetry everywhere. The English and Scotch ballads, with which they may most naturally be compared, belong to a ruder state of society, which gave to the poetry less dignity and elevation than belong to a people who, like the Spanish, were for centuries engaged in a contest ennobled by a sense of religion and loyalty, and which could not fail to raise the minds of those engaged in it far above the atmosphere that settled around the bloody feuds of rival barons, or the gross maraudings of border warfare. The great Castilian heroes, the Cid, Bernardo del Carpio, and Pelayo, are even now an essential portion of the faith and poetry of the common people of Spain, and are still honored as they were centuries ago. The stories of Guarinos and of the defeat at Roncesvalles are still sung by the wayfaring muleteers, as they were when Don Quixote heard them on his journey to Toboso, and the showmen still rehearse the same adventures in the streets of Seville, that they did at the solitary inn of Montesinos when he encountered them there.

3. THE CHRONICLES.--As the great Moorish contest was transferred to the south of Spain, the north became comparatively quiet. Wealth and leisure followed; the castles became the abodes of a crude but free hospitality, and the distinctions of society grew more apparent. The ballads from this time began to subside into the lower portions of society; the educated sought forms of literature more in accordance with their increased knowledge and leisure, and their more settled system of social life. The oldest of these forms was that of the Spanish prose chronicles, of which there are general and royal chronicles, chronicles of particular events, chronicles of particular persons, chronicles of travels, and romantic chronicles. The first of these chronicles in the order of time as well as that of merit, comes from the royal hand of Alfonso the Wise, and is entitled "The Chronicle of Spain." It begins with the creation of the world, and concludes with the death of St. Ferdinand, the father of Alfonso. The last part, relating to the history of Spain, is by far the most attractive, and sets forth in a truly national spirit all the rich old traditions of the country. This is not only the most interesting of the Spanish chronicles, but the most interesting of all that in any country mark the transition from its poetical and romantic traditions to the grave exactness of historical truth. The chronicle of the Cid was probably taken from this work. Alfonso XI. ordered the annals of the kingdom to be continued down to his own reign, or through the period from 1252 to 1312. During many succeeding reigns the royal chronicles were continued,--that of Ferdinand and Isabella, by Pulgar, is the last instance of the old style; but though the annals were still kept up, the free and picturesque spirit that gave them life was no longer there. The chronicles of particular events and persons are most of them of little value. Among the chronicles of travels, the oldest one of any value is an account of a Spanish embassy to Tamerlane, the great Tartar potentate. Of the romantic chronicles, the principal specimen is that of Don Roderic, a fabulous account of the reign of King Roderic, the conquest of the country by the Moors, and the first attempts to recover it in the beginning of the eighth century. The

style is heavy and verbose, although upon it Southey has founded much of his beautiful poem of "Roderic, the last of the Goths." This chronicle of Don Roderic, which was little more than a romance of chivalry, marks the transition to those romantic fictions that had already begun to inundate Spain. But the series which it concludes extends over a period of two hundred and fifty years, from the time of Alfonso the Wise to the accession of Charles V. (1221-1516), and is unrivaled in the richness and variety of its poetic elements. In truth, these old Spanish chronicles cannot be compared with those of any other nation, and whether they have their foundation in truth or in fable, they strike their strong roots further down into the deep soil of popular feeling and character. The old Spanish loyalty, the old Spanish religious faith, as both were formed and nourished in long periods of national trial and suffering, everywhere appear; and they contain such a body of antiquities, traditions, and fables as has been offered to no other people; furnishing not only materials from which a multitude of old Spanish plays, ballads, and romances have been drawn, but a mine which has unceasingly been wrought by the rest of Europe for similar purposes, and which still remains unexhausted.

4. ROMANCES OF CHIVALRY.--The ballads originally belonged to the whole nation, but especially to its less cultivated portions. The chronicles, on the contrary, belonged to the knightly classes, who sought in these picturesque records of their fathers a stimulus to their own virtue. But as the nation advanced in refinement, books of less grave character were demanded, and the spirit of poetical invention soon turned to the national traditions, and produced from these new and attractive forms of fiction. Before the middle of the fourteenth century, the romances of chivalry connected with the stories of Arthur and the knights of the Round Table, and Charlemagne and his peers, which had appeared in France two centuries before, were scarcely known in Spain; but after that time they were imitated, and a new series of fictions was invented, which soon spread through the world, and became more famous than, either of its predecessors. This extraordinary family of romances is that of which "Amadis" is the poetical head and type, and this was probably produced before the year 1400, by Vasco de Lobeira, a Portuguese. The structure and tone of this fiction are original, and much more free than those of the French romances that had preceded it. The stories of Arthur and Charlemagne are both somewhat limited in invention by the adventures ascribed to them in the traditions and chronicles, while that of Amadis belongs purely to the imagination, and its sole purpose is to set forth the character of a perfect knight. Amadis is admitted by general consent to be the best of all the old romances of chivalry. The series which followed, founded upon the Amadis, reached the number of twenty-four. They were successively translated into French, and at once became famous. Considering the passionate admiration which this work so long excited, and the influence that, with little merit of its own, it has ever since exercised on the poetry and romance of modern Europe, it is a phenomenon without parallel in literary history. Many other series of romances followed, numbering more than seventy volumes, most of them in folio, and their influence over the Spanish character extended through two hundred years. Their extraordinary popularity may be accounted for, if we remember that, when they first appeared in Spain, it had long been peculiarly the land of knighthood. Extravagant and impossible as are many of the adventures recorded in these books of chivalry, they so little exceeded the absurdities of living men that many persons took the romances themselves to be true histories, and believed them. The happiest work of the greatest genius Spain has produced bears witness on every page to the prevalence of an absolute fanaticism for these books of chivalry, and becomes at once the seal of their vast popularity and the monument of their fate.

5. THE DRAMA.--The ancient theatre of the Greeks and Romans was continued in some of its grosser forms in Constantinople and in other parts of the fallen empire far into the Middle Ages. But it was essentially mythological or heathenish, and, as such, it was opposed by the Christian church, which, however, provided a substitute for what it thus opposed, by adding a dramatic element to its festivals. Thus the manger at Bethlehem, with the worship of the shepherds and magi, was at a very early period solemnly exhibited every year before the altars of the churches, at Christmas, as were the tragical events of the last days of the Saviour's life, during Lent and at the approach of Easter. To these spectacles, dialogue was afterwards added, and they were called, as we have seen, *Mysteries*; they were used successfully not only as a means of amusement, but for the religious edification of an ignorant multitude, and in some countries they have been continued quite down to our own times. The period when these representations were first made in Spain cannot now be determined, though it was certainly before the middle of the thirteenth century, and no distinct account of them now remains. A singular combination of pastoral and satirical poetry indicates the first origin of the Spanish secular drama. Towards the close of the fifteenth century, these pastoral dialogues were converted into real dramas by Enzina, and were publicly represented. But the most important of these early productions is the "Tragi-comedy of Calisto and Meliboea," or "Celestina." Though it can never have been represented, it has left unmistakable traces of its influence on the national drama ever since. It was translated into various languages, and few works ever had a more brilliant success. The great fault of the Celestina is its

shameless libertinism of thought and language; and its chief merits are its life-like exhibition of the most unworthy forms of human character, and its singularly pure, rich, and idiomatic Castilian style. The dramatic writers of this period seem to have had no idea of founding a popular national drama, of which there is no trace as late as the close of the reign of Ferdinand and Isabella.

6. PROVENÇAL LITERATURE IN SPAIN.--When the crown of Provence was transferred, by the marriage of its heir, in 1113, to Berenger, Count of Barcelona, numbers of the Provençal poets followed their liege lady from Arles to Barcelona, and established themselves in her new capital. At the very commencement, therefore, of the twelfth century, Provençal refinement was introduced into the northeastern corner of Spain. Political causes soon carried it farther towards the centre of the country. The Counts of Barcelona obtained, by marriage, the kingdom of Aragon, and soon spread through their new territories many of the refinements of Provence. The literature thus introduced retained its Provençal character till it came in contact with that more vigorous spirit which had been advancing from the northwest, and which afterwards gave its tone to the consolidated monarchy. The poetry of the troubadours in Catalonia, as well as in its native home, belonged much to the court, and the highest in rank and power were earliest and foremost on its lists. From 1209 to 1229, the war against the Albigenses was carried on with extraordinary cruelty and fury. To this sect nearly all the contemporary troubadours belonged, and when they were compelled to escape from the burnt and bloody ruins of their homes, many of them hastened to the friendly court of Aragon, sure of being protected and honored by princes who were at the same time poets. >From the close of the thirteenth century, the songs of the troubadours were rarely heard in the land that gave them birth three hundred years before; and the plant that was not permitted to expand in its native soil, soon perished in that to which it had been transplanted. After the opening of the fourteenth century, no genuinely Provençal poetry appears in Castile, and from the middle of that century it begins to recede from Catalonia and Aragon; or rather, to be corrupted by the hardier dialect spoken there by the mass of the people. The retreat of the troubadours over the Pyrenees, from Aix to Barcelona, from Barcelona to Saragossa and Valencia, is everywhere marked by the wrecks and fragments of their peculiar poetry and cultivation. At length, oppressed by the more powerful Castilian, what remained of the language, that gave the first impulse to poetic feeling in modern times, sank into a neglected dialect.

7. THE INFLUENCE OF ITALIAN LITERATURE IN SPAIN.--The influence of the Italian literature over the Spanish, though less apparent at first, was more deep and lasting than that of the Provençal. The long wars that the Christians of Spain waged against the Moors brought them into closer spiritual connection with the Church of Rome than any other people of modern times. Spanish students repaired to the famous universities of Italy, and returned to Spain, bringing with them the influence of Italian culture; and commercial and political relations still further promoted a free communication of the manners and literature of Italy to Spain. The language, also, from its affinity with the Spanish, constituted a still more important and effectual medium of intercourse. In the reign of John II. (1407-1454), the attempt to form an Italian school in Spain became apparent. This sovereign gathered about him a sort of poetical court, and gave an impulse to refinement that was perceptible for several generations. Among those who interested themselves most directly in the progress of poetry in Spain, the first in rank, after the king himself, was the Marquis of Villena (1384-1434), whose fame rests chiefly on the "Labors of Hercules," a short prose treatise or allegory. First of all the courtiers and poets of this reign, in point of merit, stands the Marquis of Santillana (1398-1458), whose works belong more or less to the Provençal, Italian, and Spanish schools. He was the founder of an Italian and courtly school in Spanish poetry--one adverse to the national school and finally overcome by it, but one that long exercised a considerable sway. Another poet of the court of John II. is Juan de Mena, historiographer of Castile. His principal works are, "The Coronation" and "The Labyrinth," both imitations of Dante. They are of consequence as marking the progress of the language. The principal poem of Manrique the younger, one of an illustrious family of that name, who were poets, statesmen, and soldiers, on the death of his father, is remarkable for depth and truth of feeling. Its greatest charm is its beautiful simplicity, and its merit entitles it to the place it has taken among the most admired portions of the elder Spanish literature.

8. THE CANCIONEROS AND PROSE WRITINGS.--The most distinct idea of the poetical culture of Spain, during the fifteenth century, may be obtained from the "Cancioneros," or collections of poetry, sometimes all by one author, sometimes by many. The oldest of these dates from about 1450, and was the work of Baena. Many similar collections followed, and they were among the fashionable wants of the age. In 1511, Castillo printed at Valencia the "Cancionero General," which contained poems attributed to about a hundred different poets, from the time of Santillana to the period in which it was made. Ten editions of this remarkable book followed, and in it we find the poetry most in favor at the court and with the refined society of Spain. It contains no trace of the earliest poetry of the country, but the spirit of the troubadours is everywhere present; the occasional imitations from the Italian are

more apparent than successful, and in general it is wearisome and monotonous, overstrained, formal, and cold. But it was impossible that such a state of poetical culture should become permanent in a country so full of stirring events as Spain was in the age that followed the fall of Granada and the discovery of America; everything announced a decided movement in the literature of the nation, and almost everything seemed to favor and facilitate it. The prose writers of the fifteenth century deserve mention chiefly because they were so much valued in their own age. Their writings are encumbered with the bad taste and pedantry of the time. Among them are Lucena, Alfonso de la Torre, Pulgar, and a few others.

9. THE INQUISITION.--The first period of the history of Spanish literature, now concluded, extends through nearly four centuries, from the first breathings of the poetical enthusiasm of the mass of the people, down to the decay of the courtly literature in the latter part of the reign of Ferdinand and Isabella. The elements of a national literature which it contains--the old ballads, the old chronicles, the old theatre-- are of a vigor and promise not to be mistaken. They constitute a mine of more various wealth than had been offered under similar circumstances, at so early a period, to any other people; and they give indications of a subsequent literature that must vindicate for itself a place among the permanent monuments of modern civilization. The condition of things in Spain, at the close of the reign of Ferdinand and Isabella, seemed to promise a long period of national prosperity. But one institution, destined to check and discourage all intellectual freedom, was already beginning to give token of its great and blighting power. The Christian Spaniards had from an early period been essentially intolerant. The Moors and the Jews were regarded by them with an intense and bitter hatred; the first as their conquerors, and the last for the oppressive claims which their wealth gave them on numbers of the Christian inhabitants; and as enemies of the Cross, it was regarded as a merit to punish them. The establishment of the Inquisition, therefore, in 1481, which had been so effectually used to exterminate the heresy of the Albigenses, met with little opposition. The Jews and the Moors were its first victims, and with them it was permitted to deal unchecked by the power of the state. But the movements of this power were in darkness and secrecy. From the moment when the Inquisition laid its grasp on the object of its suspicions to that of his execution, no voice was heard to issue from its cells. The very witnesses it summoned were punished with death if they revealed the secrets of its dread tribunals; and often of the victim nothing was known but that he had disappeared from his accustomed haunts never again to be seen. The effect was appalling. The imaginations of men were filled with horror at the idea of a power so vast, so noiseless, constantly and invisibly around them, whose blow was death, but whose step could neither be heard nor followed amidst the gloom into which it retreated. From this time, Spanish intolerance took that air of sombre fanaticism which it never afterwards lost. The Inquisition gradually enlarged its jurisdiction, until none was too humble to escape its notice, or too high to be reached by its power. From an inquiry into the private opinions of individuals to an interference with books and the press was but a step, and this was soon taken, hastened by the appearance and progress of the Reformation of Luther.

PERIOD SECOND.

FROM THE ACCESSION OF THE AUSTRIAN FAMILY TO ITS EXTINCTION (1500-1700).

1. THE EFFECT OF INTOLERANCE ON LETTERS.--The central point in Spanish history is the capture of Granada. During nearly eight centuries before that event, the Christians of Spain were occupied with conflicts that developed extraordinary energies, till the whole land was filled to overflowing with a power which had hardly yet been felt in Europe. But no sooner was the last Moorish fortress yielded up, than this accumulated flood broke loose and threatened to overspread the best portions of the civilized world. Charles the Fifth, grandson of Ferdinand and Isabella, inherited not only Spain, but Naples, Sicily, and the Low Countries. The untold wealth of the Indies was already beginning to pour into his treasury. He was elected Emperor of Germany, and he soon began a career of conquest such as had not been imagined since the days of Charlemagne. Success and glory ever waited for him as he advanced, and this brilliant aspect seemed to promise that Spain would ere long be at the head of an empire more extensive than the Roman. But a moral power was at work, destined to divide Europe anew, and the monk Luther was already become a counterpoise to the military master of so many kingdoms. During the hundred and thirty years of struggle, that terminated with the peace of Westphalia, though Spain was far removed from the fields where the most cruel battles of the religious wars were fought, the interest she took in the contest may be seen from the presence of her armies in every part of Europe where it was possible to assail the great movement of the Reformation. In Spain, the contest with Protestantism was of short duration. By successive decrees the church ordained that all persons who kept in their possession books infected with the doctrines of Luther, and even all who failed to denounce such persons, should be excommunicated, and subjected to cruel and degrading punishments. The

power of the Inquisition was consummated in 1546, when the first "Index Expurgatorius" was published in Spain. This was a list of the books that all persons were forbidden to buy, sell, or keep possession of, under penalty of confiscation and death. The tribunals were authorized and required to proceed against all persons supposed to be infected with the new belief, even though they were cardinals, dukes, kings, or emperors,--a power more formidable to the progress of intellectual improvement, than had ever before been granted to any body of men, civil or ecclesiastical. The portentous authority thus given was freely exercised. The first public *auto da fé* of Protestants was held in 1559, and many others followed. The number of victims seldom exceeded twenty burned at one time, and fifty or sixty subjected to the severest punishments; but many of those who suffered were among the active and leading minds of the age. Men of learning were particularly obnoxious to suspicion, nor were persons of the holiest lives beyond its reach if they showed a tendency to inquiry. So effectually did the Inquisition accomplish its purpose, that, from the latter part of the reign of Philip II., the voice of religious dissent was scarcely heard in the land. The great body of the Spanish people rejoiced alike in their loyalty and their orthodoxy, and the few who differed from the mass of their fellow-subjects were either silenced by their fears, or sunk away from the surface of society. From that time down to its overthrow, in 1808, this institution was chiefly a political engine. The result of such extraordinary traits in the national character could not fail to be impressed upon the literature. Loyalty, which had once been so generous an element in the Spanish character and cultivation, was now infected with the ambition of universal empire, and the Christian spirit which gave an air of duty to the wildest forms of adventure in its long contest with misbelief, was now fallen into a bigotry so pervading that the romances of the time are full of it, and the national theatre becomes its grotesque monument. Of course the literature of Spain produced during this interval--the earlier part of which was the period of the greatest glory the country ever enjoyed--was injuriously affected by so diseased a condition of the national mind. Some departments hardly appeared at all, others were strangely perverted, while yet others, like the drama, ballads, and lyrical verse, grew exuberant and lawless, from the very restraints imposed on the rest. But it would be an error to suppose that these peculiarities in Spanish literature were produced by the direct action either of the Inquisition or of the government. The foundations of this dark work were laid deep and sure in the old Castilian character. It was the result of the excess and misdirection of that very Christian zeal which fought so gloriously against the intrusion of Mohammedanism into Spain, and of that loyalty which sustained the Spanish princes so faithfully through the whole of that terrible contest. This state of things, however, involved the ultimate sacrifice of the best elements of the national character. Only a little more than a century elapsed, before the government that had threatened the world with a universal empire, was hardly able to repel invasion from abroad or maintain its subjects at home. The vigorous poetical life which had been kindled through the country in its ages of trial and adversity, was evidently passing out of the whole Spanish character. The crude wealth from their American possessions sustained, for a century longer, the forms of a miserable political existence; but the earnest faith, the loyalty, the dignity of the Spanish people were gone, and little remained in their place but a weak subserviency to unworthy masters of state, and a low, timid bigotry in whatever related to religion. The old enthusiasm faded away, and the poetry of the country, which had always depended more on the state of the popular feeling than any other poetry of modern times, faded and failed with it.

2. INFLUENCE OF ITALY ON SPANISH LITERATURE.--The political connection between Spain and Italy in the early part of the sixteenth century, and the superior civilization and refinement of the latter country, could not fail to influence Spanish literature. Juan Boscan (d. 1543) was the first to attempt the proper Italian measures as they were then practiced. He established in Spain the Italian iambic, the sonnet, and canzone of Petrarch, the *terza rima* of Dante, and the flowing octaves of Ariosto. As an original poet, the talents of Boscan were not of the highest order. Garcilasso de la Vega (1503-1536), the contemporary and friend of Boscan, united with him in introducing an Italian school of poetry, which has been an important part of Spanish literature ever since. The poems of Garcilasso are remarkable for their gentleness and melancholy, and his versification is uncommonly sweet, and well adapted to the tender and sad character of his poetry. The example set by Boscan and Garcilasso so well suited the demands of the age, that it became as much a fashion at the court of Charles V. to write in the Italian manner, as it did to travel in Italy, or make a military campaign there. Among those who did most to establish the Italian influence in Spanish literature was Diego de Mendoza (1503-1575), a scholar, a soldier, a poet, a diplomatist, a statesman, a historian, and a man who rose to great consideration in whatever he undertook. One of his earliest works, "Lazarillo de Tormes," the auto-biography of a boy, little Lazarus, was written with the object of satirizing all classes of society under the character of a servant, who sees them in undress behind the scenes. The style of this work is bold, rich, and idiomatic, and some of its sketches are among the most fresh and spirited that can be found in the whole class of prose works of fiction. It has been more or less a favorite in all languages, down to the present day, and was the foundation of a class of fictions which the "Gil Blas" of Le Sage has made famous throughout the world. Mendoza, after having filled many high offices under Charles V., when Philip ascended the throne, was, for some slight

offense, banished from the court as a madman. In the poems which he occasionally wrote during his exile, he gave the influence of his example to the new form introduced by Boscan and Garcilasso. At a later period he occupied himself in writing some portions of the history of his native city, Granada, relating to the rebellion of the Moors (1568-1570). Familiar with everything of which he speaks, there is a freshness and power in his sketches that carry us at once into the midst of the scenes and events he describes. "The War of Granada" is an imitation of Sallust. Nothing in the style of the old chronicles is to be compared to it, and little in any subsequent period is equal to it for manliness, vigor, and truth.

3. HISTORY.--The imperfect chronicles of the age of Charles V. were surpassed in importance by the histories or narratives, more or less ample, of the discoverers of the western world, all of which were interesting from their subject and their materials. First in the foreground of this picturesque group stands Fernando Cortes (1485-1554), of whose voluminous documents the most remarkable were five long reports to the Emperor on the affairs of Mexico. The marvelous achievements of Cortes, however, were more fully recorded by Gomara (b. 1510), the oldest of the regular historians of the New World. His principal works are the "History of the Indies," chiefly devoted to Columbus and the conquest of Peru, and the "Chronicle of New Spain," which is merely the history and life of Cortes, under which title it has since been republished. The style of Gomara is easy and flowing, but his work was of no permanent authority, in consequence of the great and frequent mistakes into which he was led by those who were too much a part of the story to relate it fairly. These mistakes Bernal Diaz, an old soldier who had been long in the New World, set himself at work to correct, and the book he thus produced, with many faults, has something of the honest nationality, and the fervor and faith of the old chronicles. Among those who have left records of their adventures in America, one of the most considerable is Oviedo (1478-1557), who for nearly forty years devoted himself to the affairs of the Spanish colonies in which he resided. His most important work is "The Natural and General History of the Indies," a series of accounts of the natural condition, the aboriginal inhabitants, and the political affairs of the Spanish provinces in America, as they stood in the middle of the sixteenth century. It is of great value as a vast repository of facts, and not without merit as a composition. In Las Casas (1474-1566) Oviedo had a formidable rival, who, pursuing the same course of inquiries in the New World, came to conclusions quite opposite. Convinced from his first arrival in Hispaniola that the gentle nature and slight frames of the natives were subjected to toil and servitude so hard that they were wasting away, he thenceforth devoted his life to their emancipation. He crossed the Atlantic six times, in order to persuade the government of Charles V. to ameliorate their condition, and always with more or less success. His earliest work, "A Short Account of the Ruin of the Indies," was a tract in which the sufferings and wrongs of the Indians were doubtless much overstated by the zeal of its author, but it awakened all Europe to a sense of the injustice it set forth. Other short treatises followed, but none ever produced so deep and solemn an effect on the world. The great work of Las Casas, however, still remains unedited.--"A General History of the Indies from 1492 to 1525." Like his other works, it shows marks of haste and carelessness, but its value is great, notwithstanding his too fervent zeal for the Indians. It is a repository to which Herrera, and, through him, all subsequent historians of the Indies resorted for materials, and without which the history of the earliest period of the Spanish settlements in America cannot even now be written. There are numerous other works on the discovery and conquest of America, but they are of less consequence than those already mentioned. As a class, they resemble the old chronicles, though they announce the approach of the more regular form of history.

4. THE DRAMA.--Before the middle of the sixteenth century, the Mysteries were the only dramatic exhibitions of Spain. They were upheld by ecclesiastical power, and the people, as such, had no share in them. The first attempt to create a popular drama was made by Lope de Rueda, a goldbeater of Seville, who flourished between 1544 and 1567, and who became both a dramatic writer and an actor. His works consist of comedies, pastoral colloquies, and dialogues in prose and verse. They were written for representation, and were acted before popular audiences by a strolling company led about by Lope de Rueda himself. Naturalness of thought, the most easy, idiomatic Castilian terms of expression, a good-humored gayety, a strong sense of the ridiculous, and a happy imitation of the tone and manners of common life, are the prominent characteristics of these plays, and their author was justly reckoned by Cervantes and Lope de Vega as the true founder of the popular national theatre. The ancient simplicity and severity of the Spanish people had now been superseded by the luxury and extravagance which the treasures of America had introduced; the ecclesiastical fetters imposed on opinion and conscience had so connected all ideas of morality and religion with inquisitorial severity, that the mind longed for an escape, and gladly took refuge in amusements where these unwelcome topics had no place. So far, the number of dramas was small, and these had been written in forms so different and so often opposed to each other as to have little consistency or authority, and to offer no sufficient indication of the channel in which the dramatic literature of the country was at last to flow. It was reserved for Lope

de Vega to seize, with the instinct of genius, the crude and unsettled elements of the existing drama, and to form from them, and from the abundant and rich inventions of his own overflowing fancy, a drama which, as a whole, was unlike anything that had preceded it, and yet was so truly national and rested so faithfully on tradition, that it was never afterwards disturbed, till the whole literature of which it was so brilliant a part was swept away with it. Lope de Vega (1562-1635) early manifested extraordinary powers and a marvelous poetic genius. After completing his education, he became secretary to the Duke of Alba. Engaging in an affair of honor, in which he dangerously wounded his adversary, he was obliged to fly and to remain several years in exile. On his return to Madrid, religious and patriotic zeal induced him to join the expedition of the Invincible Armada for the invasion of England, and he was one of the few who returned in safety to his native country. Domestic afflictions soon after determined him to renounce the world and to enter holy orders. Notwithstanding this change, he continued to cultivate poetry to the close of his long life, with so wonderful a facility that a drama of more than two thousand lines, intermingled with sonnets and enlivened with all kinds of unexpected incidents and intrigues, frequently cost him no more than the labor of a single day. He composed more rapidly than his amanuensis could transcribe, and the managers of the theatres left him no time to copy or correct his compositions; so that his plays were frequently represented within twenty-four hours after their first conception. His fertility of invention and his talent for versification are unparalleled in the history of literature. He produced two thousand two hundred dramas, of which only about five hundred were printed. His other poems were published at Madrid in 1776, in twenty-one volumes quarto. His prodigious literary labors produced him nearly as much money as glory; but his liberality to the poor and his taste for pomp soon dissipated his wealth, and after living in splendor, he died almost in poverty. No poet has ever in his lifetime enjoyed such honors. Eager crowds surrounded him whenever he showed himself abroad, and saluted him with the appellation of *Prodigy of Nature*. Every eye was fixed on him, and children followed him with cries of pleasure. He was chosen President of the Spiritual College at Madrid, and the pope conferred upon him high marks of distinction, not only for his poetical talents, but for his enthusiastic zeal for the interests of religion. He was also appointed one of the *familiars* of the Inquisition, an office to which the highest honor was at that time attached. The fame of Lope de Vega rests upon his dramas alone, and in these there is no end to their diversity, the subjects varying from the deepest tragedy to the broadest farce, from the solemn mysteries of religion to the loosest frolics of common life, and the style embracing every variety of tone and measure known to the language of the country. In these dramas, too, the sacred and secular, the tragic and comic, the heroic and vulgar, all run into each other, until it seems that there is neither separate form nor distinction attributed to any of them. The first class of plays that Lope seems to have invented, and the one which still remains most popular in Spain, are *dramas of the cloak and sword*, so called from the picturesque national dress of the fashionable class of society from which the principal characters were selected. Their main principle is gallantry. The story is almost always involved and intriguing, accompanied with an under-plot and parody on the principal parties, formed by the servants and other inferior persons. The action is chiefly carried on by lovers full of romance, or by low characters, whose wit is mixed with buffoonery. To the second class belong the historical or heroic dramas. Their characters are usually kings, princes, and personages in the highest rank of life, and their prevailing tone is imposing and tragical. A love story, filled as usual with hair-breadth escapes, jealous quarrels, and questions of honor, runs through nearly every one of them; but truth, in regard to facts, manners, and customs, is entirely disregarded. The third class contains the dramas founded on the manners of common life; of these there are but few. Lope de Vega would doubtless have confined himself to these three forms, but that the interference of the church for a time forbade the representations of the secular drama, and he therefore turned his attention to the composition of religious plays. The subjects of these are taken from the Scriptures, or lives of the saints, and they approach so near to the comedies of intrigue, that but for the religious passages they would seem to belong to them. His *"Sacramental Acts"* was another form of the religious drama which was still more grotesque than the last. They were performed in the streets during the religious ceremonies of the Corpus Christi. The spiritual dramas of Lope de Vega are a heterogeneous mixture of bright examples of piety, according to the views of the age and country, and the wildest flights of imagination, combined into a whole by a fine poetic spirit. The variety and inexhaustible fertility of the genius of this writer constituted the corner-stone of his success, and did much to make him the monarch of the stage while he lived, and the great master of the national theatre ever since. But there were other circumstances that aided in producing these surprising results, the first of which is the principle, that runs through all his plays, of making all other interests subordinate to the interest of the story. For this purpose he used dialogue rather to bring out the plot than the characters, and to this end also he sacrificed dramatic probabilities and possibilities, geography, history, and a decent morality. Another element which he established in the Spanish drama, was the comic under-plot, and the witty *gracioso* or droll, the parody of the heroic character of the play. Much of his power over the people of his time is also to be found in the charm of his versification, which was always fresh, flowing, and effective. The success of Lope de Vega was in proportion to his rare powers. For the forty or fifty years that he wrote, nobody else was willingly heard upon the stage, and his

dramas were performed in France, Italy, and even in Constantinople. His extraordinary talent was nearly allied to improvisation, and it required but a little more indulgence of his feeling and fancy to have made him not only an improvisator, but the most remarkable one that ever lived. Nearly thirty dramatic writers followed Lope de Vega, but the school was not received with universal applause. In its gross extravagances and irregularities, severe critics found just cause for complaint. The opposition of the church to the theatre, however, which had been for a time so formidable, had at last given way, and from the beginning of the seventeenth century, the popular drama was too strong to be subjected either to classical criticism or ecclesiastical rule. Calderon de la Barca (1600-1681) was the great successor and rival of Lope de Vega. At the age of thirty-two, his reputation as a poet was an enviable one. Soon after, when the death of Lope de Vega left the theatre without a master, he was formally attached to the court for the purpose of furnishing dramas to be represented in the royal theatres. In 1651, he followed the example of Lope de Vega and other men of letters of his time, by entering a religious brotherhood. Many ecclesiastical dignities were conferred upon him, but he did not, however, on this account intermit his dramatic labors, but continued through his long life to write for the theatres, for the court, and for the churches. Many dramas of Calderon were printed without his consent, and many were attributed to him which he never wrote. His reputation as a dramatic poet rests on the seventy-three sacramental *autos*, and one hundred and eight dramas, which are known to be his. The *autos*, from the twelfth and thirteenth centuries, were among the favorite amusements of the people; but in the age of Calderon they were much increased in number and importance; they had become attractive to all classes of society, and were represented with great luxury and at great expense in the streets of all the larger cities. A procession, in which the king and court appeared, preceded by the fantastic figures of giants, with music, banners, and religious shows, followed the sacrament through the street, and then, before the houses of the great officers of state, the *autos* were performed; the giants made sport for the multitude, and the entertainment concluded with music and dancing. Sometimes the procession was headed by the figure of a monster called the *Tarasca*, half serpent in form, borne by men concealed in its cumbrous bulk, and surmounted by another figure representing the woman of Babylon, --all so managed as to fill with wonder and terror the country people who crowded round it, and whose hats and caps were generally snatched away by the grinning beast, and became the lawful prize of his conductors. This exhibition was at first rude and simple, but under the influence of Lope de Vega it became a well-defined, popular entertainment, divided into three parts, each distinct from the other. First came the *loa*, a kind of prologue; then the *entremes*, a kind of interlude or farce; and last, the *autos sacramentales*, or sacred acts themselves, which were more grave in their tone, though often whimsical and extravagant. The seventy-three *autos* written by Calderon are all allegorical, and by the music and show with which they abound, they closely approach to the opera. They are upon a great variety of subjects, and indicate by their structure that elaborate and costly machinery must have been used in their representation. They are crowded with such personages as Sin, Death, Judaism, Mercy, and Charity, and the purpose of all is to set forth the Real Presence in the Eucharist. The great enemy of mankind of course fills a large place in them. Almost all of them contain passages of striking lyrical poetry. The secular plays of Calderon can scarcely be classified, for in many of them even more than two forms of the drama are mingled. To the principle of making a story that should sustain the interest throughout, Calderon sacrificed almost as much as Lope de Vega did. To him facts are never obstacles. Coriolanus is a general under Romulus; the Danube is placed between Sweden and Russia; and Herodotus is made to describe America. But in these dramas we rarely miss the interest and charm of a dramatic story, which provokes the curiosity and enchains the attention. In the dramas of the Cloak and Sword the plots of Calderon are intricate. He excelled in the accumulation of surprises, in plunging his characters into one difficulty after another, maintaining the interest to the last. In style and versification Calderon has high merits, though they are occasionally mingled with the defects of his age. He added no new forms to dramatic composition, nor did he much modify those which had been already settled by Lope de Vega; but he showed greater skill in the arrangement of his incidents, and more poetry in the structure and tendency of his dramas. To his elevated tone we owe much of what distinguishes Calderon from his predecessors, and nearly all that is most individual in his merits and defects. In carrying out his theory of the national drama, he often succeeds and often fails; and when he succeeds, he sets before us an idealized drama, resting on the noblest elements of the Spanish national character, and one which, with all its unquestionable defects, is to be placed among the extraordinary phenomena of modern poetry. The most brilliant period of the Spanish drama falls within the reign of Philip II., which extended from 1620 to 1665, and embraced the last years of the life of Lope de Vega, and the thirty most fortunate years of the life of Calderon. After this period a change begins to be apparent; for the school of Lope was that of a drama in the freshness and buoyancy of youth, while that of Calderon belongs to the season of its maturity and gradual decay. The many writers who were either contemporary with Lope de Vega and Calderon, or who succeeded them, had little influence on the character of the theatre. This, in its proper outlines, always remained as it was left by these great masters, who maintained an almost unquestioned control over it while they lived, and at their death left a character impressed upon it, which it never lost till it ceased to exist

altogether. When Lope de Vega first appeared as a dramatic writer at Madrid, the only theatres he found were two unsheltered courtyards, which depended on such companies of strolling players as occasionally visited the capital. Before he died, there were, besides the court-yards in Madrid, several theatres of great magnificence in the royal palaces, and many thousand actors; and half a century later, the passion for dramatic representations had spread into every part of the kingdom, and there was hardly a village that did not possess a theatre. During the whole of the successful period of the drama, the representations took place in the daytime. Dancing was early an important part of the theatrical exhibitions in Spain, even of the religious, and its importance has continued down to the present day. From the earliest antiquity it was the favorite amusement of the rude inhabitants of the country, and in modern times dancing has been to Spain what music has been to Italy, a passion with the whole population. In all its forms and subsidiary attractions, the Spanish drama was essentially a popular entertainment, governed by the popular will. Its purpose was to please all equally, and it was not only necessary that the play should be interesting; it was, above all, required that it should be Spanish, and, therefore, whatever the subject might be, whether actual or mythological, Greek or Roman, the characters were always represented as Castilian, and Castilian of the seventeenth century. It was the same with their costumes. Coriolanus appeared in the costume of Don Juan of Austria, and Aristotle came on the stage dressed like a Spanish Abbé, with curled periwig and buckles on his shoes. The Spanish theatre, therefore, in many of its characteristics and attributes, stands by itself. It is entirely national, it takes no cognizance of ancient example, and it borrowed nothing from the drama of France, Italy, or England. Founded on traits of national character, with all its faults, it maintained itself as long as that character existed in its original attributes, and even now it remains one of the most striking and interesting portions of modern literature.

5. ROMANCES AND TALES.--Hitherto the writers of Spain had been little known, except in their own country; but we are now introduced to an author whose fame is bounded by no language and no country, and whose name is not alone familiar to men of taste and learning, but to almost every class of society. Cervantes (1547-1616), though of noble family, was born in poverty and obscurity, not far from Madrid. When he was about twenty-one years of age, he attached himself to the person of Cardinal Aquaviva, with whom he visited Rome. He soon after enlisted as a common soldier in the war against the Turks, and, in the great battle of Lepanto, 1572, he received a wound which deprived him of the use of his left hand and arm, and obliged him to quit the military profession. On his way home he was captured by pirates, carried to Algiers, and sold for a slave. Here he passed five years full of adventure and suffering. At length his ransom was effected, and he returned home to find his father dead, his family reduced to a still more bitter poverty by his ransom, and himself friendless and unknown. He withdrew from the world to devote himself to literature, and to gain a subsistence by his pen. One of the first productions of Cervantes was the pastoral romance of "Galatea." This was followed by several dramas, the principal of which is founded on the tragical fate of Numantia. Notwithstanding its want of dramatic skill, it may be cited as a proof of the author's poetical talent, and as a bold effort to raise the condition of the stage. After many years of poverty and embarrassment, in 1605, when Cervantes had reached his fiftieth year, he published the first part of "Don Quixote." The success of this effort was incredible. Many thousand copies are said to have been printed during the author's lifetime. It was translated into various languages, and eulogized by every class of readers, yet it occasioned little improvement in the pecuniary circumstances of the author. In 1615, he published the second part of the same work, and, in the year following, his eventful and troubled life drew to its close. "Don Quixote," of all the works of all modern times, bears most deeply the impression of the national character it represents, and it has in return enjoyed a degree of national favor never granted to any other. The object of Cervantes in writing it was, as he himself declares, "to render abhorred of men the false and absurd stories contained in books of chivalry." The fanaticism for these romances was so great in Spain during the sixteenth century, and they were deemed so noxious, that the burning of all copies extant in the country was earnestly asked for by the Cortes. To destroy a passion that had struck its roots so deeply in the character of all classes of men, to break up the only reading which, at that time, was fashionable and popular, was a bold undertaking, yet one in which Cervantes succeeded. No book of chivalry was written after the appearance of "Don Quixote;" and from that time to the present they have been constantly disappearing, until they are now among the rarest of literary curiosities,--a solitary instance of the power of genius to destroy, by a well-timed blow, an entire department of literature. In accomplishing this object, Cervantes represents "Don Quixote" as a country gentleman of La Mancha, full of Castilian honor and enthusiasm, but so completely crazed by reading the most famous books of chivalry, that he not only believes them to be true, but feels himself called upon to become the impossible knight-errant they describe, and actually goes forth into the world, like them, to defend the oppressed and avenge the injured. To complete his chivalrous equipment, which he had begun by fitting up for himself a suit of armor strange to his century, he took an esquire out of his neighborhood, a middle-aged peasant, ignorant, credulous, and good-natured, but shrewd enough occasionally to see the folly of their position. The two sally forth from their native village in search of adventures, of which the excited imagination of the knight-- turning windmills into giants,

solitary turrets into castles, and galley slaves into oppressed gentlemen--finds abundance wherever he goes, while the esquire translates them all into the plain prose of truth, with a simplicity strikingly contrasted with the lofty dignity and the magnificent illusions of the knight. After a series of ridiculous discomfitures, the two are at last brought home like madmen to their native village. Ten years later, Cervantes published the second part of Don Quixote, which is even better than the first. It shows more vigor and freedom, the invention and the style of thought are richer, and the finish more exact. Both Don Quixote and Sancho are brought before us like such living realities, that at this moment the figures of the crazed, gaunt, and dignified knight, and of his round, selfish, and most amusing esquire, dwell bodied forth in the imagination of more, among all conditions of men throughout Christendom, than any other of the creations of human talent. In this work Cervantes has shown himself of kindred to all times and all lands, to the humblest as well as to the highest degrees of cultivation, and he has received in return, beyond all other writers, a tribute of sympathy and admiration from the universal spirit of humanity. This romance, which Cervantes threw so carelessly from him, and which he regarded only as a bold effort to break up the absurd taste for the fancies of chivalry, has been established by an uninterrupted and an unquestioned success ever since, as the oldest classical specimen of romantic fiction, and as one of the most remarkable monuments of modern genius. But Cervantes is entitled to a higher glory: it should be borne in mind that this delightful romance was not the result of a youthful exuberance of feeling, and a happy external condition; with all its unquenchable and irresistible humor, its bright views, and its cheerful trust in goodness and virtue, it was written in his old age, at the conclusion of a life which had been marked at nearly every step with struggle, disappointment, and calamity; it was begun in prison, and finished when he felt the hand of death pressing cold and heavy upon his heart. If this be remembered as we read, we may feel what admiration and reverence are due, not only to the living power of Don Quixote, but to the character and genius of Cervantes; if it be forgotten or underrated, we shall fail in regard to both. The first form of romantic fiction which succeeded the romances of chivalry was that of prose pastorals, which was introduced into Spain by Montemayor, a Portuguese, who lived, probably, between 1520 and 1561. To divert his mind from the sorrow of an unrequited attachment, he composed a romance entitled "Diana," which, with numerous faults, possesses a high degree of merit. It was succeeded by many similar tales. The next form of Spanish prose fiction, and the one which has enjoyed a more permanent regard, is that known as tales in the *_gusto picaresco_*, or style of the rogues. As a class, they constitute a singular exhibition of character, and are as separate and national as anything in modern literature. The first fiction of this class was the "Lazarillo de Tormes" of Mendoza, already spoken of, published in 1554,--a bold, unfinished sketch of the life of a rogue from the very lowest condition of society. Forty-five years afterwards this was followed by the "Guzman de Alfarache" of Aleman, the most ample portraiture of its class to be found in Spanish literature. It is chiefly curious and interesting because it shows us, in the costume of the times, the life of an ingenious Machiavelian rogue, who is never at a loss for an expedient, and who speaks of himself always as an honest man. The work was received with great favor, and translated into all the languages of Europe. But the work which most plainly shows the condition of social life which produced this class of tales, is the "Life of Estevanillo Gonzalez," first printed in 1646. It is the autobiography of a buffoon who was long in the service of Piccolomini, the great general of the Thirty Years' War. The brilliant success of these works at home and abroad subsequently produced the Gil Blas of Le Sage, an imitation more brilliant than any of the originals that it followed. The serious and historical fictions produced in Spain were limited in number, and with few exceptions deserved little favor. Short stories or tales were more successful than any other form of prose-fiction during the latter part of the sixteenth, and the whole of the seventeenth century. They belonged to the spirit of their own times and to the state of society in which they appeared. Taken together, the number of fictions in Spanish literature is enormous; but what is more remarkable than their multitude, is the fact that they were produced when the rest of Europe, with a partial exception in favor of Italy, was not yet awakened to corresponding efforts of the imagination. The creative spirit, however, soon ceased, and a spirit of French imitation took its place.

6. HISTORICAL NARRATIVE POEMS.--Epic poetry, from its dignity and pretensions, is almost uniformly placed at the head of the different divisions of a nation's literature. But in Spain little has been achieved in this department that is worthy of memory. The old half-epic poem of the Cid--the first attempt at narration in the languages of modern Europe that deserves the name--is one of the most remarkable outbreaks of poetical and national enthusiasm on record. The few similar attempts that followed during the next three centuries, while they serve to mark the progress of Spanish culture, show little of the power manifested in the Cid. In the reign of Charles V., the poets of the time evidently imagined that to them was assigned the task of celebrating the achievements in the Old World and in the New, which had raised their country to the first place among the powers of Europe. There were written, therefore, during this and the succeeding reigns, an extraordinary number of epic and narrative poems on subjects connected with ancient and modern Spanish glory, but they all belong to patriotism rather than to poetry; the best of these come with equal pretension into the province of history. There is but one long poem of this class which

obtained much regard when it appeared, and which has been remembered ever since, the "Araucana." The author of this work, Ercilla (1533-1595), was a page of Philip the Second, and accompanied him to England on the occasion of his marriage with Mary. News having arrived that the Araucans, a tribe of Indians in Chili, had revolted against the Spanish authority, Ercilla joined the adventurous expedition that was sent out to subdue them. In the midst of his exploits he conceived the plan of writing a narrative of the war in the form of an epic poem. After the tumult of a battle, or the fatigues of a march, he devoted the hours of the night to his literary labors, wielding the pen and sword by turns, and often obliged to write on pieces of skin or scraps of paper so small as to contain only a few lines. In this poem the descriptive powers of Ercilla are remarkable, and his characters, especially those of the American chiefs, are drawn with force and distinctness. The whole poem is pervaded by that deep sense of loyalty, always a chief ingredient in Spanish honor and heroism, and which, in Ercilla, seems never to have been chilled by the ingratitude of the master to whom he devoted his life, and to whose glory he consecrated this poem. These narrative and heroic poems continued long in favor in Spain, and they retained to the last those ambitious feelings of national greatness which had given them birth. Devoted to the glory of their country, they were produced when the national character was on the decline; and as they sprang more directly from that character, and depended more on its spirit than did the similar poetry of any other people in modern times, so they now visibly declined with them.

7. LYRIC POETRY.--The number of authors in the various classes of Spanish lyric poetry, whose works have been preserved between the beginning of the reign of Charles V. and the end of that of the last of his race, is not less than a hundred and twenty; but the number of those who were successful is small. A little of what was written by the Argensolas, more of Herrera, and nearly the whole of the Bachiller de la Torre and Luis de Leon, with occasional efforts of Lope de Vega and Quevedo, and single odes of other writers, make up what gives its character to the graver and less popular portion of Spanish lyric poetry. Their writings form a body of poetry, not large, but one that from its living, national feeling on the one side, and its dignity on the other, may be placed without question among the most successful efforts of modern literature. The Argensolas were two brothers who flourished in Spain at the beginning of the seventeenth century; both occupy a high place in this department of poetry. The original poems of Luis de Leon (1528-1591) fill no more than a hundred pages, but there is hardly a line of them which has not its value, and the whole taken together are to be placed at the head of Spanish lyric poetry. They are chiefly religious, and the source of their inspiration is the Hebrew Scriptures. Herrera (1534-1597) is the earliest classic ode writer in modern literature, and his poems are characterized by dignity of language, harmony of versification, and elevation of ideas. Luis de Leon and Herrera are considered the two great masters of Spanish lyric poetry. Quevedo (1580-1645) was successful in many departments of letters. The most prominent characteristics of his verse are a broad, grotesque humor, and a satire often imitated from the ancients. His amatory and religious poems are occasionally marked by extreme beauty and tenderness. The works upon which his reputation principally rests, however, are in prose, and belong to theology and metaphysics rather than to elegant literature. They were produced during the weary years of an unjust imprisonment. His prose satires are the most celebrated of his compositions, and by these he will always be remembered throughout the world. In the early part of the seventeenth century there arose a sect who attempted to create a new epoch in Spanish poetry, by affecting an exquisite refinement, and who ran into the most ridiculous extravagance and pedantry. The founder of this "cultivated style," as it was called, was Luis Gongora (1561-1627), and his name, like that of Marini in Italy, has become a byword in literature. The style he introduced became at once fashionable at court, and it struck so deep root in the soil of the whole country, that it has not yet been completely eradicated. The most odious feature of this style is, that it consists entirely of metaphors, so heaped upon one another that it is as difficult to find out the meaning hidden under their grotesque mass, as if it were a series of confused riddles. The success of this style was very great, and inferior poets bowed to it throughout the country.

8. SATIRICAL AND OTHER POETRY.--Satirical poetry never enjoyed a wide success in Spain. The nation has always been too grave and dignified to endure the censure it implied. It was looked upon with, distrust, and thought contrary to the conventions of good society to indulge in its composition. Neither was elegiac poetry extensively cultivated. The Spanish temperament was little fitted to the subdued, simple, and gentle tone of the proper elegy. The echoes of pastoral poetry in Spain are heard far back among the old ballads; but the Italian forms were early introduced and naturalized. Two Portuguese writers, Montemayor and Miranda, were most successful in this department of poetry. Equally characteristic of the Spanish genius, with its pastorals, were the short epigrammatic poems which appeared through the best age of its literature. They are generally in the truest tone of popular verse. Of didactic poetry, there were many irregular varieties; but the popular character of Spanish poetry, and the severe nature of the ecclesiastical and political constitutions of Spain, were unfavorable to the development of this form of verse, and unlikely to tolerate it on any important subject. It remained, therefore, one of the feeblest and least

successful departments of the national literature. In the seventeenth century, ballads had become the delight of the whole Spanish people. The soldier solaced himself with them in his tent, the maiden danced to them on the green, the lover sang them for his serenade, the street beggar chanted them for alms; they entered into the sumptuous entertainments of the nobility, the holiday services of the church, and into the orgies of thieves and vagabonds. No poetry of modern times has been so widely spread through all classes of society, and none has so entered into the national character. They were often written by authors otherwise little known, and they were always found in the works of those poets of note who desired to stand well with the mass of their countrymen.

9. HISTORY AND OTHER PROSE WRITINGS.--The fathers of Spanish history are Zurita and Morales. Zurita (1512-1580) was the author of the "Annals of Aragon," a work more important to Spanish history than any that had preceded it. Morales (1513-1591) was historiographer to the crown of Castile, and his unfinished history of that country is marked by much general ability. Contemporary with these writers was Mendoza, already mentioned. The honor of being the first historian of the country, however, belongs to Mariana (1536-1623), a foundling who was educated a Jesuit. His main occupation for the last thirty or forty years of his life was his great "History of Spain." There is an air of good faith in his accounts and a vividness in his details which are singularly attractive. If not in all respects the most trustworthy of annals, it is at least the most remarkable union of picturesque chronicling with sober history that the world has ever seen. Sandoval (d. 1621) took up the history of Spain where Mariana left it; but while his is a work of authority, it is unattractive in style. "The General History of the Indies," by Herrera, is a work of great value, and the one on which the reputation of the author as a historian chiefly rests. One of the most pleasing of the minor Spanish histories is Argensola's account of the Moluccas. It is full of the traditions found among the natives by the Portuguese when they first landed there, and of the wild adventures that followed when they had taken possession of the island. Garcilasso de la Vega, the son of one of the unscrupulous conquerors of Peru, descended on his mother's side from the Incas, wrote the "History of Florida," of which the adventures of De Soto constitute the most brilliant portion. His "Commentaries on Peru" is a striking and interesting work. The last of the historians of eminence in the elder school of Spanish history was Solis, whose "Conquest of Mexico" is beautifully written, and as it was flattering to the national history, it was at once successful, and has enjoyed an unimpaired popularity down to our times. The spirit of political tyranny in the government, and of religious tyranny in the Inquisition, now more than ever united, were more hostile to bold and faithful inquiry in the department of history than in almost any other. Still, the historians of this period were not unworthy of the national character. Their works abound in feeling rather than philosophy, and are written in a style that marks, not so much the peculiar genius of their authors, perhaps, as that of the country that gave them birth. Although they may not be entirely classical, they are entirely Spanish; and what they want in finish and grace they make up in picturesqueness and originality. In one form of didactic composition, Spain stands in advance of other countries: that of proverbs, which Cervantes has happily called "short sentences drawn from long experience." Spanish proverbs can be traced back to the earliest times. Although twenty-four thousand have been collected, many thousands still remain known only among the traditions of the humbler classes of society that have given birth to them all. >From the early part of the seventeenth century, Spanish prose became infected with that pedantry and affectation already spoken of as Gongorism, or "the cultivated style;" and from this time, everything in prose as well as in poetry announced that corrupted taste which both precedes and hastens the decay of a literature, and which in the latter half of the seventeenth century was in Spain but the concomitant of a general decline in the arts and the gradual degradation of the monarchy. No country in Christendom had fallen from such a height of power as that which Spain occupied in the time of Charles V. into such an abyss of degradation as she reached when Charles II., the last of the house of Austria, ceased to reign. The old religion of the country, the most prominent of all the national characteristics, was now so perverted from its true character by intolerance that it had become a means of oppression, such as Europe never before witnessed. The principle of loyalty, now equally perverted and mischievous, had sunk into servile submission, and as we approach the conclusion of the century, the Inquisition and the despotism seem to have cast their blight over everything.

PERIOD THIRD.

THE ACCESSION OF THE BOURBON FAMILY TO THE PRESENT TIME (1700-1885).

1. FRENCH INFLUENCE ON THE LITERATURE OF SPAIN.--The death of Charles II., in 1700, was followed by the War of the Succession between the houses of Hapsburg and Bourbon, which lasted thirteen years. It was terminated by the treaty of Utrecht and the accession of Philip V., the grandson of Louis XIV. Under his reign the influence of France became apparent in the customs of the country. The Academy of Madrid was soon established in imitation of that of Paris, with the object of establishing and cultivating the purity of the Castilian language. The first

work published by this association was a Dictionary, which has continued in successive editions to be the proper standard of the language. At this time French began to be spoken in the elegant society of the court and the capital, translations from the French were multiplied, and at last, a poetical system, founded on the critical doctrine of Boileau, prevalent in France, was formally introduced into the country by Luzan, in his "Art of Poetry," which from its first appearance (1737) exercised a controlling authority at the court, and over the few writers of reputation then to be found in the country. Though the works of Luzan offered a remedy for the bad taste which had accompanied and in no small degree hastened the decline of the national taste, they did not lay a foundation for advancement in literature. The national mind had become dwarfed for want of its appropriate nourishment; the moral and physical sciences that had been advancing for a hundred years throughout Europe, were forbidden to cross the Pyrenees. The scholastic philosophy was still maintained as the highest form of intellectual culture; the system of Copernicus was looked upon as contrary to the inspired record; while the philosophy of Bacon and the very existence of mathematical science were generally unknown even to the graduates of universities. It seemed as if the faculties of thinking and reasoning were becoming extinct in Spain.

2. THE DAWN OF SPANISH LITERATURE IN THE EIGHTEENTH CENTURY.--The first effort for intellectual emancipation was made by a monk, Benito Feyjoo (1676-1764), who, having made himself acquainted with the truths brought to light by Galileo, Bacon, Newton, Leibnitz, and Pascal, devoted his life to the labor of diffusing them among his countrymen. The opposition raised against him only drew to his works the attention he desired. Even the Inquisition summoned him in vain, for it was impossible to question that he was a sincere and devout Catholic, and he had been careful not to interfere with any of the abuses sanctioned by the church. Before his death he had the pleasure of seeing that an impulse in the right direction had been imparted to the national mind. One of the striking indications of advancement was an attack upon the style of popular preaching, which was now in a state of scandalous degradation. The assailant was Isía (1703-1781), a Jesuit, whose "History of Friar Gerund" is a satirical romance, slightly resembling Don Quixote in its plan, describing one of those bombastic orators of the age. It was from the first successful in its object of destroying the evil at which it aimed, and preachers of the class of Friar Gerund soon found themselves without an audience. The policy of Charles III. (1759-1788) was highly favorable to the progress of literature. He abridged the power of the Inquisition, and forbade the condemnation of any book till its writer or publisher had been heard in its defense; he invited the suggestion of improved plans of study, made arrangements for popular education, and raised the tone of instruction in the institutions of learning. Finally, perceiving the Jesuits to be the most active opponents of these reforms, he expelled them from every part of his dominions, breaking up their schools, and confiscating their revenues. During his reign, intellectual life and health were infused into the country, and its powers, which had been so long wasting away, were revived and renewed. Among the writers of this age are Moratin the elder (1737-1780), whose poems are marked by purity of language and harmony of versification; and Yriarte (1750-1791), who was most successful in fables, which he applied, to the correction of the faults and follies of literary men. To this period may also be referred the school of Salamanca, whose object was to combine in literature the power and richness of the old writers of the time of the Philips with the severer taste then prevailing on the continent. Melendez (1754-1817), who was the founder of this school, devoted his muse to the joys and sorrows of rustic love, and the leisure and amusements of country life. Nothing can surpass some of his descriptions in the graceful delineation of tender feeling, and his verse is considered in sweetness and native strength, to be such a return to the tones of Garcilasso, as had not been heard in Spain for more than a century. Gonzalez (d. 1794), who, with happy success, imitated Luis de Leon, Jovellanos (1744-1811), who exerted great influence on the literary and political condition of his country, and Quintana (b. 1772), whose poems are distinguished by their noble and patriotic tone, are considered among the principal representatives of the school of Salamanca. The most considerable movement of the eighteenth century in Spain, is that relating to the theatre, which it was earnestly attempted to subject to the rules then prevailing on the French stage. The Spanish theatre, in fact, was now at its lowest ebb, and wholly in the hands of the populace. The plays acted for public amusement were still represented as they had been in the seventeenth century,--in open court-yards, in the daytime, without any pretense of scenery or of dramatic ingenuity. Soon after, through the influence of Isabella, the second wife of Philip V., improvements were made in the external arrangements and architecture of the theatres; yet, owing to the exclusive favor shown to the opera by the Italian queens, the old spirit continued to prevail. In the middle of the eighteenth century a reform of the comedy and tragedy was undertaken by Montiano and others, who introduced the French style in dramatic compositions, and from that time an active contest went on between the innovators and the followers of the old drama. The latter was attacked, in 1762, by Moratin the elder, who wrote against it, and especially against the *autos sacramentales*, showing that such wild, coarse, and blasphemous exhibitions, as they generally were, ought not to be tolerated in a civilized and religious community.

So far as the *autos* were concerned, Moratin was successful; they were prohibited in 1768, and since that time, in the larger cities, they have not been heard. The most successful writer for the stage was Ramon de la Cruz (1731-1799), the author of about three hundred dramatic compositions, founded on the manners of the middle and lower classes. They are entirely national in their tone, and abound in wit and in faithful delineations of character. While a number of writers pandered to the bad taste of low and vulgar audiences, a formidable antagonist appeared in the person of Moratin the younger (1760-1828), son of that poet who first produced, on the Spanish stage, an original drama written according to the French doctrines. Notwithstanding the taste of the public, he determined to tread in the footsteps of his father. Though his comedies have failed to educate a school strong enough to drive out the bad imitations of the old masters, they have yet been able to keep their own place. The eighteenth century was a period of revolution and change with the Spanish theatre. While the old national drama was not restored to its ancient rights, the drama founded on the doctrines taught by Luzan, and practiced by the Moratins, had only a limited success. The audiences did as much to degrade it as was done by the poets they patronized and the actors they applauded. On the one side, extravagant and absurd dramas in great numbers, full of low buffoonery, were offered; on the other, meagre, sentimental comedies, and stiff, cold translations from the French, were forced, in almost equal numbers, upon the actors, by the voices of those from whose authority or support they could not entirely emancipate themselves.

3. SPANISH LITERATURE IN THE NINETEENTH CENTURY.--The new life and health infused into literature in the age of Charles III. was checked by the French revolutionary wars in the reign of Charles IV., and afterwards by the restoration of civil despotism and the Inquisition, brought again into the country by the return of the Bourbon dynasty in 1814. Amidst the violence and confusion of the reign of Ferdinand VII. (1814-1833), elegant letters could hardly hope to find shelter or resting-place. Nearly every poet and prose writer, known as such at the end of the reign of Charles IV., became involved in the fierce political changes of the time,--changes so various and so opposite, that those who escaped from the consequences of one, were often, on that very account, sure to suffer in the next that followed. Indeed, the reign of Ferdinand VII. was an interregnum in all elegant culture, such as no modern nation has yet seen,--not even Spain herself during the War of the Succession. This state of things continued through the long civil war which arose soon after the death of that king, and, indeed, it is not yet entirely abated. But in despite of the troubled condition of the country, even while Ferdinand was living, a movement was begun, the first traces of which are to be found among the emigrated Spaniards, who cheered with letters their exile in England and France, and whose subsequent progress from the time when the death of their unfaithful monarch permitted them to return home, is distinctly perceptible in their own country. The two principal writers of the first half of the century are the satirist José de Larra (d. 1837), and the poet Espronceda (d. 1842); both were brilliant writers, and both died young. Zorrilla (b. 1817), has great wealth of imagination, and Fernan Caballero is a gifted woman whose stories have been often translated. Antonio de Trueba is a writer of popular songs and short stories not without merit, Campoamor (b. 1817) and Bequer represent the poetry of twenty years ago. The short lyrics of the first named are remarkable for their delicacy and finesse. Bequer, who died at the age of thirty, left behind him poems which have already exercised a wide influence in his own country and in Spanish America; they tell a story of passionate love, despair, and death. Perez Galdos, a writer of fiction, attacks the problem of modern life and thought, and represents with vivid and often bitter fidelity the conflicting interests and passions of Spanish life. Valera, the present minister from Spain to the United States, is the author of the most famous Spanish novel of the day, "Pepita Jimenez," a work of great artistic perfection, and his skill and grace are still more evident in his critical essays. Castelar has gained a European celebrity as an orator and a political and miscellaneous writer. The works of these authors, and of many others not named, show clearly that Spain is making vigorous efforts to bring herself, socially and intellectually, into line with the rest of Europe. Of the Spanish colonies Cuba has produced some writers of enduring renown. The most distinguished for poetic fame is Gertrude de Avelleneda; Heredia and Placido may also be mentioned. In Venezuela, Baralt is known as a historian, poet, and classical writer; Olmedo as a poet of Bolivia, and Caro a writer of the United States of Colombia.

PORTUGUESE LITERATURE.

1. The Portuguese Language.--2. Early Literature of Portugal.--3. Poets of the Fifteenth Century; Macias, Ribeyro.--4. Introduction of the Italian Style; San de Miranda, Montemayor, Ferreira.--5. Epic Poetry; Camoëns; The Lusiad.--6. Dramatic Poetry; Gil Vicente.--7. Prose Writing; Rodriguez Lobo, Barros, Brito, Veira.--8. Portuguese Literature in the Seventeenth, Eighteenth, and Nineteenth Centuries; Antonio José, Manuel do Nascimento, Manuel de Bocage.

1. THE PORTUGUESE LANGUAGE.--Portugal was long considered only as an integral part of Spain; its inhabitants called themselves Spaniards, and conferred on their neighbors the distinctive appellation of Castilians. Their language was originally the same as the Galician; and had Portugal remained a province of Spain, its peculiar dialect would probably, like that of Aragon, have been driven from the fields of literature by the Castilian. But at the close of the eleventh century, Alphonso VI., celebrated in Spanish history for his triumphs over the Moors, gave Portugal as a dowry to his daughter on her marriage with Henry of Burgundy, with permission to call his own whatever accessions to it the young prince might be able to conquer from the Moorish territory. Alphonso Henriquez, the son of this pair, was saluted King of Portugal by his soldiers on the battle-field of Castro-Verd, in the year 1139, his kingdom comprising all the provinces we now call Portugal, except the province of Algarve. Thenceforward the Portuguese became a separate nation from the Spaniards, and their language asserted for itself an independent existence. Still, however, the Castilian was long considered the proper vehicle for literature; and while few Portuguese writers wholly disused it, there were many who employed no other. Although the Portuguese language, founded on the Galician dialect, bears much similarity to the Spanish in its roots and structure, it differs widely from it in its grammatical combinations and derivations, so that it constitutes a language by itself. It has far more French, and fewer Basque and Arabic elements than the Spanish; it is softer, but it has, at the same time, a truncated and incomplete sound, compared with the sonorous beauty of the Castilian, and a predominance of nasal sounds stronger than those of the French. It is graceful and easy in its construction, but it is the least energetic of all the Romance tongues.

2. EARLY LITERATURE OF PORTUGAL.--The people, as well as the language, of Portugal possess a distinctive character. Early in the history of the country the extensive and fertile plains were abandoned to pasturage, and the number of shepherds in proportion to the rest of the population was so great, that the idea of rural life among them was always associated with the care of flocks. At the same time, their long extent of coast invited to the pursuits of commerce and navigation; and the nation, thus divided into hardy navigators, soldiers, and shepherds, was better calculated for the display of energy, valor, and enterprise than for laborious and persevering industry. Accustomed to active intercourse with society, rather than to the seclusion of castles, they were far less haughty and fanatical than the Castilians; and the greater number of Moçárabians that were incorporated among them, diffused over their feelings and manners a much stronger influence of orientalism. The passion of love seemed to occupy a larger share of their existence, and their poetry was more enthusiastic than that of any other people of Europe. Although the literature of Portugal, like the character of its people, is marked by excessive softness, elegiac sentimentality, and an undefined melancholy, it affords little originality in the general tone of its productions. Henry of Burgundy and his knights early introduced Provençal poetry, and the native genius was nurtured in the succeeding age by Spanish and Italian taste, and afterwards modified by the influence of French and English civilization. National songs were not wanting in the early history of the country, yet no relics of them have been preserved. The earliest monuments of Portuguese literature relate to the age of the French knights who founded the political independence of the country, and must be sought in the "Cancioneros," containing courtly ballads composed in the Galician dialect, after the Provençal fashion, and sung by wandering minstrels. The Cancionero of King Dionysius (1279-1325) is the most ancient of those collections, the king himself being considered by the Portuguese as the earliest poet. In fact, Galician poetry, modeled after the Provençal, was cultivated at that time all along the western portion of the Pyrenean peninsula. Alfonso the Wise, King of Castile, used this dialect in his poems; and as a poet and patron of the Spanish troubadours, he may be considered as belonging both to the Spanish and Portuguese literatures. In the fourteenth and beginning of the fifteenth century, Portuguese poetry preserved its Provençal character. The poets rallied around the court, and the kings and princes of the age sang to the Provençal lyre both in the Castilian and the Galician dialects; but only a few fragments of the poetry of the fourteenth century are extant.

3. POETS OF THE FIFTEENTH CENTURY.--Early in the fifteenth century, the same chivalrous spirit which had achieved the conquest of the country from the Moors, led the Portuguese to cross the Straits of Gibraltar, and plant their banner on the walls of Ceuta. Many other cities of Africa were afterwards taken; and in 1487, Bartolomeo Diaz doubled the Cape of Good Hope, and Vasco da Gama pointed out to Europe the hitherto unknown track to India. Within fifteen years after, a Portuguese kingdom was founded in Hindostan, and the treasures of the East flowed into Portugal. The enthusiasm of the people was thus awakened, and high views of national importance, and high hopes of national glory, arose in the public mind. The time was peculiarly favorable to the development of genius, and especially to the spirit of poetry. Indeed, the last part of the fifteenth century, and the beginning of the sixteenth, the age of King John (1481- 1495), and of Emanuel (1495-1521), may be called the golden age of the Portuguese poetry. At the head of the poetical school of the fifteenth century, stands Macias, surnamed the Enamored (fl. 1420). He was distinguished as a hero in the wars against the Moors of Granada, and as a poet in the retinue of the Marquis

of Villena. He became attached to a lady of the same princely household, who was forced to marry another. Macias continuing to express his love, though prohibited by the marquis from doing so, was thrown into prison; but even there, he still poured forth his songs on his ill-fated love, regarding the hardships of captivity as light, in comparison with the pangs of absence from his mistress. The husband of the lady, stung with jealousy, recognizing Macias through the bars of his prison, took deadly aim at him with his javelin, and killed him on the spot. The weapon was suspended over the poet's tomb, in the Church of St. Catherine, with the inscription, "Here lies Macias the Enamored." The death of Macias produced such a sensation as could only belong to an imaginative age. All those who desired to be thought cultivated mourned his fate. His few poems of moderate merit became generally known and admired, and his melancholy history continued to be the theme of songs and ballads, until, in the poetry of Lope de Vega and Calderon, the name of Macias passed into a proverb, and became synonymous with the highest and tenderest love. Ribeyro (1495-1521), one of the earliest and best poets of Portugal, was attached to the court of King Emanuel. Here he indulged a passion for one of the ladies of the court, which gave rise to some of his most exquisite effusions. It is supposed that the lady, whose name he studiously conceals, was the Infanta Beatrice, the king's own daughter. He was so wholly devoted to the object of his love, that he is said to have passed whole nights wandering in the woods, or beside the banks of a solitary stream, pouring forth the tale of his woes in strains of mingled tenderness and despair. The most celebrated productions of Ribeyro are eclogues. The scene is invariably laid in his own country; his shepherds are all Portuguese, and his peasant girls have Christian names. But under the disguise of fictitious characters, he evidently sought to place before the eyes of his beloved mistress the feelings of his own breast; and the wretchedness of an impassioned lover is always his favorite theme. The bucolic poets of Portugal may be regarded as the earliest in Europe, and their favorite creed, that pastoral life was the poetical model of human life, and the ideal point from which every sentiment and passion ought to be viewed, was first represented by Ribeyro. This idea threw an air of romantic sweetness and elegance over the poetry of the sixteenth century, but at the same time it gave to it a monotonous tone and an air of tedious affectation.

4. INTRODUCTION OF THE ITALIAN STYLE.--The poet who first introduced the Italian style into Portuguese poetry was so successful in seizing the delicate tone by which the blending of the two was to be effected that the innovation was accomplished without a struggle. Saa de Miranda (1495-1558) was one of the most pleasing and accomplished men of his age. He traveled extensively, and on his return was attached to the court of Lisbon. It is related of him that he would often sit silent and abstracted in company, and that tears, of which no one knew the cause, would flow from his eyes, while he seemed unconscious of the circumstance, and indifferent to the observation he was thus attracting. These emotions were of course attributed to poetic thought and romantic attachments. He insisted on marrying a lady who was neither young nor handsome, and whom he had never seen, having been captivated by her reputation for amiability and discretion. He became so attached to her, that when she died he renounced all his previous pursuits and purposes in life, remained inconsolable, and soon followed her to the grave. Miranda is chiefly celebrated for his lyric and pastoral poetry. Montemayor was a contemporary of Miranda, and a native of Portugal, but he declined holding any literary position in his own country. The pastoral romance of "Diana," written in the Castilian language, is his most celebrated work. It was received with great favor, and extensively imitated. With many faults, it possesses a high degree of poetic merit, and is entitled to the esteem of all ages. Ferreira (1528-1569) has been called the Horace of Portugal. His works are correct and elegant, but they are wanting in those higher efforts of genius which strike the imagination and fire the spirit. The glory, advancement, and civilization of his country were his darling themes, and it was this enthusiasm of patriotism that made him great. In his tragedy of Inez de Castro, Ferreira raised himself far above his Italian contemporaries. Many similar writers shed a lustre on this, the brightest and indeed the only brilliant period of Portuguese literature; but they are all more remarkable for taste and elegance than for richness of invention.

5. EPIC POETRY.--The chief and only boast of his country, the sole poet whose celebrity has extended beyond the peninsula, and whose name appears in the list of those who have conferred honor upon Europe, is Luis de Camoens (1524-1579). He was descended from a noble, but by no means a wealthy family. After having completed his studies at the university, he conceived a passion for a lady of the court, so violent that for some time he renounced all literary and worldly pursuits. He entered the military service, and in an engagement before Ceuta, in which he greatly distinguished himself, he lost an eye. Neglected and contemned by his country, he embarked for the East Indies. After various vicissitudes there, he wrote a bitter satire on the government, which occasioned his banishment to the island of Macao, where he remained for five years, and where he completed the great work which was to hand down his name to posterity. There is still to be seen, on the most elevated point of the isthmus which unites the town of Macao to the Chinese continent, a sort of natural gallery formed out of the rocks, apparently almost suspended in the air, and commanding a magnificent prospect over both seas, and the lofty chain of mountains which rises above

their shores. Here he is said to have invoked the genius of the epic muse, and tradition has conferred on this retreat the name of the Grotto of Camoëns. On his return to Goa, Camoëns was shipwrecked, and of all his little property, he succeeded only in saving the manuscript of the *Lusiad*, which he bore in one hand above the water, while swimming to the shore. Soon after reaching Goa, he was thrown into prison upon some unjust accusation, and suffered for a long time to linger there. At length released, he took passage for his native country, which he reached after an absence of sixteen years. Portugal was at this time ravaged by the plague, and in the universal sorrow and alarm, the poet and his great work were alike neglected. The king at length consented to accept the dedication of this poem, and made to the author the wretched return of a pension, amounting to about twenty-five dollars. Camoëns was not unfrequently in actual want of bread, for which he was in part indebted to a black servant who had accompanied him from India, and who was in the habit of stealing out at night to beg in the streets for what might support his master during the following day. But more aggravated evils were in store for the unfortunate poet. The young king perished in the disastrous expedition against Morocco, and with him expired the royal house of Portugal. The independence of the nation was lost, her glory eclipsed, and the future pregnant with calamity and disgrace. Camoëns, who had so nobly supported his own misfortunes, sank under those of his country. He was seized with a violent fever, and expired in a public hospital without having a shroud to cover his remains. The poem on which the reputation of Camoëns depends, is entitled "*Os Lusíadas*;" that is, the Lusitanians (or Portuguese), and its design is to present a poetic and epic grouping of all the great and interesting events in the annals of Portugal. The discovery of the passage to India, the most brilliant point in Portuguese history, was selected as the groundwork of the epic unity of the poem. But with this, and the Portuguese conquests in India, the author combined all the illustrious actions performed by his countrymen in other quarters of the world, and whatever of splendid and heroic achievement history or tradition could supply. Vasco da Gama has been represented as the hero of the work, and those portions not immediately connected with his expedition, as episodes. But there is, in truth, no other leading subject than the country, and no episodes except such parts as are not immediately connected with her glory. Camoëns was familiar with the works of his Italian contemporaries, but the circumstance that essentially distinguishes him from them, and which forms the everlasting monument of his own and his country's glory, is the national love and pride breathing through the whole work. His patriotic spirit, devoting a whole life to raise a monument worthy of his country, seems never to have indulged a thought which was not true to the glory of an ungrateful nation. The Greek mythology forms the epic machinery of the *Lusiad*. Vasco da Gama, having doubled the Cape of Good Hope, is steering along the western coast of Africa, when the gods assemble on Mount Olympus to deliberate on the fate of India. Venus and Bacchus form two parties; the former in favor, the latter opposed to the Portuguese. The poet thus gratified his national pride, as Portugal was eminently the land of love, and moderation in the use of wine was one of its highest virtues. Bacchus lays many snares to entrap and ruin the adventurers, who are warned and protected by Venus. He visits the palace of the gods of the sea, who consent to let loose the Winds and Waves upon the daring adventurers, but she summons her nymphs, and adorning themselves with garlands of the sweetest flowers, they subdue the boisterous Winds, who, charmed by the blandishments of love, become calm. Vasco is hospitably received by the African king of Melinda, to whom he relates the most interesting parts of the history of his native country. On the homeward voyage, Venus prepares a magic festival for the adventurers, on an enchanted island, and the goddess Thetis becomes the bride of the admiral. Here the poet finds the opportunity to complete the narrative of his country's history, and a prophetic nymph is brought forward to describe the future achievements of the nation from that period to the time of Camoëns. The *Lusiad* is one of the noblest monuments ever raised to the national glory of any people, and it is difficult to conceive how so grand and beautiful a whole could be formed on a plan so trivial and irregular. The plan has been compared to a scaffolding surrounded and concealed by a majestic building, serving to connect its parts, but having no share in producing the unity of the effect. One of the most affecting and beautiful of all the passages of the *Lusiad*, is the narrative of the tragical fate of Inez de Castro, who, after her death, was proclaimed queen of Portugal, upon the accession of her lover to the throne. In the poems of Camoëns we find examples of every species of composition practiced in his age and country. Some of them bear the impress of his personal character, and of his sad and agitated career. A wild tone of sorrow runs through them, which strikes the ear like wailings heard through the gloom of midnight and darkness. We know not by what calamity they were called forth, but it is the voice of grief, and it awakens an answering throb within the breast.

6. DRAMATIC POETRY.--The drama is quite a barren field in Portuguese literature. The stage of Lisbon has been occupied almost exclusively by the Italian opera and Spanish comedy. Only one poet of any name has written in the Portuguese spirit. This was Gil Vicente (1490-1556). He resided constantly at the court, and was employed in providing occasional pieces for its civil and religious festivities. It is probable that he was an actor, and it is certain that he educated for the stage his daughter, Paula, who was equally celebrated as an actress, a poetess, and a

musician. The dramas of Vicente consist of autos, comedies, tragi-comedies, and farces. The autos, or religious pieces, were written chiefly to furnish entertainment for the court on Christmas night. The shepherds had naturally an important part assigned to them, and the whole was pervaded by the pastoral feeling which distinguishes them remarkably from the Spanish autos. But the best productions of this author are his farces, which approach much nearer to the style of true comedy than the plays published under that name. Saa de Miranda, desirous of conferring on his country a classical theatre, produced two erudite comedies, but he was born a pastoral poet, and made himself a dramatist only by imitation. Ferreira belonged to the same school, and the favor bestowed by the court on the dramas of these two poets, was one obstacle to the formation of a national drama. Another was, the pertinacious attachment of the Portuguese to pastoral poetry, and nothing could be more contrary to dramatic life than the languor, sentimentality, and monotony peculiar to the eclogue.

7. PROSE WRITING.--After Camoëns, Saa de Miranda, and Ferreira, the language and the literature of Portugal are indebted to no other writer so much as to Rodriguez Lobo (b. 1558). The history of Portuguese eloquence may be said to commence with him, for he laid so good a foundation for the cultivation of a pure prose style that, in every effort to obtain classic perfection, subsequent writers have merely followed in his steps. His verse is nowise inferior to his prose. Among his poetic works appears a whole series of historic romances, written by way of ridiculing that species of composition. Lobo stood alone, in the sixteenth century, in his efforts to improve the prose of his country. Gongorism had, meanwhile, introduced bombast and metaphorical obscurity, and no writer of eminence arose to attempt a more natural style, till the end of the seventeenth century. Foremost among those who undertook to relate the history of their country, especially of her oriental discoveries, and who communicated to their records an ardent patriotic feeling, is Barros (1496-1571); he took Livy for his model, and his labors are worthy of honorable notice. India was the favorite topic of Portuguese historians; and several similar works, but inferior to that of Barros, appeared in the same age. Bernardo de Brito (d. 1617) undertook the task of compiling a history of Portugal. His narration begins with the creation of the world, and breaks off where the history of modern Portugal commences. It is eminently distinguished for style and descriptive talent. The biography of Juan de Castro, written by Jacinto de Andrade, is considered as a masterpiece of the Portuguese prose. The conquered Indians found an eloquent defender in Veira (1608-1697), a Catholic missionary, who spent a great part of his life in the deserts of South America, and wrote catechisms in different languages for the use of the natives. Having returned to the court of John IV., he undertook to defend the natural rights of Indians against the rapacity of the conquerors. He undertook also the defense of the Jews in his native country, and showed so much interest in their cause that he was twice brought before the Inquisition. His sermons and letters are models of prose writings, full of the inspiration which springs from the boldness of his subjects.

8. PORTUGUESE LITERATURE IN THE SEVENTEENTH, EIGHTEENTH, AND NINETEENTH CENTURIES.--Portuguese literature during the seventeenth century would present an utter blank, but for the few literary productions to which we have alluded. Previous to that time, patriotic valor and romantic enterprise expanded the national genius; but before it could mature, the despotism of the monarchy, the horrors of the Inquisition, and the influence of wealth and luxury, had done their work of destruction, and the prostrate nation had in the seventeenth century reaped the bitter fruits. The most brilliant period of Portuguese poetry had passed away, and no new era commenced. The flame of patriotism was extinct, Brazil was the only colony that remained, the spirit of national enterprise was no more, and a general lethargy overspread the nation. Labor was reckoned a disgrace, commerce a degradation, and agriculture too fatiguing for even the lowest classes of the community. Both Spain and Portugal felt the paralyzing influence of their humbled position in the scale of nations, and civil and religious despotism had overthrown, in both countries, the intellectual power which had so long withstood its degrading influence. Thousands of sonnets, chiefly of an amorous nature, filled up the seventeenth century in Portugal, while Spain was exhausting its expiring energies in dramas. Souza, the most eminent of the sonneteers, alone produced six hundred. In the first, he announces that the collection is designed to celebrate "the penetrating shafts of love, which were shot from a pair of heavenly eyes, and which, after inflicting immortal wounds, issued triumphant from the poet's breast." In the eighteenth century, the influence of French taste crept quietly into the literature as well as the manners of the Portuguese nation. Royal academies of history and language were founded, and an academy of sciences, which, since 1792, has exercised an influence over literary taste, and given birth to many excellent treatises on philosophy and criticism. About the year 1735, the nation seemed on the eve of possessing a drama of its own. Antonio José, an obscure Jew, composed a number of comic operas, in the vernacular tongue, which had long been banished from the theatre of Lisbon. In spite of much coarseness, their genuine humor and familiar gayety excited the greatest enthusiasm, and for ten years the theatre was crowded with delighted audiences. But the Jew was seized and burnt, by order of the Inquisition, at the last *auto da fê*, which took place in 1745, and the theatre was closed. Although French literature continued to exert its influence in the beginning of the

nineteenth century, masterpieces of English literature at that time found their way into Portugal, and excited much admiration and imitation. Manuel do Nascimento (1734-1819) is the representative of the classic style, and his works, both in poetry and prose, are distinguished by purity of language. Manuel de Bocage (1766-1805) is one of the most celebrated modern poets, and though his poems are not examples of refined taste or elegance of style, they evince enthusiasm and poetical fire. Among the poets of the present day, there are some who have emancipated themselves from the imitation of foreign models, and have attempted to combine the earliest national elements of their literature with the characteristic tendencies of the present age.

FINNISH LITERATURE.

1. The Finnish Language and Literature: Poetry; the Kalevala; Lönnrot; Korhonen.--2. The Hungarian Language and Literature: the Age of Stephen I.; Influence of the House of Anjou; of the Reformation; of the House of Austria; Kossuth; Josika; Eötvös; Kuthy; Szigligeti; Petöfi.

1. THE FINNISH LANGUAGE AND LITERATURE.--On passing northward from the Iranian plateaux through Turan to the Uralian mountains, which separate Europe and Asia, we arrive at the primitive seat of the Finnish race. Driven westward by other invading tribes, it scattered through northern Europe, and established itself more particularly in Finland, where, at the present time, we find its principal stock. From the earliest period of the history of the Finns, until the middle of the twelfth century, they lived under their own independent kings. They were then subjected by the Swedes, who established colonies upon their coasts, and introduced Christianity among them. After having been for many centuries the theatre of Russian and Swedish wars, in the beginning of the present century Finland passed under the dominion of Russia; yet, through these ages of foreign domination, its inhabitants preserved their national character, and maintained the use of their native tongue. The Finnish language is a branch of the Turanian family; it is written with the Roman alphabet, but it has fewer sounds; it is complicated in its declension and conjugation, but it has great capacity of expressing compound ideas in one word; it is harmonious in sound, and free, yet clear, in its construction. The Finns at an early period had attained a high degree of civilization, and they have always been distinguished for their love of poetry, especially for the melancholy strains of the elegy. They possess a vast number of popular songs or ballads, which are either lyrical or mythological; they are sung by the song-men, to the kantele, a kind of harp with five wire strings, a favorite national instrument. They have also legends, tales, and proverbs, some of which have recently been collected and published at Helsingfors, the capital of Finland. The great monument of Finnish literature is the "Kalevala," a kind of epic poem, which was arranged in a systematic collection, and given to the world in 1833, by Elias Lönnrot (d. 1884). He wandered from place to place in the remote districts of Finland, living with the peasants, and taking down from their lips the popular songs as he heard them chanted. The importance of this indigenous epic was at once recognized, and translations were made in various languages. The poem, which strongly resembles "Hiawatha," takes its name from the heroes of Kaleva, the land of happiness and plenty, who struggle with three others from the cold north and the land of death. It begins with the creation, and ends in the triumph of the heroes of Kaleva. Max Müller says of this poem that it possesses merits not dissimilar to those of the Iliad, and that it will claim its place as the fifth national epic of the world, beside that of the "Mahabharata," "Shah Nameh," and "Nibelungen." It is doubtless the product of different minds at different periods, having evidently received additions from time to time. During the present century there has been considerable literary activity in Finland, and we meet with many names of poets and dramatists. The periodical literature is specially rich and voluminous, and valuable works on Finnish history and geography have recently appeared. Of recent poets the most popular is Korhonen, a peasant, whose productions are characterized by their sharp and biting sarcasm. The prose of Finland has a religious and moral character, and is especially enriched by translations from Swedish literature.

2. HUNGARIAN LANGUAGE AND LITERATURE.--The language of the Magyars belongs to the Turanian family, and more particularly to the Finnish branch. The Hungarian differs from most European languages in its internal structure and external form. It is distinguished by harmony and energy of sound, richness and vigor of form, regularity of inflexion, and power of expression. Towards the close of the seventh century, the Magyars emigrated from Asia into Europe, and for two hundred years they occupied the country between the Don and Dneiper. Being at length pressed forward by other emigrant tribes, they entered and established themselves in Hungary, after subjugating its former inhabitants. In the year 1000, Stephen I. founded the kingdom of Hungary. He had introduced

Christianity into the country, and with it a knowledge of the Latin language, which was now taught in the schools and made use of in public documents, while the native idiom was spoken by the people, and in part in the assemblies of the Diet. On the accession of the House of Anjou to the throne of Hungary, in the fourteenth century, a new impulse was given to the Hungarian tongue. The Bible was translated into it, and it became the language of the court; although the Latin was still the organ of the church and state, and from the fourteenth to the close of the fifteenth century remained the literary language of the country. This Latin literature boasted of many distinguished writers, but so little influence had they on the nation at large, that during this period it appears that many of the high officers of the kingdom could neither read nor write. The sixteenth century was more favorable to Hungarian literature, and the political and religious movements which took place in the reign of Ferdinand I. and Maximilian II. (1527-1576) proved to be most beneficial to the intellectual development of the people. The Reformation, which was introduced into Hungary through Bohemia, the example of this neighboring country, and the close alliance which existed between the two people, exercised great influence on the public mind. The Hungarian language was introduced into the church, the schools, and the religious controversies, and became the vehicle of sacred and popular poetry. It was thus enriched and polished, and acquired a degree of perfection which it retained until the latter part of the eighteenth century. Translations of the Bible were multiplied; chronicles, histories, grammars, and dictionaries were published, and the number of schools, particularly among the Protestants, was greatly increased. But these brilliant prospects were soon blighted when the country came under the absolute dominion of Austria. In order to crush the national tendencies of the Magyars, the government now restored the Latin and German languages; and newspapers, calendars, and publications of all kinds, including many valuable works, appeared in Latin. Indeed, the interval from 1702 to 1780 was the golden age of this literature in Hungary. Maria Theresa and Joseph II., however, by prescribing the use of the German language in the schools, official acts, and public transactions, produced a reaction in favor of the national tongue, which was soon after taught in the schools, heard in the lecture-room, the theatre, and popular assemblies, and became the organ of the public press. These measures, however, the good effects of which were mainly confined to the higher classes, were gradually pursued with less zeal. It is only of late that the literature of Hungary has assumed a popular character, and become a powerful engine for the advancement of political objects. Kossuth may be considered as the founder of a national party which is at the head of the contemporary literature of the Magyars. Through the action of this party and of its leader, the Hungarian Diet passed, in 1840, the celebrated "Law of the Language," by which the supremacy of the Hungarian tongue was established, and its use prescribed in the administration and in the institutions of learning. From 1841 to 1844, Kossuth published a paper, in which the most serious and important questions of politics and economy were discussed in a style characterized by great elegance and simplicity, and by a fervid eloquence, which awakened in all classes the liveliest emotions of patriotism and independence. His writings greatly enriched the national language, and excited the emulation even of those who did not accept his political views. His memoirs, lately published, have been extensively translated. The novels of Josika (1865), modeled after those of Walter Scott, the works of Eötvös and Kemény after the writers of Germany, and those of Kuthy and others who have followed the French school, have greatly contributed to enrich the literature of Hungary. The comedies and the dramas of Eötvös and Gal, and particularly those of Szigligeti, show great progress in the Hungarian theatre, while in the poems of Petöfi and others is heard the harmonious yet sorrowful voice of the national muse. After 1849, the genius of Hungary seemed for a while buried under the ruins of the nation. Many of the most eminent writers either fell in the national struggle, or, being driven into exile, threw aside their pens in despair. But the intellectual condition of the people has of late been greatly improved. Public education has been promoted, scholastic institutions have been established, and at the present time there are eloquent voices heard which testify to the presence of a vigorous life latent in the very heart of the country. Among many other writers of the present day, are Jokai (b. 1825), the author of various historical romances which have been extensively translated, Varga, a lyric poet, and Arany, perhaps the greatest poet Hungary has produced, some of whose works are worthy of the literature of any age.

3. THE TURKISH LANGUAGE AND LITERATURE.--The Turks, or Osmanlis, are descendants of the Tartars, and their language, which is a branch of the Turanian family, is at the present day the commercial and political tongue throughout the Levant. This language is divided into two principal dialects, the eastern and the western. The eastern, though rough and harsh, has been the vehicle of certain literary productions, of which the most important are the biographies of more than three hundred ancient poets, written by Mir-Ali-Schir, who flourished in the middle of the fifteenth century, and who was the Maecenas of several Persian poets, particularly of Jami; several historical memoirs, and a number of ballads, founded on the traditions of the ancient Turkish tribes, belong also to the literature of this dialect. The western idiom constitutes what is more properly called the Turkish language. It is euphonious in sound and regular in its grammatical forms, though poor in its vocabulary. To supply its deficiencies, the Osmanlis have introduced many elements of the Arabic and Persian. They have also adopted the Arabic

alphabet, with some alterations; and, like the Arabians, they write from right to left. The literature of Turkey, although it is extremely rich, contains little that is original or national, but is a successful imitation of Persian or Arabic. Even before the capture of Constantinople works had been produced which the nation has not let perish. The most flourishing period was during the reign of Solyman the Magnificent and his son Selim in the sixteenth century. Fasli (d. 1563) was an erotic poet, who attained a high reputation; and Baki (d. 1600), a lyric poet, is ranked by the Orientals with the Persian Hafiz. In the seventeenth century a new period of literature arose, though inferior to the last. Nebi was the most admired poet, Nefti a distinguished satirist, and Hadji Khalfa a historian of Arabic, Persian, and Turkish literature, who is the chief authority upon this subject for the East and West. The annals of Saad-El-Din (d. 1599) are important for the student of the history of the Ottoman Empire. The style of these writers, however, is for the most part bombastic, consisting of a mixture of poetry and prose overladen with figures. Novels and tales abound in this literature, and it affords many specimens of geographical works, many important collections of juridical decisions, and valuable researches on the Persian and Arabian languages. The press was introduced into Constantinople early in the eighteenth century, and has been actively engaged in publishing translations of the most important works in Persian and Arabic, as well as in the native tongue. Societies are established for the promotion of various branches of science, and many scientific and literary journals are published. There are numerous primary free schools and high scholastic institutions in Constantinople, and some public libraries.

4. THE ARMENIAN LANGUAGE AND LITERATURE.--The language of Armenia belongs to the Indo-European family, and particularly to the Iranian variety; but it has been greatly modified by contact with other languages, especially the Turkish. At present the modern dialect is spoken in southern Russia around the sea of Azof, in Turkey, Galicia, and Hungary. The ancient Armenian, which was spoken down to the twelfth century, is preserved in its purity in the ancient books of the people, and is still used in their best works. This tongue, owing to an abundance of consonants, is lacking in euphony; it is deficient in distinction of gender, though it is redundant in cases and inflexions. Its alphabet is modeled after the Greek. The Armenians, from the earliest period of their existence, through all the political disasters which have signalized their history, have exhibited a strong love for a national literature, and maintained themselves as a cultivated people amidst all the revolutions which barbarism, despotism, and war have occasioned. During so many ages they have faithfully preserved not only their historical traditions, reaching back to the period of the ancient Hebrew histories, but also their national character. Their first abode--the vicinity of Mount Ararat--is even at the present day the centre of their religious and political union. Commerce has scattered them, like the Israelites, among all nations, but without debasing their character; on the contrary, they are distinguished by superior cultivation, manners, and honesty from the barbarians under whose yoke they live. The cause is to be found in their creed and in their religious union. Until the beginning of the fourth century A.D. the Armenians were Parsees; the literature of the country up to this period was contained in a few songs or ballads, and its civilization was only that which could be wrought out by the philosophy of Zoroaster. In 319, when Christianity was introduced into Armenia, the language and learning of the Greeks were exciting the profound admiration of the most eminent fathers of the church, and this attention to Greek literature was immediately manifest in the literary history of Armenia. A multitude of Grecian works was translated, commented upon, and their philosophy adopted, and the literature was thus established upon a Grecian basis. About the same period, the alphabet at present in use in the Armenian language was invented, or the old alphabet perfected by Mesrob, in connection with which the language underwent many modifications. Mesrob, with his three sons, especially educated for the task, commenced the translation of the Bible 411 A.D., and its completion nearly half a century later gave a powerful impulse to Armenian learning, and at the same time stamped upon it a religious character which it has never lost. The period from the sixth to the tenth century is the golden age of this literature. Its temporary decline after this period was owing to the invasion of the Arabians, when many of the inhabitants were converted to the Mohammedan faith and many more compelled to suffer persecution for their refusal to abjure Christianity. After the subjection of Armenia to the Greek empire, literature again revived, and until the fourteenth century was in a flourishing condition. In 1375, when the Turks took possession of the country, the inhabitants were again driven from their homes, and from that time their literature has steadily declined. After their emigration, the Armenians established themselves in various countries of Europe and Asia, and amidst all the disadvantages of their position they still preserve not only the unity of their religious faith, but the same unwearied desire to sustain a national literature. Wherever they have settled, in Amsterdam, Leghorn, Venice, Constantinople, and Calcutta, they have established printing presses and published valuable books. Of their colonies or monasteries, the most interesting and fruitful in literary works is that of Venice, which was founded in the eighteenth century by Mechitar, an Armenian, and from him its monks are called Mechitarists. From the time of their establishment they have constantly issued translations of important religious works. They now publish a semi-monthly paper in the Armenian language, which is circulated and read among the scattered families of the Armenian faith over the world.

They also translate and publish standard works of modern literature. About the year 1840, through the influence of American missionaries, the Bible was translated into Armenian, freed as far as possible from foreign elements; school-books were also translated, newspapers established, and the language awoke to new life. Within the last twenty years the intellectual progress in Armenia has been very great. In 1863 Christopher Robert, an American gentleman, established and endowed a college at Constantinople for the education of pupils of all races, religions, and languages found in the empire. This institution, not sectarian, though Christian, has met with great success. It has two hundred and fifty students from fifteen nationalities, though chiefly Armenian, Bulgarian, and Greek.

SLAVIC LITERATURES.

The Slavic Race and Languages; the Eastern and Western Stems; the Alphabets; the Old or Church Slavic Language; St. Cyril's Bible; the Pravda Russkaya; the Annals of Nestor.

THE SLAVIC RACE AND LANGUAGES.--The Slavic race, which belongs to the great Indo-European family of nations, probably first entered Europe from Asia, seven or eight centuries B.C. About the middle of the sixth century A.D. we find Slavic tribes crossing the Danube in great multitudes, and settling on both the banks of that river; from that time they frequently appear in the accounts of the Byzantine historians, under different appellations, mostly as involved in the wars of the two Roman empires; sometimes as allies, sometimes as conquerors, often as vassals, and oftener as emigrants and colonists, thrust out of their own countries by the pressing forward of the more warlike Teutonic tribes. In the latter half of the eleventh century the Slavic nations were already in possession of the whole extent of territory which they still occupy, from the Arctic Ocean on the north to the Black and Adriatic seas on the south, and from Kamtschatka and the Russian islands of the Pacific to the Baltic, and along the banks of the rivers Elbe, Muhr, and Ruab, again to the Adriatic. They are represented by early historians as having been a peaceful, industrious, hospitable people, obedient to their chiefs, and religious in their habits. Wherever they established themselves, they began to cultivate the earth, and to trade in the productions of the country. There are also early traces of their fondness for music and poetry. The analogy between the Slavic and the Sanskrit languages indicates the Oriental origin of the Slavonians, which appears also from their mythology. The antithesis of a good and evil principle is met with among most of the Slavic tribes; and even at the present time, in some of their dialects, everything good and beautiful is to them synonymous with the purity of the white color; they call the good spirit the White God, and the evil spirit the Black God. We find also traces of their Oriental origin in the Slavic trinity, which is nearly allied to that of the Hindus. Other features of their mythology remind us of the sprightly and poetical imagination of the Greeks. Such is the life attributed to the inanimate objects of nature, rocks, brooks, and trees; such are also the supernatural beings dwelling in the woods and mountains, nymphs, naiads, and satyrs. Indeed, the Slavic languages, in their construction, richness, and precision, appear nearly related to the Greek and Latin, with which they have a common origin. Following the division of the Slavic nations into the eastern and western stems, their languages may be divided into two classes, the first containing the Russian and the Servian idioms, the second embracing the Bohemian and the Polish varieties. The Slavi of the Greek faith use the Cyrillic alphabet, so called from St. Cyril, its inventor, a Greek monk, who went from Constantinople (862 A.D.) to preach to them the gospel. It is founded on the Greek, with modifications and additions from Oriental sources. The Hieronymic alphabet, particularly used by the priests of Dalmatia and Croatia, is so called from the tradition which attributes it to St. Hieronymus. The Bohemians and Poles use the Roman alphabet, with a few alterations. St. Cyril translated the Bible into the language called the _Old or Church Slavic_, and from the fact that this translation, made in the middle of the ninth century, is distinguished by great copiousness, and bears the stamp of uncommon perfection in its forms, it is evident that this language must have been flourishing long before that time. The celebrated "Pravda Russkaya," a collection of the laws of Jaroslav (1035 A.D.), and the "Annals of Nestor," of the thirteenth century, are the most remarkable monuments of the old Slavic language. This, however, has for centuries ceased to be a living tongue.

RUSSIAN LITERATURE.

1. The Language.--2. Literature in the Reign of Peter the Great; of Alexander; of Nicholas; Danilof, Lomonosof, Kheraskof, Derzhavin, Karamzin.--3. History, Poetry, the Drama: Kostrof, Dmitrief, Zhukoffski, Krylof, Pushkin, Lermontoff, Gogol.--4. Literature in Russia since the Crimean War: School of Nature; Turgenieff; Ultra-realistic School; Science: Mendeleëff.

1. THE LANGUAGE.--In the Russian language three principal dialects are to be distinguished; but the Russian proper, as it is spoken in Moscow and all the central and northern parts of European Russia, is the literary language of the nation. It is distinguished by its immense copiousness, the consequence of its great flexibility in adopting foreign words, merely as roots, from which, by means of its own resources, stems and branches seem naturally to spring. Another excellence is the great freedom of construction which it allows, without any danger of becoming ambiguous. It is clear, euphonious, and admirably adapted to poetry. The germs of Russian civilization arose with the foundation of the empire by the Varegians of Scandinavia (862 A.D.), but more particularly with the introduction of Christianity by Vladimir the Great, who, towards the close of the tenth century, established the first schools, introduced the Bible of St. Cyril, called Greek artists from Constantinople, and became the patron, and at the same time the hero of poetry. Indeed, he and his knights are the Russian Charlemagne and his peers, and their deeds have proved a rich source for the popular tales and songs of succeeding times. Jaroslav, the son of Vladimir, was not less active than his father in advancing the cause of Christianity; he sent friars through the country to instruct the people, founded theological schools, and continued the translation of the church books. To this age is referred the epic, "Igor's Expedition against the Polovtzi," discovered in the eighteenth century, a work characterized by uncommon grace, beauty, and power. >From 1238 to 1462 A.D. the Russian princes were vassals of the Mongols, and during this time nearly every trace of cultivation perished. The invaders burned the cities, destroyed all written documents, and demolished the monuments of national culture; but at length Ivan I. (1462- 1505) delivered his country from the Mongols, and prepared a new era in the history of Russian civilization. At this early period the first germs of dramatic art were carried from Poland to Russia. In Kief the theological students performed ecclesiastical dramas, and traveled about, during the holidays, to exhibit their skill in other cities. The tragedies of Simeon of Polotzk (1628- 1680), in the old Slavic language, penetrated from the convents to the court, where they were performed in the middle of the seventeenth century. At this time the first secular drama, a translation from Molière, was also represented.

2. THE LITERATURE.--Peter the Great (1689-1725) raised the Russian dialect to the dignity of a written language, introduced it into the administration and courts of justice, and caused many books to be translated from foreign languages. He rendered the Slavic characters more conformable to the Latin, and these letters, then generally adopted, continue in use at the present time. Among the writers of the age of Peter the Great may be mentioned Kirsha Danilof, who versified the popular traditions of Vladimir and his heroes; and Kantemir, a satirist, who translated many epistles of Horace, and the work of Fontenelle on the plurality of worlds. Peter the Great laid the corner-stone of a national literature, but the temple was not reared above the ground until the reign of Elizabeth and of Catharine II. Lomonosof (1711-1765), a peasant, born in the dreary regions of Archangel, has the honor of being the true founder of the Russian literature. In his Russian grammar he first laid down the principles and fixed the rules of the language; he first ventured to draw the boundary line between the old Slavic and the Russian, and endeavored to fix the rules of poetry according to the Latin standard. Among his contemporaries may be mentioned Sumarokof (1718-1777) and Kheraskof (1733-1807), both very productive writers in prose and verse, and highly admired by their contemporaries. In the middle of the eighteenth century the dramatic talent of the Russians was awakened, through the establishment of theatres at Jaroslav, St. Petersburg, and Moscow; and several gifted literary men employed themselves in dramatic compositions; but of all the productions of this time, those of Von Wisin (1745-1792) only have continued to hold possession of the stage. Among the poets of the eighteenth century, Derzhavin (1743-1816) sang the glory of Catharine II., and of the Russian arms. His "Ode to God" has obtained the distinction of being translated into several European languages, and also into Chinese, and hung up in the Emperor's palace, printed on white satin in golden letters. The reign of Alexander I. (1801-1825) opened a new era in the literature. He manifested great zeal for the mental elevation of his subjects; he increased the number of universities, established theological seminaries and institutions for the study of oriental languages, and founded gymnasia and numerous common schools for the people; he richly endowed the Asiatic museum of St. Petersburg, and for a time patronized the Russian Bible Society, and promoted the printing of books on almost all subjects. But toward the close of his reign, in consequence of certain political measures, literature sank with great rapidity. Karamzin (1765-1826), the representative of this age, undertook to shake off the yoke of the classical rules established by Lomonosof, and introduced more simplicity and naturalness. His reputation rests chiefly upon his "History of the Russian Empire," which, with many faults, is a standard work in Slavic literature. The reign of the Emperor Nicholas opened with a bloody tragedy, which exhibited in a striking manner the dissatisfied and unhealthy spirit of the literary youth of Russia. Several poets and men of literary fame were among the conspirators; and to awaken patriotism and to counteract the tendencies of the age, the government promoted historical and archaeological researches, but at the same time abolished professorships of philosophy, increased the vigilance of its censorship of

the press, lengthened the catalogue of forbidden books, and reduced the term of lawful absence for its subjects. It took the most energetic measures to promote national education, and to cultivate those fields of science where no political tares could be sown. The leading idea of the time was Panslavism, the object of which was the union of the Slavic race, an opposition to all foreign domination, and the attainment of a higher intellectual and political condition in the general march of mankind. Panslavism rose to a special branch of literature, and its principal writers were Kollar, Grabowski, and Gurowski.

3. HISTORY, POETRY, THE DRAMA.--History is a department of letters which has been treated very successfully in Russia; critical researches have been extended to all branches of archaeology, philology, mythology, and kindred subjects, and valuable works have been produced. Dmitrief (1760-1827) combined in his poems imagination, taste, correctness, and purity of language. Zhukoffski (b. 1785) a poet of deep feeling, took his models from the Germans. The fables of Krylof (b. 1768) are equally celebrated among all classes and ages, and are among the first books read by Russian children. Above all the others, Pushkin (1799-1835) must be considered as the representative of Russian poetry in the nineteenth century. He was in the service of the government, when an ode "to Liberty," written in too bold a spirit, induced Alexander I. to banish him from St. Petersburg. The Emperor Nicholas recalled him, and became his patron. Though by no means a mere imitator, his poetry bears strong marks of the influence of Byron. Lermontoff (d. 1841) was a poet and novelist whose writings, like those of Pushkin, were strongly influenced by Byron. Koltsoff (d. 1842) is the first song writer of Russia, and his favorite theme is the joys and sorrows of the people. Through the influence of Pushkin and Gogol (d. 1852), Russian literature became emancipated from the classic rule and began to develop original tendencies. Gogol in his writings manifests a deep sentiment of patriotism, a strong love of nature, and a fine sense of humor. The Russians have few ballads of great antiquity, and these rarely have any reference to the subjects of the heroic prose tales which are the delight of Russian nurseries, the favorite subjects of which are the traditions of Vladimir and his giant heroes, which doubtless once existed in the form of ballads. The Russians have ever been a singing race. Every festival day and every extraordinary event has its accompanying song. Though these songs have been modernized in language and form, that they date from the age of paganism is evident from their frequent invocations of heathen deities and allusions to heathen customs. Allied to these songs are the various ditties which the peasant girls and lads sing on certain occasions, consisting of endless repetitions of words or syllables; yet through this melodious tissue, apparently without meaning, sparks of real poetry often shine. The Russian songs, like the language, have a peculiar tenderness, and are full of caressing epithets, which are often applied even to inanimate objects. Russian lovers are quite inexhaustible in their endearing expressions, and the abundance of diminutives which the language possesses is especially favorable to their affectionate mode of address. With this exquisite tenderness of the love-song is united a pensive feeling, which, indeed, pervades the whole popular poetry of Russia, and which may be characterized as melancholy musical, and in harmony with the Russian national music, the expressive sweetness of which has been the admiration of all foreign composers to whom it has been known. In the rich and fertile steppes of the Ukraine, where every forest tree seems to harbor a singer, and every blade of grass on the boundless plains seems to whisper the echo of a song, this pensive character of Russian poetry deepens into a melancholy that finds expression in a variety of sweet elegiac melodies. A German writer says of them, "they are the sorrows of whole centuries blended in one everlasting sigh." The spirit of the past indeed breathes through their mournful strains. The cradle of the Kozak was rocked to the music of clashing swords, and for centuries the country, on both banks of the Dnieper to the northwestern branch of the Carpathian Mountains, the seat of this race, was the theatre of constant warfare. Their narrative ballads, therefore, have few other subjects than the feuds with the Poles and Tartars, the Kozak's parting with his beloved one, his lonely death on the border or on the bloody field of battle. These ballads have sometimes a spirit and boldness which presents noble relief to the habitual melancholy of this poetry in general. Professional singers, with a kind of guitar in their hand, wander through the country, sure to find a willing audience in whatever village they may stop. Their ballads are not confined to the scenes of their early history, but find subjects in the later wars with the Turks and Tartars, and in the campaigns of more modern times; they illustrate the warlike spirit, as well as the domestic relations of the Kozaks, and their skill in narrative, as well as their power of expressing in lyric strains the unsophisticated emotions of a tender heart. The poets of the present age exercise little or no influence on a society distracted and absorbed by the political questions of the day. Although the history of Russia is rich in dramatic episodes, it has failed to inspire any native dramatist. Count Tolstoi has been one of the most successful writers in this line, but, with great merits, he has the fault common to the Russian drama in general, that of great attention to the study of the chief character, to the neglect of other points which contribute to secure interest.

4. LITERATURE IN RUSSIA SINCE THE CRIMEAN WAR.--After the Crimean War, in 1854, the Russian government took the initiative in an onward movement, and by the abolition of serfdom the country awoke to new

life. In literature this showed itself in the rise of a new school, that of Nature, in which Turgenieff (1818-1883) is the most prominent figure, a place which he still holds in contemporary Russian literature. The publication of his "Diary of a Sportsman" first made the nobility of Russia aware that the serf was a man capable of feeling and suffering, and not a brute to be bought and sold with the soil, and this work was not without its effect in causing the emancipation. No writer has studied so faithfully and profoundly the Russian peasant and better understood the moral needs of the time and the great questions which agitate it. Within the last twenty years the new theory of Nihilism has begun to find expression in literature, particularly in fiction. Rejecting all authority in religion, politics, science, and art, this school is the reaction from long ages of oppression. The school of nature lent itself to this new movement until at last it reached the pessimistic standpoint of Schopenhauer. Of late, the ultra-realistic school has appeared in Russia, the writers of which devote themselves to the study of a low realism in its most repulsive aspects. While it boasts of not idealizing the peasant, like Turgenieff and others, it presents him in an aspect to excite only aversion. Art being thus excluded, and the school having neither authority, principle, nor object, whatever influence it may have cannot but be pernicious. SCIENCE.--In mathematics and in all the natural sciences Russia keeps pace with the most advanced European nations. In chemistry Mendeleeff formulated the theory relating to atoms and their chemical properties and relations, not then discovered to be the law by which they were governed, as later experiments proved.

THE SERBIAN LANGUAGE AND LITERATURE.

The Serbian alphabet was first fixed and the language reduced to certain general rules only within the present century. The language extends, with some slight variations of dialect, and various systems of writing, over the Turkish and Austrian provinces of Serbia, Bosnia, Herzegovina, Montenegro, and Dalmatia, and the eastern part of Croatia. The southern sky, and the beauties of natural scenery that abound in all these regions, so favorable to the development of poetical genius, appear also to have exerted a happy influence on the language. While it yields to none of the other Slavic dialects in richness, clearness, and precision, it far surpasses them all in euphony. The most interesting feature of the literature of these countries is their popular poetry. This branch of literature still survives among the Slavic race, particularly the Serbians and Dalmatians, in its beauty and luxuriance, while it is almost extinct in other nations. Much of this poetry is of unknown antiquity, and has been handed down by tradition from generation to generation. From the gray ages of paganism it reaches us like the chimes of distant bells, unconnected, and half lost in the air. It often manifests the strong, deep-rooted superstitions of the Slavic race, and is full of dreams, omens, and forebodings; witchcraft, and a certain Oriental fatalism, seeming to direct will and destiny. Love and heroism form the subject of all Slavic poetry, which is distinguished for the purity of manners it evinces. Wild passions or complicated actions are seldom represented, but rather the quiet scenes of domestic grief and joy. The peculiar relation of brother and sister, particularly among the Serbians, often forms an interesting feature of the popular songs. To have no brother is a misfortune, almost a disgrace, and the cuckoo, the constant image of a mourning woman in Serbian poetry, was, according to the legend, a sister who had lost her brother. This poetry was first collected by Vuk Stephanovitch Karadshitch (b. 1786), a Turkish Serbian, the author of the first Oriental Serbian grammar and dictionary, who gathered the songs from the lips of the peasantry. His work, published at Vienna in 1815, has been made known to the world through a translation into German by the distinguished authoress of the "Languages and Literature of the Slavic Nations," from which this brief sketch has been made. Nearly one third of these songs consist of epic tales several hundred verses in length. The lyric songs compare favorably with those of other nations, but the long epic extemporized compositions, by which the peasant bard, in the circle of other peasants, in unpremeditated but regular and harmonious verse, celebrates the heroic deeds of their ancestors or contemporaries, have no parallel in the whole history of literature since the days of Homer. The poetry of the Serbians is intimately interwoven with their daily life. The hall where the women sit spinning around the fireside, the mountain on which the boys pasture their flocks, the square where the village youth assemble to dance, the plains where the harvest is reaped, and the forests through which the lonely traveler journeys, all resound with song. Short compositions, sung without accompaniment, are mostly composed by women, and are called female songs; they relate to domestic life, and are distinguished by cheerfulness, and often by a spirit of graceful roguery. The feeling expressed in the Serbian love-songs is gentle, often playful, indicating more of tenderness than of passion. In their heroic poems the Serbians stand quite isolated; no modern nation can be compared to them in epic productiveness, and the recent publication of these poems throws new light on the grand compositions of the ancients. The general character of these Serbian tales is objective and plastic; the poet is, in most cases, in a

remarkable degree above his subject; he paints his pictures, not in glowing colors, but in prominent features, and no explanation is necessary to interpret what the reader thinks he sees with his own eyes. The number and variety of the Servian heroic poems is immense, and many of them, until recently preserved only by tradition, cannot be supposed to have retained their original form; they are frequently interwoven with a belief in certain fanciful creatures of pagan superstition, which exercise a constant influence on human affairs. The poems are often recited, but most frequently sung to the music of a rude kind of guitar. The bard chants two lines, then he pauses and gives a few plaintive strokes on his instrument; then he chants again, and so on. While in Slavic poetry generally the musical element is prominent, in the Servian it is completely subordinate. Even the lyric poetry is in a high degree monotonous, and is chanted rather than sung. Goethe, Grimm, and "Talvi" drew attention to these songs, many translations of which were published in Germany, and Bowering, Lytton, and others have made them known in England. At present there is much intellectual activity among the Servians in various departments of literature, tragedy, comedy, satire, and fiction, but the names of the writers are new to Europeans, and not easily remembered.

THE BOHEMIAN LANGUAGE AND LITERATURE.

John Huss, Jerome of Prague, Tycho Brahe, Kepler, Comenius, and others.

The Bohemian is one of the principal Slavic languages. It is spoken in Bohemia and in Moravia, and is used by the Slovaks of Hungary in their literary productions. Of all the modern Slavic dialects, the Bohemian was the first cultivated; it early adopted the Latin characters, and was developed under the influence of the German language. In its free construction, the Bohemian approaches the Latin, and is capable of imitating the Greek in all its lighter shades. The first written documents of the Bohemians are not older than the introduction of Christianity into their country; but there exists a collection of national songs celebrating battles and victories, which probably belongs to the eighth or ninth century. During the eleventh and twelfth centuries the influence of German customs and habits is apparent in Bohemian literature; and in the thirteenth and fourteenth this influence increased, and was manifest in the lyric poetry, which echoed the lays of the German Minnesingers. Of these popular songs, however, very few are left. In 1348 the first Slavic university was founded in Prague, on the plan of those of Paris and Bologna, by the Emperor Charles IV., who united the crowns of Germany and Bohemia. The influence of this institution was felt, not merely in the two countries, but throughout Europe. The name of John Huss (1373-1415) stands at the head of a new period in Bohemian literature. He was professor at the university of Prague, and early became acquainted with the writings of Wickliffe, whose doctrines he defended in his lectures and sermons. The care and attention he bestowed on his compositions exerted a decided and lasting influence on the language. The old Bohemian alphabet he arranged anew, and first settled the Bohemian orthography according to fixed principles. Summoned to appear before the council of Constance to answer to the charges of heresy, he obeyed the call under a safe-conduct from the Emperor Sigismund. But he was soon arrested by order of the council, condemned, and burned alive. Among the coadjutors of Huss was Jerome of Prague, a professor in the same university, who in his erudition and eloquence surpassed his friend, whose doctrinal views he adopted, but he had not the mildness of disposition nor the moderation of conduct which distinguished Huss. He wrote several works for the instruction of the people, and translated some of the writings of Wickliffe into the Bohemian language. On hearing of the dangerous situation of his friend he hastened to Constance to assist and support him. He, too, was arrested, and even terrified into temporary submission; but at the next audience of the council he reaffirmed his faith, and declared that of all his sins he repented of none more than his apostasy from the doctrines he had maintained. In consequence of this avowal he was condemned to the same fate as his friend. These illustrious martyrs were, with the exception of Wickliffe, the first advocates of truth a century before the Reformation. Since then, in no language has the Bible been studied with more zeal and devotion than in the Bohemian. The long contest for freedom of conscience which desolated the country until the extinction of the nation is one of the great tragedies of human history. The period from 1520 to 1620 is considered the golden age of Bohemian literature. Nearly two hundred writers distinguished the reign of Rudolph I. (1526-1611), and among them were many ladies and gentlemen of the court, of which Tycho Brahe, Kepler, and other scientific men, from foreign countries, were the chief ornaments. Numerous historical works were published, theology was cultivated with talent and zeal, the eloquence of the pulpit and the bar acquired a high degree of cultivation, and in religious hymns all sects were equally productive. The triumph of the Catholic party, which followed the battle of the White Mountain, near Prague (1620), gave a fatal blow to Bohemia. The leading men of the country were executed, exiled, or imprisoned; the Protestant religion was abolished, and the country was declared a hereditary Catholic monarchy. The Bohemian language ceased to be used in public transactions; and

every book written in it was condemned to the flames as necessarily heretical. Great numbers of monks came from southern Europe, and seized whatever native books they could find; and this destruction continued to go on until the close of the last century. Among the Bohemian emigrants who continued to write in their foreign homes, Comenius (1592-1691) surpassed all others. When the great persecution of the Protestants broke out he fled to Poland, and in his exile he published several works in Latin and in Bohemian, distinguished for the classical perfection of their style. In the latter part of the eighteenth century the efforts to introduce into Bohemia the German as the official language of the country awoke the national feeling of the people, and produced a strong reaction in favor of their native tongue. When the tolerant views of Joseph II. were known, more than a hundred thousand Protestants returned to their country; books long hidden were brought to light, and many works were reprinted. During the reign of his two successors, the Bohemians received still more encouragement; the use of the language was ordained in all the schools, and a knowledge of it was made a necessary qualification for office. Among the writers who exerted a favorable influence in this movement may be mentioned Kramerius (1753-1808), the editor of the first Bohemian newspaper, and the author of many original works; Dobrovsky (1753-1829), the patriarch of modern Slavic literature, and one of the profoundest scholars of the age; and Kollar (b. 1763), the leading poet of modern times in the Bohemian language. Schaffarik (b. 1795), a Slovak, is the author of a "History of the Slavic Language and Literature," in German, which has, perhaps, contributed more than any other work to a knowledge of Slavic literature. Palacky, a Moravian by birth, was the faithful fellow-laborer of Schaffarik; his most important work is a "History of Bohemia." Since 1848 there has arisen a school of poets whose writings are more in accordance with those of the western nations. Among them are Hálek (d. 1874) and Cech, the most celebrated of living Bohemian poets. Caroline Soëtla (b. 1830) is the originator of the modern Bohemian novel. Since 1879 many poems have appeared, epic in their character, taking their materials both from the past and the present. In various branches of literature able writers are found, too numerous even to name.

THE POLISH LANGUAGE AND LITERATURE.

Rey, Bielski, Copernicus, Czartoryski, Niemcewicz, Mickiewicz, and others.

The Polish language is the only existing representative of that variety of idioms originally spoken by the Slavic tribes, which, under the name of Lekhes, in the sixth or seventh century, settled on the banks of the Vistula and Varta. Although very little is known of the progress of the language into its present state, it is sufficiently obvious that it has developed from the conflict of its natural elements with the Latin and German idioms. Of the other Slavic dialects, the Bohemian is the only one which has exerted any influence upon this tongue. The Polish language is refined and artificial in its grammatical structure, rich in its words and phrases, and, like the Bohemian, capable of faithfully imitating the refinements of the classical languages. It has a great variety and nicety of shades in the pronunciation of the vowels, and such combinations of consonants as can only be conquered by a Slavic tongue. The literary history of Poland begins, like that of Bohemia, at the epoch of the introduction of Christianity. In the year 965, Miecislav, Duke of Poland, married the Bohemian princess Dombrovka, who consented to the marriage on the condition of the duke becoming a convert to Christianity; and from that time the Polish princes, and the greater part of the nation, adopted the new faith. The clergy in those early ages in Poland, as well as elsewhere, were the depositaries of mental light; and the Benedictine monks who, with others, had been invited to the converted country, founded convents, to which they early attached schools. Their example was followed, at a later period, by other orders, and for several centuries the natives were excluded from all clerical dignities and privileges, and the education of the country was directed by foreign monks. They burned the few writings which they found in the vernacular tongue, and excited unnatural prejudices against it. From the ninth to the sixteenth century Polish literature was almost entirely confined to the translation of a part of the Bible and a few chronicles written in Latin. Among these must be noticed the chronicle of Martin Gallus (d. 1132), an emigrant Frenchman, who is considered as the oldest historian of Poland. Casimir (1333-1370) was one of the few princes who acquired the name of the Great, not by conquests, but by the substantial benefits of laws, courts of justice, and means of education, which he procured for his subjects. In his reign was formed the first code of laws, known by the name of "Statute of Wislica," a part of which is written in the Polish language; and he laid the foundation of the university of Cracow (1347), which, however, was only organized half a century later. Hedevig, the granddaughter of Casimir, married Jagello of Lithuania, and under their descendants, who reigned nearly two centuries, Poland rose to the summit of power and glory. With Sigismund I. (1505-1542), and Sigismund Augustus (1542-1613), a new period of Polish literature begins. The university of Cracow had been organized in 1400, on the model of that of Prague, and this opened a door for the doctrines, first of the Bohemian, then of the German reformers. The wild flame of superstition which

kindled the fagots for the disciples of the new doctrines in Poland was extinguished by Sigismund I. and Sigismund II., in whom the Reformation found a decided support. Under their administration Poland was the seat of a toleration then unequalled in the world; the Polish language became more used in literary productions, and was fixed as the medium through which laws and decrees were promulgated. Rey of Naglowic (1515-1569), who lived at the courts of the Sigismunds, is called the father of Polish poetry. Most of his productions are of a religious nature, and bear the stamp of a truly poetical talent. John Kochanowski (1530-1584) published a translation of the Psalms, which is still considered as a classical work. His other poems, in which Pindar, Anacreon, and Horace were alternately his models, are distinguished for their conciseness and terseness of style. Rybinski (fl. 1581) and Simon Szymonowicz (d. 1629), the former as a lyric poet, the latter as a writer of idyls, maintain a high rank. The Poles possess all the necessary qualities for oratory, and the sixteenth century was eminent for forensic and pulpit eloquence. History was cultivated with much zeal, but mostly in the Latin language. Martin Bielski (1500-1576) was the author of the "Chronicle of Poland," the first historical work in Polish. Scientific works were mostly written in Latin, the cultivation of which, in Poland, has ever kept pace with the study of the vernacular tongue. Indeed, the most eminent writers and orators of the sixteenth century, who made use of the Polish language, managed the Latin with equal skill and dexterity, and in common conversation both Latin and Polish were used. Among the scientific writers of Latin is the astronomer Copernicus (1473- 1543). He early went to Italy, and was appointed professor of mathematics at Rome. He at length returned to Poland, and devoted himself to the study of astronomy. Having spent twenty years in observations and calculations, he brought his scheme to perfection, and established the theory of the universe which is now everywhere received. The interval between 1622 and 1760 marks a period of a general decadence in Polish literature. The perversion of taste which, at the beginning of that age, reigned in Italy, and thence spread over Europe, reached Poland; and for nearly a hundred and fifty years the country, under the influence of the Jesuits, was the victim of a stifling intolerance, and of a general mental paralysis. But in the reign of Stanislaus Augustus (1762-1795), Poland began to revive, and the national literature received a new impulse. Though the French language and manners prevailed, and the bombastic school of Marini was only supplanted by that of the cold and formal poets of France, the cultivation of the Polish language was not neglected; a periodical work, to which the ablest men of the country contributed, was published, public instruction was made one of the great concerns of the government, and the power of the Jesuits was destroyed. The dissolution of the kingdom which soon followed, its partition and amalgamation with foreign nations, kindled anew the patriotic spirit of the Poles, who devoted themselves with more zeal than ever to the cultivation of their native language, the sole tie which still binds them together. The following are the principal representatives of this period: Stephen Konarski (1700-1773), a writer on politics and education, who devoted himself entirely to the literary and mental reform of his country; Zaluski (1724-1786), known more especially as the founder of a large library, which, at the dismemberment of Poland, was transferred to St. Petersburg; and, above all, Adam Czartoryski (1731-1823), and the two brothers Potocki, distinguished as statesmen, orators, writers, and patrons of literature and art. At the head of the historical writers of the eighteenth century stands Naruszewicz (1753-1796), whose history of Poland is considered as a standard work. In respect to erudition, philosophical conception, and purity of style, it is a masterpiece of Polish literature. Krasicki (1739-1802), the most distinguished poet under Stanislaus Augustus, was called the Polish Voltaire. His poems and prose writings are replete with wit and spirit, though bearing evident marks of French influence, which was felt in almost all the poetical productions of that age. Niemcewicz (1787-1846) is regarded as one of the greatest poets of the eighteenth and nineteenth centuries. Having fought by the side of Kosciusko, and shared his fate as a prisoner, he accompanied him to America, where he became the friend and associate of Washington, whose life he afterwards described. His other works consist of historical songs, dramas, and a history of the reign of Sigismund. There is no branch of literature in which the Poles have manifested greater want of original power than in the drama, where the influence of the French school is decided, and, indeed, exclusive. Novels and tales, founded on domestic life, are not abundant in Polish literature; philosophy has had few votaries, and the other sciences, with the exception of the mathematical and physical branches, have been, till recently, neglected. The failure of the revolution of 1830 forms a melancholy epoch in Polish history, and especially in Polish literature. The universities of Warsaw and Wilna were broken up, and their rich libraries removed to St. Petersburg. Even the lower schools were mostly deprived of their funds, and changed to Russian government schools. The press was placed under the strictest control, the language and the national peculiarities of the country were everywhere persecuted, the Russian tongue and customs substituted, and the poets and learned men either silenced or banished. Yet since that time the national history has become more than ever a chosen study with the people; and as the results of these researches, since 1830, cannot be written in Poland, Paris has become the principal seat of Polish learning. One of the first works of importance published there was the "History of the Polish Insurrection," by Mochnachi (1804- 1835), known before as the author of a work on the Polish literature of the nineteenth century, and as the able editor of several periodicals. Lelewel, one of the leaders of the revolution, wrote a work on the civil rights of the

Polish peasantry, which has exercised a more decided influence in Poland than that of any modern author. Mickiewicz (1798- 1843), a leader of the same revolution, is the most distinguished of the modern poets of Poland. His magnificent poem of "The Feast of the Dead" is a powerful expression of genius. His "Sonnets on the Crimea" are among his happiest productions, and his "Sir Thaddeus" is a graphic description of the civil and domestic life of Lithuania. Mickiewicz is the founder of the modern romantic school in Poland, to which belong the most popular productions of Polish literature. Zalesski, Grabowski, and others of this school have chosen the Ukraine as the favorite theatre of their poems, and give us pictures of that country, alternately sweet, wild, and romantic. Of all the Slavic nations, the Poles have most neglected their popular poetry, a fact which may be easily explained in a nation among whom whatever refers to mere boors and serfs has always been regarded with the utmost contempt. Their beautiful national dances, however, the graceful Polonaise, the bold Masur, the ingenious Cracovienne, are equally the property of the nobility and peasantry, and were formerly always accompanied by singing instead of instrumental music. These songs were extemporized, and were probably never committed to writing. The centre of literary activity in Poland is Warsaw, which, in spite of the severe restrictions on the press, has always maintained its preëminence.

ROUMANIAN LITERATURE.

Carmen Sylva.

The kingdom of Roumania, composed of the principalities of Moldavia and Wallachia, united in 1859, has few literary monuments. The language is Wallachian, in which the Latin predominates, with a mixture of Slavic, Turkish, and Tartar, and has only of late been classed with the Romance languages, by the side of Italian, Spanish, and Portuguese. There are some historical fragments of the fifteenth century remaining; the literature that followed was mostly theological. In recent times a great number of learned and poetical works have been produced, and political movements have led to many political writings and to the establishment of many newspapers. The most distinguished name in Roumanian literature is that of "Carmen Sylva," the nom de plume of the beautiful and gifted queen of that country, whose writings in prose and verse are remarkable for passionate feeling, grace, and finished execution.

DUTCH LITERATURE.

1. The Language.--2. Dutch Literature to the Sixteenth Century: Maerlant; Melis Stoke; De Weert; the Chambers of Rhetoric; the Flemish Chroniclers; the Rise of the Dutch Republic.--3. The Latin Writers: Erasmus; Grotius; Arminius; Lipsius; the Scaligers, and others; Salmasius; Spinoza; Boerhaave; Johannes Secundus.--4. Dutch Writers of the Sixteenth Century: Anna Byns; Coornhert; Marnix de St. Aldegonde, Bor, Visscher, and Spieghel.--5. Writers of the Seventeenth Century: Hooft; Vondel; Cats; Antonides; Brandt, and others; Decline in Dutch Literature.--6. The Eighteenth Century: Poot; Langendijk; Hoogvliet; De Marre; Feitama; Huydecoper; the Van Harens; Smits; Ten Kate; Van Winter; Van Merken; De Lannoy; Van Alphen; Bellamy; Nieuwland, Styl, and others.--7. The Nineteenth Century: Feith; Helmers; Bilderdyk; Van der Palm; Loosjes; Loots, Tollens, Van Kampen, De s'Gravenweert, Hoevill, and others.

1. THE LANGUAGE.--The Dutch, Flemish, and Frisic languages, spoken in the kingdoms of Holland and Belgium, are branches of the Gothic family. Toward the close of the fifteenth century, the Dutch gained the ascendancy over the others, which it has never since lost. This language is energetic and flexible, rich in synonyms and delicate shades, and from its fullness and strength, better adapted to history, tragedy, and odes, than to comedy and the lighter kinds of poetry. The Flemish, which still remains the literary language of the southern provinces, is inferior to the Dutch, and has been greatly corrupted by the admixture of foreign words. The Frisic, spoken in Friesland, is an idiom less cultivated than the others, and is gradually disappearing. In the seventeenth century it boasted of several writers, of whom the poet Japix was the most eminent. The first grammar of the Frisic language was published by Professor Rask, of Copenhagen, in 1825. In some parts of Belgium the Walloon, an old dialect of the French, is still spoken, but the Flemish continues to be the common language of the people, although since the

establishment of Belgium as an independent kingdom the use of the French language has prevailed among the higher classes.

2. DUTCH LITERATURE TO THE SIXTEENTH CENTURY.--When the obscurity of the dark ages began to disappear with the revival of letters, the Netherlands were not last among the countries of Europe in coming forth from the darkness. The cities of Flanders were early distinguished for the commercial activity and industrial skill of their inhabitants. Bruges reached the height of its splendor in the beginning of the fifteenth century, and was for some time one of the great commercial emporiums of the world, to which Constantinople, Genoa, and Venice sent their precious argosies laden with the products of the East. At the close of the thirteenth century Ghent, in wealth and power, eclipsed the French metropolis; and at the end of the fifteenth century there was, according to Erasmus, no town in all Christendom to compare with it for magnitude, power, political institutions, or the culture of its citizens. The lays of the minstrels and the romances of chivalry were early translated, and a Dutch version of "Reynard the Fox" was made in the middle of the thirteenth century. Jakob Maerlant (1235-1300), the first author of note, translated the Bible into Flemish rhyme, and made many versions of the classics; and Melis Stoke, his contemporary, wrote a rhymed "Chronicle of Holland." The most important work of the fourteenth century is the "New Doctrine," by De Weert, which, for the freedom of its expression on religious subjects, may be regarded as one of the precursors of the Reformation. Towards the close of the fourteenth century there arose a class of wandering poets called Sprekers, who, at the courts of princes and elsewhere, rehearsed their maxims in prose or verse. In the fifteenth century they formed themselves into literary societies, known as "Chambers of Rhetoric" (poetry being at that time called the "Art of Rhetoric"), which were similar to the Guilds of the Meistersingers. These institutions were soon multiplied throughout the country, and the members exercised themselves in rhyming, or composed and performed mysteries and plays, which, at length, gave rise to the theatre. They engaged in poetical contests, distributed prizes, and were prominent in all national fêtes. The number of the rhetoricians was so immense, that during the reign of Philip II. of Spain more than thirty chambers, composed of fifteen hundred members, often entered Antwerp in triumphal procession. But the effect of these associations, composed for the most part of illiterate men, was to destroy the purity of the language and to produce degeneracy in the literature. The Chamber of Amsterdam, however, was an honorable exception, and towards the close of the sixteenth century it counted among its members distinguished scholars, such as Spieghel, Coornhert, Marnix, and Visscher, and it may be considered as the school which formed Hooft and Vondel. During the reign of the House of Burgundy (1383-1477), which was essentially French in tastes and manners, the native tongue became corrupted by the admixture of foreign elements. The poets and chroniclers of the time were chiefly of Flemish origin; the most widely known among the latter are Henricourt (d. 1403), Monstrelet (d. 1453), and Chastelain (d. 1475). A translation of the Bible and a few more works close the literary record of the fifteenth century. The invention of printing, the great event of the age, is claimed by the cities of Mayence, Strasbourg, and Harlem; but if the art which preserves literature originated in the Netherlands, it did not at once create a native literature, the growth of which was greatly retarded by the use of the Latin tongue, which long continued to be the organ of expression with the principal writers of the country, nearly all of whom, even to the present day, are distinguished for the purity and elegance with which they compose in this language. The Reformation and the great political agitations of the sixteenth century ended in the independence of the northern provinces and the establishment of the Dutch Republic (1581) under the name of the United Provinces, commonly called Holland, from the province of that name, which was superior to the others in extent, population, and influence. The new republic rose rapidly in power; and while intolerance and religious disputes distracted other European states, it offered a safe asylum to the persecuted of all sects. The expanding energies of the people soon sought a field beyond the narrow boundaries of the country; their ships visited every sea, and they monopolized the richest commerce of the world. They alone supplied Europe with the productions of the Spice Islands, and the gold, pearls, and jewels of the East all passed through their hands; and in the middle of the seventeenth century the United Provinces were the first commercial and the first maritime power in the world. A rapid development of the literature was the natural consequence of this increasing national development, which was still more powerfully promoted by the great and wise William I., Prince of Orange, who in 1575 founded the university of Leyden as a reward to that city for its valiant defense against the Spaniards. Similar institutions were soon established at Groningen, Utrecht, and elsewhere; these various seats of learning produced a rivalry highly advantageous to the diffusion of knowledge, and great men arose in all branches of science and literature. Among the distinguished names of the sixteenth century those of the Latin writers occupy the first place.

3. LATIN WRITERS.--One of the great restorers of letters in Europe, and one of the most elegant of modern Latin authors, was Gerard Didier, a native of Rotterdam, who took the name of Erasmus (1467-1536). To profound learning he joined a refined taste and a delicate wit, and few men have been so greatly admired as he was during his

lifetime. The principal sovereigns of Europe endeavored to draw him into their kingdoms. He several times visited England, where he was received with great deference by Henry VIII., and where he gave lectures on Greek literature at Cambridge. He made many translations from Greek authors, and a very valuable translation of the New Testament into Latin. His writings introduced the spirit of free inquiry on all subjects, and to his influence may be attributed the first dawning of the Reformation. But his caution offended some of the best men of the times. His treatise on "Free Will" made an open breach between him and Luther, whose opinions favored predestination; his "Colloquies" gave great offense to the Catholics; and as he had not declared for the Protestants, he had but lukewarm friends in either party. It has been said of Erasmus, that he would have purified and repaired the venerable fabric of the church, with a light and cautious touch, fearful lest learning, virtue, and religion should be buried in its fall, while Luther struck at the tottering ruin with a bold and reckless hand, confident that a new and more beautiful temple would rise from its ruins. Hugo de Groot, who, according to the fashion of the time, took the Latin name of Grotius (1583-1645), was a scholar and statesman of the most diversified talents, and one of the master minds of the age. He was involved in the religious controversy which at that time disturbed Holland, and he advocated the doctrines of Arminius, in common with the great statesman, Barneveldt, whom he supported and defended by his pen and influence. On the execution of Barneveldt, Grotius was condemned to imprisonment for life in the castle of Louvestein; but after nearly two years spent in the prison, his faithful wife planned and effected his escape. She had procured the privilege of sending him a chest of books, which occasionally passed and repassed, closely scrutinized. On one occasion the statesman took the place of the books, and was borne forth from the prison in the chest, which is still in the possession of the descendants of Grotius, in his native city of Delft. The States-General perpetuated the memory of the devoted wife by continuing to give her name to a frigate in the Dutch navy. After his escape from prison, Grotius found an asylum in Sweden, from whence he was sent ambassador to France. His countrymen at length repented of having banished the man who was the honor of his native land, and he was recalled; but on his way to Holland he was taken ill and died before he could profit by this tardy act of justice. The writings of Grotius greatly tended to diffuse an enlightened and liberal manner of thinking in all matters of science. He was a profound theologian, a distinguished scholar, an acute philosopher and jurist, and among the modern Latin poets he holds a high place. The philosophy of jurisprudence has been especially promoted by his great work on natural and national law, which laid the foundation of a new science. Arminius (1560-1609), the founder of the sect of Arminians or Remonstrants, was distinguished as a preacher and for his zeal in the Reformed Religion. He attempted to soften the Calvinistic doctrines of predestination, in which he was violently opposed by Gomarus. He counted among his adherents Grotius, Barneveldt, and many of the eminent men of Holland. Other eminent theologians of this period were Drusus and Coeceius. Lipsius (1547-1606) is known as a philologist and for his treatises on the military art of the Romans, on the Latin classics, and on the philosophy of the Stoics. Another scholar of extensive learning, whose editions of the principal Greek and Latin classics have rendered him famous all over Europe, was Daniel Heinsius (1580-1655). Gronovius and several of the members of the Spanheim family became also eminent for their scholarship in various branches of ancient learning. The two Scaligers, father and son (1483-1554) (1540-1609), Italians, resident in Holland, are eminent for their researches in chronology and archaeology, and for their valuable works on the classics. Prominent among those who followed in the new path of philological study opened by the elder Scaliger was Vossius, or Voss (1577-1649), who excelled in many branches of learning, and particularly in Latin philology, which owes much to him. He left five sons, all scholars of note, especially the youngest, Isaac Vossius (1618-1689). Peter Burmann (1668-1741) was a scholar of great erudition and industry. Christian Huyghens (1629-1695) was a celebrated astronomer and mathematician, and many great men in those branches of science flourished in Holland in the seventeenth century. Among the great philologists and scholars must also be mentioned Hemsterhuis, Ruhnkenius, and Valckenaer. Menno van Coehorn (1641-1704) was a general and engineer distinguished for his genius in military science; his great work on fortifications has been translated into many foreign languages. Helmont and Boerhaave have acquired world-wide fame by their labors in chemistry; Linnaeus collected the materials for his principal botanical work from the remarkable botanical treasures of Holland; and zoology and the natural sciences generally counted many devoted and eminent champions in that country. Salmasius (1588-1653), though born in France, is ranked among the writers of Holland. He was professor in the University of Leyden, and was celebrated for the extent and depth of his erudition. He wrote a defense of Charles I. of England, which was answered by Milton, in a work entitled "A Defense of the English People against Salmasius' Defense of the King." Salmasius died soon after, and some did not scruple to say that Milton killed him by the acuteness of his reply. Boerhaave (1668-1738) was one of the most eminent writers on medical science in the eighteenth century, and from the time of Hippocrates no physician had excited so much admiration. Spinoza (1632-1677) holds a commanding position as a philosophical writer. His metaphysical system, as expounded in his principal work, "Ethica," merges everything individual and particular in the Divine substance, and is thus essentially pantheistic. The philosophy of Spinoza exercised a powerful influence upon the mind of Kant, and the master-minds and great poets of modern times,

particularly of Germany, have drawn copiously from the deep wells of his suggestive thought. Among the many Latin poets of Holland, John Everard (1511-1536) (called Jan Second or Johannes Secundus, because he had an uncle of the same name) is most celebrated. His poem entitled "The Basia or Kisses" has been translated into the principal European languages. Nicholas Heinsius (1620- 1681), son of the great philologist and poet Heinsius, wrote various Latin poems, the melody of which is so sweet that he was called by his contemporaries the "Swan of Holland."

4. DUTCH WRITERS OF THE SIXTEENTH CENTURY.--The first writer of this century in the native language was Anna Byns, who has been called the Flemish Sappho. She was bitterly opposed to the Reformation, and such of her writings as were free from religious intolerance evince more poetic fire than is found in those of her contemporaries. Coornhert (1522-1605) was a poet and philosopher, distinguished not less by his literary works than by his participation in the revolution of the Provinces. In purity of style and vigor of thought he far surpassed his predecessors. Marnix de St. Aldegonde (d. 1598) was a soldier, a statesman, a theologian, and a poet. He was the author of the celebrated "Compromise of the Nobles," and his satire on the Roman Catholic Church was one of the most effective productions of the time. He translated the Psalms from the original Hebrew, and was the author of a lyric which, after two centuries and a half, is still the rallying song of the nation on all occasions of peril or triumph. Bor (1559-1635) was commissioned by the States to write a history of their struggles with Spain, and his work is still read and valued for its truthfulness and impartiality. Meteren, the contemporary of Bor, wrote the history of the country from the accession of the House of Burgundy to the year 1612--a work which, with some faults, has a high place in the literature. Visscher (d. 1612) and Spieghel (d. 1613) form the connecting link between the sixteenth and seventeenth centuries. Visscher, the Maecenas of the day, was distinguished for his epigrammatic and fugitive poems, and rendered immense service to letters by his influence on the literary men of his time. His charming daughters were both distinguished in literature. Spieghel is best remembered by his poem, the "Mirror of the Heart," which abounds in lofty ideas, and in sentiments of enlightened patriotism.

5. THE SEVENTEENTH CENTURY.--At the close of the sixteenth century, although the language was established, it still remained hard and inflexible, and the literature was still destitute of dramatic, erotic, and the lighter kinds of poetry; but an earnest, patriotic, religious, and national character was impressed upon it, and its golden age was near at hand. The commencement of the seventeenth century saw the people of the United Provinces animated by the same spirit and energy, preferring death to the abandonment of their principles, struggling with a handful of men against the most powerful monarchy of the time; conquering their political and religious independence, after more than half a century of conflict, and giving to the world a great example of freedom and toleration; covering the ocean with their fleets, and securing possessions beyond the sea a hundred times more vast than the mother country; becoming the centre of universal commerce, and cultivating letters, the sciences, and the arts, with equal success. Poetry was national, for patriotism predominated over all other sentiments; and it was original, because it recognized no models of imitation but the classics. The spirit of the age naturally communicated itself to the men of letters, who soon raised the literature of the country to a classic height; first among these were Hooft, Vondel, and Jacob Cats. Hooft (1581-1647), a tragic and lyric poet as well as a historian, greatly developed and perfected the language, and by a careful study of the Italian poets imparted to his native tongue that sonorous sweetness which has since characterized the poetry of Holland. He was the creator of native tragedy, as well as of erotic verse, in which his style is marked by great sweetness, tenderness, and grace. He rendered still greater service to the native prose. His histories of "Henry IV.," of the "House of Medici," and above all the history of the "War of Independence in the Low Countries," without sacrificing truth, often border on poetry, in their brilliant descriptions and paintings of character, and in their nervous and energetic style. Hooft was a man of noble heart; he dared to protect Grotius in the days of his persecution; he defended Descartes and offered an asylum to Galileo. Vondel (1587-1660), as a lyric, epic, and tragic poet, far surpassed all his contemporaries, and his name is honored in Holland as that of Shakspeare is in England. His tragedies, which are numerous, are his most celebrated productions, and among them "Palamedes Unjustly Sacrificed" is particularly interesting as representing the heroic firmness of Barneveldt, who repeated one of the odes of Horace when undergoing the torture. Vondel excelled as a lyric and epigrammatic poet, and the faults of his style belonged rather to his age than to himself. No writer of the time acquired a greater or more lasting reputation than Jacob Cats (1577-1660), no less celebrated for the purity of his life than for the sound sense and morality of his writings, and the statesmanlike abilities which he displayed as ambassador in England, and as grand pensioner of Holland. His style is simple and touching, his versification easy and harmonious, and his descriptive talent extraordinary. His works consist chiefly of apologues and didactic and descriptive poems. No writer of Holland has been more read than Father Cats, as the people affectionately call him; and up to the present hour, in all families his works have their place beside the Bible, and his verses are known by heart all over the country. An

illustrated edition of his poems in English has been recently published in London. Hooft and Vondel left many disciples and imitators, among whom are Antonides (1647-1684), surnamed Van der Goes, whose charming poem on the River Y, the model of several similar compositions, is still read and admired. Among numerous other writers were Huygens (b. 1596), a poet who wrote in many languages besides his own; Heinsius (b. 1580), a pupil of Scaliger, the author of many valuable works in prose and poetry; Vallenhoven, contemporary with Antonides, a religious poet; Rotgans, the author of an epic poem on William of England; Elizabeth Hoofman (b. 1664), a poetess of rare elegance and taste, and Welckens (b. 1658), whose eclogues and idyls occupy the first place among that class of poems. As a historian Hooft found a worthy successor in Brandt (1626-1683), also a poet, but best known by his "History of the Reformation in the Netherlands," which has been translated into French and English, and which is a model in point of style. At this period the Bible was translated and commented upon, and biographies, criticisms, and many other prose works appeared. The voyages and discoveries of the Dutch merchants and navigators were illustrated by numerous narratives, which, for their interest both in style and detail, deserve honorable mention. >From the commencement of the last quarter of the seventeenth century, however, many causes combined to produce a decline in the literature of the Netherlands. The honors which were accorded not only by the Dutch universities, but by all Europe to their Latin writers and learned professors, were rarely bestowed on writers in the native tongue, and thus the minds of men of genius were turned to the study of the classics and the sciences. The Dutch merchants, while they cultivated all other languages for the facilities they thus gained in their commercial transactions, restricted by so much the diffusion of their own. Other causes of this decline are to be found in the indifference of the republican government to the interests of literature, and in the increasing number of alliances with foreigners, who were attracted to Holland by the mildness of its laws, in the growing commercial spirit and taste for luxury, and especially in the influence of French literature, which, towards the close of the seventeenth century, became predominant in Holland as elsewhere.

6. THE EIGHTEENTH CENTURY.--For the first three quarters of the eighteenth century the literature of Holland, like that of other countries of Europe, with the exception of France, remained stationary, or slowly declined. But in the midst of universal mediocrity, a few names shine with distinguished lustre. Among them that of Poot (1689-1732) is commonly cited with those of Hooft and Vondel. He was a young peasant, whose rare genius found expression in a sweet and unaffected style. He excelled in idyllic and erotic poetry, and while he has no rival in Holland, he may perhaps be compared to Burns in Scotland, and Béranger in France. The theatre of Amsterdam, the only one of the country, continued to confine itself to translations or imitations from the French. There appeared, however, at the commencement of this period, an original comic author, Langendijk (1662-1735), whose works still hold their place upon the stage, partly for their merit, and partly to do honor to the only comic poet Holland has produced. Hoogvliet (1689-1763) was distinguished as the author of a poem entitled "Abraham," which had great and merited success, and which still ranks among the classics; for some years after it appeared, it produced a flood of imitations. De Marre (b. 1696), among numerous writers of tragedy, occupies the first place. From his twelfth year he was engaged in the merchant marine service, and besides his tragedies his voyages inspired many other works, the chief of which, a poem entitled "Batavia," celebrates the Dutch domination in the Asiatic archipelago. Feitama (1694-1758), with less poetic merit than De Marre, had great excellence. He was the first translator of the classics who succeeded in imparting to his verse the true spirit of his originals. Huydecoper (d. 1778) was the first grammarian of merit, and he united great erudition with true poetic power. His tragedies are still represented. Onno Zwier Van Haren (1713-1789) was also a writer of tragedy, and the author of a long poem in the epic style, called the Gueux (beggars), a name given in derision to the allied noblemen of the Netherlands in the time of Philip, and adopted by them. This poem represents the great struggle of the country with Spain, which ended in the establishment of the Dutch republic, and is distinguished for its fine episodes, its brilliant pictures, and its powerful development of character. The only strictly epic poem that Holland has produced is the "Friso" of William Van Haren (1710-1758), the brother of the one already named. Friso, the mythical founder of the Frisons, is driven from his home on the shores of the Ganges, and, after many adventures, finds an asylum and establishes his government in the country to which he gives his name. This work with many faults is full of beauties. The brothers Van Haren were free from all foreign influence, and may justly be regarded as the two great poets of their time. The poems of Smits (1702-1750) are full of grace and sentiment, but, like those of almost all the Dutch poets, they are characterized by a seriousness of tone nearly allied to melancholy. Ten Kate (1676-1723) stands first among the grammarians and etymologists, and his works are classical authorities on the subject of the language. Preëminent among the crowd of historians is Wagenaar (1709-1773), the worthy successor of Hooft and Brandt, whose "History of the United Provinces" is particularly valuable for its simplicity of style and truthfulness of detail. Of the lighter literature, Van Effen, who had visited England, produced in French the "Spectator," in imitation of the English periodical, and, like that, it is still read and considered classical. Towards the conclusion of the century, other

periodicals were established, which, in connection with literary societies and academies, exercised great influence on literature. The contemporary writers of Germany were also read and translated, and henceforth in some degree they counterbalanced French influence. First among the writers who mark the close of the eighteenth century are Van Winter (d. 1795), and his distinguished wife, Madame Van Merken (d. 1789). They published conjointly a volume of tragedies in which the chief merit of those of Van Winter consists in their originality and in the expression of those sentiments of justice, humanity, and equality before the law, which were just then beginning to find a voice in Europe. Madame Van Merken, who, late in life, married Van Winter, has been called the Racine of Holland. To masculine energy and power she united all the virtues and sweetness of her own sex. Besides many long poems, she was the author of several tragedies, many of which have remarkable merit. Madame Van Merken gave a new impulse to the literature of her country, of which she is one of the classic ornaments, and prepared the way for Feith and Bilderdyk. The Baroness De Lannoy, the contemporary of Madame Van Merken, was, like her, eminent in tragedy and other forms of poetry, though less a favorite, for in that free country an illustrious birth has been ever a serious obstacle to distinction in the republic of letters. Nomz (d. 1803) furnished the theatre of Amsterdam with many pieces, original and translated, and merited a better fate from his native city than to die in the public hospital. The poets who mark the age from Madame Van Merken to Bilderdyk, are Van Alphen, Bellamy, and Nieuwland. Van Alphen (d. 1803) is distinguished for his patriotism, originality, and deeply religious spirit. His poems for children are known by heart by all the children of Holland, and he is their national poet, as Cats is the poet of mature life and old age. Bellamy, who died at the early age of twenty-eight years (1786), left many poems characterized by originality, force, and patriotic fervor, no less than by beauty and harmony of style. Nieuwland (d. 1794), like Bellamy, rose from the lower order of society by the force of his genius; at the age of twenty-three he was called to the chair of philosophy, mathematics, and astronomy at Utrecht, and later to the university of Leyden. He was equally great as a mathematician and as a poet in the Latin language as well as his own. All his productions are marked by elegance and power. Styl (d. 1804) was a poet as well as a historian; one of the most valuable works on the history of the country is his "Growth and Prospects of the United Provinces." Te Water, Bondam, and Van de Spiegel contributed to the same department. Romance writing has, with few exceptions, been surrendered to women. Among the romances of character and manners, those of Elizabeth Bekker Wolff (d. 1804) are distinguished for their brilliant and caustic style, and those of Agatha Deken for their earnest and enlightened piety. The works of both present lively pictures of national character and manners.

7. THE NINETEENTH CENTURY.--The political convulsions of the last years of the eighteenth century and the early part of the nineteenth, which overthrew the Dutch Republic, revolutionized the literature not less than the state,--and the new era was illustrated by its poets, historians, and orators. But in the elevation of inferior men by the popular party, the more eminent men of letters for a time withdrew from the field, and the noblest productions of native genius were forgotten in the flood of poor translations which inundated the country and corrupted the taste and the language by their Germanisms and Gallicisms. Among the crowd of poets, a few only rose superior to the influences of the time. Feith (d. 1824) united a lofty patriotism to a brilliant poetical genius; his odes and other poems possess rare merit, and his prose is original, forcible, and elegant. Helmers (d. 1813) is most honored for his poem, "The Dutch Nation," which, with some faults, abounds in beautiful episodes and magnificent passages. Bilderdyk (1756-1831) is not only the greatest poet Holland has produced, but he is equally eminent as a universal scholar. He was a lawyer, a physician, a theologian, a historian, astronomer, draftsman, engineer, and antiquarian, and he was acquainted with nearly all the ancient and modern languages. In 1820 he published five cantos of a poem on "The Destruction of the Primitive World," which, though it remains unfinished, is a superb monument of genius and one of the literary glories of Holland. Bilderdyk excelled in every species of poetry, tragedy only excepted, and his published works fill more than one hundred octavo volumes. Van der Palm (b. 1763) occupies the same place among the prose writers of the nineteenth century that Bilderdyk does among the poets. He held the highest position as a pulpit orator and member of the Council of State, and his discourses, orations, and other prose works are models of style, and are counted among the classics of the country. His great work, however, was the translation of the Bible. Since the time of Bilderdyk and Van der Palm no remarkable genius has appeared in Holland. Loosjes (d. 1806) added to his reputation as a poet by his historical romances, and Fokke (d. 1812) was a satirist of the follies and errors of his age. Among the historians who have devoted themselves to the history of foreign countries are Stuart, Van Hamelsveld, and Muntinghe, who, in a short space of time, enriched their native literature with more than sixty volumes of history, of a profoundly religious and philosophical character, which bear the stamp of originality and nationality. The department of oratory in Dutch literature, with the exception of that of the pulpit, is poor, and this is to be explained in part by the fact that the deliberations of the States-General were always held with closed doors. Holland was an aristocratic republic, and the few families who monopolized the power had no disposition to share it with the people, who, on the other hand, were too much occupied with their own affairs and

too confident of the wisdom and moderation of their rulers, to wish to mingle in the business of state. The National Assembly, however, from 1775 to 1800, had its orators, chiefly men carried into public life by the events of the age, but they were far inferior to those of other countries. The impulse given to literature by Bilderdyk and Van der Palm is not arrested. Among the numerous authors who have since distinguished themselves, are Loots, a patriotic poet of the school of Vondel; Tollens, who ranks with the best native authors in descriptive poetry and romance; Wiselius, the author of several tragedies, a scholar and political writer; Klyn (d. 1856); Van Walré and Van Halmaal, dramatic poets of great merit; Da Costa and Madame Bilderdyk, who, as a poetess, shared the laurels of her husband. In romance, there are Anna Toussaint, Bogaers, and Jan Van Lennep, son of the celebrated professor of that name, who introduced into Holland historical romances modeled after those of Scott, and who contributed much to discard French and to popularize the national literature. In prose, De Vries must be named for his eloquent history of the poetry of the Netherlands; Van Kampen (1776-1839) for his historical works; Geysbeck for his biographical dictionary and anthology of the poets, and De s'Gravenweert, a poet and the translator of the Iliad and Odyssey. Von Hoevell is the author of a work on slavery, which appeared not many years since, the effect of which can be compared only to that of "Uncle Tom's Cabin." In Belgium, Conscience is a successful author of fiction and history, and his works have been frequently translated into other languages. De Laet, one of the ablest writers of the country in connection with Conscience, has done much for the revival of Flemish literature, which now boasts of many original writers in various departments. The literature of the Netherlands, like the people, is earnest, religious, always simple, and often elevated and sublime. It is especially distinguished for its reflective and patriotic character, and bears the mark of that accurate study of the classic models which has formed the basis of the national education, and to which its purity of taste, naturalness, and simplicity are undoubtedly to be attributed. There exists no nation of equal population which, within the course of two or three centuries, has produced a greater number of eminent men. >From the age of Hooft and Vondel to the present day, though the Dutch literature may have submitted at times to foreign influence, and though, like all others, it may have paid its tribute to the fashions and faults of the day, it has still preserved its nationality, and is worthy of being known and admired.

SCANDINAVIAN LITERATURE.

1. Introduction. The Ancient Scandinavians; their Influence on the English Race.--2. The Mythology.--3. The Scandinavian Languages.--4. Icelandic, or Old Norse Literature: the Poetic Edda, the Prose Edda, the Scalds, the Sagas, the "Heimskringla," The Folks-Sagas and Ballads of the Middle Ages.--5. Danish Literature: Saxo Grammaticus and Theodoric; Arreboe, Kingo, Tycho Brahe, Holberg, Evald, Baggesen, Oehlenschläger, Grundtvig, Blicher, Ingemann, Heiberg, Gyllenbourg, Winther, Hertz, Müller, Hans Andersen, Plong, Goldschmidt, Hastrup, and others; Malte Brun, Rask, Rafn, Magnusen, the brothers Oersted.--6. Swedish Literature: Messenius, Stjernhjelm, Lucidor, and others. The Gallic period: Dalin, Nordenflycht, Crutz and Gyllenborg, Gustavus III., Kellgren, Leopold, Oxenstjerna. The New Era: Bellman, Hallman, Kexel, Wallenberg, Lidnor, Thorild, Lengren, Franzen, Wallin. The Phosphorists: Atterborn, Hammarsköld, and Palmblad. The Gothic School: Geijer, Tegnér, Stagnelius, Almquist, Vitalis, Runeberg, and others. The Romance Writers: Cederborg, Bremer, Carlén, Knorrning. Science: Swedenborg, Linnaeus, and others.

1. INTRODUCTION.--It is a singular fact that the progressive and expanding spirit which characterizes the English race should be so universally referred to their Anglo-Saxon blood, while the transcendent influence of the Scandinavian element is entirely overlooked. The so-called Anglo-Saxons were a handful of people in Holstein, where they may still be found in inglorious obscurity, the reluctant subjects of Denmark. The early emigrants who bore that name, were, it is true, from various portions of Germany; but even if the glory of our English ancestry be transferred from Anglen, and spread over the whole country, we find a race bearing no resemblance to the English in their more active and powerful qualities, but an intellectual people, possessed of a patient and conceding nature, which, without other more aspiring attributes, doubtless would have left the English people in the same condition of political slavery that the Germans continue in to this day. Of all those institutions so commonly and gratuitously ascribed to them, of representative government, trial by jury, and such machinery of political and social independence, there is not a vestige to be found in any age in Germany, from the Christian era to the present time. During the period of their dominion in England, the Anglo-Saxons, so far from showing themselves an enterprising people were notoriously weak, slothful, and degenerate, overrun by the Danes, and soon permanently subjected by the Normans. It is evident, from the trifling resistance they made, that they had neither energy to fight, nor property,

laws, nor institutions to defend, and that they were merely serfs on the lands of the nobles or of the church, who had nothing to lose by a change of masters. It is to the renewal of the original spirit of the Anglo-Saxons, by the fresh infusion of the Danish conquerors into a very large proportion of the whole population, in the eleventh century, that we must look for the actual origin of the national character and institutions of the English people, and for that check of popular opinion and will upon arbitrary rule which grew up by degrees, and which slowly but necessarily produced the English law, character, and institutions. These belong not to the German or Anglo-Saxon race settled in England previous to the tenth or eleventh century, but to that small, cognate branch of Northmen or Danes, who, between the ninth and twelfth centuries, brought their paganism, energy, and social institutions to conquer, mingle with, and invigorate the inert descendants of the old race. That this northern branch of the common race has been the more influential in the society of modern Europe, we need only compare England and the United States with Saxony, Prussia, Hanover, or any country of strictly ancient Teutonic descent, to be satisfied. From whatever quarter civil, religious, and political liberty and independence of mind may have come, it was not from the banks of the Rhine or the forests of Germany. The difference in the spirit of the two branches of the same original race was immense, even at the earliest period. When the Danes and Norwegians overran England, the Germans had, for six centuries, been growing more and more pliant to despotic government, and the Scandinavians more and more bold and independent. At home they elected their kings, and decided everything by the general voice of the *_Althing_*, or open Parliament. Abroad they became the most daring of adventurers; their Vikings spread themselves along the shores of Europe, plundering and planting colonies; they subdued England, seized Normandy, besieged Paris, conquered a large portion of Belgium, and made extensive inroads into Spain. They made themselves masters of lower Italy and Sicily under Robert Guiscard, in the eleventh century; during the Crusades they ruled Antioch and Tiberias, under Tancred; and in the same century they marched across Germany, and established themselves in Switzerland, where the traditions of their arrival, and traces of their language still remain. In 861 they discovered Iceland, and soon after peopled it; thence they stretched still farther west, discovered Greenland, and proceeding southward, towards the close of the tenth century they struck upon the shores of North America, it would appear, near the coast of Massachusetts. They seized on Novogorod, and became the founders of the Russian Empire, and of a line of Czars which became extinct only in 1598, when the Slavonic dynasty succeeded. From Russia they made their way to the Black Sea, and in 866 appeared before Constantinople, where their attacks were bought off only on the payment of large sums by the degenerate emperors. From 902 to the fall of the empire, the emperors retained a large body-guard of Scandinavians, who, armed with double-edged battle-axes, were renowned through the world, under the name of *Varengar*, or the *_Väringjar_* of the old Icelandic Sagas. Such were the ancient Scandinavians. To this extraordinary people the English and their descendants alone bear any resemblance. In them the old Norse fire still burns, and manifests itself in the same love of martial daring and fame, the same indomitable seafaring spirit, the same passion for the discovery of new seas and new lands, and the same insatiable longing, when discovered, to seize and colonize them.

2. THE MYTHOLOGY.--The mythology of the northern nations, as represented in the Edda, was founded on Polytheism; but through it, as through the religion of all nations, there is dimly visible, like the sun shining through a dense cloud, the idea of one Supreme Being, of infinite power, boundless knowledge, and incorruptible justice, who could not be represented by any corporeal form. Such, according to Tacitus, was the supreme God of the Germans, and such was the primitive belief of mankind. Doubtless, the poet priests, who elaborated the imaginative, yet philosophical mythology of the north, were aware of the true and only God, infinitely elevated above the attributes of that Nature, which they shaped into deities for the multitude whom they believed incapable of more than the worship of the material powers which they saw working in everything around them. The dark, hostile powers of nature, such as frost and fire, are represented as giants, "jotuns," huge, chaotic demons; while the friendly powers, the sun, the summer heat, all vivifying principles, were gods. >From the opposition of light and darkness, water and fire, cold and heat, sprung the first life, the giant Ymer and his evil progeny the frost giants, the cow *Adhumla*, and *Bor*, the father of the god *Odin*. *Odin*, with his brothers, slew the giant *Ymer*, and from his body formed the heavens and earth. From two stems of wood they also shaped the first man and woman, whom they endowed with life and spirit, and from whom descended all the human race. There were twelve principal deities among the Scandinavians, of whom *Odin* was the chief. There is a tradition in the north of a celebrated warrior of that name, who, near the period of the Christian era, fled from his country, between the Caspian and the Black Sea, to escape the vengeance of the Romans, and marched toward the north and west of Europe, subduing all who opposed him, and finally established himself in Sweden, where he received divine honors. According to the Eddas, however, *Odin* was the son of *Bor*, and the most powerful of the gods; the father of *Thor*, *Balder*, and others; the god of war, eloquence, and poetry. He was made acquainted with everything that happened on earth, through two ravens, *Hugin* and *Munin* (mind and memory); they flew daily round the world, and returned every night to whisper in his ear all that they had

seen and heard. Thor, the god of thunder, was the implacable and dreaded enemy of the giants, and the avenger and defender of the gods. His stature was so lofty that no horse could bear him, and lightning flashed from his eyes and from his chariot wheels as they rolled along. His mallet or hammer, his belt of strength and his gauntlets of iron, were of wonderful power, and with them he could overthrow the giants and monsters who were at war with the gods. Balder, the second son of Odin, was the noblest and fairest of the gods, beloved by everything in nature. He exceeded all beings in gentleness, prudence, and eloquence, and he was so fair and graceful that light emanated from him as he moved. In his palace nothing impure could exist. The death of Balder is the principal event in the mythological drama of the Scandinavians. It was foredoomed, and a prognostic of the approaching dissolution of the universe and of the gods themselves. Heimdall was the warder of the gods; his post was on the summit of Bifrost, called by mortals the rainbow--the bridge which connects heaven and earth, and down which the gods daily traveled to hold their councils under the shade of the tree Yggdrasil. The red color was the flaming fire, which served as a defense against the giants. Heimdall slept more lightly than a bird, and his ear was so exquisite that he could hear the grass grow in the meadows and the wool upon the backs of the sheep. He carried a trumpet, the sound of which echoed through all worlds. Loke was essentially of an evil nature, and descended from the giants, the enemies of the gods; but he was mysteriously associated with Odin from the infancy of creation. He instilled a spark of his fire into a man at his creation, and he was the father of three monsters, Hela or Death, the Midgard Serpent, and the wolf Fenris, the constant terror of the gods, and destined to be the means of their destruction. Besides these deities, there were twelve goddesses, the chief of whom was Frigga, the wife of Odin, and the queen and mother of the gods. She knew the future, but never revealed it; and she understood the language of animals and plants. Freya was the goddess of love, unrivaled in grace and beauty--the Scandinavian Venus. Iduna was possessed of certain apples, of such virtue that, by eating of them, the gods became exempted from the consequences of old age, and retained, unimpaired, all the freshness of youth. The gods dwelt above, in Asgard, the garden of the Asen or the Divinities; the home of the giants, with whom they were in perpetual war, was Jotunheim, a distant, dark, chaotic land, of which Utgard was the chief seat. Midgard, or the earth, the abode of man, was represented as a disk in the midst of a vast ocean; its caverns and recesses were peopled with elves and dwarfs, and around it lay coiled the huge Midgard Serpent. Muspelheim, or Flameland, and Nifelheim or Mistland, lay without the organized universe, and were the material regions of light and darkness, the antagonism of which had produced the universe with its gods and men. Nifelheim was a dark and dreary realm, where Hela, or Death, ruled with despotic sway over those who had died ingloriously of disease or old age. Helheim, her cold and gloomy palace, was thronged with their shivering and shadowy spectres. She was livid and ghastly pale, and her very looks inspired horror. The chief residence of Odin, in Asgard, was Valhalla, or the Hall of the Slain; it was hung round with golden spears, and shields, and coats of mail; and here he received the souls of warriors killed in battle, who were to assist him in the final conflict with the giants; and here, every day, they armed themselves for battle, and rode forth by thousands to their mimic combat on the plains of Asgard, and at night they returned to Valhalla to feast on the flesh of the boar, and to drink the intoxicating mead. Here dwelt, also, the numerous virgins called the Valkyriur, or Choosers of the Slain, whom Odin sent forth to every battle-field to sway the victory, to make choice of those who should fall in the combat, and to direct them on their way to Valhalla. They were called, also, the Sisters of War; they watched with intense interest over their favorite warriors and sometimes lent an ear to their love. In the field they were always in complete armor; led on by Skulda, the youngest of the Fates, they were foremost in battle, with helmets on their heads, armed with flaming swords, and surrounded by lightning and meteors. Sometimes they were seen riding through the air and over the sea on shadowy horses, from whose manes fell hail on the mountains and dew on the valleys; and at other times their fiery lances gleamed in the spectral lights of the aurora borealis; and again, they were represented clothed in white, with flowing hair, as cupbearers to the heroes at the feasts of Valhalla. In the centre of the world stood the great ash tree Yggdrasil, the Tree of Life, of which the Christmas tree and the Maypole of northern nations are doubtless emblems. It spread its life-giving arms through the heavens, and struck its three roots down through the three worlds. It nourished all life, even that of Nethog, the most venomous of serpents, which continually gnawed at the root that penetrated Nifelheim. A second root entered the region of the frost giants, where was the well in which wisdom and understanding were concealed. A third root entered the region of the gods; and there, beside it, dwelt the three Nornor or Fates, over whom even the gods had no power, and who, every day, watered it from the primeval fountain, so that its boughs remained green. The gods were benevolent spirits--the friends of mankind, but they were not immortal. A destiny more powerful than they or their enemies, the giants, was one day to overwhelm them. At the Ragnarök, or twilight of the gods, foretold in the Edda, the monsters shall be unloosed, the heavens be rent asunder, and the sun and moon disappear; the great Midgard Serpent shall lash the waters of the ocean till they overflow the earth; the wolf Fenris, whose enormous mouth reaches from heaven to earth, shall rush upon and devour all within his reach; the genii of fire shall ride forth, clothed in flame, and lead on the giants to the storming of Asgard. Heimdall sounds his trumpet, which echoes through all worlds; the gods fly to arms; Odin appears in his

golden casque, his resplendent cuirass, with his vast scimitar in his hand, and marshals his heroes in battle array. The great ash tree is shaken to its roots, heaven and earth are full of horror and affright, and gods, giants, and heroes are at length buried in one common ruin. Then comes forth the mighty one, who is above all gods, who may not be named. He pronounces his decrees, and establishes the doctrines which shall endure forever. A new earth, fairer and more verdant, springs forth from the bosom of the waves, the fields bring forth without culture, calamities are unknown, and in Heaven, the abode of the good, a palace is reared, more shining than the sun, where the just shall dwell forevermore. Traces of the worship of these deities by our pagan ancestors still remain in the names given to four days of the week. Tuesday was consecrated to Tyr, a son of Odin; Wednesday, Odin's or Wooden's day, to Odin; Thursday, or Thor's day, to Thor; and Friday, or Freya's day, was sacred to the goddess Freya.

3. THE LANGUAGE.--The Scandinavian or Norse languages include the Icelandic, Danish, Swedish, and Norwegian dialects. The Icelandic or Old Norse, which was the common language of Denmark, Sweden, and Norway, in the ninth century, was carried into Iceland, where, to the present time, it has wonderfully retained its early characteristics. The written alphabet was called Runic, and the letters, Runes, of which the most ancient specimens are the inscriptions on Rune stones, rings, and wooden tablets. The Danish and Swedish, may be called the New Norse languages; they began to assume a character distinct from the Old Norse about the beginning of the twelfth century. The Danish language is not confined to Denmark, but is used in the literature, and by the cultivated society of Norway. The Swedish is the most musical of the Scandinavian dialects, its pronunciation being remarkably soft and agreeable. Its character is more purely Norse than the Danish, which has been greatly affected by its contact with the German. The Norwegian exists only in the form of dialects spoken by the peasantry. It is distinguished from the other two by a rich vocabulary of words peculiar to itself, and by its own pronunciation and peculiar construction; only literary cultivation is wanted to make it an independent language like the others.

4. ICELANDIC OR OLD NORSE LITERATURE.--In 868 one of the Norwegian vikings or sea rovers, being driven on the coast of Iceland, first made known the existence of the island. Harold, the fair-haired, having soon after subdued or slain the petty kings of Norway, and introduced the feudal system, many of the inhabitants, disdainful to sacrifice their independence, set forth to colonize this dreary and inhospitable region, whose wild and desolate aspect seemed to attract their imaginations. Huge mountains of ice here rose against the northern sky, from which the smoke of volcanoes rolled balefully up; and the large tracts of lava, which had descended from them to the sea, were cleft into fearful abysses, where no bottom could be found. Here were strange, desolate valleys, with beds of pure sulphur, torn and overhanging precipices, gigantic caverns, and fountains of boiling water, which, mingled with flashing fires, soared up into the air, amid the undergroans of earthquakes, and howlings and hissings as of demons in torture. Subterranean fires, in terrific contest with the wintry ocean, seemed to have made sport of rocks, mountains, and rivers, tossing them into the most fantastic and appalling shapes. Yet such was the fondness of the Scandinavian imagination for the wild and desolate, and such their hatred of oppression, that they soon peopled this chaotic island to an extent it has never since reached. In spite of the rigor of the climate, where corn refused to ripen, and where the labors of fishing and agriculture could only be pursued for four months of the year, the people became attached to this wild country. They established a republic which lasted four hundred years, and for ages it was destined to be the sanctuary and preserver of the grand old literature of the North. The people took with them their Scalds and their traditions, and for a century after the peopling of the island, they retained their Pagan belief. Ages rolled away; the religion of Odin had perished from the mainland, and the very hymns and poems in which its doctrines were recorded had perished with it, when, in the middle of the seventeenth century, the Rhythmical Edda of Samund was discovered, followed by the Prose Edda of Snorre Sturleson. These discoveries roused the zeal of the Scandinavian literati, and led to further investigations, which resulted in the discovery of a vast number of chronicles and sagas, and much has since been done by the learned men of Iceland and Denmark to bring to light the remote annals of northern Europe. These remains fall into the three divisions of Eddaic, Scaldic, and Saga literature. Samund the Wise (1056-1131), a Christian priest of Iceland, was the first to collect and commit to writing the oral traditions of the mythology and poetry of the Scandinavians. His collection has been termed the "Edda," a word by some supposed to signify grandmother, and by others derived, with more probability, from the obsolete word *_oeda_*, to teach. The elder or poetic Edda consists of thirty-eight poems, and is divided into two parts. The first, or mythological cycle, contains everything relating to the Scandinavian ideas of the creation of the world, the origin of man, the morals taught by the priests, and stories of the gods; the second, or heroic cycle, contains the original materials of the "Nibelungen Lied" of Germany. The poems consist of strophes of six or eight lines each, with little of the alliteration by which the Scalds were afterwards distinguished. One of the oldest and most interesting is the "Voluspa," or Song of the Prophetess, a kind of sibylline lay, which contains an account of the creation, the origin of man and of evil, and concludes with a prediction of the destruction and renovation of the universe, and a description

of the future abodes of happiness and misery. "Vafthrudnir's Song" is in the form of a dialogue between Odin, disguised as a mortal, and the giant Vafthrudnir, in which the same subjects are discussed. "Grimner's Song" contains a description of twelve habitations of the celestial deities, considered as symbolical of the signs of the zodiac. "Rig's Song" explains, allegorically, the origin of the three castes: the thrall, the churl, and the noble, which, at a very early period, appear to have formed the framework of Scandinavian society. "The Havamal," or the High Song of Odin, is the complete code of Scandinavian ethics. The maxims here brought together more resemble the Proverbs of Solomon than anything in human literature, but without the high religious views of the Scripture maxims. It shows a worldly wisdom, experience, and sagacity, to which modern life can add nothing. In the Havamal is included the Rune Song. Runes, the primitive rudely-shaped letters of the Gothic race, appear never to have been used to record their literature, which was committed to the Scalds and Sagamen, but they were reserved for inscriptions on rocks or memorial stones, or they were cut in staves of wood, as a rude calendar to assist the memory. Odin was the great master of runes, but all the gods, many of the giants, kings, queens, prophetesses, and poets possessed the secret of their power. In the ballads of the Middle Ages, long after the introduction of Christianity, we find everywhere the boast of Runic knowledge and of its power. Queens and princesses cast the runic spell over their enemies; ladies, by the use of runes, inspire warriors with love; and weird women by their means perform witchcraft and sorcery. Some of their rune songs taught the art of healing; others had power to stop flying spears in battle, and to excite or extinguish hatred and love. There were runes of victory inscribed on swords; storm runes, which gave power over sails, inscribed on rudders of ships, drink runes, which gave power over awls, inscribed on drinking horns; and herb runes, cut in the bark of trees which cured sickness and wounds. These awful characters, which struck terror into the hearts of our heathen ancestors, and which appalled and subdued alike kings, warriors, and peasants, were simple letters of the alphabet; but they prove to what a stupendous extent knowledge was power in the dark ages of the earth. The poet who sings the Rune Song in the Havamal does it with every combination of mystery, calculated to inspire awe and wonder in the hearer. The two poems, "Odin's Raven Song" and the "Song of the Way-Tamer," are among the most deeply poetical hymns of the Edda. They relate to the same great event--the death of Balder--and are full of mystery and fear. A strange trouble has fallen upon the gods, the oracles are silent, and a dark, woeful foreboding seizes on all things living. Odin mounts his steed, Sleipner, and descends to hell to consult the Vala there in her tomb, and to extort from her, by runic incantations, the fate of his son. This "Descent of Odin" is familiar to the English reader through Gray's Ode. In all mythologies we have glimpses continually of the mere humanity of the gods, we witness their limited powers and their consciousness of a coming doom. In this respect every mythology is kept in infinite subordination to the true faith, in which all is sublime, infinite, and worthy of the Deity--in which God is represented as pure spirit, whom the heaven of heavens cannot contain; and all assumption of divinity by false gods is treated as a base superstition. The remaining songs of the first part of the Edda relate chiefly to the exploits, wanderings, and love adventures of the gods. The "Sun Song," with which it concludes, is believed to be the production of Samund, the collector of the Edda, In this he retains some of the machinery of the old creed, but introduces the Christian Deity and doctrines. The second part of the elder Edda contains the heroic cycle of Icelandic poems, the first part of which is the Song of Voland, the renowned northern smith. The story of Voland, or Wayland, the Vulcan of the North, is of unknown antiquity; and his fame, which spread throughout Europe, still lives in the traditions of all northern nations. The poems concerning Sigurd and the Niflunga form a grand epic of the simplest construction. The versification consists of strophes of six or eight lines, without rhyme or alliteration. The sad and absorbing story here narrated was wonderfully popular throughout the ancient Scandinavian and Teutonic world, and it is impossible to say for how many centuries these great tragic ballads had agitated the hearts of the warlike races of the north. It is clear that Sigurd and Byrnhilda, with all their beauty, noble endowment, and sorrowful history, were real personages, who had taken powerful hold on the popular affections in the most ancient times, and had come down from age to age, receiving fresh incarnations and embellishments from the popular Scalds. There is a great and powerful nature living through these poems. They are pictures of men and women of godlike beauty and endowments, and full of the vigor of simple but impetuous natures. Though fragmentary, they stand in all the essentials of poetry far beyond the German Lied, and, in the tragic force of passion which they portray, they are superior to any remains of ancient poetry except that of Greece. Their greatness lies less in their language than their spirit, which is sublime and colossal. Passion, tenderness, and sorrow are here depicted with the most vivid power; and the noblest sentiments and the most heroic actions are crossed by the foulest crimes and the most terrific tragedies. They contain materials for a score of dramas of the most absorbing character. The Prose or Younger Edda was the work of Snorre Sturleson (1178-1241), who was born of a distinguished Icelandic family, and, after leading a turbulent and ambitious life, and being twice supreme magistrate of the republic, was at last assassinated. The younger Edda repeats in prose the sublime poetry of the elder Edda, mixed with many extravagances and absurdities; and in point of literary and philosophical value it bears no comparison with it. It marks the transition from the art of the Scalds to the prose relation of the Sagaman. This work

concludes with a treatise on the poetic phraseology of the Scalds, and a system of versification by Snorre. The Bard, or Scald (literally smoothers of language, from *_scaldre_*, to polish), formed an important feature of the courts of the princes and more powerful nobles. They often acted, at the same time, as bard, councilor, and warrior. Until the twelfth century, when the monks and the art of writing put an end to the Scaldic art, this race of poets continued to issue from Iceland, and to travel from country to country, welcomed as the honored guests of kings, and receiving in return for their songs, rings and jewels of great value, but never money. There is preserved a list of two hundred and thirty scalds, who had distinguished themselves from the time of Ragnor Lodbrok to that of Vladimir II., or from the latter end of the eighth, to the beginning of the thirteenth century. Ragnor Lodbrok was a Danish king, who, in one of his predatory excursions, was taken prisoner in England and thrown into a dungeon, to be stung to death by serpents. His celebrated death song is said to have been composed during his torments. The best of the scaldic lays, however, are greatly inferior to the Eddaic poems. Alliteration is the chief characteristic of the versification. The word Saga means literally a tale or narrative, and is used in Iceland to denote every species of tradition, whether fabulous or true. In amount, the Saga literature of ancient Scandinavia is surprisingly extensive, consisting of more than two hundred volumes. The Sagas are, for the most part, unconnected biographies or narratives of greater or less length, principally describing events which took place from the ninth to the thirteenth century. They are historical, mythic, heroic, and romantic. The first annalist of Iceland of whom we have any remains was Ari the Wise (b. 1067), the contemporary of Samund, and his annals, for the most part, have been lost. Snorre Sturleson, already spoken of as the collector of the Prose Edda, was the author of a great original work, the "Heimskringla," or Home-Circle, so called from the first word of the manuscript, a most admirable history of a great portion of northern Europe from the period of the Christian Era to 1177, including every species of Saga composition. It traces Odin and his followers from the East, from Asaland and Asgard, its chief city, to their settlement in Scandinavia. It narrates the contests of the kings, the establishment of the kingdoms of Norway, Sweden, and Denmark, the Viking expeditions, the discovery and settlement of Iceland and Greenland, the discovery of America, and the conquests of England and Normandy. The stories are told with a life and freshness that belong only to true genius, and a picture is given of human life in all its reality, genuine, vivid, and true. Some of the Sagas of the "Heimskringla" are grand romances, full of brilliant adventures, while at the same time they lie so completely within the range of history that they may be regarded as authentic. That of Harold Haardrada narrates his expedition to the East, his brilliant exploits in Constantinople, Syria, and Sicily, his scaldic accomplishments, and his battles in England against Harold, the son of Earl Godwin, where he fell only a few days before Godwin's son himself fell at the battle of Hastings. This Saga is a splendid epic in prose, and is particularly interesting to the English race. The first part of the "Heimskringla" is necessarily derived from tradition; as it advances fable and fact all curiously intermingle, and it terminates in authentic history. Among the most celebrated Sagas of the remaining divisions are the "Sagas of Erik the Wanderer," who went in search of the Island of Immortality; "Frithiof's Saga," made the subject of Tegnér's great poem; the Saga of Ragnor Lodbrok, of Dietrich of Bern, and the Volsunga Saga, relating to the ancestors of Sigurd or Siegfried, the hero of the Nibelungen Lied. There are, besides, Sagas of all imaginable fictions of heroes, saints, magicians, conquerors, and fair women. Almost every leading family of Iceland had its written saga. The Sagamen, like the Scalds, traveled over all Scandinavia, visited the courts and treasured up and transmitted to posterity the whole history of the North. This wonderful activity of the Scandinavian mind from the ninth to the thirteenth century, both in amount and originality, throws completely into the shade the literary achievements of the Anglo-Saxons during the same period. When Christianity superseded the ancient religion, the spirit and traditions of the old mythology remained in the minds of the people, and became their fireside literature under the name of "Folk Sagas." Their legends and nursery tales are diffused over modern Scandinavia, and appear, with many variations, through all the literature of Europe. Among them are found the originals of "Jack the Giant Killer," "Cinderella," "Blue Beard," the "Little Old Woman Cut Shorter," "The Giant who smelt the Blood of an Englishman," and many others. The Folk Sagas have only recently been collected, but they are the true productions of ancient Scandinavians. The art of the Scald and Sagaman, which was extinguished with the introduction of Christianity, revived after a time in the Romances of Chivalry and the popular ballads. These ballads are classified as heroic, supernatural, historic, and ballads of love and romance; they successively describe all the changes in the life and opinions of society, and closely resemble those of England, Scotland, and Germany. They are the common expression of the life and feelings of a common race, under the prevailing influences of the same period, and the same stories often inspired the nameless bards of both countries. They are composed in the same form and possess the same curious characteristic of the refrain or chorus which distinguishes this poetry in its transition from the epic to the lyric form. They express a peculiar poetic feeling which is sought for in vain in the epic age--a sentiment which, without art and without name, wanders on until it is caught up by fresh lips, and becomes the regular interpreter of the same feelings. Thus this simple voice of song travels onward from mouth to mouth, from heart to heart, the language of the general sorrows, hopes, and memories; strange, and yet near to every one, centuries old, yet never growing older, since the

human heart, whose history it relates in so many changing images and notes, remains forever the same. Though the great majority of the popular ballads of Scandinavia are attributed to the twelfth, thirteenth, and fourteenth centuries, the composition of them by no means ceased then. This voice of the people continued more or less to find expression down to the close of the last century, when it became the means of leading back its admirers to truth and genuine feeling, and, more than anything else, contributed to the revival of a new era in literature.

5. DANISH LITERATURE--In taking leave of the splendid ancient literature of Scandinavia, we find before us a waste of nearly four centuries from the thirteenth, which presents scarcely a trace of intellectual cultivation. The ballads and tales, indeed, lingered in the popular memory and heart; fresh notes of genuine music were from time to time added to them, and they form the connecting link between the ancient and modern literature. Saxo Grammaticus and Theodoric the monk, in the thirteenth century, adopted the Latin language in their chronicles of Denmark and Norway, and from that time it usurped the place of the native tongue among the educated. In the sixteenth century the spirit of the Reformation began to exert an influence, and the Bible was translated into the popular tongue. New fields of thought were opened, a passion for literature was excited, and translations, chiefly from the German, were multiplied; a knowledge of the classics was cultivated, and, in time, a noble harvest of literature followed. The first author who marks the new era is Arreboe (1587-1637), who has been called the Chaucer of Denmark. His chief work was the "Hexameron," or "The World's First Week." It abounds with learning, and displays great poetic beauty. The religious psalms and hymns of Kingo (1634-1703) are characterized by a simple yet powerfully expressed spirit of piety, and are still held in high esteem. His Morning and Evening Prayers, or, as he beautifully terms them, "Sighs," are admirable. Many other names of note are found in the literature of this period, but the only one who achieved a world-wide celebrity, was Tycho Brahe (1546- 1601), who, for a time, was the centre of a brilliant world of science and literature. The learned and celebrated, from all countries, visited him, and he was loaded with gifts and honors, in return for the honor which he conferred upon his native land. But at length, through the machinations of his enemies, he lost the favor of the king, and was forced to exile himself forever from his country. The services rendered to astronomy by Tycho Brahe were great, although his theory of the universe, in which our own planet constituted the centre, has given way before the more profound one of Copernicus. Holberg (1684-1754), a native of Norway, is commonly styled the creator of the modern literature of Denmark, and would take a high place in that of any country. In the field of satire and comedy he was a great and unquestionable master. All his actors are types, and are as real and existent at the present hour as they were actual when he sketched them. Besides satires and numerous comedies, Holberg was the author of various histories, several volumes of letters, and a book of fables. The principal names which appear in Danish literature, from Holberg to Evald, are those of Stub, Sneedorf, Tullin, and Sheersen. Evald (1743- 1780) was the first who perceived the superb treasury of poetic wealth which lay in the far antiquity of Scandinavia, among the gods of the Odinic mythology, and who showed to his nation the grandeur and beauty which the national history had reserved for the true poetic souls who should dare to appropriate them. But the sound which he drew from the old heroic harp startled his contemporaries, while it did not fascinate them. The august figures which he brought before them seemed monstrous and uncouth. Neglected in life, and doomed to an early death, the history of this poet was painfully interesting; a strangely brilliant web of mingled gold and ordinary thread--a strangely blended fabric of glory and of grief. Solitary, poor, bowed down with physical and mental suffering, from his heart's wound, as out of a dark cleft in a rock, swelled the clear stream of song. The poem of "Adam and Eve," "Rolf Krage," the first original Danish tragedy, "Balder's Death," and "The Fishermen," are his principal productions. "Rolf Krage" is the outpouring of a noble heart, in which the most generous and exalted sentiments revel in all the inexperience of youth. "Balder's Death" is a masterpiece of beauty, sentiment, and eloquence of diction. It is full of the passion of an unhappy love, and thus expresses the burning emotions of the poet's own heart. The old northern gods and mythic personages are introduced, and the lyric element is blended with the dramatic. The lyrical drama of "The Fishermen" is perhaps the most perfect and powerful of all Evald's works. The intense interest it excites testifies to the power of the writer, while the music of the versification delights the ear. His lyric of "King Christian," now the national song of Denmark, is a masterly production of its kind. During the forty years which succeeded the death of Evald, Denmark produced a great number of poets and authors of various kinds, who advanced the fame of their country; but the chief of those who closed the eighteenth century are Baggesen (1764-1826) and Rahbek (1760-1830). Though they still wrote in the nineteenth century, they belonged in spirit essentially to the eighteenth. The life of Baggesen was a genuine romance, with all its sunshine and shade. He was born in poverty and obscurity, and when a child of seven years old, on one occasion, attracted the momentary attention of the young and lovely Queen Caroline, who took him in her arms and kissed him. "Still, after half a century," he writes, "glows the memory of that kiss; to all eternity I shall never forget it. From that kiss sprang the germ of my entire succeeding fate." After a long and severe struggle with poverty, he suddenly found himself the most popular poet of the country, and for a quarter of a century he was

the petted favorite of the nation. Supplanted in public favor by the rising glory of Oehlenschläger, he had the misfortune to see the poetic crown of Denmark placed on the head of his rival; and the last years of his life were embittered by disappointment and care. The works of Baggesen fill twelve volumes, and consist of comic stories, numerous letters, satires and impassioned lyrics, songs and ballads, besides dramas and operas. His "Poems to Nanna," who, in the northern mythology, is the bride of Balder, are among the most beautiful in the Danish language, and no poet could have written them until he had gone through the deep and ennobling baptism of suffering. In these, Nanna is the symbol of the pure and eternal principle of love, and Balder is the type of the human heart, perpetually yearning after it in sorrow, yet in hope. Nanna appears lost--departed into a higher and invisible world; and Balder, while forever seeking after her, bears with him an internal consciousness that there he shall overtake her, and possess her eternally. One of Baggesen's characteristics was the projection of great schemes, which were never accomplished. He was too fond of living in the present--in the charmed circle of admiring friends-- to achieve works otherwise within the limit of his powers. But with all his faults, his works will always remain brilliant and beautiful amid the literary wealth of his country. In the early part of the nineteenth century the new light which radiated from Germany found its way into Denmark, and in no country was the result so rapid or so brilliant. There soon arose a school of poets who created for themselves a reputation in all parts of Europe that would have done honor to any age or country. A new epoch in the language began with Oehlenschläger (1779-1856), the greatest poet of Denmark, and the representative, not only of the North, but, like Scott, Byron, Goethe, and Schiller, the outgrowth of a great era as well, and the incarnation of the broader and more natural spirit of his time. In 1819 he published the "Gods of the North," in which he combines all the legends of the Edda into one connected whole. He entered fully into the spirit of these grand old poems, and condensed and elaborated them into one. In the various regions of gods, giants, dwarfs, and men, in the striking variety of characters, the great and wise Odin, the mighty Thor, the good Balder, the malicious Loke, the queenly Frigga, the genial Freya, the lovely Iduna, the gentle Nanna--in all the magnificent scenery of Midgard, Asgard, and Nifelheim, with the glorious tree Yggdrasil and the rainbow bridge, the poet found inexhaustible scope for poetical embellishment, and he availed himself of it all with a genuine poet's power. The dramas of Oehlenschläger are his masterpieces, but they form only a small portion of his works. His prose stories and romances fill several volumes, and his smaller poems would of themselves have established almost a greater reputation than that of any Danish poet who went before him. Grundtvig (b. 1783) is one of the most original and independent minds of the North. As a preacher he was fervid and eloquent; as a writer on the Scandinavian mythology and hero-life, he gave, perhaps, the truest idea of the spirit of the northern myths. Blicher (1782-1868) was a stern realist, who made his native province of Jutland the scene of his poems and stories, which in many respects resemble those of Crabbe. Ingemann (1789-1862) is a voluminous writer in every department of literature. His historical romances are the delight of the people, who, by their winter firesides, forget their snow-barricaded woods and mountains in listening to his pages. Heiberg (1791-1860) as a critic ruled the Danish world of taste for many years, and by his writings did much to elevate dramatic art and public sentiment. The greatest authoress that Denmark has produced is the Countess Gyldenbourg (1773-1856). Her knowledge of life, sparkling wit, and faultless style, make her stories, the authorship of which was unknown before her death, masterpieces of their kind. The greatest pastoral lyricist of this country is Winther (1796-1876). His descriptions of scenery and rural life have an extraordinary charm. Hertz (1796-1870) is the most cosmopolitan Danish writer of his time. Müller (1809-1876) is celebrated for his comedies, tragedies, lyrics, and satires, all of which prove the immense breadth of his compass and the inexhaustible riches of his imagination. Hans Christian Andersen (1805-1875) is known to the English reader by his stories and legends for the young, his romances, and autobiography. He was born of humble peasants, and early attracted the attention of persons in power, who, with that liberality to youthful genius so characteristic of Denmark, enabled him to enter the university, and afterwards to travel over Europe. The "Improvisatore" is considered the best of his romances. Three writers connect the age of romanticism with the present day,--Plong (b. 1812), a vigorous politician and poet; Goldschmidt (b. 1818), author of novels and poems in the purest Danish; Hastrup (b. 1818), the author of a series of comedies unrivaled in delicacy and wit. Among the names distinguished in science are those of Malte Brun in geography; Rask, Grundtvig, Molbech, Warsaae, Rafn, Finn Magnussen and others in philology and literary antiquities. Of the two brothers Oersted, one, a lawyer and statesman, has done much to establish the principles of state economy, while the discoveries of the other entitle him to the highest rank in physical science.

6. SWEDISH LITERATURE.--The first independent literature of modern Scandinavia was, as we have seen, the popular songs and ballads which, during the Middle Ages, kept alive the germ of intellectual life. The effect of the Reformation was soon seen in the literature of Sweden, as of other countries. The first intellectual development displayed itself in the dramatic attempt of Messenius and his son, who changed and substituted actual history for legendary and scriptural subjects. The genius of Sweden, however, is essentially lyrical, rather than dramatic or epic.

Stjernhjelm (1598-1672) was a writer of great merit,—the author of many dramas, lyrics, and epic and didactic poems. He so far surpassed his contemporaries that he decided the character of his country's literature for a century; but his influence was finally lost in the growing Italian and German taste. The principal names of this period are those of Lucidor, a wild, erratic genius; Mrs. Brenner, the first female writer of Sweden, whose numerous poems are distinguished for their neat and easy style; and Spegel (d. 1711), whose Psalms, full of the simplest beauty, give him a lasting place in the literature of the country. The literary taste of Sweden, in the seventeenth century, made great progress; native genius awoke to conscious power, and the finest productions of Europe were quoted and commented on. During the eighteenth century, French taste prevailed all over Europe; not only the manners, etiquette, and toilets of France were imitated, the fashion of its literature was also adopted. Corneille, Racine, Molière, and Boileau stamped their peculiar philosophy of literature on the greater portion of the civilized world. Imagination was frozen by these cold, glittering models; life and originality became extinct, imitator followed upon imitator, until there was a universal dearth of soul; and men gravely asserted that everything had been said and done in poetry and literature that could be said and done. What a glorious reply has since been given to this utterance of inanity and formalism, in a countless host of great and original names, all the world knows. But in no country was this Gallomania more strongly and enduringly prevalent than in Sweden. The principal writers of the early part of the Gallic period are Dalin, Nordenflycht, Creutz, and Gyllenborg. As a prose writer, rather than a poet, Dalin deserves remembrance. He established a periodical in imitation of the "Spectator," and through this conferred the same benefits on Swedish literature that Addison conferred on that of England,—a great improvement in style, and the origination of a national periodical literature. Charlotte Nordenflycht (b. 1718) is called the Swedish Sappho. Her poetry is all love and sorrow, as her life was; in a better age she would have been a better poetess, for she possessed great feeling, passion, and imagination. She exerted a wide influence on the literary life of her time, in the capital, where the coteries which sprung up about her embraced all the poets of the day. Gyllenborg and Creutz were deficient in lyric depth, and were neither of them poets of the first order. Of the midday of the Gallic era, the king, Gustavus III. (1771-1792), Kellgren, Leopold, and Oxenstjerna are the chiefs. Gustavus was a master of rhetoric, and in all his poetical tendencies fast bound to the French system. He was, however, the true friend of literature, and did whatever lay in his power to promote it, and to honor and reward literary men. In 1786 he established the Swedish Academy, which for a long time continued to direct the public taste. As an orator, Gustavus has rarely found a rival in the annals of Sweden, and his dramas in prose possess much merit, and are still read with interest. Kellgren (1751-1795) was the principal lyric poet of this period. His works betray a tendency to escape from the bondage of his age, and open a new spring-time in Swedish poetry. For his own fame, and that of his age, his early death was a serious loss. Leopold (1756-1829) continued to sway the literary sceptre, after the death of Kellgren, for the remainder of the century. He is best known by his dramas and miscellaneous poems. His plays have the faults that belong to his school, but many of his poems abound with striking thoughts, and are elastic and graceful in style. The great writer of this period, however, was Oxenstjerna (1750-1818), a descriptive poet, who, with all the faults of his age and school, displays a deep feeling for nature. His pictures of simple life, amid the fields and woods of Sweden, are full of idyllic beauty and attractive grace. As the French taste overspread Europe at very nearly the same time, so its influence decayed and died out almost simultaneously. In France itself, long before the close of the eighteenth century, elements were at work destined to produce the most extraordinary changes in the political, social, and literary condition of the world. Even those authors who were most French were most concerned in preparing this astounding revolution. In many countries it was not the French doctrines, but the French events, that startled, dazzled, and excited the human heart and imagination, and produced the greatest effects on literature. Those who sympathized least with French views were often most influenced by the magnificence of the scenes which swept over the face of the civilized world, and antagonism was not less potent than sympathy to arouse the energies of mind. But even before these movements had produced any marked effect, Gallic influence began to give way, and genius began freely to range the earth and choose its materials wherever God and man were to be found. The heralds of the new era in Sweden were Bellman, Hallman, Kexel, Wallenberg, Lidner, Thorild, and Lengren. Bellman (1740-1795) is regarded by the Swedes with great enthusiasm. There is something so perfectly national in his spirit that he finds an echo of infinite delight in all Swedish hearts. Everything patriotic, connected with home life and feelings, home memories, the loves and pleasures of the past, all seem to be associated with the songs of Bellman. Hallman, his friend, wrote comedies and farces. His characters are drawn from the bacchanalian class described in Bellman's lyrics, but they are not sufficiently varied in their scope and sphere to create an actual Swedish drama. Kexel, the friend of the two last named, lived a gay and vagabond life, and is celebrated for his comedies. Wallenberg was a clergyman, full of the enjoyment of life, and disposed to see the most amusing side of everything. Lidner and Thorild, unlike the writers just named, were grave, passionate, and sorrowful. Lidner was a nerve-sick, over-excited genius; but many of his inspired thoughts struck deep into the heart of the time, and Swedish literature is highly indebted to Thorild for the spirit of manly freedom and the principles of sound reasoning and taste which

he introduced into it. One of the most interesting names of the transition period is that of Anna Maria Lengren (1754-1811). She has depicted the scenes of domestic and social life with a skill and firmness, yet a delicacy of touch that is perhaps more difficult of attainment than the broad lines of a much more ambitious style. Her scenes and personages are all types, and her heroes and heroines continually present themselves in Swedish life in perpetual and amusing reproduction. These poems will secure her a place among the classical writers of her country. The political revolution of 1809 secured the freedom of the press, new men arose for the new times, and a deadly war was waged between the old school and the new, until the latter triumphed. The first distinguished names of the new school are those of Franzén and Wallin. Franzén (1772-1847), a bishop, was celebrated for his lyrics of social life, and in many points resembles Wordsworth. The qualities of heart, the home affections, and the gladsome and felicitous appreciation of the beauty of life and nature found in his poems, give him his great charm. Archbishop Wallin (1779- 1839) is the great religious poet of Sweden. In his hymns there is a strength and majesty, a solemn splendor and harmony of intonation, that have no parallel in the Swedish language. Among other writers of the time are Atterbom, Hammarsköld, and Palmblad. The works of Atterbom (b. 1790) indicate great lyrical talent, but they have an airy unreality, which disappoints the healthy appetite of modern readers. Hammarsköld (1785-1827) was an able critic and literary historian, though his poems are of little value. Palmblad, besides being a critic, is the author of several novels and translations from the Greek. These three writers belonged to the Phosphoric School, so called from a periodical called "The Phosphorus," which advocated their opinions. The most distinguished school in Swedish literature is the Gothic, which took its rise in 1811, and which, aiming at a national spirit and character, embraced in that nationality all the Gothic race as one original family, possessing the same ancestry, original religion, traditions, and even still the same spirit, predilections, and language, although broken into several dialects. This new school had truth, nature, and the spirit of the nation and the times with it, and it speedily triumphed. First in the rank of its originators may be placed Geijer (1783-1847), who was at once a poet, musician, and historian; his poems are among the most precious treasures of Swedish literature. In his "Chronicles of Sweden" he penetrates far into the mists and darkness of antiquity, and brings thence magnificent traces of men and ages that point still onward to the times and haunts of the world's youth. The work presents all that belongs to the North, its gods, its mythic doctrines, its grand traditions, its heroes, vikings, runes, and poets, carrying whole ages of history in their trains. In his hands the dry bones of history and chronology live like the actual flesh and blood of the present time. As Geijer is the first historian of Sweden, so is Tegnér (1782-1848) the first poet; and in his "Frithiof's Saga" he has made the nearest approach to a successful epic writer. Although this poem has rather the character of a series of lyrical poems woven into an epic cycle, it is still a complete and great poem. It is characterized by tender, sensitive, and delicate feeling rather than by deep and overwhelming passion. In the story he has, for the most part, adhered to the ancient Saga. Tegner is as yet only the most popular poet of Sweden; but the bold advance which he has made beyond the established models of the country shows what Swedish poets may yet accomplish by following on in the track of a higher and freer enterprise. The other most prominent poets of the new school are Stagnelius (1793-1828), who bears a strong resemblance to Shelley in his tendency to the mythic and speculative, and in his wonderful power of language and affluence of inspired phrase; Almquist (d. 1866), an able and varied writer, who has written with great wit, brilliancy, and power in almost every department; Vitalis (d. 1828), the author of some religious poetry; Dahlgren, an amusing author, and Fahlcrantz, who wrote "Noah's Ark," a celebrated humorous poem. Runeberg, one of the truest and greatest poets of the North, is a Finn by birth, though he writes in Swedish; with all the wild melancholy character of his country he mingles a deep feeling of its sufferings and its wrongs. His verse is solemn and strong, like the spirit of its subject. He brings before you the wild wastes and the dark woods of his native land, and its brave, simple, enduring people. You feel the wind blow fresh from the vast, dark woodlands; you follow the elk-hunters through the pine forests or along the shores of remote lakes; you lie in desert huts and hear the narratives of the struggles of the inhabitants with the ungenial elements, or their contentions with more ungenial men. Runeberg seizes on life wherever it presents itself in strong and touching forms,--in the beggar, the gypsy, or the malefactor,-- it is enough for him that it is human nature, doing and suffering, and in these respects he stands preeminently above all the poets of Sweden. Besides the poets already spoken of, there are many others who cannot here be even named. If the literature of Sweden is almost wholly modern, its romance literature is especially so. Cederborg was not unlike Dickens in his peculiar walk and character, and in all his burlesque there is something kind, amiable, and excellent. He was followed by many others, who displayed much talent, correct sketching of costumes and manners, and touches of true descriptive nature. But an authoress now appeared who was to create a new era in Swedish novel-writing, and to connect the literary name and interests of Sweden more intimately with the whole civilized world. In 1828, Fredrika Bremer (1802-1865) published her first works, which were soon followed by others, all of which attracted immediate attention. Later they were made known to the English and American public through the admirable translations of Mrs. Howitt, and now they are as familiar as "Robinson Crusoe," or the "Vicar of Wakefield," wherever the English language is spoken. Wherever these works have been known they have

awakened a more genial judgment of life, a better view of the world and its destinies, a deeper trust in Providence, and a persuasion that to enjoy existence truly ourselves is to spread that enjoyment around us to our fellow-men, and especially by the daily evidences of good-will, affection, cheerfulness, and graceful attention to the feelings of others, which, in the social and domestic circle, are so small in their appearance, but immense in their consequences. As a teacher of this quiet, smiling, but deeply penetrating philosophy of life, no writer has yet arisen superior to Fredrika Bremer, while she has all the time not even professed to teach, but only to entertain. The success of Miss Bremer's writings produced two contemporaneous female novelists of no ordinary merit--the Baroness Knorring (d. 1833) and Emily Carlon (b. 1833). The works of the former are distinguished by a brilliant wit and an extraordinary power of painting life and passion, while a kind and amiable feeling pervades those of the latter. Among the later novelists of Sweden are many names distinguished in other departments of literature. In conclusion, there are in Sweden hosts of able authors in whose hands all sciences, history, philology, antiquities, theology, every branch of natural and moral philosophy and miscellaneous literature have been elaborated with a talent and industry of which any nation might be proud. Among the names of a world-wide fame are those, of Swedenborg (1688-1772), not more remarkable for his peculiar religious ideas than for his profound and varied acquirements in science; Linnaeus (1707-1778), the founder of the established system of botany; and Scheele (1742-1786), eminent in chemistry. If the literature of Scandinavia continues to develop during the present century with the strength and rapidity it has manifested during the last, it will present to the mind of the English race rich sources of enjoyment of a more congenial spirit than that of any other part of the European continent; and the more this literature is cultivated the more it will be perceived that we are less an Anglo-Saxon than a Scandinavian race. The last few years in Sweden have been a period of political rather than literary activity, yielding comparatively few works of high aesthetic value, Rydberg, a statesman and metaphysician, has produced a powerful work of fiction, "The Last Athenian," and other works of minor importance have been produced in various departments of literature. LITERATURE OF NORWAY.--Norway cannot be said to have had a literature distinct from the Danish until after its union with Sweden in 1814. The period from that time to the present has been one of great literary activity in all departments, and many distinguished names might be mentioned, among them that of Björnson (b. 1832), whose tales have been extensively translated. Jonas Lie who enjoys a wide popularity, Camilla Collett, and Magdalene Thoresen are also favorite writers. Wergeland and Welhaven were two distinguished poets of the first half of the century. Kielland is an able novelist of the realistic school, and Professor Boyesen is well known in the United States for his tales and poems in English. Henrik Ibsen is the most distinguished dramatic writer of Norway and belongs to the realistic school. Among other writers of the present time are Björjesson whose "Eric XIV." is a masterpiece of Swedish drama; Tekla Knös, a poetess whose claims have been sanctioned by the Academy; and Claude Gérard (_nom de plume_), very popular as a novelist. Charles XV. and Oscar II. are poets of merit.

GERMAN LITERATURE.

INTRODUCTION.--1. German Literature and its Divisions.--2. The Mythology. --3. The Language.

PERIOD FIRST.--1. Early Literature; Translation of the Bible by Ulphilas; the Hildebrand Lied.--2. The Age of Charlemagne; his Successors; the Ludwig's Lied; Roswitha; the Lombard Cycle.--3. The Suabian Age; the Crusades; the Minnesingers; the Romances of Chivalry; the Heldenbuch; the Nibelungen Lied.--4. The Fourteenth and Fifteenth Centuries; the Mastersingers; Satires and Fables; Mysteries and Dramatic Representations; the Mystics; the Universities; the Invention of Printing.

PERIOD SECOND.--From 1517 to 1700.--1. The Lutheran Period: Luther, Melancthon.--2. Manuel, Zwingle, Fischart, Franck, Arnd, Boehm.--3. Poetry, Satire, and Demonology; Paracelsus and Agrippa; the Thirty Years' War.--4. The Seventeenth Century: Opitz, Leibnitz, Puffendorf, Kepler, Wolf, Thomasius, Gerhard; Silesian Schools; Hoffmannswaldau, Lohenstein.

PERIOD THIRD.--1. The Swiss and Saxon Schools: Gottsched, Bodmer, Rabener, Gellert, Kästner, and others.--2. Klopstock, Lessing, Wieland, and Herder. --3. Goethe and Schiller.--4. The Göttingen School: Voss, Stolberg, Claudius, Bürger, and others.--5. The Romantic School: the Schlegels, Novalis; Tieck, Körner, Arndt, Uhland, Heine, and others.--6. The Drama: Goethe and Schiller; the _Power Men_; Müllner, Werner, Howald, and Grillparzer.--7. Philosophy: Kant, Fichte, Schelling, Hegel, Schopenhauer, and Hartmann; Science: Liebig, Du Bois-Raymond, Virchow, Helmholst, Haeckel.--8. Miscellaneous Writings.

INTRODUCTION.

1. GERMAN LITERATURE AND ITS DIVISIONS.--Central Europe, from the Adriatic to the Baltic, is occupied by a people who, however politically divided as respects language and race, form but one nation. The name Germans is that given to them by the Romans; the appellation which they apply to themselves is Deutsch, a term derived from Teutones, by which they were generally known, as also by the term Goths, in the early history of Europe. In glancing at the various phases of German literature, we see the bards at first uttering in primitive strains their war songs and traditions. The introduction of Christianity brought with it the cultivation of the classic languages, although the people had no part in this learned literature, which was confined to the monasteries and schools. In the twelfth and thirteenth centuries, letters, so long monopolized by the clergy, passed from their hands to those of the princes and nobles; and in the next century the songs of the minnesingers gave way to the pedantic craft of the mastersingers. A great intellectual regeneration followed the Reformation, but it was of brief duration. With the death of Luther and Melancthon the lofty spirit of reform degenerated into scholasticism, and the scholars were as exclusive in their dispensation of intellectual light as the clergy had been at an earlier period. While the priests, the minstrels, and the bookmen had each enlarged the avenues to knowledge, they were still closed and locked to the masses of the people; and so they remained, until philosophy arose to break down all barriers and to throw open to humanity at large the whole domain of knowledge and literature. In the midst of the convulsions which marked the close of the eighteenth century, the leading minds of Germany sought a solution of the great problems of civilization in the abysses of philosophy. Kant and his compeers gave an electric impulse to the German mind, the effects of which were manifest in the men who soon arose to apply the new discoveries of philosophy to literature. In Lessing, Herder, Goethe, and Schiller, the clergy, the minstrels, and the bookmen were each represented, but philosophy had breathed into them an all-embracing, cosmical spirit of humanity, and under their influence German literature soon lost its exclusive and sectional character, and became cosmopolitan and universal. The long cycle of literary experiments, however, is not yet completed. Since the philosophers have accomplished their mission by establishing principles, and the poets have made themselves intelligible to the masses, the German mind has entered upon the exploration of all spheres of learning, and is making new and great advances in the solution of the problems of humanity. The most eminent scholars, no longer pursuing their studies as a matter of art or taste, are inspired by the noble desire of diffusing knowledge and benefiting their fellow-beings; and to grapple with the laws of nature, and to secure those conditions best adapted to the highest human welfare, are their leading aims. The German explorers of the universe have created a new school of natural philosophers; German historians are sifting the records of the past and bringing forth great political, social, and scientific revelations. In geography, ethnology, philology, and in all branches of science, men of powerful minds are at work, carrying the same enthusiasm into the world of fact that the poets have shown in the fairy-land of the imagination. To these earnest questioners, these untiring explorers, nature is reluctantly unveiling her mysteries, and history is giving up the buried secrets of the ages. The lyre of the bard may be silent for a time, but this mighty struggle with the forces of nature and with the obscurities of the past will at last inspire a new race of poets and open a new vein of poetry, far more rich than the world of fancy has ever afforded. Science, regarded from this lofty point of view, will gradually assume epic proportions, and other and more powerful Schillers and Goethes will arise to illustrate its achievements. The history of German literature may be divided into three periods. The first, extending from the earliest times to the beginning of the Reformation, 1517, embraces the early literature; that of the reign of Charlemagne and his successors; that of the Suabian age (1138-1272), and of the first centuries of the reign of the House of Hapsburg. The second period, extending from 1517 to 1700, includes the literature of the age of the Reformation, and of the Thirty Years' War. The third period, from 1700 to the present time, contains the development of German literature in the eighteenth and nineteenth centuries.

2. THE MYTHOLOGY.--The German mythology is almost identical with the Scandinavian, and in it, as in all the legends of the North, women play an important part. Indeed, they occupied a far higher position among these ancient barbarians than in the polished nations of Greece and Rome. "It is believed," says Tacitus, "that there is something holy and prophetic about them, and therefore the warriors neither despise their counsels nor disregard their responses." The Paganism of the North, less graceful and beautiful than that of Greece, had still the same tendency to people earth, air, and water with beings of its own creation. The rivers had their Undines, the ocean its Nixes, the caverns their Gnomes, and the woods their Sprites. Christianity did not deny the existence of these supernatural races, but it invested them with a demoniac character. They were not regarded as immortal, although permitted to attain an age far beyond that granted to mankind, and they were denied the hope of salvation, unless purchased by a union with creatures of an earthly mould. According to the Edda, the Dwarfs were formed by Odin from the dust. They were either Cobolds--house spirits who attach themselves to the fortunes of the family, and, if well fed and

treated, nestle beside the domestic hearth--or Gnomes, who haunt deserted mansions and deep caverns. The mountain echoes are the mingled sounds of their voices as they mock the cries of the wanderer, and the fissures of the rocks are the entrances to their subterranean abodes. Here they have heaped up countless treasures of gold, silver, and precious stones, and here they pass their time in fabricating costly armor. The German Elves, like those of other climes, have an irresistible propensity to dance and song, especially the Nixes, who, rising from their river or ocean home, will seat themselves on the shore and pour forth such sweet music as to enchant all who hear them, and are ever ready to impart their wondrous skill for the hope or promise of salvation. To secure this, they also lure young maidens to their watery domains, and force or persuade them to become their brides. If they submit, they are allowed to sit on the rocks and wreath their tresses with corals, sea-weeds, and shells; but if they manifest any desire to return to their homes, a streak of blood on the surface of the waters tells the dark story of their doom. The Walkyres are the youthful maidens who have died upon their bridal eve, and who, unable to rest in their graves, return to earth and dance in the silver rays of the moon; but if a mortal chances to meet them, they surround and draw him within their magic ring, till, faint and exhausted, he falls lifeless to the earth. Not less dangerous are the river-maids, who, rising to the surface of the stream, lure the unwary traveler into the depths below. There are also the White Women, who often appear at dawn or evening, with their pale faces and shadowy forms; these are the goddesses of ancient Paganism, condemned to wander through ages to expiate the guilt of having received divine worship, and to suffer eternal punishment if not redeemed by mortal aid. Among the goddesses who, in the form of White Women, were long believed to exercise an influence for good or ill on human affairs, Hertha and Frigga play the most conspicuous parts, and figure in many wild legends; proving how strong was the hold which the creed of their ancestors had on the minds of the Germans long after its idols had been broken and its shrines destroyed. Hertha still cherished the same beneficent disposition ascribed to her in the old mythology, and continued to watch over and aid mankind until driven away by the calumnies of which she was the victim, while Frigga appears as a fearful ogress and sorceress. These popular superstitions, which retained their power over the minds of the people during the Middle Ages, and which even now are not wholly eradicated, have furnished a rich mine from which the poets and tale-writers of Germany have derived that element of the supernatural by which they are so often characterized.

3. THE LANGUAGE.--The Teutonic languages, which belong to the Indo-European stock, consist of two branches; the Northern or Scandinavian, and the Southern or German of the continent. The latter has three subdivisions; the Eastern or Gothic, with its kindred idioms, the high German or German proper,--the literary idiom of Germany,--and the low German, which includes the Frisian, old Saxon, Anglo-Saxon, Dutch, and Flemish. The high German, or German proper, comprehends the language of three periods: the old high German, which prevailed from the seventh to the eleventh century; the middle high German, from the eleventh century to the time of the Reformation; and the new high German, which dates from the time of Luther, and is the present literary language of the country. No modern language equals the German in its productiveness and its capacity of constant and homogeneous growth, in its aesthetical and philosophical character, and in its originality and independence. Instead of borrowing from the Greek, Latin, and other languages, to find expressions for new combinations of ideas, it develops its own resources by manifold compositions of its own roots, words, and particles. To express one idea in its various modifications, the English requires Teutonic, Greek, and Latin elements, while the German tongue unfolds all the varieties of the same idea by a series of compositive words founded upon one Gothic root. The German language, therefore, while it is far superior in originality, flexibility, richness, and universality, does not admit the varieties which distinguish the English.

PERIOD FIRST

FROM THE EARLIEST TIMES TO THE REFORMATION (360-1517).

1. EARLY LITERATURE.--Previous to the introduction of Christianity the Germans had nothing worthy of the name of literature. The first monument that has come down to us is the translation of the Bible into Moeso-Gothic, by Ulphilas, bishop of the Goths (360-388), who thus anticipated the work of Luther by a thousand years. As the art of writing was unknown to the Goths, Ulphilas formed an alphabet by combining Runic, Greek, and Roman, letters, and down to the ninth century this version was held in high esteem and seems to have been in general use. For nearly four hundred years after Ulphilas, no trace of literature is discovered among the Teutonic tribes. They, however, had their war-songs, and minstrel skill seems to have been highly prized by them. These lays were collected by Charlemagne, and are described by Eginhardt as "ancient barbarous poems, celebrating the deeds and

wars of the men of old;" but they have nearly all disappeared, owing, probably, to the refusal of the monks, then the only scribes, to transmit to paper aught which tended to recall the rites and myths of Paganism. Only two relics of this age, in their primitive form, remain; they are rhymeless, but alliterated,--a kind of versification common to the German, Anglo-Saxon, and Scandinavian poetry, and which, early in the ninth century, gave place to rhyme. Of these two poems, the Hildebrand Lied is probably a fragment of the traditions which had circulated orally for centuries, and which, with many modifications, were transcribed by the Scandinavians in their sagas, and by Charlemagne in his collection. None of the other poems which have come down to us from this period bear an earlier date than the twelfth and thirteenth centuries, when they were remodeled and appeared in the form of the Heldenbuch and Nibelungen Lied. The Hildebrand Lied belongs to the cycle of Theodoric the Great, or Dietrich of Bern or Verona, as he is called in poetry, from that town being the seat of his government after he had subdued the Empire of the West. This poem, though rude and wild, is not without grandeur and dramatic effect.

2. CHARLEMAGNE AND HIS SUCCESSORS.--The era of Charlemagne, in all respects so memorable, could not be without influence on the literature of Germany, then in a condition of almost primitive rudeness. The German language was taught by his command in the schools and academies which he established in all parts of the empire; he caused the monks to preach in the vernacular tongue, and he himself composed the elements of a grammar for the use of his subjects. He recompensed with imperial munificence the learned men who resorted to his court; Alcuin, Theophilus, Paul Winifred, and Eginhardt were honored with his peculiar confidence. Under his influence the monasteries became literary as well as ecclesiastical seminaries, which produced such men as Otfrid (fl. 840), the author of the rhymed Gospel-book, and Notker Teutonicus, the translator of the Psalms. After the death of Charlemagne the intellectual prospects of Germany darkened. The empire was threatened by the Normans from the west, and the Hungarians from the east, and there were few places where the peaceful pursuits of the monasteries and schools could be carried on without interruption. The most important relic of the last part of the ninth century is the "Ludwig's Lied," a hymn celebrating the victory of Louis over the Normans, composed by a monk with whom that monarch was on terms of great intimacy. The style is coarse and energetic, and blends the triumphant emotions of the warrior with the pious devotion of the recluse. Towards the close of the tenth century, Roswitha, a nun, composed several dramas in Latin, characterized by true Christian feeling and feminine tenderness. The eleventh century presents almost an entire blank in the history of German literature. The country was invaded by the Hungarian and Slavonic armies from abroad, or was the scene of contest between the emperors and their vassals at home, and in the struggle between Henry IV. and Pope Gregory VII., the clergy, who had hitherto been the chief supporters of their literature, became estranged from the German people. A series of lays or poems, however, known as the Lombard Cycle, belongs to this age, among which are "Duke Ernest," "Count Rudolph," and others, which combine the wild legends of Paganism with the more courtly style of the next period.

3. THE SUABIAN AGE.--A splendid epoch of belles-lettres dates from the year 1138, when Conrad III., of the Hohenstauffen dynasty, ascended the throne of the German Empire. The Crusades, which followed, filled Germany with religious and martial excitement, and chivalry was soon in the height of its splendor. The grand specimens of Gothic architecture produced during this period, the cathedrals of Ulm, Strasbourg, and Cologne, in which ponderous piles of matter were reduced to forms of beauty, speak of the great ideas and the great powers called into exercise to fulfill them. The commercial wealth of Germany was rapidly developed; thousands of serfs became freemen; large cities arose, mines were discovered, and a taste for luxury began to prevail. In 1149, when the emperor undertook a crusade in concert with Louis VII. of France, the nobility of Germany were brought into habitual acquaintance with the nobility of France, who at that time cultivated Provençal poetry, and the result was quickly apparent in German literature. The poets began to take their inspiration from real life, and though far from being imitators, they borrowed their models from the romantic cycles of Brittany and Provence. The emperors of the Suabian or Hohenstauffen dynasty formed a new rallying-point for the national sympathies, and their courts and the castles of their vassals proved a more genial home for the Muses than the monasteries of Fulda and St. Gall. In the Crusades, the various divisions of the German race, separated after their inroad into the seats of Roman civilization, again met; no longer with the impetuosity of Franks and Goths, but with the polished reserve of a Godfrey of Bouillon and the chivalrous bearing of a Frederic Barbarossa. The German emperors and nobles opened their courts and received their guests with brilliant hospitality; the splendor of their tournaments and festivals attracted crowds from great distances, and foremost among them poets and singers; thus French and German poetry were brought face to face. While the Hohenstauffen dynasty remained on the imperial throne (1138-1272) the Suabian dialect prevailed, the literature of chivalry was patronized at the court, and the Suabian minstrels were everywhere heard. These poets, who sang their love-songs, or minne songs (so called from an old German word signifying love), have received the name of Minnesingers. During a century and a half, from 1150 to 1300, emperors, princes, barons,

priests, and minstrels vied with each other in translating and producing lays of love, satiric fables, sacred legends, *_fabliaux_*, and metrical romances. Some of the bards were poor, and recited their songs from court to court; but many of them sang merely for pleasure when their swords were unemployed. This poetry was essentially chivalric; ideal love for a chosen lady, the laments of disappointed affection, or the charms of spring, formed the constant subjects of their verse. They generally sang their own compositions, and accompanied themselves on the harp; yet some even among the titled minstrels could neither read nor write, and it is related of one that he was forced to keep a letter from his lady-love in his bosom for ten days until he could find some one to decipher it. Among the names of nearly two hundred Minnesingers that have come down to us, the most celebrated are Wolfram of Eschenbach (fl. 1210), Henry of Ofterdingen (fl. 1250), and Walter of the Vogel Weide (1170-1227). The numerous romances of chivalry which were translated into German rhyme during the Suabian period have been divided into classes, or cycles. The first and earliest cycle relates to Arthur and the Knights of the Round Table; the are of Anglo-Norman origin, and were probably derived from Welsh chronicles extant in Britain and Brittany before the poets on either side of the Channel began to rhyme in the *_Langue d'oui_*. Of all the Round Table traditions, none became so popular in Germany as that of the "San Graal," or "*Sang Réal*" (the real blood). By this was understood a cup or charger, supposed to have served the Last Supper, and to have been employed in receiving the precious blood of Christ from the side-wound given on the cross. This relic is stated to have been brought by Joseph of Arimathea into northern Europe, and to have been intrusted by him to the custody of Sir Parsifal. Wolfram of Eschenbach, in his "Parsifal," relates the adventures of the hero who passed many years of pilgrimage in search of the sanctuary of the Graal. The second cycle of romance, respecting Charlemagne and his twelve peers, was mostly translated from the literature of France. The third cycle relates to the heroes of classical antiquity, and exhibits them in the costume of chivalry. Among them are the stories of Alexander the Great, and "Aeneid," and the "Trojan War." But the age of German chivalry and chivalric poetry soon passed away. Toward the end of the thirteenth century the Crusades languished, and the contest between the imperial and papal powers raged fiercely; with the death of Frederic I. the star of the Suabian dynasty set, and the sweet sounds of the Suabian lyre died away with the last breath of Conradin on the scaffold at Naples, in 1268. During this period there was a wide difference between the minstrelsy patronized by the nobility and the old ballads preserved by the popular memory. These, however, were seized upon by certain poets of the time, probably Henry of Ofterdingen, Wolfram of Eschenbach, and others, and reduced to the epic form, in which they have come down to us under the titles of the *Heldenbuch* and the *Nibelungen Lied*. They contain many singular traits of a warlike age, and we have proof of their great antiquity in the morals and manners which they describe. The *Heldenbuch*, or *Book of Heroes*, which, in its present form, belongs to the close of the twelfth century, is a collection of poems, containing traditions of events which happened in the time of Attila, and the irruptions of the German nations into the Roman Empire. The principal personages who figure in these tales of love and war are Etzel or Attila, Dietrich or Theodoric the Great, Siegfried, the Achilles of the North, Gudrune, Hagan, and others, who reappear in the *Nibelungen Lied*, and who have been already alluded to in the heroic legends of the Scandinavian Edda. The *Nibelungen Lied* (from *_Nibelungen_*, the name of an ancient powerful Burgundian race, and *_Lied_*, a lay or song) occupies an important place in German literature, and in grandeur of design and beauty of execution it far surpasses any other poetical production of this period. The "Horny Siegfried," one of the poems of the *Heldenbuch*, serves as a sort of prelude to the *Nibelungen*. In that, Siegfried appears as the personification of manly beauty, virtue, and prowess; invulnerable, from having bathed in the blood of some dragons which he had slain, save in one spot between his shoulders, upon which a leaf happened to fall. Having rescued the beautiful Chriemhild from the power of a giant or dragon, and possessed himself of the treasures of the dwarfs, he restores her to her father, the King of the ancient city of Worms, where he is received with regal honors, and his marriage with Chriemhild celebrated with unparalleled splendor. In the *Nibelungen*, Chriemhild is represented as the sister of Günther the King of Burgundy; the gallant Siegfried having heard of her surpassing beauty, resolves to woo her for his bride, but all his splendid achievements fail to secure her favors. In the mean time tidings reach the court of the fame of the beautiful Brunhild, queen of Isenland, of her matchless courage and strength; every suitor for her hand being forced to abide three combats with her, and if vanquished to suffer a cruel death. Günther resolves to try his fortune, and to win her or perish, and Siegfried accompanies him on condition that the hand of Chriemhild shall be his reward if they succeed. At the court of Brunhild, Siegfried presents himself as the vassal of Günther, to increase her sense of his friend's power, and this falsehood is one cause of the subsequent calamities. In the combats, Siegfried, becoming invisible by means of a magic cap he had obtained from the dwarfs, seizes the arm of Günther and enables him to overcome the martial maid in every feat of arms: and the vanquished Brunhild bids her vassals do homage to him as their lord. A double union is now celebrated with the utmost pomp and rejoicing. The proud Brunhild, however, is indignant at her sister-in-law wedding a vassal. In vain Günther assures her that Siegfried is a mighty prince in his own country; the offended queen determines to punish his deception, and ties him hand and foot with her magic girdle, and hangs him upon a nail; Siegfried pitying the condition of the king, promises his aid in

depriving the haughty queen of the girdle, the source of all her magic strength. He successfully accomplishes the feat, and in a luckless hour presents the trophy to Chriemhild, and confides the tale to her ear. A dispute having afterwards arisen between the two queens, Chriemhild, carried away by pride and passion, produces the fatal girdle, a token which, if found in the possession of any save the husband, was regarded as an almost irrefutable proof of guilt among the nations of the North. At this Brunhild vows revenge, and is aided by the fierce Hagan, Günther's most devoted follower, who, having induced Chriemhild to confide to him the secret of the spot where Siegfried is mortal, seizes the first occasion to plunge a lance between his shoulders, and afterwards bears the body to the chamber door of Chriemhild, who is overwhelmed with grief and burning with resentment. To secure her revenge she at length marries Etzel, or Attila, king of the Huns, who invites the Burgundians to his court, and at a grand festival Chriemhild involves them in a bloody battle, in which thousands are slain on both sides. Günther and Hagan are taken prisoners by Dietrich of Berne, and put to death by Chriemhild, who in turn suffers death at the hands of one of the followers of Dietrich. Such is an imperfect outline of this ancient poem, which, despite all its horrors and improbabilities, has many passages of touching beauty, and wonderful power. Siegfried, the hero, is one of the most charming characters of romance or poetry. Chriemhild, at first all that the poet could fancy of loveliness, becomes at last an avenging fury. Brunhild is proud, haughty, stern, and vindictive, though not incapable of softer emotions. In the Scandinavian legend we find the same personages in grander outlines and more gigantic proportions. The mythological portion of the story occupies the most prominent place, and Brunhild is there represented as a Valkyriur. The time in which the scene of this historical tragedy is laid is about 430 A.D. From the thirteenth to the sixteenth century it was widely read, and highly appreciated. But in the succeeding age it was almost entirely forgotten. It was brought again to light in the beginning of the present century, and since that time, it has been the subject of many learned commentaries and researches.

4. THE FOURTEENTH AND FIFTEENTH CENTURIES.--The period from the accession of the House of Hapsburg to the beginning of the Reformation was crowded with events of great social importance, but its literature was remarkably poor. The palmy days of the minstrels and romancists had passed away. Rudolph was an economical prince, who mended his own doublet to spare money, and as he had no taste for minstrelsy, the composers of songs who went to his court found no rewards there. The rank and influence of the metropolis were transferred from Frankfort to Vienna, and the communication with the southern and southwestern parts of Europe was greatly impeded. The Germans were occupied in crusades against the Huns; the court language was changed from west Gothic to an east Gothic dialect, which was less national, and much of the southern culture and the European sympathies which had characterized the reign of the Suabian emperors disappeared. Some inferior princes, however, encouraged versification, but the prizes were so reduced in value that the knights and noblemen left the field in favor of inferior competitors. A versifying mania now began to pervade all classes of society; chaplains, doctors, schoolmasters, weavers, blacksmiths, shoemakers--all endeavored to mend their fortunes by rhyming. Poetry sank rapidly into dullness and mediocrity, while the so-called poets rose in conceit and arrogance. The spirit of the age soon embodied these votaries of the muse in corporations, and the Emperor Charles IV. (1346-1378) gave them a charter. They generally called twelve poets among the minnesingers their masters, and hence their name Mastersingers. They met on certain days and criticised each other's productions. Correctness was their chief object, and they seemed to have little idea of the difference between poetical and prosaic expressions. Every fault was marked, and he who had fewest received the prize, and was allowed to take apprentices in the art. At the expiration of his poetical apprenticeship the young poet was admitted to the corporation and declared a master. Though the institution of the Mastersingers was established at the close of the thirteenth century, it was not until the fifteenth and sixteenth that it really flourished, particularly through the genius of Hans Sachs. The institution, survived, however, though languishing, through the seventeenth century, and the calamities of the Thirty Years' War. At Ulm it outlasted even the changes which the French Revolution effected in Europe, and as late as 1830 twelve old Mastersingers yet remained, who, after being driven from one asylum to another, sang their ancient melodies from memory in the little hostelry where the workmen used to meet in the evening to drink together. In 1839 four only were living, and in that year these veterans assembled with great solemnity, and declaring the society of Mastersingers forever closed, presented their songs, hymns, books, and pictures to a modern musical institution at Ulm. While the early Mastersingers were pouring forth their strains with undiminished confidence in their own powers, a new species of poetic literature was growing up beside them in the form of simple and humorous fables, or daring satires, often directed against the clergy and nobility, which were among the most popular productions of the Middle Ages. Such were "Friar Amis" and the "Ship of Fools." Indeed, from the year 1300 to the era of the Reformation, we may clearly trace the progress of a school of lay doctrine which was opposed to a great part of the teaching of the church, and which was yet allowed to prevail among the people. Among the fables, "Reynard the Fox" had a very early origin, and has remained a favorite of the German people for several centuries. After many

transformations it reappeared as a popular work at the era of the Reformation, and it was at last immortalized by the version of Goethe.

5. THE DRAMA.--We find the first symptoms of a German drama as early as the thirteenth century, in rude attempts to perform religious pieces like the old Mysteries once so popular throughout Europe. At first these dramatic readings were conducted in the churches and by the priests, but when the people introduced burlesque digressions, they were banished to the open fields, where they assumed still greater license. Students in the universities delighted to take part in them, and these exhibitions were continued after the Reformation. There is no reason to suppose that the early Christians objected to these sacred dramas or mysteries when they were compatible with their religion. They were imported into Europe from Constantinople, by crusaders and pilgrims, and became favorite shows to an illiterate populace. Indeed, Christianity was first taught throughout the north of Europe by means of these Mysteries and miracle plays, and the first missionaries had familiarized their rude audiences with the prominent incidents of Biblical history, long before the art of reading could have been called in to communicate the chronicles themselves. The most important writings of the fourteenth and fifteenth centuries are the works of the monks of the mystic school, which form the connecting link between the great era of the Crusades and the greater era of the Reformation. They kindled and kept alive a new religious fervor among the inferior clergy and the middle and lower classes, and without the labors of these reformers of the faith, the reformers of the church would never have found a whole nation waiting to receive them, and ready to support them. While the scholastic divines who wrote in Latin introduced abstruse metaphysics into their theology, the mystics represented religion as abiding in the sentiments of the heart, rather than in doctrines. Their main principle was that piety depended not on ecclesiastical forms and ceremonies, but that it consisted in the abandonment of all selfish passions. The sentiments of the mystic writers were collected and arranged by Tauler (1361), in a well-known work, entitled "German Theology." Luther, in a preface to this book, expresses his admiration of its contents, and asserts that he had found in it the doctrines of the Reformation. Another celebrated work of this school is "The Imitation of Christ," written in Latin, and generally attributed to Thomas à Kempis, a monk who died 1471. It has passed through numberless editions, and still maintains its place among the standard devotional works of Germany and other countries. Two other events prepared the way for the German reformers of the sixteenth century--the foundation of the universities, (1350), and the invention of printing. The universities were national institutions, open alike to rich and poor, to the knight, the clerk, and the citizen. The nation itself called these schools into life, and in them the great men who inaugurated the next period of literature were fostered and formed. The invention of printing (1438) admitted the middle classes, who had been debarred from the use of books, to the privileges hitherto enjoyed almost exclusively by the clergy and the nobility, and placed in their hands weapons more powerful than the swords of the knights, or the thunderbolts of the clergy. The years from 1450 to 1500 form a period of preparation for the great struggle that was to signalize the coming age.

PERIOD SECOND.

THE REFORMATION TO THE BEGINNING OF THE EIGHTEENTH CENTURY (1517-1700).

1. THE LUTHERAN PERIOD.--With the sixteenth century we enter upon the modern history and modern literature of Germany. The language now becomes settled, and the literature for a time becomes national. Luther and the Reformers belonged to the people, who, through them, now for the first time claimed an equality with the old estates of the realm, the two representatives of which, the emperor and the pope, were never more powerful than at this period. The armies of the emperor were recruited from Spain, Austria, Naples, Sicily, and Burgundy while the pope, armed with the weapons of the Inquisition, and the thunderbolts of excommunication, levied his armies of priests and monks from all parts of the Christian world. Against these formidable powers a poor Augustine monk came forth from his study in the small university of Wittenberg, with no armies, no treasures, with no weapon in his hand but the Bible, and in his clear manly voice defied both emperor and pope, clergy and nobility. There never was a more memorable spectacle. After the Reformation nearly all eminent men in Germany, poets, philosophers, and historians, belonged to the Protestant party, and resided chiefly in the universities, which were what the monasteries had been under Charlemagne, and the castles under Frederic Barbarossa--the centres of gravitation for the intellectual and political life of the country. A new aristocracy now arose, founded on intellectual preëminence, which counted among its members princes, nobles, divines, soldiers, lawyers, and artists. But the danger which threatens all aristocracies was not averted from the intellectual nobility of Germany; the spirit of caste, which soon pervaded all their institutions, deprived the second generation of that power which men like Luther had gained at the

beginning of the Reformation. The moral influence of the universities was great, but it would have been far greater if the intellectual leaders of the realm had not separated themselves from the ranks whence they themselves had risen, and to which alone they owed their influence. This intellectual aristocracy manifested a disregard of the real wants of the people, a contempt of all knowledge which did not wear the academic garb, and the same exclusive spirit of caste that characterizes all aristocracies. Latin continued to be the literary medium of scholars, and at the close of the seventeenth century German was only beginning to assert its capabilities as a vehicle of elegant and refined literature. The sixteenth century may be called the Lutheran period, for Martin Luther (1483-1546) was the most prominent character in the general literature as well as in the theology of Germany. He was the exponent of the national feeling, he gave shape and utterance to thoughts and sentiments which had been before only obscurely expressed, and his influence was felt in almost every department of life and literature. The remodeling of the German tongue may be said to have gone hand in hand with the Reformation, and it is to Luther more than to any other that it owes its rapid progress. His translation of the Bible was the great work of the period, and gives to him the deserved title of creator of German prose. The Scriptures were now familiarly read by all classes, and never has their beautiful simplicity been more admirably rendered. The hymns of Luther are no less remarkable for their vigor of style, than for their high devotional feeling. His prose works consist chiefly of twenty volumes of sermons, and eight volumes of polemical writings, besides his "Letters" and "Table Talk," which give us a view of the singular mixture of qualities which formed the character of the great Reformer. The literature of that period also owes much to Melancthon (1497-1560), the author of the "Confession of Augsburg," who by his classical learning, natural sagacity, simplicity and clearness of style, and above all by his moderation and mildness, greatly contributed to the progress of the Reformation. He devoted himself to the improvement of schools and the diffusion of learning, and through his influence the Protestant princes of Germany patronized native literature, established public libraries, and promoted the general education of the people. The earnest polemical writings of the age must be passed over, as they belong rather to ecclesiastical and political than to literary history. Yet these are the most characteristic productions of the times, and display the effects of controversy in a very unfavorable light. The license, personality, acrimony, and grossness of the invectives published by the controversial writers, particularly of the sixteenth century, can hardly be imagined by a modern reader who has not read the originals. The better specimens of this style of writing are found in the remains of Manuel and Zwingle. Manuel (1484-1530), a native of Switzerland, is an instance of the versatility of talent, which was not uncommon at this time; he was a soldier, a poet, a painter, a sculptor, and a wood-engraver. The boldness and license of his satires are far beyond modern toleration. Zwingle (1484-1531), the leading reformer of Switzerland, was a statesman, a theologian, a musician, and a soldier. His principal work is the "Exposition of the Christian Faith." A celebrated writer of prose satire was Fischart (1530-1590), whose numerous works, under the most extravagant titles, are distinguished by wit and extensive learning. His "Prophetic Almanac" was the selling book at all the fairs and markets of the day, and was read with an excitement far exceeding that produced by any modern novels. In his "Garagantua," he borrowed some of his descriptions from Rabelais; and this extravagant, satirical, and humorous book, though full of the uncouth and far-fetched combinations of words found in his other writings, contains many ludicrous caricatures of the follies of society in his age. Franck (fl. 1533), one of the best writers of German prose on history and theology during the sixteenth century, was the representative of the mystic school, and opposed Luther, whom he called the new pope. His religious views in many respects correspond with those of the Society of Friends. Rejecting all ecclesiastical authority, he maintained that there is an internal light in man which is better fitted than even the Scriptures to guide him aright in religious matters. He wrote with bitterness and severity, though he seldom used the coarse style of invective common to his age. Arnd (1555-1621) may be classed among the best theological writers of the period. His treatise "On True Christianity" is still read and esteemed. He belonged to the mystic school, and the pious and practical character of his work made it a favorite among religious men of various sects. Jacob Boehm (1575-1624) was a poor shoemaker, who, without the advantages of education, devoted his mind to the most abstruse studies, and professed that his doctrines were derived from immediate revelation; his works contain many profound and lofty ideas mingled with many confused notions.

2. POETRY, SATIRE, AND DEMONOLOGY.--In the sixteenth century the old poetry of Germany was in a great measure forgotten; the Nibelungen Lied and the Heldenbuch were despised by the learned as relics of barbarian life; classical studies engaged the attention of all who loved elegant literature, and while Horace was admired, the title of German poet was generally applied as a badge of ridicule. A propensity to satire of the most violent and personal description seems to have been almost universal in these excited times. Hutten (1488-1523) shared the general excitement of the age, and warmly defended the views of Luther. He addressed many satirical pamphlets in prose and verse to the people, and was compelled to flee from one city to another, his life being always in danger from the numerous enemies excited by his severity. Next to invectives and satires, comic stories and fables were the

characteristic productions of these times. Hans Sachs (1494-1576), the most distinguished of the Mastersingers of the sixteenth century, excelled in that kind of poetry as well as in all other styles of composition, and following his business as shoemaker, he made verses with equal assiduity. He employed his pen chiefly in writing innumerable tales and fables containing common morality for common people. In one of these he represents the Apostle St. Peter as being greatly perplexed by the disorder and injustice prevailing in the world. Peter longs to have the reins of government in his own hand, and believes that he could soon reduce the world to order. While he is thinking thus, a peasant girl comes to him and complains that she has to do a day's work in the field, and at the same time to keep within bounds a frolicsome young goat. Peter kindly takes the goat into custody, but it escapes into the wood, and the apostle is so much fatigued by his efforts to recover the animal that he is led to this conclusion: "If I am not competent to keep even one young goat in my care, it cannot be my proper business to perplex myself about the management of the whole world." The best lyrical poetry was devoted to the service of the church. Its merit consists in its simple, energetic language. Hymns were the favorite literature of the people; they were the cradle songs which lulled the children to sleep, they were sung by mechanics and maid-servants engaged in their work; and they were heard in the streets and market-places instead of ballads. Luther, who loved music and psalmody, encouraged the people to take a more prominent part in public worship, and wrote for them several German hymns and psalms. The belief in demonology and witchcraft, which was universally diffused through Europe in the Middle Ages, raged in Germany with fearful intensity and fury. While in other countries persecution was limited to the old, the ugly, and the poor, here neither rank nor age offered any exemption from suspicion and torture. While this persecution was at its height, from 1580 to 1680, more than one hundred thousand individuals, mostly women, were consigned to the flames, or otherwise sacrificed to this blood-thirsty insanity. Luther himself was a devout believer in witchcraft, and in the bodily presence of the Spirit of Evil upon the earth; all his harassing doubts and mental struggles he ascribes to his visible agency. Germany, indeed, seemed to live and breathe in an atmosphere of mysticism. Among the mystic philosophers and speculators on natural history and the occult sciences who flourished in this period are Paracelsus (1493-1546), and Cornelius Agrippa (1486-1539). Camerarius was distinguished in the classics and philosophy; Gesner in botany, zoölogy, and the classics; Fuchs in botany and medicine; and Agricola in mineralogy. Among the legends of the period, that of Faust, or Dr. Faustus, has obtained the most lasting popularity. There are good reasons for believing that the hero of this tale was a real personage, who lived in Suabia in the early part of the sixteenth century. He is frequently mentioned as a well-known character who gained his celebrity by the profession of magic. In the "History of Dr. Faustus," first published 1587, he is represented as a magician, who gained by unlawful arts a mastery over nature. The legend rapidly spread; it was versified by the English dramatist Marlowe, it became the foundation of innumerable tales and dramas, until, transformed by the genius of Goethe, it has acquired a prominent place in German literature. At the conclusion of the sixteenth century, owing to the disturbed state of religious, social, and political life, and to the fact that the best minds of the age were occupied in Latin writings on theology, while a few, devoted to quiet study, cultivated only the classics, the hopes which had been raised of a national poetry and literature were blighted, and a scholastic and polemical theology continued to prevail. The native tongue was again neglected for the Latin; the national poems were translated into Latin to induce the learned to read them; native poets composed their verses in Latin, and all lectures at the universities were delivered in that tongue. The work of Luther was undone: ambitious princes and quarrelsome divines continued the rulers of Germany, and everything seemed drifting back into the Middle Ages. Then came the Thirty Years' War (1618- 1648), with all its disastrous consequences. At the close of that war the public mind was somewhat awakened, literary societies were organized, and literature was fostered; but the nation was so completely demoralized that it hardly cared for the liberty sanctioned by the treaty of Westphalia, or for the efforts of a few princes and scholars to better its intellectual condition. The population of Germany was reduced by one half; thousands of villages and towns had been burnt to the ground; the schools, the churches, the universities, were deserted; and a whole generation had grown up during the war, particularly among the lower classes, with no education at all. The once wealthy merchants were reduced to small traders. The Hanse League was broken up; commerce was suspended, and intellectual activity paralyzed. Where any national feeling was left, it was a feeling of shame and despair.

3. THE SEVENTEENTH CENTURY.--During the seventeenth century the German language was regarded by comparatively few writers as a fit vehicle for polite literature, and was reserved almost exclusively for satires, novels, and religious discourses. Opitz (1597-1639) attempted to introduce the use of his native tongue, and, in a work on German poetry, explained the laws of poetic composition and the mechanism of versification. Several scholars at length directed their attention to the grammar of the language, which, through their influence, now began to be used in the treatment of scientific subjects. Meantime great mathematical and physical discoveries were made through the Academy of Berlin, which was founded under the auspices of Leibnitz, and scientific and literary associations were everywhere established. Books became a vast branch of commerce and great philologists and

archaeologists devoted themselves to the study of classical antiquity. Puffendorf expounded his theories of political history, Kepler, of astronomy, Arnold, of ecclesiastical history; and Leibnitz laid a basis for the scientific study of philosophy in Germany. Wolf shaped the views of Leibnitz into a comprehensive system, and popularized them by publishing his works in the German language. Thomasius, the able jurist and pietistic philosopher, was the first, in 1688, to substitute in the universities the German for the Latin language as the medium of instruction. Satirical novels form a prominent feature in the prose literature of the time, and took the place of the invectives and satires of the sixteenth century. No work of fiction, however, produced such an excitement as the translation of Defoe's "Robinson Crusoe." Soon after its publication more than forty imitations appeared. During this century the Mastersingers went on composing, according to the rules of their guilds, but we look in vain for the raciness and simplicity of Hans Sachs. Some poets wrote plays in the style of Terence, or after English models; and fables in the style of Phaedrus became fashionable. But there was no trace anywhere of originality, truth, taste, or feeling, except in sacred poetry. Paul Gerhard (1606-1696) is yet without an equal in his sacred songs; many of the best hymns which are still heard in the churches of Germany date from the age of this poet. Soon, however, even this class of poetry degenerated on one side into dry theological phraseology, on the other into sentimental affectation. This century saw the rise and the fall of the first and the second Silesian schools. The first is represented by Opitz (1597-1639), Paul Flemming, a writer of hymns (1609-1640), and a number of less gifted poets. Its character is pseudo-classical. All these poets endeavored to write correctly, sedately, and eloquently. Some of them aimed at a certain simplicity and sincerity, particularly Flemming. But it would be difficult to find in all their writings one single thought or expression that had not been used before; although the works of Opitz and of his followers were marked by a servile imitation of French and Dutch poets, they exerted an influence on the literary taste of their country, enriched the German language with new words and phrases, and established the rules of prosody. The second Silesian school is represented by Hoffmanswaldan (1618-1679) and Lohenstein (1635-1683), who undertook to introduce into the German poetry the bad taste of Marini which at that time so corrupted the literature of Italy. Their compositions are bombastic and full of metaphors,--the poetry of adjectives, without substance, truth, or taste. Dramatic writing rose little above the level of the first period, The Mysteries and Moralities still continued popular, and some of them were altered to suit the new doctrines. Opitz wrote some operas in imitation of the Italian, and Gryphius acquired popularity by his translations from Marini and his introduction of the pastoral drama. The theatrical productions of Lohenstein, characterized by pedantry and bad taste, together with the multitude of others belonging to this age, are curious instances of the folly and degradation to which the stage may be reduced.

PERIOD THIRD.

FROM THE BEGINNING OF THE EIGHTEENTH CENTURY TO THE PRESENT TIME (1700-1885.)

1. THE SAXONIC AND SWISS SCHOOLS.--In contrast to the barrenness of the last period, the eighteenth and nineteenth centuries present us with a brilliant constellation of writers in every department of letters, whose works form an era in the intellectual development of Germany unsurpassed in many respects by any other in the history of literature. Gottsched and Bodmer each succeeded in establishing schools of poetry which exerted great influence on the literary taste of the country. Gottsched (1700- 1766), the founder of the Saxon school, exercised the same dictatorship as a poet and critic which Opitz had exercised at the beginning of the seventeenth century. He was the advocate and copyist of French models in art and poetry, and he used his widespread influence in favor of the correct and so-called classical style. After having rendered good service in putting down the senseless extravagance of the school of Lohenstein, he became himself a pedantic and arrogant critic; then followed a long literary warfare between him and Bodmer (1698-1783), the founder of the Swiss school. Gottsched and his followers at Leipsic defended the French and insisted on classical forms and traditional rules; Bodmer and his friends in Switzerland defended the English style, and insisted on natural sentiment and spontaneous expression. A paper war was carried on in their respective journals, which at length ended favorably to the Swiss or Bodmer's school, which, although the smaller party, obtained a splendid victory over its antagonist. Many of the followers of Gottsched, disgusted with his pedantry, finally separated themselves from him and formed a new poetical union, called the Second Saxon School. They established at the same time a periodical, which was at once the channel of their communications and the point around which they centred. The principal representatives of this school were Rabener (1714-1771), very popular for the cheerful strain of wit that runs through his satires, and for the correctness of his language and style; Gellert (1715-1769), whose "Fables" contain great moral truth enlivened by vivid pictures of life, full of sprightliness and humor, and expressed in a style of extraordinary ease and clearness; Kästner (1719-1800), a celebrated and acute mathematician, and the author of many epigrams, elegies, odes, and songs; John Elias Schlegel

(1718-1749), distinguished for his dramatic compositions; and Zachariae (1726-1777), endowed with a poetical and witty invention, which he displayed in his comic epopees and descriptive poems. The following two poets were the most celebrated of them all: Hagedorn (1708-1754), whose fables and poems are remarkable for their fancy and wit; and Haller (1708-1777), who acquired an enduring fame as a poet, anatomist, physiologist, botanist, and scholar. Of inferior powers, but yet of great popularity, were: Gleim (1719-1803), upon whom the Germans bestowed the title of "father," which shows at once how high he ranked among the poets of his time; Kleist (1715-1759), whose poems are characterized by pleasant portraiture, harmonious numbers, great ease, and richness of thought, conciseness of expression, and a noble morality; Ramler (1725-1798), who has been styled the German Horace, from his odes in praise of Frederic the Great; Nicolai (1733-1811), who acquired considerable fame, both for the promotion of literature and for the correction of German taste particularly, through his critical reviews; and Gessner (1730-1787), who gained a great reputation for his "Idyls," which are distinguished by freshness of thought and grace and eloquence of style.

2. KLOPSTOCK, LESSING, WIELAND, AND HERDER.--Klopstock (1724-1803), inspired by the purest enthusiasm for Christianity, and by an exalted love for his fatherland, expressed his thoughts and feelings in eloquent but somewhat mystic strains. He was hailed as the herald of a new school of sacred and national literature, and his "Messiah" announced him in some respects as the rival of Milton. In comparing the Messiah with the "Paradise Lost," Herder says: "Milton's poem is a building resting on mighty pillars; Klopstock's, a magic picture hovering between heaven and earth, amid the tenderest emotions and the most moving scenes of human nature." Lessing (1729-1781) produced a reformation in German literature second only to that effected by Luther in theology. He was equally eminent as a dramatist, critic, and philosopher. His principal dramatic productions are "Emilie Galotti" and "Nathan the Wise." As a critic he demanded creative imagination from all who would claim the title of poet, and spared neither friends nor foes in his efforts to maintain a high standard of literary excellence. The writings of Lessing exerted a commanding influence on the best minds of Germany in almost all departments of thought. They mark, and in a great measure produced, the important change in the tone of German literature, from the national and Christian character of Klopstock to the cosmopolitan character which prevails in the writings of Goethe and Schiller. Wieland (1733-1813) was, in his youth, the friend of Klopstock, and would tolerate nothing but religious poetry; but he suddenly turned to the opposite extreme, and began to write epicurean romances as vehicles of his new views of human life and happiness. Among his tales are "Agathon," "Musarion," and "Aristippus," which last is considered his best work. In all these writings his purpose was to represent pleasure or utility as the only criterion of truth. Although there is much in his prose writings to subject him to severe censure, he maintains his place in the literature of his native country as one of its most gay, witty, and graceful poets. His "Oberon" is one of the most charming and attractive poems of modern times. Herder (1741-1803) was deeply versed in almost all branches of study, and exercised great influence, not only as a poet, but as a theologian, philosopher, critic, and philologist. He studied philosophy under Kant, and, after filling the offices of teacher and clergyman, he was invited to join the circle of poets and other literary men at Weimar, under the patronage of the Grand Duke Karl August. Here he produced a series of works on various subjects, all marked by a kindly and noble spirit of humanity. Among them are a treatise "On the Origin of Language," an essay on "Hebrew Poetry," and a work entitled "Ideas for the Philosophy of Humanity," besides poetical and critical writings. In his collection of popular ballads from various nations he showed his power of appreciating the various national tomes of poetry. The most noble feature in Herder's character was his constant striving for the highest interests of mankind. He did not employ literature as the means of satisfying personal ambition, and the melancholy of his last days arose from his lofty and unfulfilled aspirations. His friend Richter said of him: "Herder was no poet,--he was something far more sublime and better than a poet,--he was himself a poem,--an Indian Greek Epic composed by one of the purest of the gods."

3. GOETHE AND SCHILLER.--The close of the eighteenth and the beginning of the nineteenth century, the age of Herder, Goethe, and Schiller, was one of remarkable intellectual excitement, and it has produced a literature richer, more voluminous, and more important than that of all preceding periods taken collectively. The time extending between 1150 and 1300 has been styled the First Classic Period, and that we are now entering upon is regarded as the second. These two epochs resemble each other not only in their productiveness, but in the failure of both to maintain a distinct national school of poetry. In the thirteenth century the national epic appeared, but was soon neglected for the foreign legends and sentimental verses of the romancists and minnesingers. In the eighteenth century, when Lessing had made a path for original genius by clearing away French pedantry and affectation, there appeared some hope of a revival of true national literature. But Herder directed the literary enthusiasm of his time towards foreign poetry and universal studies, and a cosmopolitan rather than a national style has been the result; although for thoughtfulness and sincerity, and for the number of important ideas which it has brought into circulation,

modern German literature may justly claim the highest honor. Goethe (1749-1832) was a man of universal genius; he was born at Frankfort-on-the-Maine, and of his boyhood he gives a pleasant account in his work entitled "Poetry and Truth." In 1773 the appearance of his "Götz von Berlichingen," a drama founded upon the autobiography of that national and popular hero, was regarded as the commencement of an entirely new period in German dramatic literature. It was followed, in 1774, by the sentimental novel, "The Sorrows of Werther," in which Goethe gave expression to the morbid sentiments of many of his contemporaries. The Grand Duke of Weimar invited him to his court, where he was elevated to an honorable position. Here he produced his dramatic poems, "Iphigenia," "Egmont," "Tasso," and "Faust," besides many occasional poems and other works, and continued writing until his eighty-second year, while he varied his literary life with the pleasures of society. As a poet, Goethe is chiefly known by his dramas, "Faust," "Tasso," and "Egmont;" his lyrical and occasional poems, and his domestic epic, entitled "Herman and Dorothea." The first part of "Faust" is the poem by which the fame of this author has been most widely extended. Though incomplete, it is remarkably original, and suggests important reflections on human character and destiny. The narrative is partly founded on the old legend of Faust, the magician. We are introduced to the hero at the moment when he despairs of arriving at any valuable result, after years of abstruse study, and is about to put the cup of poison to his lips. The church bells of Easter Sunday recall to his mind the scenes of his innocent childhood, and he puts aside the cup and resolves to commence a new career of life. At this moment, his evil genius, Mephistopheles, appears, and persuades him to abandon philosophy and to enjoy the pleasures of the world. Faust yields to his advice, and after many adventures ends his career in crime and in misery. Many parts of the poem are written in a mystical vein, and intimate rather than express the various reflections to be deduced from it. The second part of "Faust" is remarkable for its varied and harmonious versification. Goethe was a voluminous writer, and much devoted to the fine arts and the natural sciences, as is attested by his remarkable work on the theory of colors. He extended his wide sympathies over almost every department of literature. The great merit of Goethe lies not so much in his separate productions, as in the philosophy of life and individual development which pervades his works, all of which, from "Faust," his greatest achievement, to his songs, elegies, and shorter poems, have the same peculiar character, and are tinged with the same profound reflections. The service he rendered to the German language was immense. The clearness and simplicity of his prose style make the best model for the imitation of his countrymen. During his lifetime, professors of various universities lectured on his works, and other authors wrote commentaries on his productions, while his genius has been amply recognized in foreign countries, especially within the last thirty years. Schiller (1759-1805) was born at Marbach, a town of Wurtemberg. At the age of fourteen he was admitted to the military academy at Stuttgart, where, in spite of its dull routine, he secretly educated himself as a poet. At the age of twenty-two, he gave to the world his tragedy of the "Robbers" (composed when he was only seventeen), in which his own wild longings for intellectual liberty found a turbulent and exaggerated expression. The public received it with great enthusiasm, as the production of a vigorous and revolutionary genius, and Schiller soon after escaped from the academy to try his fortune as a theatrical author. Accompanied by a young musician, with only twenty-three florins in his pocket, he set out for Manheim, on the night when the Grand Duke Paul of Russia paid a visit to Stuttgart, and all the people were too full of the excitement of the royal preparations and illuminations to observe the departure of the young poet. The good citizens did not dream that an obscure youth was leaving the city gate, of whom they would one day be far more proud than of the glittering visit of the Grand Duke. Yet the royal entrance is only now remembered because on that night young Schiller ran away; and the people of Stuttgart, when they would show a stranger their objects of interest, point first of all to the statue of Friedrich Schiller. After many adventures, Schiller was appointed poet to the theatre at Manheim. At a later period he was made Professor of History at the University of Jena, a position for which his genius eminently fitted him, and every prospect of happiness opened before him. But his health soon failed, and, after a short illness, he expired at the early age of forty-five. The principal works of Schiller are the dramas of "Wallenstein", "Marie Stuart", "The Maid of Orleans", "The Bride of Messina", and the celebrated ode called the "Song of the Bell". Besides these, he wrote many ballads, didactic poems, and lyrical pieces. The "Song of the Bell" stands alone as a successful attempt to unite poetry with the interests of daily life and industry. In his lyrical ballads and romances, Schiller rises above the didactic and descriptive style, and is inspired with noble purposes. The "Cranes of Ibycus" and the "Fight with the Dragon" may be mentioned as instances. Schiller was so interesting as a man, a philosopher, a historian, and critic, as well as poet, that, as Carlyle observes, in the general praise of his labors, his particular merits have been overlooked. His aspirations in literature were noble and benevolent. He regarded poetry especially as something other than a trivial amusement,--as the companion and cherisher of the best hopes and affections that can be developed in human life. While Goethe excels Schiller in completeness of aesthetical and philosophical perception, and in the versatility of his world-embracing and brilliant attainments, as a lover of his race, and as a poet who knew how to embody that love in the most exquisite conceptions, Schiller far surpassed him, and stands preeminent among all other poets. While Goethe represented the actual thoughts and feelings of his age, Schiller reflected its ideal yearnings; while the

practical result of Goethe's influence was to develop the capacities of each individual to their utmost extent, Schiller's aim was to lead men to consecrate their gifts to _the good, the beautiful, and the true_, the ethical trinity of the ages. The one poet represents the majesty, and at the same time the tyranny of the intellect; the other, the power and the loveliness of the affections; and although Goethe will always receive the respect and admiration of the world, Schiller will command its love.

4. THE GÖTTINGEN SCHOOL.--This association was formed at the epoch of Goethe and Schiller, when poets such as no other times had produced started up in quick succession. The following are among the principal members of this school: Voss (1756-1826) is distinguished by a classical taste and great fluency of style. His "Louise" is a masterpiece of bucolic poetry. His "Idyls" are the best of his minor poems. Christian Stolberg (1748-1821) was the author of two dramas, many elegiac poems and translations from the Greek. Leopold Stolberg (1750-1817), his brother, was still more successful as a poet, and distinguished for his acute observation of the beautiful in nature. Hoelty (1748-1776) was a poet of the gentler affections, the eloquent advocate of love, friendship, and benevolence. Claudius (1743-1815), in his poetical productions, ranges through song, elegy, romance, and fable. Bürger (1748-1794) was remarkable as the author of wild, picturesque ballads and songs. His most celebrated poem is "Leonore", which was at one time known by heart all over Germany. Schubart (1739-1791), though not belonging to the Göttingen association, may be here referred to. His songs and poems evince a warm imagination, and his descriptions are true and beautiful. One of the most powerful writers of this period was Klinger (1753-1831), whose highly wrought productions reflected most vividly the vehemence of thought and feeling of his time, and whose drama, "Storm and Stress", gave the name to that peculiar school known as the Storm and Stress literature.

5. THE ROMANTIC SCHOOL.--The founders of the Romantic School, Novalis, the two Schlegels, and Tieck, opposed the system which held up the great masters of antiquity as exclusive models of excellence; they condemned this theory as cold and narrow, and opposed alike to the true interests of literature and progress. They pointed out the vast changes in religion, morality, thought, habits, and manners which separated the ancient from the modern world, and declared that to follow blindly the works of Virgil and Cicero was to repress all originality and creative power. From the times of Pericles or Augustus they turned to the Middle Ages, and, forgetting their crimes and miseries, threw around them a halo of illusive romance. It was not only in poetry that this reaction was visible--in art and architecture the same tendency appeared. The stiff and quaint but vigorous productions of the old German painters were drawn forth from the obscurity where they had long mouldered; the glorious old cathedrals were repaired and embellished; the lays of the minnesingers, collected by Tieck, were on every lip, and the records of the olden times were ransacked for historic and traditionary lore. Although the Romantic School soon fell into extravagances which did much to diminish its influence, the whole of Germany was to some extent affected by it. The love for particular epochs led to researches in the language and antiquities, as such, as in Oriental studies, and during the calamitous period of the French invasion the national feeling was revived and kept alive by the stirring and patriotic songs which recalled the glories of the past. The brothers Schlegel are more celebrated as philologists and critics than as poets; although their metrical compositions are numerous, they are wholly deficient in warmth, passion, and imagination. Tieck is more distinguished as a novelist than a poet, but even his prose tales are so pervaded by the spirit of poetry that they may be said to belong to this department. Among other poets, Körner and Arndt are best remembered by their patriotic songs, which once thrilled every German heart. Seldom in romance or history is there found a more noble or heroic character than Theodore Körner (1791-1813). Short as was his existence, he had already struck, with more or less success, almost every chord of the poetic lyre. His dramas, with many faults, abound in scenes glowing with power and passion, and prove what he might have achieved had life been spared to him. But it is his patriotic poems, his "Lyre and Sword," which have invested the name of Körner with the halo of fame and rendered his memory sacred to his countrymen. The name of Arndt (1769-1860) is also associated in every German mind with the cause of national liberty; and his poems have incited many German hearts to the achievement of heroic deeds. His patriotic song, "Where is the German's fatherland," is a universal favorite. Arndt is not less celebrated for his historical and scientific works than for his poems. The Suabian School is represented by Uhland, Schwab, Kerner, and others who have enriched German poetry with many original lyrics. Uhland (1787- 1862) is the most distinguished ballad writer of the present age in Germany. The conceptions embodied in his poetry refer chiefly to the Middle Ages, and his stories are many of them founded on well-known legends. Kerner (b. 1786) is more intrinsically romantic than Uhland, but he is equally at home in other species of composition. Schwab (1792-1850) is distinguished among the lyric poets. An epic tendency, combined with great facility in depicting scenery and describing events, is the main feature of his metrical romances. Rückert (1789-1866), one of the most original lyric poets of Germany, is distinguished for the versatility of his descriptive powers, the richness of his imagination, and his bold, fiery spirit. He has been followed by Daumer, Bodenstedt, and others. The most remarkable poet whom Germany has produced in the present century is Heinrich Heine (1800-1856), and his poems are among the

most fascinating lyrics in European literature. The delicacy, wit, and humor of his writings, their cruel and cynical laughter, and their tender pathos, give him a unique place in the literature of his country. A school of writers known as *Young Germany* was deeply influenced by Heine. Their object was to revolutionize the political, social, and religious institutions of the country. Börne (d. 1837), the rival of Heine in the leadership of the party, was inferior to him in poetical power, but his superior in earnestness, moral beauty, and elevation. Börne was the nightmare of the German princes, at whom he darted, from his place of exile in Paris, the arrows of his bitter satire. Some of his writings are among the most eloquent of modern German compositions. Prominent among the followers of Heine and Börne are Gutzkow (b. 1811), a novelist, essayist, and dramatist; Laube (b. 1806); and Mundt (b. 1808). >From about 1830 a group of Austrian poets, more or less political in tendency, commanded the respect of all Germans, the chief among them was Count Auersperg, who, under the assumed name of Anastasius Grün, wrote lyrical and other brilliant and effective poems. Of the writers who before 1848 attempted to force poetry into the service of freedom, the best known is Herwegh, who advocated liberty with a vehemence that won for him immense popularity. The poems of Freiligrath (1810-1876) have graphic force, and possess merit of a high order. He has a rich imagination, great power of language, and musical versification. Among the more distinguished contemporary poets, Hamerling is remarkable for the boldness of his conceptions, and the passionate vehemence of his expression.

6. THE DRAMA.--At the beginning of the eighteenth century, Gottsched and his followers had rendered good service to the stage, not so much by their own productions as by driving from it the bombast of Lohenstein. Lessing followed this movement by attacking the French dramas, which had hitherto been esteemed the highest productions of human genius, and by bringing forward Shakspeare as the true model of dramatic style. This attack was so successful that the influence of the French drama soon declined, and in the reaction, Greeks, Romans, kings and princesses were replaced by honest, tiresome burghers, with their commonplace wives and daughters, and the toga and tunic gave way to woolen petticoats and dress-coats. Everything like poetry, either in language or sentiment, was banished from the stage. Such was the state of things when Goethe appeared. His rapid glance at once discerned the poverty of dramatic art, and his flexible and many-sided genius set itself to supply the deficiency. His "Götz von Berlichingen" illustrated the possibility of a dramatic literature founded upon national history and national character. His "Egmont" is a highly poetic and eloquent dramatization of that popular hero, and of the struggles of the Netherlands against the tyranny of Spain. His "Tasso" is a poem of psychological interest, illustrating a favorite maxim of the author that a poet, like every other artist, for his true development, needs education. "A hundred times," says Goethe, "have I heard artists boast that they owed everything to themselves, and I am often provoked to add, 'Yes, and the result is just what might be expected.' What, let me ask, is a man in and of himself?" The lesson of the drama of "Tasso" is this--that the poet cannot fulfill his duty by cultivating merely his imagination, however splendid and powerful it may be. Like all other men who would be good and great, he must exercise patience and moderation; must learn the value of self-denial; must endure the hardships and contradictions of the real world; contentedly occupy his place, with its pains and pleasures, as a part of the great whole, and patiently wait to see the beauty and brightness which flow from his soul, win their way through the obstacles presented by human society. The singular merit of this dramatic poem is this: that it is the fruit of genuine experience, adorned with the hues of a beautiful imagination, and clothed in classical language; but it is a work written for the few. "Iphigenia" is a fine imitation of the ancient Greek style, but not well suited to the stage. In his dramatic, as in all his other works, the only end and aim of Goethe was to carry to perfection the art in which he was so great a master. Virtue and vice, truth and falsehood, are each portrayed with the same graceful complacency and the same exquisite skill. His immense and wide-spreading influence renders this singular indifference, which seems to confound the very sense of right and wrong, doubly lamentable. In plastic skill and variety, the dramatic creations of Schiller are regarded, in some respects, inferior to those of Goethe, but they all glow with the love of true goodness and greatness, and with an enthusiasm for virtue and liberty which communicates itself, as by an electric spark, to his readers. The violent tone of Schiller's first tragedy, the "Robbers," was suggested by other theatrical writers of the period, who esteemed wildness and absurdity the chief characteristics of poetical genius. Schiller gave to his dramatic works more movement and popular interest than can be found in Goethe's dramas, but yielded in some instances to the sentimental tone so prevalent in German poetry. "Fiesco" was written in a better style than the "Robbers," though less suited to please the low theatrical taste of the time. "Don Carlos" showed more maturity of thought, and is pervaded by a coloring of poetic sentiment; "Wallenstein" won for the poet a universal reputation in his native land, and was translated into English by Coleridge. "Marie Stuart," the "Maid of Orleans," and the "Bride of Messina," contributed still more to increase the poet's fame. "Wilhelm Tell" was the most popular of Schiller's plays, and is still esteemed by some as his best production. Here the love of liberty, so wildly expressed in the "Robbers," appears in its true and refined character. Kotzebue (1760-1819) was one of the most successful playwrights of Germany. He composed an almost countless number of plays, and his plots were equally versatile and amusing; but he was

entirely destitute of poetic and moral beauty. His opposition to liberal principles caused him to be regarded as the enemy of liberty, and to be assassinated by an enthusiastic student named George Sand, who, on obtaining admittance to him under the pretense of business, stabbed him to the heart. While the influence of the Romantic School tended to invest all poetry with a dreamy and transcendental character, in the drama it was mingled with stormy and exciting incidents, often carried to the extreme of exaggeration and absurdity. The Romancists dealt almost exclusively with the perturbed elements of the human mind and the fearful secrets of the heart. They called to their aid the mysteries of the dark side of nature, and ransacked the supernatural world for its marvels and its horrors. The principal of these "Power Men," as they were called, are Müllner, Werner, Howald, and Grillparzer. Müllner (1774-1829) displayed no common order of poetic genius; but the elements of crime, horror, and remorse often supply the place of originality of thought and delineation of character. Werner (1768-1823), after a youth of alternate profligacy and remorse, embraced the Catholic faith and became a preacher. His dramas of "Martin Luther," "Attila," and the "Twenty-ninth of February," have rendered him one of the most popular authors in Germany. Grillparzer (b. 1790) is the author of a drama entitled the "Ancestress." The wildest dreams of Müllner and Werner sink into insignificance before the extravagance of this production, both in language and sentiment. The "Sappho" of this author displays much lyric beauty. Iffland (1759-1814) was a fertile but dull dramatist. One of the best national tragedies was written by Münch Bellinghausen. Charlotte Birchpfeifer has dramatized a great number of stories. Raupach (1784-1852) was one of the most able of recent German writers of plays, Gutzkow is distinguished among contemporary dramatists; and Freytag and Bauernfeld are excellent writers of comedy. Kleist (d. 1811) was also a distinguished writer of dramas of the Romantic School. Mosenthal, the author of "Deborah," has achieved distinction by aiming at something higher than stage effect.

7. PHILOSOPHY.--The appearance of Kant (1724-1804) created a new era in German philosophy. Previous to his time, the two systems most in vogue were the sensualism of Locke and his followers and the idealism of Leibnitz, Wolf, and others. Kant, in his endeavors to ascertain what we can know and what we originally do know, was led to the fundamental laws of the mind, and to investigate original or transcendental ideas, those necessary and unchangeable forms of thought, without which we can perceive nothing. For instance, our perceptions are submitted to the two forms of time and space. Hence these two ideas must be within us, not in the objects and not derived from experience, but the necessary and pure intuitions of the internal sense. The work in which Kant endeavored to ascertain those ideas, and the province of certain human knowledge, is entitled the "Critique of Pure Reason," and the doctrines there expounded have been called the Critical Philosophy and also the Transcendental. In the "Critique of Practical Reason" the subject of morals is treated, and that of aesthetics in the "Observations on the Sublime and Beautiful." The advent of Kant created a host of philosophical writers and critics, and besides Lessing and Herder there were Moses Mendelssohn, Hamann (the Magus of the North), Reinhold, Jacobi, and many others who speculated in various directions upon the most momentous problems of humanity and of the human soul. Fichte (1762-1814) carried the doctrine of Kant to its extreme point, and represented all that the individual perceives without himself, or all that is distinguished from the individual, as the creation of this I or ego; that the life of the mind is the only real life, and that everything else is a delusion. Schelling (1775-1854), in his "Philosophy of Identity," argues that the same laws prevail throughout the material and the intellectual world. His later writings contain theories in which the doctrines of Christianity are united with philosophical speculations. The leading principle of Schelling is found in a supposed intuition, which he describes as superior to all reasoning, and admitting neither doubt nor explanation. Coleridge adopted many views of this philosopher, and some of his ideas may be found in the contemplative poems of Wordsworth. Hegel (1770-1831), in his numerous, profound, and abstruse writings, has attempted to reduce all the departments of knowledge to one science, founded on a method which is expounded in his work on Logic. The "Identity System" of Schelling and the "Absolute Logic" of Hegel have already produced an extensive library of philosophical controversy, and the indirect influence of the German schools of philosophy has affected the tone of the literature in France, England, America, Denmark, and Sweden. The effect of German philosophy has been to develop intense intellectual activity. The habit of searching into the hidden mysteries of being has inclined the German mind to what is deepest, and sometimes to what is most obscure in thought; and the tendency to rise to the absolute, which is characteristic of this philosophy, manifests its influence not only in the blending of poetry and metaphysics, but in every department of science, literature, and art. The literary theory thus developed, that ideal beauty and not the imitation of nature is the highest principle of art, is everywhere applied even to the study of the great monuments of the past, and in the writings of the German archaeologists new youth seems to spring from the ruins of the ancient world. The physical sciences are also introduced into that universal sphere of ideas where the most minute observations, as well as the most important results, pertain to general interests. >From 1818 to the time of his death, in 1831, the influence of Hegel dominated the highest thought. Later, his school broke into three divisions; Ruge, one of the most brilliant writers of the school,

led the extreme radicals; Strauss resolved the narratives of the gospel into myths, and found the vital elements of Christianity in its spiritual teaching; while Feuerbach urged that all religion should be replaced by a sentiment of humanity. Ulrici and the younger Fichte exercised considerable influence as advocates of a pantheistic doctrine which aims to reconcile religion and science. None of these names, however, have the importance which attaches to that of Schopenhauer (d. 1860), who, at the present day, stirs a deeper interest than any other thinker. His main doctrine is that Will is the foundation principle of existence, the one reality in the universe, and all else is mere appearance. History is a record of turmoil and wretchedness, and the world and life essentially evil. High moral earnestness and great literary genius are shown in his graphic and scornful pictures of the darker aspects of the world. Van Hartmann, the most prominent leader of the Pessimistic School (1842- 1872), the latest original thinker of Germany, in his "Philosophy of the Unconscious," follows essentially the same line of thought. He assumes that there is in nature a blind, impersonal, unconscious, all-pervading will and idea, a pure and spiritual activity, independent of brain and nerve, and manifesting itself in thought, emotion, instinct, morals, language, perception, and history. He teaches that this is the last principle of philosophy, described by Spinoza as substance, by Fichte as the absolute I, by Plato and Hegel as the absolute idea, and by Schopenhauer as Will. He believes the world to be utterly and hopelessly bad, and the height of wisdom to suppress the desire to live. At the same time he believes that there is no peace for the heart and intellect until religion, philosophy, and science are seen to be one, as root, stem, and leaves are all organic expressions of one same living tree.

8. MISCELLANEOUS WRITINGS.--The best German minds of the nineteenth century have been absorbed by severe labor in all branches of learning and the sciences. Many memoirs of eminent persons have appeared, and many books of travel, since the days of George Forster (1754-1794), the teacher of Humboldt and the inaugurator of a new scientific and picturesque school of the literature of travel. Lichtenstein has written his travels in Southern Africa; Prince Maximilian von Wied and Martius, in Brazil; Pöppig, in Chili, Peru, etc.; Burmeister and Tschudi, in South America; Lepsius and Brugsch, in Egypt; and more recently, Gützlaff, in China; Siebold, in Japan; Barth and Vogel, in Africa; Leichhardt, in Australia; the brothers Schlagintweit, one of whom fell a victim to his zeal, in Asia; and Ida Pfeiffer (1797-1858), a woman of rare intrepidity, who visited, mostly on foot, the most remote regions of the globe. Another tourist and voluminous writer is Kohl (b. 1808). Qualities rarely united in one individual met in the character of Alexander von Humboldt (1769- 1859), an enterprising traveler, a man of extensive science, and an accomplished writer. Accompanied by his friend Bonpland, he visited South America, and after five years of adventurous research among the wonders of nature, he returned, and prepared for the press the results of his travels--the "Aspects of Nature," "Picturesque Views of the Cordilleras," and "Travels in the Equinoctial Regions of America." This veteran student produced at an advanced age a remarkable work entitled "Cosmos," containing the results of a long life of observation and contemplation. In the first part he gives general views of the economy of nature, while in the second we find ingenious speculations regarding the influence of nature on human society, in its various stages of culture. The Chevalier Bunsen (d. 1860) celebrated by his theological and historico-philosophical researches, has written, among other works, one on the "Position of Egypt in the History of the World," which is a learned dissertation on the antiquities and especially on the primitive language of Egypt. In the periodicals of Germany every department of letters and science is represented, and through the book-fairs of Leipsic all the literature of the ancient and modern world passes. They are the magazines of the productions of all nations. Every class of contending tastes and opinions is represented and all the contrasts of thought which have been developed in the course of ages meet in the Leipsic book-market. SCIENCE.--The growth of science has been one of the most powerful factors in the recent development of Germany, and some of the best works present in a popular form the results of scientific labor. Among these the first place belongs to the "Cosmos" of Humboldt. Although no longer in accordance with the best thought, it has enduring merit from the author's power of handling vast masses of facts, his poetic feeling and purity and nobility of style. In chemistry Liebig (d. 1873) is widely and popularly known; DuBois-Raymond has made great researches in animal electricity, physics, and physiology; Virchow in biology; Helmholtz in physiological optics and sound; Haeckel has extended the theories and investigations of Darwin, and all have made admirable attempts to render science intelligible to ordinary readers. With the death of Goethe began a new era in German literature not yet closed. The period has been one of intense political excitement, and while much of the best of the nation has been devoted to politics there has also been great literary activity deeply influenced by the practical struggles, hopes, and fears of the time. There has been a tendency in German writers hitherto to neglect the laws of expression, although their writings have evinced great originality and power of imagination, owing doubtless to the fact that they were addressed only to particular classes of readers. But since the political unity of the country has been accomplished, increasing numbers of thinkers and scholars have appealed to the whole nation, and, in consequence, have cultivated more directness and force of style. NOVELS, ROMANCES, AND POPULAR LEGENDS.--Poetry and prose fiction form the general literature of a nation, and are distinguished from the

literature of the study or from special literature, which consists chiefly of books for the use of distinct classes or parties. Fiction borders closely on the province of history, which, in its broad and comprehensive outlines, must necessarily leave unnoticed many of the finer lights and shades of human life, descriptions of motives, private characters, and domestic scenes. To supply these in the picture of humanity is the distinct office of fiction, which, while free in many respects, should still be essentially true. The poetry and fiction of a country should be the worthy companion to its history. The true poet should be the interpreter and illustrator of life. While the historian describes events and the outward lives of men, the poet penetrates into the inner life, and portrays the spirit that moves them. The historian records facts; the poet records feelings, thoughts, hopes, and desires; the historian keeps in view the actual man; the poet, the ideal man; the historian tells us what man has been; the poet reminds us either in his dreams of the past, or in his visions of the future, what man can be; and the true poet who fulfills such a duty is as necessary to the development and education of mankind as the historian. The numerous fictitious works of Germany may be arranged in four different classes. The first, comprehending historical romances, affords few writers who bear comparison with Scott. In the second class, containing novels which describe characters and scenes in real life, German literature is also comparatively poor. The third class comprises all the fictions marked by particular tendencies respecting art, literature, or society. In the fourth class, which includes imaginative tales, German literature is especially rich. To this department of fiction, in which the imagination is allowed to wander far beyond the bounds of real life and probability, the Germans apply distinctively the term poetical. In these imaginative and mystical fictions there is an important distinction between such tales as convey moral truth and interest under an array of visionary adventures, and those which are merely fantastic and almost destitute of meaning. Goethe's novel, "Wilhelm Meister's Apprenticeship," may be classed with fictions intended to convey certain views of life; but its chief defect is, that the object of the writer remains in a mist, even at the end of the story. The "Elective Affinities," while it contains many beauties as a work of art, is objectionable in a moral point of view. Jean Paul Richter (1763-1825) describes human life in all its aspects of light and shade, and his voluminous works embrace all subjects, from the highest problems of transcendental philosophy and the most passionate poetical delineations to "Instructions in the Art of Falling Asleep;" but his essential character, however disguised, is that of a philosopher and moral poet, whose study has been human nature, and whose delight is in all that is beautiful, tender, and mysteriously sublime in the fate or history of man. Humor is the ruling quality of his mind, the central fire that pervades and vivifies his whole being. The chief productions of Jean Paul (the title under which he wrote) are novels, of which "Hesperus" and "Titan" are considered his masterpieces. These and the charming prose idyl, "The Years of Wild Oats," keep their place as works of permanent excellence. In his famous "Dream," in which he describes a universe without religion, he rises to the loftiest height of imagination. Tieck (1773-1853) was at once a novelist, poet, and critic; but his fairy tales have perhaps rendered him most popular. His fancy was brilliant and sportive, and his imagination varied and fantastic. The world of his creation was peopled by demons who shed their malignant influence on mankind, or by spirits such as the Rosicrucians had conjured up, nymphs of the air, the woods, or waters. These airy visions he wove into form and shape with a master hand, and he invested even the common objects of life with a supernatural hue. At times he seems almost to have acquired a closer intimacy with nature than that granted to common men, and to have dived into the secret of her operations and the working of her laws. But while Tieck is unrivaled in the world of phantasy, he becomes an ordinary writer when he descends to that of daily life. Hardenberg, known by the assumed name of Novalis (1772-1801), by his unsullied character, his early death, and the mystic tone of his productions, was long regarded with an enthusiasm which has now greatly declined. His romance, "Henry von Ofterdingen," contains elements of beauty, but it deals too exclusively with the shadowy, the distant, and the unreal. His "Aphorisms" are sometimes deep and original, but often paradoxical and unintelligible. La Motte Fouqué (1777-1843) is best known by his charming story of "Undine," founded on one of those traditions in which the ancient fairy mythology of Germany abounded. Undine, a beautiful water-spirit, wins the heart of a noble knight, and consents to be his bride. We have seen it was only through the union with a being of mortal mould that the spirits of air and water could obtain the gift of a soul. But before giving her hand to her lover, Undine reminds him that the relentless laws of her race condemn her to become herself the instrument of his destruction if he should break his plighted vow. The knight accepts the conditions, and for a time he remains true to his beautiful wife. But at length, weary of her charms, he seeks the daughter of a neighboring baron for his bride, and in the midst of the wedding festivities the faithless knight is suffocated by an embrace from Undine, who is forced by the race of spirits thus to destroy him. The sweetness and pathos of this tale and its dream-like beauty have given it a place among those creations which appeal to all the world, and do not depend for their popularity on the tendencies of any particular age. Chamisso (1781-1836), one of the most popular poets of Germany, was the author of "Peter Schlemihl," a well-known tale describing the adventures of a man who sold his shadow for a large sum of money, and found afterward that he had made a very bad bargain. The moral it seems to indicate is that gold is dearly obtained at the sacrifice of any part, even of the shadow, of our humanity. Hoffmann (1776-1822) surpassed all

other imaginative writers in inventing marvelous incidents, while he was inferior to many of them in poetical genius. His stories mingle the circumstances of real life with grotesque and visionary adventures. Zschokke (1771-1847) was remarkable as a man and an author. His literary activity extended over more than half a century, and his tales and miscellaneous writings have had extensive popularity. His studies were generally directed toward human improvement, as in "The Goldmaker's Village," where he describes the progress of industry and civilization among a degraded population. Of the other numerous writers of fiction the names of a few only can be mentioned. Theresa Huber (1764-1829) was the authoress of several popular novels. Benedicte Naubert wrote several historical romances mentioned by Scott as having afforded him some suggestions. Caroline Pichler's "Tales" were accounted among the best fictions of her times. Henriette Hanke produced eighty-eight volumes of domestic narratives and other writings of a moral character; the Countess Hahn-Hahn follows the tendencies of Madame Dudevant (George Sand), though with less genius. Brentano, the author of "Godiva," and Arnim, author of the "Countess Dolores," may also be mentioned among the remarkable writers of fantastic romances. Bettina (1785-1859), the sister of Brentano, and the wife of Arnim, who resembles these authors in her imaginative character, wrote a singularly enthusiastic book, entitled, "Goethe's Correspondence with a Child." Imaginative pictures in words, interspersed with sentiments, characterize the writings of Bettina and many other romancists, while they show little power in the construction of plots and the development of character. Among the more renowned female writers are Auguste von Paalzow, Amalie Schoppe, Johanna Schoppenhauer, Friederike Brun, Talvi (Mrs. Robinson). Henriette Herz (1764-1841) and Rahel (1771-1844) also occupied a brilliant position in the literary and social world. The latter was the wife of Varnhagen von Ense (d. 1859), the most able and attractive biographical writer of Germany. Wilhelm Häring (Wilibald Alexis) is particularly eminent as a romance writer. The historical novelists of the early part of this century, as Van der Velde, Spindler, Rellstab, Storch, and Rau, have been succeeded by König, Heller, and several others. Good French and English novels are translated into German, almost immediately after their appearance, and the comparative scarcity of interesting German novels is accounted for by the taste for this foreign literature, and also by the increasing absorption of literary talent in the periodical press. Schucking is remarkable for his power of vividly conceiving character. Fanny Lewald is artistic in her methods and true and keen in her observation of life; and among novelists of simple village life Auerbach (1812-1883) takes the first place. Gustave Freytag (b. 1816), whose "Debit and Credit" is an intensely realistic study of commercial life, is also one of the distinguished writers of fiction. The popular legends of Germany are numerous and characteristic of the country. These narratives are either legends of local interest, associated with old castles, or other antiquities, or they are purely fabulous. Though they are sometimes fantastic and in their incidents show little respect to the laws of probability, they are genuine and fairly represent the play of the popular imagination; while under their wild imagery they often convey symbolically a deep and true meaning,

LITERARY HISTORY AND CRITICISM.--Modern German literature is singularly rich in this department. In the Republic of Letters, German students have found the liberty they could not enjoy in actual life, and this cause has promoted investigation in ancient and modern literature. Poets, historians, philosophers, and other writers have been studied and criticised, not merely as authors, but with especial reference to their respective contributions to the progress of ideas and the movements of society. Some of the most eminent German critical writers have already been mentioned under various preceding heads. Winckelmann (1717-1768) devoted himself with enthusiasm to the study of antique sculpture, and wrote elegant dissertations on the grace and beauty of the works of ancient art. His writings display true enthusiasm and refined taste. It may be said that the school of art-criticism in Germany owes its origin to the studies of Winckelmann. The critical writings of Herder were more remarkable for the impulse which they gave to the studies of authors than for their intrinsic merits. Goethe in his prose writings showed with what grace and precision the German language might be written. The letters of Schiller are pervaded by a lofty and ideal tone. William von Humboldt (1762-1832) was the founder of the science of comparative philology, a scholar of remarkable comprehensiveness and scientific knowledge, and the author of several highly important works on language and literature. The brothers Schlegel developed that taste for universal literature which had been introduced by Herder. The mind of Augustus Schlegel (1767-1845) was rather comprehensive than endowed with original and creative genius. His poems are elegant, but not remarkable. Friedrich Schlegel (1772-1829), like his brother, was opposed to the skeptical character of some of the philosophical theories of his day, and after entering the Catholic Church he expressed his religious and polemical opinions in his works on literature. His lectures on "The Philosophy of History" were evidently written with political and religious purposes. He participated with his brother in the study of Oriental literature and language, but his lectures on "The Literature of all Nations" have chiefly extended his fame for great capacity, critical acumen, and extensive learning. The main purpose of the author is to describe the development of literature in its connection with the social and religious institutions of various nations and periods. He thus elevates literature, and especially poetry, far above the views of trivial and

commonplace criticism, and regards it in its highest aspect as the product of human life and genius in various stages of cultivation. The history of the world of books is thus represented as no dry and pedantic study, but as one intimately connected with the best interests of humanity. In the establishment of this humanitarian style of literature, the services of this author were of great value, although many of his works, as well as those of others in this department, have been written rather for the use of scholars than for the public. There still remains in Germany that distinction between a popular and scholastic style which characterized the Middle Ages, when the literati excluded their thoughts from the people by writing in Latin. The literature of the past, which is in itself too diffuse to be comprehended by men of scanty leisure in modern times, is with most writers too often rather complicated and extended than simplified and compressed into a readable form. If the labors of learned historians and critics had been directed to popularize the results of their extensive scholarship, readers without much time for study might have acquired a fair general acquaintance with universal literature. But while concise and masterly summaries are required, many scholars love to wander in never-ending disquisitions, and the consequence is that the greater number of readers acquire only a fragmentary and accidental knowledge of books. While the brothers Schlegel, and many other writers, followed the tendencies of Herder in universal literature, a national school of criticism was founded and supported by the brothers Grimm, with many able associates. Jacob, the eldest (d. 1863), devoted his researches to the German literature of the Middle Ages, and collected the scattered remnants of old popular legends. In conjunction with his brother William (d. 1860) he published his "Children's Fables," or "Household Tales," which are marked by great simplicity, and often convey pleasing sentiments and good morals mingled with fantastic and supernatural adventures. Later works on the "German Language," "Legal Antiquities," and "German Mythology," have secured for this author the highest position among national philologists and antiquaries. The example of these brothers gave a strong impulse to the study of German archaeology, and the results have been received with great enthusiasm. Many relics of old literature have been recovered, and these remains form a considerable library of literary antiquities. Menzel (d. 1855), well known as a critical and polemical writer of the national school, has written the "History of German Literature," "The Spirit of History," and other works, in which he has warmly opposed the extreme revolutionary tendencies of recent political and social theorists. Gervinus (d. 1871) may be considered as a historian, politician, and critic. In his "History of the Poetical National Literature of the Germans," he traces the development of poetry in its relations to civilization and society. He has also written a work on Shakspeare, and a history of the nineteenth century, which is characterized by its liberal tendencies. His views of literature are directly opposed to those of Frederic Schlegel. As historians of ancient classical literature, German scholars have maintained the highest position, and to them the world is prodigiously indebted. Their works, however, are too comprehensive to be described here, and too numerous even to be mentioned. The idea of classical erudition, as maintained by them, is extended far beyond its common limitation, and is connected with researches respecting not the language only, but also the religion, philosophy, social economy, arts, and sciences of ancient nations. Karl Otfried Müller (d. 1840) must be mentioned as an accomplished scholar and the author of a standard work, the "History of Greek Literature." Among the other great writers on ancient history are Böckh, Duncker, Droysen, Mommsen, and Kortüm. Several works on the modern literature of European nations have recently been published in Germany; and much industry and research have been displayed in numerous criticisms on the fine arts. The principles of Winckelmann and Lessing have been developed by later authors who have written excellent critical and historical works on the plastic arts, sculpture, painting, and architecture. In general, the literary criticism of Germany deserves the highest commendation for its candor, carefulness, and philosophical consistency.

HISTORY AND THEOLOGY.--The extensive historical works of the modern writers of Germany form an important feature in the literature. The political circumstances of the country have been in many respects favorable to the progress of these studies. Professors and students, excluded in a great measure from political life, have explored the histories of ancient nations, and have given opinions in the form of historical essays, which they could not venture to apply to the institutions of Germany. While Prussia and Austria were perilous topics for discussion, liberal and innovating doctrines might be promulgated in lectures on the progress and decline of liberty in the ancient world. Accordingly, the study of universal history, to which the philosophical views of Herder gave the impulse, has been industriously prosecuted during the last fifty years, and learned and diligent collectors of historical material are more numerous in Germany than in any other country. Müller (d. 1804), a native of Switzerland, displayed true historical genius and extended erudition in his "Lectures on Universal History." Among other writers on the same subject are Rotteck, Becker, Böttiger, Dittmar, and Vehse. Of the two last authors, the one wrote on this vast subject especially in reference to Christianity, and the other describes the progress of civilization and intellectual culture. Schlosser's (b. 1786) "History of the Ancient World and its Culture" holds a prominent place among historical works. His writings are the result of laborious and conscientious researches to which he has devoted his life. Heeren (d. 1842) opened a new vein of ancient history in his learned work on the "Commercial

Relations of Antiquity." While other historians have been attracted by the sword of the conqueror, Heeren followed the merchant's caravan laden with corn, wine, oils, silks, and spices. His work is a valuable contribution to the true history of humanity. Carl Ritter (d. 1859) has united the studies of geography and history in his "Geography viewed in its Relations to Nature and History." This great work, the result of a life devoted to industrious research, has established the science of comparative geography. Lepsius and Brugsch have rendered important services to Egyptology, and Lachmann, K. O. Müller, Von der Hagen, Böckh, the brothers Grimm, Moritz Haupt, and others, to ancient and German philology. In Roman history, Niebuhr (1776-1831), stands alone as the founder of a new school of research, by which the fictions so long mingled with the early history of Rome, and copied from book to book, and from century to century, have been fully exploded. Through the labors of this historian, modern readers know the ancient Romans far better than they were known by nations who were in close contact with them. Niebuhr made great preparations for his work, and took care not to dissipate his powers by appearing too soon as an author. Besides many other histories relating to the Roman Empire, German literature is especially rich in those relating to the Middle Ages. The historical writings of Ranke (b. 1795) connect the events of that period with modern times, and give valuable notices of the age of the Reformation. "The History of Papacy in the Sixteenth and Seventeenth Centuries" is highly esteemed, though Catholic critics have objected to some of its statements. Histories of the German people, of the Hohenstauffen Dynasty, of the Crusades; histories of nations, of cities, of events, and of individuals, all have found their interpreters in German genius. Schlosser (b. 1776), the vigorous and truthful historian of the eighteenth century; Dahlmann (b. 1785) the German Guizot, and Raumer (b. 1781), the historian of the Hohenstauffens, deserve particular mention. Nor is the department of ecclesiastical history and theology less distinguished by its research. No writer of his time contributed more towards the formation of an improved prose style than Mosheim (1694-1755); although his "Ecclesiastical History" is now superseded by works of deeper research. His contemporary, Reimar, wrote in favor of natural theology, and may be considered the founder of the Rationalistic School. Neander (d. 1850) wrote a history of the church, in ten volumes, distinguished for its liberal views. The sermons of Reinhard (d. 1812), in thirty-nine volumes, display earnestness and unaffected solemnity of style. Schleiermacher (d. 1834), celebrated as a preacher at Berlin, was the author of many works, in which he attempted to reconcile the doctrines of Protestantism with certain philosophical speculations. De Wette, the friend of Schleiermacher, is one of the most learned and able representatives of the Rationalistic School. Tholuck (b. 1799) is celebrated as a learned exegetical writer. Mommsen (b. 1817) is the vigorous historian of ancient Rome, and Curtius (b. 1819), the author of a history of Greece, not more remarkable for its learning than for the clear and attractive arrangement of its material. In histories of philosophy recent German literature is absolutely supreme. Hegel still ranks as one of the greatest writers in this line, and Ueberweg, Uedmann, and others are important workers in the same department. Fischer writes the history of philosophy with sympathetic appreciation and in a fascinating style, and Lange, in his "History of Materialism," does full justice to the different phases of materialistic philosophy. Since the time of Lessing, aesthetics have formed a prominent branch of philosophy with the Germans, and they have been no less successful as historians of art than of metaphysics. Among the most distinguished are Kugler, Carrière, and Lübke. Biographers and historians of literature are numerous.

ENGLISH LITERATURE.

INTRODUCTION.--1. English Literature. Its Divisions.--2. The Language.

PERIOD FIRST.--1. Celtic Literature. Irish, Scotch, and Cymric Celts; the Chronicles of Ireland; Ossian's Poems; Traditions of Arthur; the Triads; Tales.--2. Latin Literature. Bede; Alcuin; Erigena.--3. Anglo-Saxon Literature. Poetry; Prose; Versions of Scripture: the Saxon Chronicle; Alfred.

PERIOD SECOND.--The Norman Age and the Fourteenth and Fifteenth Centuries.--1. Literature in the Latin Tongue--2. Literature in Norman-French. Poetry; Romances of Chivalry.--3. Saxon-English. Metrical Remains.--4. Literature in the Fourteenth Century.--Prose Writers; Occam, Duns Scotus, Wickliffe, Mandeville, Chaucer. Poetry; Langland, Gower, Chaucer.--5. Literature in the Fifteenth Century. Ballads.--6. Poets of the Fourteenth and Fifteenth Centuries in Scotland. Wyntoun, Barbour, and others.

PERIOD THIRD.--1. Age of the Reformation (1509-1558), Classical, Theological, and Miscellaneous Literature: Sir Thomas More and others. Poetry: Skelton, Surrey, and Sackville; the Drama.--2. The Age of Spenser, Shakspeare, Bacon, and Milton (1558-1660). Scholastic and Ecclesiastical Literature. Translations of the Bible: Hooker, Andrews, Donne, Hall, Taylor, Baxter: other Prose Writers: Fuller, Cudworth, Bacon, Hobbes. Raleigh,

Milton, Sidney, Selden, Burton, Browne and Cowley. Dramatic Poetry: Marlowe and Greene, Shakspeare, Beaumont and Fletcher, Ben Jonson, and others; Massinger, Ford, and Shirley; Decline of the Drama. Non-dramatic Poetry: Spenser and the Minor Poets. Lyrical Poets; Donne, Cowley, Denham, Waller, Milton.--3. The Age of the Restoration and Revolution (1660-1702). Prose: Leighton, Tilotson, Barrow, Bunyan, Locke and others. The Drama: Dryden, Otway. Comedy; Didactic Poetry: Roscommon, Marvell, Butler, Pryor, Dryden.--4. The Eighteenth Century. The First Generation (1702-1727): Pope, Swift, and others; the Periodical Essayists: Addison, Steele. The Second Generation (1727-1760); Theology; Warburton, Butler, Watts, Doddridge. Philosophy: Hume. Miscellaneous Prose: Johnson; the Novelists: Richardson, Fielding, Smollett and Sterne. The Drama; Non- dramatic Poetry: Young, Blair, Akenside, Thomson, Gray, and Collins. The Third Generation (1780-1800); the Historians: Hume, Robertson, and Gibbon. Miscellaneous Prose: Johnson, Goldsmith, "Junius," Pitt, Fox, Sheridan, and Burke. Criticism: Burke, Reynolds, Campbell, Kames. Political Economy: Adam Smith. Ethics: Paley, Smith, Tucker, Metaphysics: Reid. Theological and Religious Writers: Campbell, Paley, Watson, Newton, Hannah More, and Wilberforce. Poetry: Comedies of Goldsmith and Sheridan; Minor Poets; Later Poems; Beattie's Minstrel; Cowper and Burns. 5. The Nineteenth Century. The Poets: Campbell, Southey, Scott, Byron; Coleridge and Wordsworth; Wilson, Shelley, Keats; Crabbe, Moore, and others; Tennyson, Browning, Proctor, and others. Fiction: the Waverley and other Novels; Dickens, Thackeray, and others. History: Arnold, Thirlwall, Grote, Macaulay, Alison, Carlyle, Freeman, Buckle. Criticism: Hallam, De Quincey, Macaulay, Carlyle, Wilson, Lamb, and others. Theology: Foster, Hall, Chalmers. Philosophy: Stewart, Brown, Mackintosh, Bentham, Alison, and others. Political Economy: Mill, Whewell, Whately, De Morgan, Hamilton. Periodical Writings: the Edinburgh, Quarterly, and Westminster Reviews, and Blackwood's Magazine. Physical Science: Brewster, Herschel, Playfair, Miller, Buckland, Whewell.--Since 1860. 1. Poets: Matthew Arnold, Algernon Swinburne, Dante Rossetti, Robert Buchanan, Edwin Arnold, "Owen Meredith," William Morris, Jean Ingelow, Adelaide Procter, Christina Rossetti, Augusta Webster, Mary Robinson, and others. 2. Fiction: "George Eliot," MacDonal, Collins, Black, Blackmore, Mrs. Oliphant, Yates, McCarthy, Trollope, and others. 3. Scientific Writers: Herbert Spencer, Charles Darwin, Tyndall, Huxley, and others. 4. Miscellaneous.

INTRODUCTION.

1. ENGLISH LITERATURE AND ITS DIVISIONS.--The original inhabitants of England, belonging to the great race of Celts, were not the true founders of the English nation; and their language, which is still spoken unchanged in various parts of the kingdom, has exerted but an incredibly small influence on the English tongue. During the period of the Roman domination (55 B.C.-447 A.D.), the relations between the conquerors and the natives did not materially alter the nationality of the people, nor did the Latin language permanently displace or modify the native tongue. The great event of the Dark Ages which succeeded the fall of the Roman empire was the vast series of emigrations which planted tribes of Gothic blood over large tracts of Europe, and which was followed by the formation of all the modern European languages, and by the general profession of Christianity. The Anglo-Saxon invaders of England continued to emigrate from the Continent for more than a hundred years, and before many generations had passed away, their language, customs, and character prevailed throughout the provinces they had seized. During the six hundred years of their independence (448-1066), the nation made wonderful progress in the arts of life and thought. The Pagans accepted the Christian faith; the piratical sea-kings applied themselves to the tillage of the soil and the practice of some of the ruder manufactures; the fierce soldiers constructed, out of the materials of legislation common to the whole Teutonic race, a manly political constitution. The few extant literary monuments of the Anglo-Saxons possess a singular value as illustrations of the character of the people, and have the additional attraction of being written in what was really our mother tongue. In the Middle Ages (from the eleventh to the sixteenth centuries), the painful convulsions of infant society gave way to the growing vigor of healthy though undisciplined youth. All the relations of life were modified, more or less, by the two influences predominant in the early part of the period, but decaying in the latter,--Feudalism and the Church of Rome,--and by the consolidation of the new languages, which were successively developed in all European countries, and were soon qualified as instruments for communicating the results of intellectual activity. The Middle Ages closed by two events occurring nearly at the same time: the erection of the great monarchies on the ruins of feudalism, and the shattering of the sovereignty of the Romish Church by the Reformation. At the same period, the invention of printing, the most important event in the annals of literature, became available as a means of enlightenment. The Norman conquest of England (1066) subjected the nation at once to both of the ruling mediaeval impulses: feudalism, which metamorphosed the relative positions of the people and the nobles, and the recognition of papal supremacy, which altered not less thoroughly the standing of the church. While these changes were not unproductive of good at that time, they were distasteful to the nation, and soon became injurious, both to freedom and knowledge, until at length,

under the dynasty of the Tudors, the ecclesiastical shackles were cast off, and the feudal bonds began gradually to be loosened. The Norman invaders of England took possession of the country as military masters. They suppressed the native polity by overwhelming force, made Norman-French the fashionable speech of the court and the aristocracy, and imposed it on the tribunals. Their romantic literature soon weaned the hearts of educated men from the ancient rudeness of taste, but the mass of the English people clung so obstinately to their ancestral tongue, that the Anglo-Saxon language kept its hold in substance until it was evolved into modern English; and the Norman nobles were at length forced to learn the dialect which had been preserved among their despised English vassals. Emerging from the Middle Ages into the illuminated vista of modern history, we find the world of action much more powerfully influenced by the world of letters than ever before. Among the causes which produced this change are the invention of printing, the use of a cultivated living language, and in England the vindication of freedom of thought and constitutional liberty. The period from the accession of Elizabeth to the Restoration (1558-1660) is the most brilliant in the literary history of England. The literature assumes its most varied forms, expatiates over the most distant regions of speculation and investigation; and its intellectual chiefs, while they breathe the spirit of modern knowledge and freedom, speak to us in tones which borrow an irregular stateliness from the chivalrous past. But this magnificent panorama does not meet the eye at once; the unveiling of its features is as gradual as the passing away of the mists that shroud the landscape before the morning sun. The first quarter of the century was unproductive in all departments of literature. Of the great writers who have immortalized the name of Elizabeth, scarcely one was born five years before she ascended the throne, and the immense and invaluable series of literary works which embellished the period in question may be regarded as beginning only with the earliest poem of Spenser, 1579. "There never was anywhere," says Lord Jeffrey, "anything like the sixty or seventy years that elapsed from the middle of the reign of Elizabeth to the Restoration. In point of real force and originality of genius, neither the age of Pericles nor the age of Augustus, nor the times of Leo X., or of Louis XIV., can come at all into comparison. In that short period we shall find the names of almost all the very great men that this nation has ever produced." Among the influences which made the last generation of the sixteenth century so strong in itself, and capable of bequeathing so much strength to those who took up its inheritance, was the expanding elasticity, the growing freedom of thought and action. The chivalry of the Middle Ages began to seek more useful fields of adventure in search of new worlds, and fame, and gold. There was an increasing national prosperity, and a corresponding advance of comfort and refinement, and mightier than all these forces was the silent working of the Reformation on the hearts of the people. The minor writers of this age deserve great honor, and may almost be considered the builders of the structure of English literature, whose intellectual chiefs were Spenser, Shakspeare, and Hooker. Spenser and Shakspeare were both possessed of thoughts, feelings, and images, which they could not have had if they had lived a century later, or much earlier; and, although their views were very dissimilar, they both bear the characteristic features of the age in which they lived. Spenser dwelt with animation on the gorgeous scenery which covered the elfin land of knighthood and romance, and present realities were lost in his dream of antique grandeur and ideal loveliness. He was the modern poet of the remote past; the last minstrel of chivalry, though incomparably greater than his forerunners. Shakspeare was the poet of the present and the future, and of universal humanity. He saw in the past the fallen fragments on which men were to build anew--august scenes of desolation, whose ruin taught men to work more wisely. He painted them as the accessory features and distant landscape of colossal pictures, in whose foreground stood figures soaring beyond the limits of their place, instinct with the spirit of the time in which the poet lived, yet lifted out of it and above it by the impulse of potent genius prescient of momentous truths that lay slumbering in the bosom of futurity. By the side of poetry contemporary prose shows poorly, with one great exception. In respect to style, Hooker stands almost alone in his time, and may be considered the first of the illustrious train of great prose writers. His "Ecclesiastical Polity" appeared in 1594. Sir Philip Sidney's "Arcadia" had been written before 1587. Bacon's Essays appeared in 1596, and also Spenser's "View of Ireland," But none of these are comparable in point of style to Hooker. The reign of Elizabeth gave the key-note to the literature of the two succeeding reigns, that of James I. (1603-1625), and Charles (1625-1649), and the literary works of this period were not only more numerous, but stand higher in the mass than those which closed the sixteenth century. But Spenser remained un-imitated and Shakspeare was inimitable; the drama, however, which in this as in the last generation monopolized the best minds, received new developments, poetry was enriched beyond precedent, and prose writing blossomed into a harvest of unexampled eloquence. But although, under the rule of James, learning did good service in theology and the classics, English writing began to be infected with pedantic affectations. The chivalrous temper of the preceding age was on the wane, coarseness began to pass into licentiousness, and moral degeneracy began to diffuse its poison widely over the lighter kinds of literature. Bacon, the great pilot of modern science, gave to the world the rudiments of his philosophy. Bishop Hall exemplified not only the eloquence and talent of the clergy, but the beginning of that resistance to the tendencies by which the church was to be soon overthrown. The drama was headed by Ben Jonson, honorably severe in morals, and by Beaumont and Fletcher, who heralded the licentiousness which soon corrupted

the art generally, while the poet Donne introduced fantastic eccentricities into poetical composition. Some of the most eloquent prose writings of the English language had their birth amidst the convulsions of the Civil War, or in the strangely perplexed age of the Commonwealth and protectorate (1649-1660), that stern era which moulded the mind of one poet gifted with extraordinary genius. Although Milton would not, in all likelihood, have conceived the "Paradise Lost" had he not felt and acted with the Puritans, yet it would have been less the consummate work of art which it is, had he not fed his fancy with the courtly pomp of the last days of the monarchy. The prose writers of this time are represented by Bishop Hall and Jeremy Taylor, among the clergy, and Selden and Camden among the laymen. The roughness of speech and manners of Elizabeth's time, followed, in the next reign, by a real coarseness and lowness of sentiment, grew rapidly worse under Charles, whose reign was especially prolific in poetry, the tone of which varied from grave to gay, from devotion to licentiousness, from severe solemnity to indecent levity; but no great poet appeared in the crowd. The drama was still rich in genius, its most distinguished names being those of Ford, Massinger, and Shirley; but here depravity had taken a deeper root than elsewhere, and it was a blessing that, soon after the breaking out of the war, the theatres were closed, and the poets left to idleness or repentance. The Commonwealth and Protectorate, extending over eleven years (1649-1660), made an epoch in literature, as well as in the state and church. The old English drama was extinct, and poetry had few votaries. Cowley now closed with great brilliancy the eccentric and artificial school of which Donne had been the founder, and Milton was undergoing the last steps of that mental discipline that was to qualify him for standing forth the last and all but the greatest of the poetical ancients. At the same time, the approach of a modern era was indicated by the frivolity of sentiment and ease of versification which prevailed in the poems of Waller. In philosophy, Hobbes now uttered his defiance to constitutional freedom and ecclesiastical independence; Henry More expounded his platonic dreams in the cloisters of Cambridge; and Cudworth vindicated the belief in the being of the Almighty and in the foundations of moral distinctions. The Puritans, the ruling power in the state, became also a power in literature, nobly represented by Richard Baxter. Milton, like many of his remarkable contemporaries, lived into the succeeding generation, and he may be accepted as the last representative of the eloquence of English prose in that brilliant stage of its history which terminated about the date of the Restoration. The aspect of the last forty years of the seventeenth century--the age of the Restoration and the Revolution--is far from being encouraging, and some features marking many of their literary works are positively revolting. Of the social evils of the time, none infected literature so deeply as the depravation of morals, into which the court and aristocracy plunged, and many of the people followed. The drama sunk to a frightful grossness, and the tone of all other poetry was lowered. The reinstated courtiers imported a mania for foreign models, especially French, literary works were anxiously moulded on the tastes of Paris, and this prevalence of exotic predilections lasted for more than a century. But amidst these and other weaknesses and blots there was not wanting either strength or brightness. The literary career of Dryden covers the whole of this period and marks a change which contained many improvements. Locke was the leader of philosophical speculation; and mathematical and physical science had its distinguished votaries, headed by Sir Isaac Newton, whose illustrious name alone would have made the age immortal. The Nonconformists, forbidden to speak, wrote and printed. A younger generation was growing up among them, and some of the elder race still survived, such as Baxter, Owen, and Calamy. But greatest of all, and only now reaching the climax of his strength, was Milton, in his neglected old age consoling himself for the disappointments which had darkened a weary life, by consecrating its waning years, with redoubled ardor of devotion, to religion, to truth, and to the service of a remote posterity. In England, as elsewhere in Europe, the temper of the eighteenth century was cold, dissatisfied, and hypercritical. Old principles were called in question, and the literary man, the statesman, the philosopher, and the theologian found their tasks to be mainly those of attack or defence. The opinions of the nation and the sentiments which they prompted were neither speculative nor heroic, and they received adequate literary expression in a philosophy which acknowledged no higher motive than utility,--in a kind of poetry which found its field in didactic discussion, and sunk in narrative into the coarse and domestic. In all departments of literature, the form had come to be more regarded than the matter; and melody of rhythm, elegance of phrase, and symmetry of parts were held to be higher excellences than rich fancy or fervid emotion. Such an age could not give birth to a literature possessing the loftiest and most striking qualities of poetry or of eloquence; but it increased the knowledge previously possessed by mankind, swept away many wrong opinions, produced many literary works, excellent in thought and expression, and exercised on the English language an influence partly for good and partly for evil, which is shown in every sentence which we now speak or write. The First Generation is named from Queen Anne (1702-1714), but it includes also the reign of her successor. Our notion of its literary character is derived from the poetry of Pope and the prose of Addison and his friends. In its own region, which, though not low, is yet far from the highest, the lighter and more popular literature of Queen Anne's time is valuable; its lessons were full of good sense and correct taste, and as literary artists, the writers of this age attained an excellence as eminent as can be attained by art not inspired by the enthusiasm of genius nor employed on majestic themes. In its moral tone, the early part of the eighteenth century was much better

than that of the age before it. The Second Generation of the century may be reckoned as contained in the reign of George II. (1727-1760). It was more remarkable than the preceding for vigor of thinking and often for genuine poetic fancy and susceptibility, though inferior in the skill and details of literary composition. Samuel Johnson produced his principal works before the close of this period. Among the novelists, Richardson alone had anything in common with him. Fielding, Smollett, and Sterne are equally distant from the dignified pomp of his manner and the ascetic elevation of his morality. In contrast to the looseness of the novels and the skepticism of Hume, the reasoning of Butler was employed in defense of sacred truth, and the stern dissent of Whitefield and Wesley was entered against religious deadness. Poetry began to stir with new life; a noble ambition animated Young and Akenside, and in Thomson, Gray, and Collins a finer poetic sense was perceptible. The Third Generation of the eighteenth century, beginning with the accession of George III. (1760), was by no means so fertile in literary genius as either of the other two. But the earliest of its remarkable writers, Hume, Robertson, and Gibbon, produced works which have rarely been exceeded as literary compositions of their class. In ethics, there were Paley and Adam Smith; in psychology and metaphysics, Reid and the founders of the Scottish school; and in the list of poets who adorned these forty years were Goldsmith, Cowper, and Burns. The nineteenth century, for us naturally more interesting than any other period of English literature, is, in its intellectual character, peculiarly difficult of analysis, from its variety and novelty. For the reason that we have been moulded on its lessons, we are not favorably placed for comprehending it profoundly, or for impartially estimating the value of the monuments it has produced. It has been a time of extraordinary mental activity more widely diffused than ever before throughout the nation at large. While books have been multiplied beyond precedent, readers have increased in a yet greater proportion, and the diffusion of enlightenment has been aimed at as zealously as the discovery of new truths. While no other time has exhibited so surprising a variety in the kinds of literature, none has been so distinguished for the prevalence of enlightened and philanthropic sentiment. In point of literary merit, the half century presents two successive and dissimilar stages, of which the first or opening epoch of the century, embraced in its first thirty years, was by far the most brilliant. The animation and energy which characterized it arose from the universal excitation of feeling and the mighty collision of opinions which broke out over all Europe with the first French Revolution, and the fierce struggle so long maintained almost single-handed by England against Napoleon I. The strength of that age was greatest in poetry, but it gave birth to much valuable speculation and eloquent writing. The poetical literature of that time has no parallel in English literature, unless in the age of Shakspeare. A marked feature in the English poetry of the nineteenth century is the want of skill in execution. Most of the poets not only neglect polishing in diction but also in symmetry of plan, and this fault is common to the most reflective as well as the most passionate of them. Byron, in his tales and sketches, is not more deficient in skill as an artist than Wordsworth in his "Excursion," the huge fragment of an unfathomable design, cherished throughout a long and thoughtful lifetime. Another feature is this, that the poems which made the strongest impression were of the narrative kind. That and the drama may be said to be the only forms of representation adequate to embody the spirit or to interest the sympathies of an age and nation immersed in the turmoil of energetic action. Among the prose writings of this period, two kinds of composition employed a larger fund of literary genius than any other, and exercised a wider influence; these were the novels and romances, and the reviews and other periodicals. Novel-writing acquired an unusually high rank in the world of letters, through its greatest master, and was remarkable for the high character imprinted on it. By Scott and two or three precursors and some not unworthy successors, the novel was made for us nearly all that the drama in its palmy days had been for our fore-fathers, imbibing as much of its poetic spirit as its form and purpose allowed, thoughtful in its views of life, and presenting pictures faithful to nature. In the beginning of the present century was founded the dynasty of the reviews, which now began to be chosen as the vehicles of the best prose writing and the most energetic thinking that the nation could command. Masses of valuable knowledge have been laid up, and streams of eloquence have been poured out in the periodicals of our century by authors who have often left their names to be guessed at. But the best writers have not always escaped the dangers of this form of writing, which is unfavorable to completeness and depth of knowledge, and strongly tempting to exaggeration of style and sentiment. This evil has worked on the ranks of inferior contributors with a force which has seriously injured the purity of the public taste. The strong points of periodical writers are their criticism of literary works and their speculation in social and political philosophy, which have nowhere been handled so skillfully as in the Reviews. After poetry, they are the most valuable departments in the literature of the first age. Since the Anglo-Saxon period, English literature has derived much of its materials and inspiration from the teaching of other countries. In the Middle Ages, France furnished the models of chivalrous poetry and much of the social system; the Augustan age of French letters, the reign of Louis XIV., ruled the literary taste of England from the Restoration to the middle of the eighteenth century; and from Germany, more than from any other foreign nation, have come the influences by which the intellect of Great Britain has been affected, especially during the last thirty years. Within this time, the study and translation of German literature have become fashionable pursuits, and on the whole, highly beneficial. The philology of Germany

and its profound poetical criticism have taught much: the philosophical tendency of German theology has engaged the attention of teachers of religion, and had its effect both for good and evil, and the accurate study of the highest branches of German philosophy has tended decidedly to elevate the standard of abstract speculation. The most hopeful symptom of English literature in the last thirty years is to be found in the zeal and success with which its teachings have been extended beyond the accustomed limits. Knowledge has been diffused with a zeal and rapidity never before dreamed of, and the spirit which prompted it has been worthily embodied in the enlarged and enlightened temper with which it has been communicated. In the midst of much error, there are many features prominent which presage the birth of a love of mankind more expansive and generous than any that has ever yet pervaded society. The present age possesses no poetry comparable to that of the preceding, and few men who unite remarkable eloquence with power of thought. Among the thinkers, there is greater activity of speculation in regard to questions affecting the nature and destiny of man; and problems have been boldly propounded, but the solutions have not been found, and amidst much doubt and dimness, the present generation seems to be struggling toward a new organization of social and intellectual life. The literature of England may be divided into three periods: the first, extending from the departure of the Romans to the Norman Conquest (448- 1066), comprises the literature in the Celtic, Latin, and Anglo-Saxon tongues. The second period, extending from the Norman Conquest to the accession of Henry VIII. (1066-1509), contains the literature of the Norman period from 1066 to 1307, in the Latin, Norman-French, and Anglo-Saxon tongues, the transition of the Anglo-Saxon into English, and the literature of the fourteenth and fifteenth centuries. The third period, extending from 1509 to 1884, includes the literature of the age of the Reformation, that of the age of Spenser, Shakspeare, Bacon, and Milton, of the Restoration and Revolution, and of the eighteenth and nineteenth centuries.

2. THE LANGUAGE.--The English language is directly descended from the Anglo-Saxon, but derives much from the Norman-French, and from the Latin. Although the Celtic in its branches of Cymric and Gaelic still continues to be the speech of a portion of the inhabitants of Great Britain, it has never exercised any influence on the language of the nation. The origin of the Anglo-Saxon tongue is involved in obscurity. It most nearly resembles the Frisic, a Low German dialect once spoken between the Rhine and the Elbe, and which is the parent of modern Dutch. Before the battle of Hastings, the Anglo-Saxon tongue had been spoken in England for at least six hundred years, during which time it must have undergone many changes and dialectic variations. On the subjugation of the conflicting states by the kings of Wessex, the language of the West Saxons came to be the ruling one, and its use was extended and confirmed by the example of Alfred, himself a native of Berks. But it does not necessarily follow that this dialect is the parent of the English language. We must look for the probable ground-work of this in the gradual coalescence of the leading dialects. The changes by which the Anglo-Saxon passed into the modern English assumed in succession two distinct types, marking two eras quite dissimilar. First came the Semi-Saxon, or transition period, throughout which the old language was suffering disorganization and decay, a period of confusion, perplexing alike to those who then used the tongue, and to those who now endeavor to trace its vicissitudes. This chaotic state came to an end about the middle of the thirteenth century, after a duration of nearly two hundred years. The second era, or period of reconstruction, follows, during which the language may be described as English. A late critic divides the Old English Period, extending from 1250 to 1500, into the Early English (1250-1330) and the Middle English (1330-1500). The latter was used by Chaucer and Wickliffe, and is in all essentials so like the modern tongue, except in the spelling, that a tolerable English scholar may easily understand it. A great change was effected in the vocabulary by the introduction and naturalization of words from the French. The poems of Chaucer and Gower are studded with them, and the style of these favorite writers exercised a commanding influence ever after. The grammar of the English language, in all points of importance, is a simplification of the grammar of the Anglo-Saxon. In considering the sources of the English vocabulary, we find that from the Anglo-Saxon are derived first, almost all those words which import relations; secondly, not only all the adjectives, but all the other words, nouns, and verbs which grammarians call irregular; thirdly, the Saxon gives us in most instances our only names, and in all instances those which suggest themselves most readily for the objects perceived through the senses; fourthly, all words, with a few exceptions, whose signification is specific, are Anglo-Saxon. For instance, we use a foreign, naturalized term when we speak of color, or motion, in general, but the Saxon in speaking of the particular color or motion, and the style of a writer becomes animated and suggestive in proportion to the frequency with which he uses these specific terms; fifthly, it furnishes a rich fund of expressions for the feelings and affections, for the persons who are the earliest and most natural objects of our attachment, and for those inanimate things whose names are figuratively significant of domestic union; sixthly, the Anglo-Saxon is, for the most part, the language of business; of the counting-house, the shop, the street, the market, the farm. Among an eminently practical people it is eminently the organ of practical action, and it retains this prerogative in defiance alike of the necessary innovations caused by scientific discovery

and of the corruptions of ignorance and affectation. Seventhly, a very large proportion of the language of invective, humor, satire, and colloquial pleasantry is Anglo-Saxon. In short, the Teutonic elements of our vocabulary are equally valuable in enabling us to speak and write perspicuously and with animation; and besides dictating the laws which connect our words, and furnishing the cement which binds them together, they yield all our aptest means of describing imagination, feeling, and the every-day facts of life. >From the Latin the English has borrowed more or less for two thousand years, and freely for more than six centuries; but from the time of the Conquest it is difficult to distinguish words of Latin origin from those of French. The Latinisms of the language have arisen chiefly in three epochs. The first was the thirteenth century, which followed an age devoted to classical studies, and its theological writers and poets coined freely in the Roman mint. The second was the Elizabethan age, when, in the enthusiasm of a new revival of admiration for antiquity, the privilege of naturalization was used to an extent which threatened serious danger to the purity and ease of speech. In the third epoch, the latter part of the eighteenth century, Johnson was the dictator of form and style, and the pompous rotundity that then prevailed has been permanently injurious, although our Latin words, on the whole, have done much more good than harm. The introduction of French words began with the Conquest, when the political condition of the country made it imperative that many words should be understood. The second stage began about a century later, when the few native Englishmen who loved letters entered on the study of French poetry. The third era of English Gallicisms opened in the fourteenth century, when the French tastes of the nobles, and the zeal with which Chaucer and other men of letters studied the poetry of France, greatly contributed to introduce that tide of French diction which flowed on to the close of the Middle Ages. By that time the new words were so numerous and so strongly ingrafted on the native stock that all subsequent additions are unimportant. The dictionaries of modern English are said to contain about 38,000 words, of which about 23,000 or five eighths of the whole number, come from the Anglo-Saxon. The English language, by its remarkable combination of strength, precision, and copiousness, is worthy of being, as it already is, spoken by many millions, and these the part of the human race that appear likely to control, more than any others, the future destinies of the world.

PERIOD FIRST.

FROM THE DEPARTURE OF THE ROMANS TO THE NORMAN CONQUEST (448-1066).

1. CELTIC LITERATURE.--During this period four languages were used for literary communication in the British Islands; two Celtic tongues spoken by nations of that race, who still occupied large portions of the country; Latin, as elsewhere the organ of the church and of learning; and Anglo-Saxon. The first of the Celtic tongues, the Erse or Gaelic, was common only to the Celts of Ireland and Scotland, where it is still spoken. The second, that of the Cymrians or ancient Britons, has been preserved by the Welsh. The literary remains of this period in Ireland consist of bardic songs and historical legends, some of which are asserted to be older than the ninth century, the date of the legendary collection called the "Psalter of Cashel," which still survives. There exist, also, valuable prose chronicles which are believed to contain the substance of others of a very early date, and which furnish an authentic contemporary history of the country in the language of the people from the fifth century. No other modern nation of Europe is able to make a similar boast. All the earliest relics of the Scotch Celts are metrical. The poems which bear the name of Ossian are professedly celebrations by an eye-witness of events which occurred in the third century. They were first presented to the world in 1762 by Macpherson, a Scotch poet, and represented by him to be translations from the ancient Gaelic poetry handed down by tradition through so many centuries and still found among the Highlands. The question of their authenticity excited a fierce literary controversy which still remains unsettled. By some recent English and German critics, however, Ossian's poems are considered genuine. The existence of bards among the Celtic nations is well established, and their songs were preserved with pride. The name of Ossian is mentioned by Giraldus Cambrensis in the twelfth century, and that of Fingal, the hero of the legends, was so popular that in the fifteenth and sixteenth centuries many bishops complained that their people were more familiar with Fingal than with the catechism. The Gaelic original of Ossian was published in 1807. The literature of the Cymric Celts is particularly interesting, as affording those fragments of British poetry and history from which the magnificent legends were built up to immortalize King Arthur and his Knights of the Round Table. In the bardic songs and elsewhere, frequent allusion is made to this heroic prince, who with his warriors resisted the Saxon enemies of his country, and who, we are told, died by domestic treason, the flower of the British nobles perishing with him. His deeds were magnified among the Welsh Britons, and among those who sought refuge on the banks of the Loire. The chroniclers wove these traditions into a legendary history of Britain. From this compilation Geoffrey of Monmouth, in the twelfth century, constructed a Latin historical work; and the poets of chivalry, allured by the beauty and pathos of the tale, made it for ages the centre of the most animated pictures of romance. Many ancient

Welsh writings are extant which treat of a wonderful variety of topics, both in prose and verse. The singular pieces called the Triads show a marked character of primitive antiquity. They are collections of historical facts, mythological doctrines, maxims, traditions, and rules for the structure of verse, expressed with extreme brevity, and disposed in groups of three. Among the Welsh metrical remains, some are plausibly assigned to celebrated bards of the sixth century. There is also a considerable stock of old Welsh romances, the most remarkable of which are contained in a series called the "Mabinogi," or Tales of Youth, many of which have been translated into English. Some of these stories are very similar to the older Norse Sagas, and must have sprung from traditions of a very rude and early generation.

2. LATIN LITERATURE.--The Latin learning of the Dark Ages formed a point of contact between instructed men of all countries. At first it was necessarily adopted,--the native tongues being in their infancy; and it was afterwards so tenaciously adhered to, that the Latin literature of the Middle Ages far exceeds in amount all other. Its cultivation in England arose out of the introduction of Christianity, and its most valued uses related to the church. Almost all who cultivated Latin learning were ecclesiastics, and by far the larger number of those who became eminent in it were natives of Ireland. Amidst the convulsions which followed the fall of the Roman empire, Ireland was a place of rest and safety to fugitives from England and the Continent, and it contained for some centuries a larger amount of learning than could have been collected in all Europe. With the introduction of the Christian faith each nation became a member of the ecclesiastical community, and maintained its connection with other nations and with Rome as the common centre; thus communication between different countries received a new impulse. The churches and schools of England received many distinguished foreigners, and many of the native churchmen lived abroad. Of the three scholars who held the highest place in the literature of this period--Bede (d. 735), Alcuin (d. 804), and Erigena (d. 884), (celebrated for his original views in philosophy)--the two last gave the benefit of their talents to France. The writings of the Venerable Bede, as he is called, exhibit an extent of classical scholarship surprising for his time, and his "Ecclesiastical History of England" is to this day a leading authority not only for church annals, but for all public events that occurred in the earlier part of the Saxon period.

3. LITERATURE IN THE ANGLO-SAXON TONGUE.--The remains of Anglo-Saxon literature, both in prose and verse, differ essentially from the specimens of a similar age which come down to us from other nations. The ancestral legends, which were at once the poetry and history of their contemporaries, the Anglo-Saxons entirely neglected; they even avoided the choice of national themes for their poetry, which consisted of ethical reflections and religious doctrines or narratives. They eschewed all expression of impassioned fancy, and embodied in rough but lucid phrases practical information and every-day shrewdness. Among the Anglo-Saxon metrical monuments three historical poems are still preserved, which embody recollections of the Continent, and must have been composed long before the emigrations to England; of these the most important is the tale of "Beowulf," consisting of six thousand lines, which is essentially a Norse Saga. After the introduction of Christianity there appeared many hymns, metrical lives of the saints, and religious and reflective poems. The most remarkable relics of this period are the works attributed to Caedmon (d. 680), whose narrative poems on scriptural events are inspired by a noble tone of solemn imagination. The melody of the Saxon verse was regulated by syllabic accent or emphasis, and not by quantity, like the classical metres. Alliteration, or the use of several syllables in the same stanza beginning with the same letter, takes the place of rhyme. The alliterative metres and the strained and figurative diction common to the Anglo-Saxon poets was common to the Northmen, and seems to have been derived from them. Anglo-Saxon prose was remarkable for its straightforward and perspicuous simplicity, and, especially after the time of Alfred, it had a marked preference over the Latin. Translations were early made from the Latin, particularly versions of parts of the Scriptures, which come next, in point of date, to the Moeso-Gothic translation of Ulphilas, and preceded by several generations all similar attempts in any of the new languages of Europe. The most important monument of Saxon prose literature is the series of historical records arranged together under the name of "The Saxon Chronicle," which is made up from records kept in the monasteries, probably from the time of Alfred, and brought down to the year 1154. The illustrious name of Alfred (849-900) closes the record of Anglo-Saxon literature. From him went forth a spirit of moral strength and a thirst for enlightenment which worked marvels among an ignorant and half-barbarous people. Besides his translations from the Scriptures, he made selections from St. Augustine, Bede, and other writers; he translated "The Consolations of Philosophy," by Boethius, and he incorporates his own reflections with all these authors. It is impossible, at this time, to estimate justly the labors of Alfred, since the obstacles which in his time impeded the acquisition of knowledge cannot even now be conceived. "I have wished to live worthily," said he, "while I lived, and after my life, to leave to the men who should come after me, my remembrance in good works."

PERIOD SECOND.

FROM THE NORMAN CONQUEST TO THE ACCESSION OF HENRY VIII. (1066-1509).

1. LITERATURE IN THE LATIN TONGUE.--The Norman Conquest introduced into England a foreign race of kings and barons, with their military vassals, and churchmen, who followed the conqueror and his successors. The generation succeeding the Conquest gave birth to little that was remarkable, but the twelfth century was particularly distinguished for its classical scholarship, and Norman-French poetry began to find English imitators. The thirteenth century was a decisive epoch in the constitutional as well as in the intellectual history of England. The Great Charter was extorted from John; the representation of the commons from his successors; the universities were founded or organized; the romantic poetry of France began to be transfused into a language intelligible throughout England; and above all, the Anglo-Saxon tongue was in this century finally transformed into English. Three of the Crusades had already taken place; the other four fell within the next century; and these wars diffused knowledge, and kindled a flame of zeal and devotion to the church. The only names which adorned the annals of erudition in England in the latter half of the eleventh century were those of two Lombard priests-- Lanfranc (d. 1089) and Anselm (d. 1109). They prepared the means for diffusing classical learning among the ecclesiastics, and both acquired high celebrity as theological writers. Their influence was visible on the two most learned men whom the country produced in the next century--John of Salisbury (d. 1181). befriended by Thomas à Becket, and Peter of Blois, the king's secretary, and an active statesman. In the thirteenth century, when the teachings of Abelard and Rosellinus had made philosophy the favorite pursuit of the scholars of Europe, England possessed many names which, in this field, stood higher than any others--among them Alexander de Hales, called "the Irrefragable Doctor," and Johannes Duns Scotus, one of the most acute of thinkers. In the same age, while Scotland sent Michael Scott into Germany, where he prosecuted his studies with a success that earned for him the fame of a sorcerer, a similar character was acquired by Roger Bacon (d. 1292), a Franciscan friar, who made many curious conjectures on the possibility of discoveries which have since been made. Very few of the historical works of this period possess any merit, except as curious records of fact. Chronicles were kept in the various monasteries, which furnish a series extending through the greater part of the Middle Ages. Among these historians are William of Malmesbury, who belonged properly to the twelfth century; Geoffrey of Monmouth, who preserved for us the stories of Arthur, of Lear, and Cymbeline; Gerald de Barri, or Giraldus Cambrensis; Matthew Paris, a Benedictine monk, of St. Albans; Henry of Huntingdon; Gervase of Tilbury; and Roger de Hoveden. The spirit of resistance to secular and ecclesiastical tyranny, which now began to show itself among the English people, found also a medium of expression in the Latin tongue. The most biting satires against the church, and the most lively political pasquinades, were thus expressed, and written almost always by churchmen. To give these satires a wider circulation, the Norman-French came to be frequently used, but at the close of the period the English dialect was almost the only organ of this satirical minstrelsy. The Latin tongue also became the means of preserving and transmitting an immense stock of tales, by which the later poetry of Europe profited largely. One of these legends, narrated by Gervase of Tilbury, suggested to Scott the combat of Marmion with the spectre knight. A series of fictions called the "Gesta Romanorum" attained great celebrity. It is composed of fables, traditions, and familiar pictures of society, varying with the different countries it passed through. The romance of Apollonius, in the Gesta, furnished the plot of two or three of Chaucer's tales, and of Gower's most celebrated poem, which again gave the ground-work of Pericles, Prince of Tyre. The Merchant of Venice, the Three Black Crows, and Parnell's Hermit, are indebted also to the Gesta Romanorum.

4. LITERATURE IN NORMAN-FRENCH.--From the preference of the Norman kings of England for the poets of their own country, the distinguished literary names of the first two centuries after the Conquest are those of Norman poets. One of the chief of these is Wace (fl. 1160), who composed in French his "Brut d'Angleterre" (Brutus of England), the mythical son of Aeneas and founder of Britain. The Britons settled in Cornwall, Wales, and Bretagne had long been distinguished for their traditionary legends, which were at length collected by Geoffrey of Monmouth (fl. 1138), and gravely related by him in Latin as serious history. This production, composed of incredible stories, furnished the ground-work for Wace's poem, and proved an unfailling resource for writers of romantic narration for two centuries; at a later period Shakspeare drew from it the story of Lear; Sackville that of Ferrex and Porrex; Drayton reproduced it in his Poly-Olbion, and Milton and other poets frequently draw allusions from it. The Romances of chivalry, drawn from the same source, were composed for the English court and nobles, and the translation of them was the most frequent use to which the infant English was applied. They imprinted on English poetry characteristics which it did not lose for centuries, if it can be said to have lost them at all. A poetess known as Marie of France made copious use of British materials, and addressed herself to a king, supposed to have been Henry VI. Her twelve lays, which celebrate the marvels of the Round Table, are among the most beautiful relics of

the Middle Ages, and were freely used by Chaucer and other English poets. The romances are, many of them, in parts at least, delightfully imaginative, spirited, or pathetic, and their history is important as illustrating mediaeval manners and customs, and for their connection with early English literature. Among the oldest of these romances is "Havelok," relating to the early Norse settlement in England, the "Gest of King Horn," and "Guy of Warwick." But of all the French romances, the most interesting by far are those that celebrate the glory and fall of King Arthur and the Knights of the Round Table. The order in which they were composed seems to have been the same with that of the events narrated. First comes the romance of "The Saint Graal," relating the history of this sacred relic which was carried by Joseph of Arimathea or his descendants into Britain, where it vanished for ages from the eyes of sinful men. Second, the romance of "Merlin," which derives its name from the fiend-born prophet and magician, celebrates the birth and exploits of Arthur, and the gathering round him of the Knights of the Round Table. The historic origin of this story is from Geoffrey of Monmouth, though it is disguised by its supernatural and chivalrous features. In the third romance, that of Launcelot, the hero nurtured by the Lady of the Lake in her fairy realm beneath the waters, grows up the bravest champion of chivalry, admired for all its virtues, although guilty of treachery to Arthur, and from his guilt is to ensue the destruction of the land. Fourth, the "Quest of the Saint Graal" relates the solitary wanderings of the knights in this search, and how the adventure is at last achieved by Sir Gallahad, who, while the vision passes before him, prays that he may no longer live, and is immediately taken away from a world of calamity and sin. Fifth, "The Mort Artus," or Death of Arthur, winds up with supernatural horrors the tale into which the fall of the ancient Britons had been thus transformed. Arthur, wounded and dying, is carried by the fairy of the lake to the enchanted island of Avalon, there to dream away the ages that must elapse before his return to reign over the perfected world of chivalry. Sixth, "The Adventures of Tristram," or Tristan, is a repetition of those which had been attributed to Launcelot of the Lake. These six romances of the British cycle, the originals of all others, were written in the latter half of the twelfth century for the English court and nobles, some of them at the suggestion of king Henry II. Although, composed in French, the authors were Englishmen, and from these prose romances the poets of France constructed many metrical romances which in the fifteenth century reappeared as English metrical romances.

5. SAXON ENGLISH.--The Saxon tongue of England decayed, but like the healthy seed in the ground it germinated again. The Saxon Chronicle which had been kept in the monasteries ceased abruptly on the accession of Henry II., 1154, and at the same period the Saxon language began to take a form in which the beginning of the present English is apparent. During the thirteenth century appeared a series of rhyming chroniclers, the chief of whom were Layamon and Robert of Gloucester. All the remains of the English tongue, in its transition state, are chiefly in verse; among them are the "Ormulum" (so called from the name of the author, Ormin), which is a metrical harmony of passages from the gospels contained in the service of the mass, and the long fable of "The Owl and the Nightingale," one of the most pleasing of these early relics. "The Land of Cockayne," a satirical poem, said to have been written by Michael of Kildare, belongs also to the thirteenth century, as well as many anonymous poems, both amatory and religious. The old English drama was almost contemporaneous with the formation of the Old English language; but all dramatic efforts previous to the sixteenth century were so rude as to deserve little notice.

6. LITERATURE IN THE FOURTEENTH CENTURY.--The fourteenth and fifteenth centuries, the afternoon and evening of the Middle Ages, are the picturesque period in English history. In the contemporary chronicle of Froissart, the reign of Edward III. shines with a long array of knightly pageants, and a loftier cast of imaginative adornment is imparted by the historical dramas of Shakspeare to the troubled rule of the house of Lancaster and the crimes and fall of the brief dynasty of York. The reign of Edward II. was as inglorious in literature as in the history of the nation. That of his son was not more remarkable for the victories of Poitiers and Cressy than for the triumphs in poetry and thought. The Black Prince, the model of historic chivalry, and Occam, the last and greatest of the English scholastic philosophers, lived in the same century with Chaucer, the father of English poetry, and Wickliffe, the herald of the Reformation. The earlier half of the fourteenth century, in its literary aspects, may be regarded as a separate period from the later. The genius of the nation seemed to sleep. England, indeed, was the birth-place of Occam (1300- 1347), but he neither remained in his own country, nor imparted any strong impulse to his countrymen. Educated abroad, he lived chiefly in France, and died in Munich. While the writings of his master, Duns Scotus (d. 1308), were the chief authorities of the metaphysical sect called Realists, Occam himself was the ablest and one of the earliest writers among the Nominalists. While the former of these sects was held especially favorable to the Romish Church, the latter was discouraged as heretical, and Occam was persecuted for enunciating those opinions which are now held in one form or another by almost all metaphysicians. No eminent names appear in the ecclesiastical literature of this period, nor in that of the spoken tongue; but the dawn of English literature was close at hand. The latter half of this century was a remarkable era in the ecclesiastical and intellectual progress of

England. Many colleges were founded, and learning had munificent patrons. The increase of papal power led to claims which were resisted by the clergy as well as by the parliament. Foremost among those who called for reform was the celebrated John Wickliffe (1324- 1384). A priest of high fame for his knowledge and logical dexterity, he was placed at the head of several of the colleges of Oxford, and there, and from the country parsonages to which he was afterwards compelled to retreat, he thundered forth his denunciations against the abuses of the church, attacked the papal supremacy, and set forth doctrinal views of his own nearly approaching to Calvinism. Although repeatedly called to account for his opinions he was never even imprisoned, and he enjoyed his church- livings to the last. But the church was weakened by the *Great Schism*, and he was protected by powerful nobles. Soon after his death, however, a storm of persecution burst on his disciples, which crushed dissent till the sixteenth century. We owe to Wickliffe the earliest version of the Scriptures into English, which is among the first prose writings in the old tongue. The very oldest book in English prose, however, is the account given by Sir John Mandeville of his thirty-three years' travel in the East, from which he returned about 1355. It is an odd and amusing compound of facts and marvelous stories. But the best specimens of English prose of this period are Chaucer's translation of Boethius, his "Testament of Love," and two of his Canterbury Tales. In poetical literature, "The Vision of Piers Plowman," written (1362) by a priest named Robert Langland, is one of the highest works in point of genius and one of the most curious as illustrating manners and opinions. The poet supposes himself falling asleep on Malvern Hills, and in his vision he describes the vices of the times in an allegorical form, which has been compared to "The Pilgrim's Progress." The poetical vigor of many passages is extraordinary. John Gower (d. 1408), a contemporary and friend of Chaucer, is chiefly remembered for his "Confessio Amantis," or Lover's Confession, a long English poem, containing physical, metaphysical, and ethical reflections and stories taken from the common repertoires of the Middle Ages. It is tedious, and often feeble, but it has many excellences of language and description. Geoffrey Chaucer (1328-1400) was born in London. He was early thrown into public life and intimacy with men of high rank. John of Gaunt was his chief patron, and he was several times employed in embassies to France and Italy. A very large proportion of Chaucer's writings consists of free versions from the Latin and French, and perhaps also from the Italian; but in some of these he has incorporated so much that is his own as to make them the most celebrated and valuable of his works. His originals were not the chivalrous romances, but the comic Fabliaux, and the allegorical poetry cultivated by the Trouvères and Troubadours. Three of his largest minor works are thus borrowed; the "Romance of the Rose," from one of the most popular French poems of the preceding century; "Troilus and Cressida," a free translation, probably, from Boccaccio; and the "Legend of Good Women," founded on Ovid's Epistles. The poetical immortality of Chaucer rests on his "Canterbury Tales," a series of stories linked together by an ingenious device. A party of about thirty persons, the poet being one, are bound on a pilgrimage to the tomb of Thomas à Becket, at Canterbury; each person is to tell two tales, one in going, and the other in returning. Twenty-four only of the stories are related, but they extend to more than 17,000 lines. In the prologue, itself a poem of great merit, the poet draws up the curtain from a scene of life and manners which has not been surpassed in subsequent literature, a picture whose figures have been studied with the truest observation, and are outlined with the firmest, yet most delicate pencil. The vein of sentiment in these tales is always unaffected, cheerful, and manly, the most touching seriousness varying with the keenest humor. In some the tone rises to the highest flight of heroic, reflective, and even religious poetry; while in others it sinks below coarseness into positive licentiousness of thought and sentiment.

LITERATURE IN THE FIFTEENTH CENTURY.--The fifteenth century, usually marked in continental history as the epoch of the Revival of Classical Learning, was not in England a period of erudition or of original invention. The unwise and unjust wars with France, the revolts of the populace, and the furious struggles between the partisans of the rival houses desolated the country, and blighted and dwarfed all intellectual growth. For more than a hundred years after the death of Chaucer, scarcely any names of mark distinguish the literary annals of England, and the poetical compositions of this period are principally valuable as specimens of the rapid transition of the language into modern English. Almost all the literary productions previous to the time of Chaucer were designed only for a limited audience. Neither comprehensive observation of society nor a wish to instruct or please a wide circle of readers was observable before this period. Chaucer was indeed a national poet, an active and enlightened teacher of all classes of men who were susceptible of literary instruction. John Lydgate (d. 1430), a Benedictine monk, the best and most popular poet of the fifteenth century, began to write before the death of Chaucer, but in passing from the works of the latter to those of Lydgate, we seem to be turning from the open highway into the dark, echoing cloisters. If he was the pupil of Chaucer in manner and style, his masters in opinion and sentiment were the compilers of the "Gesta Romanorum." Stephen Hawes, who wrote in the reign of Henry VII., is the author of "The Pastime of Pleasure," an allegorical poem in the same taste as the "Romance of the Rose." This allegorical school of poetry, so widely spread through the Middle Ages, reappears in the Elizabethan age, where the same turn of thought is seen in the immortal

"Faerie Queene." In leaving this period we bid adieu to metrical romances, which, introduced into English in the latter half of the thirteenth century, continued to be composed until the middle of the fifteenth century, and were to the last almost always translations or imitations. Chivalrous stories next began to be related in prose. The most famous of these, one of the best specimens of Old English, and the most delightful of all repositories of romantic fiction is the "Mort Arthur," in which Sir Thomas Mallory, a priest in the reign of Edward IV., combined into one narrative the leading adventures of the Round Table. As the romances ceased to be produced, the ballads gradually took their place, many of which indeed are either fragments or abridgments of them. The ballad-poetry was to the popular audience what the recital of the romances had been among the nobles. The latter half of the fifteenth century appears to have been fertile in minstrels and minstrelsy. "Chevy Chase," of which Sir Philip Sidney said it would move him like the blast of a trumpet, is one of the most ancient; but, according to Hallam, it relates to a totally fictitious event. The ballad of "Robin Hood" had probably as little origin in fact. Towards the close of the fifteenth century, a mighty revolution took place. William Caxton, a merchant of London residing abroad, became acquainted with the recently invented art of printing, and embraced it as a profession. He introduced it into England about 1474, and practiced it for nearly twenty years. He printed sixty-four works in all, and the low state of taste and information in the public for which they were designated is indicated by the selection. But the enterprise and patience of Caxton hastened the time when this mighty discovery became available in England, and his name deserves to stand with honor at the close of the survey of English literature in the Middle Ages. Thenceforth literary works were to undergo a total change of character, brought about by many causes, but none more active than the substitution of the printed book for the manuscript.

6. THE FOURTEENTH AND FIFTEENTH CENTURIES IN SCOTLAND.--From the twelfth and thirteenth centuries there might be collected the names of a few scholastic theologians of Scottish birth, whose works have survived; but they spent their lives mostly on the continent, as was the case with Michael Scott, who gained his fame as a wizard at the court of the Emperor Frederic II. His extant writings are wholly inferior to those of Friar Bacon, his contemporary. Two metrical romances of note belong to the fourteenth century, the "Original Cronykil" of Andrew Wyntoun (d. 1420), a long history of Scotland, and of the world at large; and "The Bruce" of John Barbour (d. 1396), a narrative of the adventures of King Robert in more than thirteen thousand rhymed lines. Dramatic vigor and occasional breadth of sentiment entitle this poem to a high rank. Sir Walter Scott, in his "Lord of the Isles," owes much to "The Bruce." The earliest Scottish poem of the fifteenth century, "The King's Quair," or Book, in which James I. (d. 1437) celebrates the lady whom he afterwards married, presents no traces of a distinct Scottish dialect. But James was educated in England, and probably wrote there, and his pleasing poem exhibits the influence of those English writers whom he acknowledges as his masters. From this time, however, the development of the language of Scotland into a dialect went rapidly on. The "Wallace" of Henry the Minstrel, or Blind Harry, rivaled the "Bruce" in popularity, on account of the more picturesque character of the incidents, its passionate fervor, and the wildness of fancy by which it is distinguished. Towards the close of this century, and in the beginning of the next, Scottish poetry, now couched in a dialect decidedly peculiar, was cultivated by men of high genius. Robert Henryson (d. 1400) wrote "The Testament of the Faire Cresside," a continuation of Chaucer's poem, and "Robin and Makyne," a beautiful pastoral, preserved in Percy's "Reliques." More vigorous in thought and fancy, though inferior in skill and expression, was Gavin Douglas, Bishop of Dunkeld (d. 1522). His "King Hart" and "Palace of Honor" are complex allegories; and his translation of the Aeneid is the earliest attempt to render classical poetry into the living language of the country. William Dunbar (d. 1520), the best British poet of his age, exhibits a versatility of talent which has rarely been equaled; but in his comic and familiar pieces, the grossness of language and sentiment destroys the effect of their force and humor. Allegory is his favorite field. In his "Golden Terge," the target is Reason, a protection against the assaults of love. "The Dance of the Seven Deadly Sins" is wonderfully striking; but the design even of this remarkable poem could not be decorously described. While Scotland thus redeemed the poetical character of the fifteenth century, her living tongue was used only in versified compositions. Scottish prose does not appear in any literary shape until the first decade of the sixteenth century.

PERIOD THIRD.

FROM THE ACCESSION OF HENRY VIII. TO THE PRESENT TIME (1509-1884).

1. AGE OF THE REFORMATION.--In the early part of the sixteenth century human intellect began to be stirred by impulses altogether new, while others, which had as yet been held in check, were allowed, one after another, to work

freely. But there was no sudden or universal metamorphosis in literature, or in those phenomena by which its form and spirit were determined. It was not until 1568, when the reign of Elizabeth was within thirty years of its close, that English literature assumed a character separating it decisively from that of the ages which had gone before, and took its station as the worthy organ of a new epoch in the history of civilization. But the literary poverty of the age of the Reformation was the poverty which the settler in a new country experiences, while he fells the woods and sows his half-tilled fields; a poverty, in the bosom of which lay rich abundance. The students of classical learning profited at first more than others by the diffusion of the art of printing, from the greater number of classical works which, were given to the press. Foreign men of letters visited England; Erasmus, especially, gave a strong impulse to study, and Greek and Latin were learned with an accuracy never before attained. Among the scholars of the time were Cardinals Pole and Wolsey, Ridley, Ascham, and Sir Thomas More, the author of the "Utopia," a romance in the scholastic garb. It describes an imaginary commonwealth, the chief feature of which is a community of property, on an imaginary island, from which the book takes its name. The epithet "Utopian" is still used as descriptive of chimerical schemes. The most important works in the living tongue were those devoted to theology, and first among them were the translations of the Scriptures into English, none of which had been publicly attempted since that of Wickliffe. In 1526, William Tyndale (afterwards strangled and burnt for heresy, at Antwerp), translated the New Testament, and the five books of Moses. In 1537, after the final breach of Henry VIII. with Rome, there was published the first complete translation of the Bible, by Miles Coverdale. Many others followed until the accession of Mary, when the circulation of the translation was made in secrecy and fear. The theological writers of this period are chiefly controversial. Among them are Ridley, famous as a preacher; Cranmer, remarkable for his patronage of theological learning, and Latimer (d. 1555), whose sermons and letters are highly instructive and interesting. The "Book of Martyrs," by John Fox (d. 1527), was printed towards the close of this period. The miscellaneous writings of this age in prose are most valuable as specimens of the language in its earliest maturity. None of them are entitled to high rank as monuments of English literature. The style of Sir Thomas More (1480-1535) had great excellence; but his works were only the recreation of an accomplished man in a learned age. The writings of the learned Ascham (1515-1565) have a value not to be measured by their inconsiderable bulk. Their language is pure, idiomatic, vigorous English; and they exhibit a great variety of knowledge, remarkable sagacity, and sound common sense. His most celebrated work, the "Schoolmaster," proposes improvements in education for which there is still both room and need. Thomas Wilson, who wrote a treatise on the "Art of Logic" and "Rhetoric," may be considered the first critical writer in the living tongue. The poetry of England during the reigns of Henry VIII. and his immediate successors is like the prose, valuable for its relation to other things, rather than for its own merit. Yet it occupies a higher place than the prose; it exhibits a decided contrast to that of the times past, and in many points bears a close resemblance to the poetry of the energetic age that was soon to open. The names of the poets of this age may be arrayed in three groups, headed by Skelton, Surrey, and Sackville. The poems of Skelton (d. 1529) are singularly though coarsely energetic. He was the tutor of Henry VIII., and during the greater part of the reign of his pupil he continued to satirize social and ecclesiastical abuses. His poems are exceedingly curious and grotesque, and the volubility with which he vents his acrid humors is truly surprising. Henry Howard, Earl of Surrey (1516-1547), opened a new era in English poetry, and by his foreign studies, and his refinement of taste and feeling, was enabled to turn poetical literature into a path as yet untrodden, although in vigor and originality this ill-fated poet was inferior to others who have been long forgotten. His works consist of sonnets and poems of a lyrical and amatory cast, and a translation of the Aeneid. He first introduced the sonnet, and the refined and sentimental turn of thought borrowed from Petrarch and the other Italian masters. In his Aeneid he introduced blank verse, a form of versification in which the noblest English poetry has since been couched. This was also taken from Italy, where it had appeared only in the century. Surrey's versions of some of the Psalms, and those of his contemporary, Sir Thomas Wyatt, are the most polished of the many similar attempts made at that time, among which was the collection of Sternhold and Hopkins. Thomas Sackville, Lord Buckhurst (1586-1608) wrote those portions most worthy of notice, of the "Mirror for Magistrates," a collection of poems celebrating illustrious but unfortunate personages who figure in the history of England. From his "Induction," or preparatory poem, later writers have drawn many suggestions. The dramatic exhibitions of the Middle Ages, which originated in the church, or were soon appropriated by the clergy, were of a religious cast, often composed by priests and monks who were frequently the performers of them in the convents. All the old religious plays called Mysteries were divided into Miracles, or Miracle plays, founded on Bible narratives or legends of the saints; and Moralities or Moral plays, which arose out of the former by the introduction of imaginary features and allegorical personages, the story being so constructed as to convey an ethical or religious lesson. They became common in England about the time of the reign of Henry VI. (1422-1461). Some of the Miracle plays treated of all the events of Bible history, from the Creation to the Day of Judgment; they were acted on festivals, and the performance often lasted more than one day. The most sacred things are here treated with undue freedom, and the broadest and coarsest mirth is introduced to keep the

attention of the rude audience. Many of them had a character called *Iniquity*, whose avowed function was that of buffoonery. The Mysteries were not entirely overthrown by the Reformation, the Protestant Bishop Bale having composed several, intended to instruct the people in the errors of popery. After the time of Henry VIII. these plays are known by the name of *Interludes*, the most celebrated of which are those by John Heywood (the epigrammatist). They deal largely in satire, and are not devoid of spirit and humor. But they have little skill in character-painting, and little interest in the story. About the middle of the century (sixteenth) the drama extricated itself completely from its ancient fetters, and both comedy and tragedy began to exist in a rude reality. The oldest known comedy was written by Nicholas Udall (d. 1556); it has the title of "Ralph Roister Doister," a personage whose misadventures are represented with much comic force. Ten years later the earliest tragedy, known by two names, "Gorboduc" and "Ferrex and Porrex," was publicly played in the Lower Temple. It is founded on the traditions of fabulous British history, and is believed to have been written by Thomas Norton and Lord Buckhurst. The chief merit of this earliest English tragedy lies in its stately language and solemnly reflective tone of sentiment.

2. THE AGE OF SPENSER, SHAKSPEARE, BACON, AND MILTON (1558-1660).--The prose of this illustrious period is vast in amount and various in range. The study of the Oriental languages and other pursuits bearing on theology were prosecuted with success, and many of the philosophical and polemical writings were composed in Latin. A second series of translations of the Scriptures were among the most important works of the time. The first of the three versions which now appeared (1560), came from a knot of English and Scotch exiles who sought refuge in Geneva, and their work, known as the Geneva Bible, though not adopted by the Church of England, long continued in favor with the English Puritans and Scotch Presbyterians. Cranmer's version was next revised (1568) under the superintendence of Matthew Parker, archbishop of Canterbury, eminent among the fathers of the English church, and called the Bishops' Bible, a majority of fifteen translators having been selected from the bench. The Catholic version, known as the Douay Bible, appeared in 1610. Our current translation, which also appeared in 1610, during the reign of James I., occupied forty-seven learned men, assisted by other eminent scholars, for a period of three years. Among theological writings, the "Ecclesiastical Polity" of Hooker (1553-1600) is a striking effort of philosophical thinking, and in point of eloquence one of the noblest monuments of the language. More than Ciceronian in its fullness and dignity of style, it wears with all its richness a sober majesty which is equally admirable and rare. The sermons of Bishop Andrews (1565-1626), though corrupt as models of style, made an extraordinary impression, and contain more than any other works of the kind the inwrought materials of oratory. The sermons of Donne (1573-1631), while they are superior in style, are sometimes fantastic, like his poetry, but they are never coarse, and they derive a touching interest from his history. But the most eloquent of all the old English divines are the two celebrated prelates of the reign of Charles I., Joseph Hall (1574-1656) and Jeremy Taylor (1613-1671), alike eminent for Christian piety and conscientious zeal. Besides his pulpit discourses, Bishop Hall has left a series of "Contemplations" on passages of the Bible, and "Meditations," which are particularly rich in beautiful descriptions. Among the most practical and popular of Taylor's works are his "Holy Living" and "Holy Dying," while his sermons distinguish him as one of the great ornaments of the English pulpit. The chief theologian of the close of the period was Richard Baxter (1615-1691). His works have great value for their originality and acuteness of thought, and for their vigorous and passionate though unpolished eloquence. His "Call to the Unconverted" and "The Saint's Everlasting Rest" deserve their wide popularity. Among the semi-theological writers of the time are Fuller, Cudworth, and Henry More, Fuller (1608-1661) is most widely known through his "Worthies of England," a book of lively and observant gossip. Cudworth and More, his contemporaries, deviated in their philosophical writings from the tendencies of Bacon and the sensualistic doctrines of Hobbes, and regarded existence rather from the spiritual point of view of Plato; in the preceding generation, the skepticism of Lord Herbert of Cherbury taught a different lesson from theirs. In this period we encounter in the philosophical field two of the strongest thinkers who have appeared in modern Europe, Bacon and Hobbes. Bacon (1561-1620) aimed at the solution of two great problems, the answers to which were intended to constitute the "Instauratio Magna," the great Restoration of Philosophy, that colossal work, towards which the chief writings of this illustrious author were contributions. The first problem was an Analytic Classification of all departments of Human Knowledge, which occupies a portion of his treatise "On the Advancement of Learning." Imperfect and erroneous as his scheme may be allowed to be, D'Alembert and his coadjutors in the last century were able to do no more than to copy and distort it. In his "Novum Organum" he undertakes to supply certain deficiencies of the Aristotelian system of logic, and expounds his mode of philosophizing; he was the first to unfold the inductive method, which he did in so masterly a way, that he has earned, with posterity, the title of the father of experimental science. His "Essays," from the excellence of their style and the interesting nature of the subjects, are the most generally read of all the author's productions. No English writer surpasses Bacon in fervor and brilliancy of style, in force of expression, or in richness and significance of imagery. His writings, though they received during his lifetime the neglect for which he had proudly prepared

himself, gave a mighty impulse to scientific thought for at least a century after his time. In his will, the following strikingly prophetic passage is found: "My name and memory I leave to foreign nations, and to mine own country, after some time is passed over." The influence of Hobbes on philosophy in England has been greater than that of Bacon. In politics, his theory is that of uncontrolled absolutism, subjecting religion and morality to the will of the sovereign; in ethics he resolves all our impulses regarding right and wrong into self-love. His reasoning is close and consistent, and if his premises are granted, it is hardly possible to avoid his conclusions. Other departments in the prose literature of this period were amply filled and richly adorned. Speculations upon the Theory of Society and Civil Polity were frequent. Among them are the Latin works of Bellenden "On the State," the "New Atlantis," a romance by Lord Bacon, the "Oceana" of Harrington, and the "Leviathan" of Hobbes. In the collection of materials for national history the period was exceedingly active. Camden and Selden stand at the head of the band of antiquaries. Hobbes wrote in his old age "Behemoth, or a History of the Civil Wars," and the "Turkish History" of Knolles has been pronounced one of the most spirited narratives in the language. Sir Walter Raleigh (1552-1618), while lying in the Tower under sentence of death, wrote a "History of the World," from the Creation to the Republic of Rome. The narrative is spirited and pervaded by a tone of devout sentiment. The accomplished Sir Philip Sidney (1554-1586), in his "Defense of Poesy," pays an eloquent tribute to the value of the most powerful of all the literary arts. His "Arcadia" is a ponderous combination of romantic and pastoral incidents, the unripe production of a young poet, but it abounds in isolated passages beautiful alike in sentiment and language. Towards the close of the period, Milton manifested extraordinary power in prose writing; his defense of the "Liberty of Unlicensed Printing" is one of the most impressive pieces of eloquence in the English tongue. His style is more Latinized than that of most of his contemporaries, and this exotic infection pervades both his terms and his arrangement; yet he has passages marvelously sweet, and others in which the grand sweep of his sentences emulates the cathedral music of Hooker. The press now began to pour forth shoals of short novels, romances, and essays, and pamphlets on various subjects. Among other productions is Burton's "Anatomy of Melancholy," a storehouse of odd learning and quaintly-original ideas; it is deficient, however, in style and power of consecutive reasoning. Far above Burton in eloquence and strength of thought is Sir Thomas Browne (1605-1682), whose writings have all the characteristics of the age in a state of extravagant exaggeration. The thoughtful melancholy, the singular mixture of skepticism and credulity, and the brilliancy of imaginative illustration, give his essays a peculiarity of character that renders them exceedingly fascinating. The poet Cowley, in his prose writings, is distinguished for his undeviating simplicity and perspicuity, and for smoothness and ease, of which hardly another instance could be produced from any other book written before the Restoration. The English drama has been called Irregular in contrast to the Regular drama of Greece and that of modern France, founded upon the Greek, by the French critics of the age of Louis XIV. The principal law of this system, as we have seen, prescribed obedience to the Three Unities, of Time, of Place, and of Action; the two first being founded on the desire to imitate in the drama the series of events which it represents, the time of action was allowed to extend to twenty-four hours, and the scene to change from place to place in the same city. But by Shakspeare and his contemporaries no fixed limits were acknowledged in regard either of time or place, the action stretching through many years, and the scene changing to very wide distances. The rule prescribing unity of action, that everything shall be subordinate to the series of events which is taken as the guiding-thread, is a much more sound one; and in most of Shakspeare's works, as well as those of his contemporaries, this unity of impression, as it has been called, is fully preserved. Before the year 1585 no perceptible advance had been made in the drama, and for the period of sixty years, from that date to the closing of the theatres in 1645, on the breaking out of the Civil War, the history of Shakspeare's works forms the leading thread. Men of eminent genius lived around and after him, but there were none who do not derive much of their importance from the relation in which they stand to him, and hardly any whose works do not owe much of their excellence to the influence of his. Thus considered, the stages through which the drama now passed may be said to have been four, three of which occurred chiefly during the life of the poet, the fourth after his death. The first of these periods witnessed the early manhood of Shakspeare, and closes about 1593. Among his immediate predecessors and coadjutors were Marlowe and Greene. The plays of Marlowe (1562-1593) are stately tragedies, serious in purpose, energetic and often extravagant in passion and in language, and richly and pompously imaginative. His "Tragical History of Doctor Faustus" is one of the finest poems in the language. The productions of Greene are loose, legendary plays of a form exemplified in Cymbeline. To the first period of the dramatic life of Shakspeare (1564-1616) belong the "Two Gentlemen of Verona," the "Comedy of Errors," and "Love's Labor's Lost," which show that the mighty master, even in these juvenile essays, had taken a wide step beyond the dramas of the time. Pure comedy had no existence in England until he created it, and in these comedies it is evident that everything is juvenile, unripe, and marvelously unlike the grand pictures of life which he soon afterwards began to paint. But if he was more than a student in this first stage of his progress, he was a teacher and model ever after. The second period for Shakspeare and the drama closes with the year 1600. During this most active part of his literary life, he produced eight comedies, and re-wrote "Romeo and Juliet." But

the most elevated works of these six years were his magnificent series of historical plays. The series after 1600 began with the great tragedies, Othello, Hamlet (recomposed), Macbeth, and Lear, followed by Henry VIII., the three tragedies on Roman subjects, and the three singular pieces, "Timon of Athens," "Troilus and Cressida," and "Measure for Measure," apparently of the same date. "Cymbeline" and the "Winter's Tale" were probably composed after he had retired from the turmoil of his profession to the repose of his early home. In the "Tempest," doubtless his last work, he peopled his haunted island with a group of beings whose conception indicates a greater variety of imagination, and in some points a greater depth of thought than any others which he has bequeathed to us. The name of Shakspeare is the greatest in all literature. No man ever came near him in creative power--no man had ever such strength combined with such variety of imagination. Of all authors, he is the most natural in his style, and yet there is none whose words are so musical in arrangement, so striking and picturesque in themselves, or contain so many thoughts. Every page furnishes instances of that intensifying of expression, where some happy word conveys a whole train of ideas condensed into a single luminous point--words so new, so full of meaning, yet so unforced and natural, that the rudest mind intuitively perceives their meaning, and yet which no study could improve or imitate. This constitutes the most striking peculiarity of the Shakspearean language, and while it justifies the almost idolatrous veneration of his countrymen, renders him, of all writers, the most untranslatable. Of all authors, Shakspeare has least imitated or repeated himself. While he gives us, in many places, portraits of the same passion, the delineations are as distinct and dissimilar as they are in nature; all his personages involuntarily, and in spite of themselves, express their own characters. From his works may be gleaned a complete collection of precepts adapted to every condition of life and every conceivable circumstance of human affairs. His wit is unbounded, his passion inimitable, and over all he has thrown a halo of human sympathy no less tender than his genius was immeasurable and profound. The effect of Shakspeare's influence on his contemporaries was predominating in everything but the moral aspect of his plays. The licentiousness, begun in the earlier years of the seventeenth century, increased with accelerated speed down to the closing of the theatres by the Civil War. Highest by far, in poetical and dramatic value, stand the works of Beaumont (1586-1615) and Fletcher (1576-1625). Many of them are said to have been written by the two jointly, a few by the former alone, and a large number by the latter after he had lost his friend; such alliances in dramatic poetry were common in England at this period. But the looseness of fancy which deformed the drama, and which degenerated at last into deliberate licentiousness, is nowhere so glaring as in these finest and most imaginative productions of their day, and which are poetically superior to all of the kind in the language, except those of Shakspeare. The classical model was closely approached by Ben Jonson (1574-1637) in both tragedy and comedy, and he deserves immortality for other reasons than his comparative purity of morals. He was the one man of his time besides Shakspeare who deserves to be called a reflective artist, who perceived the rules of art and worked in obedience to them. His tragedies are stately, eloquent, and poetical; his comedies are more faithful poetic portraits of contemporary English life than those of any other dramatist, Shakspeare excepted. Jonson wrote for men of sense and knowledge; Beaumont and Fletcher for men of fashion and the world. A similar audience to that of Jonson may have been aimed at in the stately tragedies of Chapman, and the other class would have relished the plays of Middleton and Webster. Among the dramatists of the commonalty may be named Thomas Heywood, one of the most moral play writers of his time, who has sometimes been called the prose Shakspeare, and Decker, a voluminous writer, who cooperated in several plays of more celebrated men, especially those of Massinger. The closing period of the old English drama is represented by Massinger, Ford, and Shirley. Massinger (1584-1640) is by some critics ranked next to Shakspeare. The theatres have retained unaltered his "New Way to Pay Old Debts," and his "Fatal Dowry" is preserved in Rowe's plagiarism from it, in the "Fair Penitent." But the low moral tone of the time is indicated in all these works, in which heroic sentiments, rising often even to religious rapture, are mingled with scenes of the grossest ribaldry. By Ford, incidents of the most revolting kind are laid down as the foundation of his plots, upon which he wastes a pathos and tenderness deeper than is elsewhere found in the drama; and with Shirley vice is no longer held up as a mere picture, but it is indicated, and sometimes directly recommended, as a fit example. When the drama was at length suppressed, the act destroyed a moral nuisance. Spenser (1553-1599), among the English poets, stands lower only than Shakspeare, Chaucer, and Milton. His works unite rare genius with moral purity, exquisite sweetness of language, luxuriant beauty of imagination, and a tenderness of feeling rarely surpassed, and never elsewhere conjoined with an imagination so vivid. His magnificent poem, the "Faerie Queene," though it contains many thousand lines, is yet incomplete, no more than half of the original design being executed. The diction is studded purposely with forms of expression already become antiquated, and many peculiarities are forced upon the author from the difficulties of the complex measure which he was the first to adopt, and which still bears his name. The Fairy Land of Spenser is rather the Land of Chivalry than the region we are accustomed to understand by that term; a scene in which heroic daring and ideal purity are the objects chiefly presented to our imagination, in which the principal personages are knights achieving perilous adventures, ladies rescued from frightful miseries, and good and evil enchanters, whose spells affect the destiny of

those human persons. Spenser would probably not have written precisely as he did, if Ariosto had not written before him; nor is it unlikely that he was also guided by the later example of Tasso; but his design was in many features nobler and more arduous than that of either. His deep seriousness is unlike the mocking tone of the "Orlando Furioso," and in his moral enthusiasm he rises higher than the "Jerusalem;" although the poetic effect of his work is marred by his design of producing a series of ethical allegories. The hero is the chivalrous Arthur of the British legends, but wrapt in a cloud of symbols. Gloriana, the Faërie Queene, who was to be the object of the prince's warmest love, was herself an emblem of Virtuous Renown, and designed also to represent the poet's queen, Elizabeth. All the incidents are significant of moral truth, and all the personages are allegorical. The adventures of the characters, connected by no tie, except the occasional interposition of Arthur, form really six independent poetic tales. The First Book, by far the finest of all, relates the Legend of the Red Cross Knight, who is a type of Holiness, and who shadows forth the history of the Church of England. In the second, which abounds in exquisite painting of picturesque landscapes, we have the Legend of Sir Guyon, illustrating the virtue of Temperance. The theme of the Third Book is the Legend of Britomart, or of Chastity, in which we are introduced to Belpheobe and Amoret, two of those beautiful female characters which the poet takes such pleasure in delineating. Next comes the Legend of Friendship, personified in the knights Cambel and Triamond. In the Fifth Book, containing the Legends of Sir Artegal, the emblem of Justice, there is a perceptible falling off. The Sixth Book, the Legend of Sir Calidore, or Courtesy, though it lacks unity, is in some scenes inspired with the warmest glow of fancy. The mind of Spenser embraced a vast range of imaginary creation, but the interest of real life is wanting. His world is ideal, abstract, and remote, yet affording in its multiplied scenes ample scope for those nobler feelings and heroic virtues which we love to see even in transient connection with human nature. The non-dramatic poets of this time begin with Spenser and end with Milton, and between these two there were writers of great excellence. The vice of the age was a laboring after conceits or novel turns of thought, usually false, and resting upon some equivocation of language or remote analogy. No poet of the time was free from it; Shakspeare indulged in it occasionally, others incessantly, holding its manifestations to be their finest strokes of art. The poetical works of this age were metrical translations from the classics--narrative, historical, descriptive, didactic, pastoral, and lyrical poems. One of the most beautiful religious poems in any language is "Christ's Victory and Triumph," by Giles Fletcher (d. 1623): it is animated in narrative, lively in fancy, and touching in feeling. Drayton (d. 1631) was the author of the "Poly-Olbion," a topographical description of England, and a signal instance of fine fancy and great command of language, almost thrown away from its prosaic design. Fulke Greville (Lord Brooke), the friend of Sir Philip Sidney, exhibits great powers of philosophical thought, in pointed and energetic diction, in his poem on "Human Learning." Among the religious poets are "Holy George Herbert" (d. 1632), who, by his life and writings, presented the belief and offices of the church in their most amiable aspect, and Quarles (d. 1644), best known by his "Divine Emblems," which abound in quaint and grotesque illustrations. The lyrical poems of the time were numerous, and were written by almost all the poets eminent in other departments. In those of Donne, in spite of their conceits and affectations, are many passages wonderfully fine. Those of Herrick (b. 1591), in graceful fancy and delicate expression, are many of them unsurpassed; in subject and tone they vary from grossly licentious expression to the utmost warmth of devout aspiration. Cowley (1618-1667), the latest and most celebrated of the lyric poets, was gifted with extraordinary poetic sensibility and fancy, but he was prone to strained analogies and unreal refinements. Among the minor lyrical poets are Carew, Ayton, Habington, Suckling, and Lovelace. Denham (1615-1668) and Waller (1605-1687) form a sort of link between the time before the Restoration and that which followed. The "Cooper's Hill" of the first is a reflective and descriptive poem in heroic verse, and the diversified poems of the last were remarkable advances in ease and correctness of diction and versification. The poetry of that imaginative period which began with Spenser closes yet more nobly with Milton (1608-1674). He, standing in some respects apart from his stern contemporaries of the Commonwealth as from those who debased literature in the age of the Restoration, yet belongs rather to the older than the newer period. In the midst of evil men and the gloom of evil days the brooding thought of a great poetical work was at length matured, and the Christian epic, chanted at first when there were few disposed to hear, became an enduring monument of genius, learning, and art. His early poems alone would indicate his superiority to all the poets of the period, except Shakspeare and Spenser. The most popular of them, "L'Allegro" and "Il Penseroso," are the best of their kind in any language. In the "Comus" there are passages exquisite for imagination, for sentiment, and for the musical flow of the rhythm, in which the majestic swell of the poet's later blank verse begins to be heard. The "Paradise Regained" abounds with passages in themselves beautiful, but the plan is poorly conceived, and the didactic tendency prevails to weariness as the work proceeds. The theme of the "Paradise Lost" is the noblest of any ever chosen. The stately march of its diction; the organ peal with which its versification rolls on; the continual overflowing of beautiful illustrations; the brightly-colored pictures of human happiness and innocence; the melancholy grandeur with which angelic natures are clothed in their fall, are features which give the mind images and feelings not soon or easily effaced.

3. THE AGE OF THE RESTORATION AND THE REVOLUTION (1660-1702).--Among the able churchmen who passed from the troubles of the Commonwealth and Protectorate to the Restoration were Jeremy Taylor, Archbishop Leighton, and others of eminence. South, Tillotson, and Barrow were more able theologians, but their writings lack the charm of sentiment which Leighton's warmth of heart diffuses over all his works. South (d. 1716) was a man of remarkable oratorical endowments, sarcastic, intolerant, and fierce in polemical attacks. The writings of Tillotson (d. 1694) are pervaded by a higher and better spirit, and the sermons of Barrow (d. 1677) combine comprehensiveness, sagacity, and clearness. Other divines, such as Stillingfleet, Pearson, Burnet, Bull, hold a more prominent place in the history of the church than in that of letters. But all the writers of this age are wanting in that impressiveness and force of undisciplined eloquence which distinguished the first half of the seventeenth century. Among the nonconformist clergy, Howe (d. 1715) wrote the "Living Temple," which is ranked among the religious classics. The great though untrained genius of John Bunyan (1628-1688) produced the "Pilgrim's Progress," which holds a distinguished place in permanent English literature. John Locke (1632-1704) may be taken as the representative of the English Philosophy of the time, and his influence on the speculative opinions of his day was second only to that of Hobbes. His "Essay on the Understanding" contains the germ of utter skepticism and was the ground on which Berkeley denied the existence of the material world, and Hume involved all human knowledge in doubt. In classical learning the greatest of the scholars of this period was Bentley (1662-1742). In history Lord Clarendon (1608-1774) wrote the "History of the Rebellion," and Burnet (1643-1715) his "History of the Reformation," one of the most thoroughly digested works of the century. His "History of his own Times" is valuable for its facts, and for the shrewdness with which he describes the state of things around him. In miscellaneous prose, John Evelyn wrote several useful and tasteful works, and Izaak Walton (1593-1688), a London tradesman, wrote his interesting Biographies and the quaint treatise "On Angling." Both in diction and sentiment these works remind us of the preceding age; and Walton, surviving Milton, closes the series of old English prose writers. Samuel Butler (1612-1680), the unfortunate, ill-requited laureate of the Royalists, who satirized the Puritans and Republicans in his celebrated "Hudibras," left some exceedingly witty and vigorous prose writings; and Andrew Marvell (1620-1678), the friend and protector of Milton, was most successful in sarcastic irony, and in his attacks on the High Church opinions and doings. John Dryden (1631-1700) was the literary chief of the interval between Cromwell and Queen Anne. His prose writings, besides comedies, are few, but in these he taught principles of poetical art previously unknown to his countrymen, and showed the capabilities of the tongue in a new light. Inferior to Dryden in vigor of thought was Sir William Temple (1628-1698), who may yet share with him the merit of having founded regular English prose. His literary character rests chiefly on his "Miscellaneous Essays." The symmetrical structure and artificial polish of contemporaneous French literature, while it was not without some good influence on English prose, was less beneficial to poetry, and its worst effect was on the drama, which soon ceased to be pictures of human beings in action and became only descriptive of such pictures. In this walk as in others Dryden was the literary chief, and of his plays it can truly be said that the serious ones contain many striking and poetical pieces of declamation, finely versified. His comedies are bad morally, and as dramas even worse than those of his rival Shadwell. Lee was only a poor likeness of Dryden. In the "Orphan" and "Venice Preserved" of Otway we have southing of the revival of the ancient strength of feeling though alloyed by false sentiment and poetic poverty. Congreve showed great power of language in tragedy, and Southerne not a little nature and pathos. In comedy the fame of these writers was eclipsed by a knot of dramatists who adopted prose, but whose works are the foulest that ever disgraced the literature of a nation. They are excellent specimens of that which has been called the comedy of manners; vice is inextricably interwoven in the texture of all alike, in the broad humor of Wycherly (the most vigorous of the set), in the wit of Congreve, in the character painting of Vanbrugh, and the lively invention of Farquhar. In other kinds of poetry we find similar changes of taste which affected the art injuriously, although the increased attention paid to correctness and refinement was a step in improvement. These mischievous changes related both to the themes and forms of poetry, and in neither can the true functions of art be forgotten without injury to the work. An age must be held unpoetical, and cannot produce great poetical works, if its poetry chooses insufficient topics; and the aims of the age of the Restoration were low, producing only a constant crop of poems celebrating contemporary events or incidents in the lives of individuals. The dramatic and narrative forms of poetry are undoubtedly those in which that imaginative excitement of pleasing emotion, which is the immediate and characteristic end of the art, may be most powerfully worked out, and to one of these forms all the greatest poems have belonged. But in the age of the Restoration the drama had lost its elevation and poetic significance, and original narrative poetry was hardly known. Almost all the poems of the day were didactic, and the prevalence of this style of poetry is a palpable symptom of an unpoetical age. The verse-making of these forty years, after setting aside a very few works, maintains a dead level. Among the dwarfish rhymers of the day there lingered some of the august shapes of a former age. Milton still walked his solitary course, and Waller wrote his occasional odes and verses, but

of names not already given there are no more than two or three that require commemoration. One of the famous poems of the day was an "Essay on Translated Verse," by Lord Roscommon; and the smaller poems of Marvell are felicitous in feeling and diction; both writers are distinguished for their moral purity. The "Hudibras" of Butler, which properly belongs to the age before, is a phenomenon in the history of English literature. His pungent wit, his extraordinary ingenuity, and his command of words are rare endowments, but he has no poetic vein that yields jewels of the first water, and his place is not a high one in the path which leads upward to the ethereal regions of the imagination. Pryor (1661-1721) in his lighter pieces shows wit of a less manly kind. His serious poems have great facility of phrase and melody. Dryden was a man of high endowments as a poet and thinker, condemned to labor for a corrupt generation, and he has received from posterity no higher fame than that of having improved English prose style and versification. His poems are rather essays couched in vigorous verse, with here and there passages of great poetical beauty. His "Annus Mirabilis," celebrating with great animation the year 1666, is an effusion of historical panegyric. The "Absalom and Achitophel" is a satire on the unfortunate Duke of Monmouth and his adviser Shaftesbury. "The Hind and Panther," full of poetical and satirical force, was an argument to justify the author's recent change of religion. One of the most thoroughly sustained poems is the "Ode on Alexander's Feast." His translation of the Aeneid, as imperfect a picture of the original as Pope's translation of the Iliad, is yet full of vigor and one of his best specimens of the heroic couplet, a measure never so well written in English as by Dryden.

4. THE EIGHTEENTH CENTURY.--The influence of the eighteenth century on prose style has been great and permanent, and the two dissimilar manners of writing which were then formed, have contributed to all that is distinctive in our modern form of expression. The earlier of these is found in the language of Addison and Swift, the later in that of Johnson. The style of Addison and his friends reproduced those genuine idiomatic peculiarities of our speech which had been received into the conversation of intelligent men. The style of which Johnson was the characteristic example abandons in part the native and familiar characteristics of the Saxon for those expressions and forms common to the modern European tongues. Large use was made of words derived from the Latin, which, in addition to the effect of novelty, gave greater impressiveness and pomp to the style. In the First Generation, named from Queen Anne, but including also the reign of George I. (d. 1727), the drama scarcely deserves more than a parenthesis. Although the moral tone had improved, it was still not high, when Gray's "Beggars Opera" and Cibber's "Careless Husband" were the most famous works. The "Fair Penitent" has been noticed as a clever plagiarism from Massinger; in Addison's "Cato" the strict rules of the French stage were preserved, but its stately and impressive speeches cannot be called dramatic. The "Revenge" of Young had more of tragic passion; but it wanted the force of characterization which seemed to have been buried with the old dramatists. The heroic measure, as it was now used, aimed at smoothness of melody and pointedness of expression, and in this the great master was Pope. In the poems of Pope (1688-1744), we find passages beautifully poetical, exquisite thoughts, vigorous portraits of character, shrewd observation, and reflective good sense, but we are wafted into no bright world of imagination, rapt in no dream of strong passion, and seldom raised into any high region of moral thought. Like all the poets of his day, he set a higher value on skill of execution than on originality of conception, and systematically abstained from all attempts to excite imagination or feeling. The taste of the poet and of his times is most clearly shown in his "Essay on Criticism," published before his twenty-first year. None of his works unites more happily, regularity of plan, shrewdness of thought, and beauty of verse. His most successful effort, the "Rape of the Lock," assumed its complete shape in his twenty-sixth year, and is the best of all mock-heroic poems. The sharpest wit, the keenest dissection of the follies of fashionable life, the finest grace of diction, and the softest flow of melody, come appropriately to adorn a tale in which we learn how a fine gentleman stole a lock of a lady's hair. In the "Epistle of Eloisa to Abelard," and in the "Elegy on an Unfortunate Lady," he attempted the pathetic not altogether in vain. The last work of his best years was his "Translation of the Iliad;" of the Odyssey he translated only half. Both misrepresent the natural and simple majesty of manner which the ancient poet never lost; yet if we could forget Homer, we might be proud of them. In the "Dunciad" he threw away an infinity of wit upon writers who would not otherwise have been remembered. His "Essay on Man" contains much exquisite poetry and finely solemn thought; it abounds in striking passages which, by their felicities of fancy, good sense, music, and extraordinary terseness of diction, have gained a place in the memory of every one. Among the philosophical writers none holds so prominent a place as Bishop Berkeley (1684-1753), whose refinement of style and subtlety of thought have seldom been equaled. His philosophical Idealism exercised much influence on the course of metaphysical inquiry. Lord Shaftesbury's brilliant but indistinct treatises have also been the germ of many discussions in ethics. Bolingbroke wrote with great liveliness, but with equal shallowness of thought and knowledge. Daniel Defoe (1661-1731) is not likely to be forgotten on account of one of his many novels, "Robinson Crusoe." His idiomatic English style is not one of the least of his merits. Among the prose writings of Swift (1667-1745) there is none that is not a masterpiece of strong Saxon-English, and none quite destitute of his keen wit or cutting sarcasm. His satirical romances are most

pungent when human nature is his victim, as in "Gulliver's Travels;" and not less amusing in "The Battle of the Books," or where he treats of church disputes in the "Tale of a Tub." The burlesque memoir of "Martinus Scriblerus" was the joint production of Swift, Pope, and Arbuthnot. It contains more good criticism than any of the serious writings of the generation, and it abounds in the most biting strokes of wit. Arbuthnot is supposed to have been the sole author of the whimsical, national satire called the "History of John Bull," the best work of the class produced in that day. The "Letters of Lady Mary Wortley Montagu" belong to this age. Of all the popular writers, however, that adorned the reign of Queen Anne and her successor, those whose influence has been the greatest and most salutary are the Essayists, among whom Joseph Addison and Richard Steele are preeminently distinguished. "The Tatler," begun in Ireland by Steele, aided first by Swift, and afterwards by Addison, appeared three times a week from 1709 to 1711; "The Spectator," in which Addison took the lead, from 1711 to 1712; and "The Guardian," a part of the next year. Steele (1676-1729) had his merits somewhat unfairly clouded by the fame of his coadjutor. The extraordinary popularity of those periodicals, especially "The Spectator," was creditable to the reading persons of the community, then much fewer than now. The writers discarded from their papers all party-spirit, and designed to make them the vehicle of judicious teaching in morals, manners, and literary criticism. Thus they widened the circle of readers, and raised the standard of taste and thinking. Of some of the more serious papers of the "Spectator," those of Addison (1672-1719) on the "Immortality of the Soul" and the "Pleasures of the Imagination" may be cited. Among the theological writers of the Second Generation of the eighteenth century (the reign of George II., 1726-1760), one of the most famous in his day, though not the most meritorious, was Bishop Warburton; Bishop Butler (d. 1752), wrote his "Analogy of Religion, Natural and Revealed, to the Constitution and Course of Nature," a work of extraordinary force of thought; and there is much literary merit in the writings of the pious Watts and the devout Doddridge. The increasing zeal both in the Church of England and among the Dissenters, and the more cordial recognition of the importance of religion, greatly affected the literature of the times. Philosophy had also its distinguished votaries. The philosophical works of Hume (1711-1776) are allowed by those who dissent most strenuously from their results to have constituted an epoch in the history of the science. In accepting the principles which had been received before him, and showing that they led to no conclusion but universal doubt, he laid bare the flaws in the system, and prepared the way for the subtle speculations of Kant and the more cautious systems of Reid and the Scottish school. The miscellaneous literature of this, the age of Johnson, cannot stand comparison with that of the preceding, which was headed by Addison. Samuel Johnson (1709-1784), one of the most celebrated of the professional authors of the eighteenth century, however, belongs to this period. Compelled by poverty to leave his education uncompleted, he sought the means of living in London, where, for a long time, unpatronized and obscure, he labored with dogged perseverance, until at length he won a fame which must have satisfied the most grasping ambition, but when, as he says, "most of those whom he had wished to please had sunk into the grave, and he had little to fear from censure or praise." That the reputation of his writings was above their deserts, cannot be denied, though it must also be admitted that the literature of our time is deficient in many of their excellences, both of thought and expression. They are the fruit of a strong and original mind, working with imperfect knowledge and an inadequate scope for activity. The language of Johnson is superior to his matter; he has striking force of diction, and many of his sentences roll on the ear like the sound of the distant sea, while the thoughts they convey impress us so vividly that we are slow to scrutinize them. His great merit lies in the two departments of morals and criticism, but everywhere he is inconsistent and unequal. His Dictionary occupied him for eight years, but it is of little value now to the student of language, being poor and incorrect in etymology and unsatisfactory though acute in definition. His poems, which are of Pope's school, would scarcely have preserved his name. The "Rambler," and "Rasselas," are characteristic of his merits and defects. The "Tour to the Hebrides" is one of the most pleasant and easy of his writings. His "Lives of the Poets" is admirable for its skill of narration, but it is alternately enlightened and unsound in criticism, and frequently marred by political prejudices and personal jealousies. Of the novels of the time, the series begun by Richardson's (1689-1761) "Pamela," "Clarissa Harlowe," and "Sir Charles Grandison" have a virtuous aim, but they err by the plainness with which they describe vice. The tediousness and overwrought sentimentality of these works go far towards disqualifying the reader from appreciating their extraordinary skill in invention and in the portraiture of character. Fielding (1707-1757) unites these qualities with greater knowledge of the world, pungent wit, and idiomatic strength of style. His mastery in the art of fictitious narrative has never been excelled; but his living pictures of familiar life, as well as the whimsical caricatures of Smollett and the humorous fantasies of Sterne, are disfigured by faults of which the very smallest are coarseness of language and bareness of licentious description, in which they outdid Richardson. Not only is their standard of morality low, but they display indifference to the essential distinctions of right and wrong, in regard to some of the cardinal relations of society. The drama of the period has little literary importance. In non-dramatic poetry, several men of distinguished genius appeared, and changes occurred which indicated more just and comprehensive views of the art than those that had been prevalent in the last generation. Young (1681-1765), in his "Night Thoughts," produced a work eloquent rather than poetical,

dissertative when true poetry would have been imaginative, but suggesting much of imagery and feeling as well as religious reflection. Resembling it in some points, but with more force of imagination, is the train of gloomy scenes which appears in Blair's "Grave." In Akenside's "Pleasures of Imagination," a vivid fancy and an alluring pomp of language are lavished on a series of pictures illustrating the feelings of beauty and sublimity; but, theorizing and poetizing by turns, the poet loses his hold of the reader. The more direct and effective forms of poetry now came again into favor, such as the Scottish pastoral drama of Ramsay, and Falconer's "Shipwreck." But the most decisive instance of the growing insight into the true functions of poetry is furnished by Thomson's (1700-1748) "Seasons." No poet has ever been more inspired by the love of external nature, or felt with more keenness and delicacy those analogies between the mind and the things it looks upon, which are the fountains of poetic feeling. The faults of Thomson are triteness of thought when he becomes argumentative and a prevalent pomposity and pedantry of diction; though his later work, "The Castle of Indolence," is surprisingly free from these blemishes. But the age was an unpoetical one, and two of the finest poetical minds of the nation were so dwarfed and weakened by the ungenial atmosphere as to bequeath to posterity nothing more than a few lyrical fragments. In the age which admired the smooth feebleness of Shenstone's pastorals and elegies, and which closed when the libels of Churchill were held to be good examples of poetical satire, Gray turned aside from the unrequited labors of verse to idle in his study, and Collins lived and died almost unknown. Gray (1716-1771) was as consummate a poetical artist as Pope. His fancy was less lively, but his sympathies were warmer and more expanded, though the polished aptness of language and symmetry of construction which give so classical an aspect to his Odes bring with them a tinge of classical coldness. The "Ode on Eton College" is more genuinely lyrical than "The Bards," and the "Elegy In a Country Churchyard" is perhaps faultless. The Odes of Collins (1720-1759) have more of the fine and spontaneous enthusiasm of genius than any other poems ever written by one who wrote so little. We close his tiny volume with the same disappointed surprise which overcomes us when a harmonious piece of music suddenly ceases unfinished. His range of tones is very wide, and the delicacy of gradation with which he passes from thought to thought has an indescribable charm. His most popular poem, "The Passions," conveys no adequate idea of some of his most marked characteristics. All can understand the beauty and simplicity of his odes "To Pity," "To Simplicity," "To Mercy;" and the finely woven harmonies and the sweetly romantic pictures in the "Ode to Evening" recall the youthful poems of Milton. Between the period just reviewed and the reign of George III., or the Third Generation of the eighteenth century, there were several connecting links, one of which was formed by a group of historians whose works are classical monuments of English literature. The publication of Hume's "History of England" began in 1754. Robertson's "History of Scotland" appeared in 1759, followed by his "Reign of Charles V." and his "History of America;" Gibbon's "Decline and Fall of the Roman Empire" was completed in twelve years from 1776. The narrative of Hume is told with great clearness, good sense, and quiet force of representation, and if his matter had been as carefully studied as his manner, if his social and religious theories had been as sound as his theory of literary art, his history would still hold a place from which no rival could hope to degrade it. The style of Robertson and Gibbon is totally unlike that of Hume. They want his seemingly unconscious ease, his delicate tact, and his calm yet lively simplicity. Hume tells his tale to us as a friend to friends; his successors always seem to hold that they are teachers and we pupils. This change of tone had long been coming on, and was now very general in all departments of prose. Very few writers of the last thirty years of Johnson's life escaped this epidemic desire of dictatorship. Robertson (1722-1793) is an excellent story-teller, perspicuous, lively, and interesting. His opinions are wisely formed and temperately expressed, his disquisitions able and instructive, and his research so accurate that he is still a valuable historical authority. The learning of Gibbon (1737-1794), though not always exact, was remarkably extensive, and sufficient to make him a trustworthy guide, unless in those points where he was inclined to lead astray. There is a patrician haughtiness in the stately march of his narrative and in the air of careless superiority with which he treats his heroes and his audience. He is a master in the art of painting and narration, nor is he less skillful in indirect insinuation, which is, indeed, his favorite mode of communicating his own opinions, but he is most striking in those passages in his history of the church, where he covertly attacks a religion which he neither believed nor understood. Other historians produced works useful in their day, but now, for the most part, superseded; and in various other departments men of letters actively exerted themselves. Johnson, seated at last in his easy-chair, talked for twenty years, the oracle of the literary world, and Boswell, soon after his death, gave to the world the clever record of these conversations, which has aided to secure the place in literature he had obtained by his writings. Goldsmith (1728-1774), had he never written poems, would stand among the classic writers of English prose from the few trifles on which he was able, in the intervals of literary drudgery, to exercise his powers of observation and invention, and to exhibit his warm affections and purity of moral sentiment. Such is his inimitable little novel, "The Vicar of Wakefield," and that good-natured satire on society, the "Citizen of the World." Among the novelists, Mackenzie (1745-1831) wrote his "Man of Peeling," not unworthy of the companionship of Goldsmith's masterpiece; and among later novelists, Walpole, Moore, Cumberland, Mrs. Inchbald, and Charlotte Smith, Miss Burney and Mrs.

Radcliffe may also be named. In literary criticism, the authoritative book of the day was Johnson's "Lives of the Poets." Percy's "Reliques of Ancient English Poetry" (1765) was a delightful compilation, which, after being quite neglected for many years, became the poetical text-book of Sir Walter Scott and the poets of his time. A more scientific and ambitious effort was Warton's (1729-1790) "History of English Poetry," which has so much of antiquarian learning, poetical taste, and spirited writing, that it is not only an indispensable and valuable authority, but an interesting book to the mere amateur. With many errors and deficiencies, it has yet little chance of being ever entirely superseded. In parliamentary eloquence, before the middle of the eighteenth century, we have the commanding addresses of the elder Pitt (Lord Chatham), and at the close, still leading the senate, are the younger Pitt, Fox, Sheridan, and Burke. Burke (1730-1797) must be remembered not only for his speeches but for his writing on political and social questions, as a great thinker of comprehensive and versatile intellect, and extraordinary power of eloquence. The letters of "Junius," a remarkable series of papers, the authorship of which is still involved in mystery, appeared in a London daily journal from 1769 to 1772. They were remarkable for the audacity of their attacks upon the government, the court, and persons high in power, and from their extraordinary ability and point they produced an indelible impression on the public mind. The "Letters" of Walpole are poignantly satirical; those of Cowper are models of easy writing, and lessons of rare dignity and purity of sentiment. In the history of philosophy, the middle of the eighteenth century was a very important epoch; before the close of the century, almost all of those works had appeared which have had the greatest influence on more recent thinking. These works may be divided into four classes. Under the first, Philosophical Criticism, may be classed Burke's treatise "On the Sublime and Beautiful," Sir Joshua Reynolds's "Discourse on Painting," Campbell's "Philosophy of Rhetoric," Kames's "Elements of Criticism," Blair's "Lectures on Rhetoric and Belles Lettres," and Horne Tooke's "Philosophy of Language." In the second department, Political Economy, Adam Smith's great work, "The Wealth of Nations," stands alone, and is still acknowledged as the standard text-book of this science. In the third department, Ethics, are Smith's "Theory of Moral Sentiment," Tucker's "Light of Nature," and Paley's "Moral and Political Philosophy." In the fourth or Metaphysical department, we have only to note the rise of the Scottish School, under Thomas Reid (1710-1796), who combats each of the three schools, the Sensualistic evolved from Locke, holding that our ideas are all derived from sensation; the Idealistic, as proposed by Berkeley, which, allowing the existence of mind, denies that of matter; and the Skeptical, headed by Hume, which denies that we can know anything at all. Reid is a bold, dry, but very clear and logical writer, a sincere lover of truth, and a candid and honorable disputant; his system is original and important in the history of philosophy. In the theological literature of this time are found Campbell's "Essay on Miracles," Paley's "Evidences of Christianity" and "Natural Theology," and Bishop Watson's "Apology for Christianity." Among the devout teachers of religion was John Newton of Olney, the spiritual guide of Cowper; and of the moral writers, Hannah More and Wilberforce may be mentioned. The only tragedy that has survived from these last forty years of the eighteenth century is the "Douglas" of Home, whose melody and romantic pathos lose much of their effect from its monotony of tone and feebleness in the representation of character. Comedy was oftener successful. There was little merit in the plays of the elder Colman or those of Mrs. Cowley, or of Cumberland. The comedies of Goldsmith abound in humor and gayety, and those of Sheridan have an unintermitted fire of epigrams, a keen insight into the follies and weaknesses of society, and great ingenuity in inventing whimsical situations. Of the verse-writers in the time of Johnson's old age, Goldsmith has alone achieved immortality. "The Traveller" and "The Deserted Village" cannot be forgotten while the English tongue is remembered. The foundations of a new school of poetry were already laid. Percy's "Reliques" and Macpherson's "Fingal" attracted great attention, and many minor poets followed. The short career of the unhappy Chatterton (1752-1770) held out wonderful promise of genius. Darwin, in his "Botanic Garden," went back to the mazes of didactic verse. Seattle's (1735-1803) "Minstrel" is the outpouring of a mind exquisitely poetical in feeling; it is a kind of autobiography or analytic narrative of the early growth of a poet's mind and heart, and is one of the most delightful poems in our language. Opening with Goldsmith, our period closes with Cowper and Burns. The unequalled popularity of Cowper's (1731-1800) poems is owing, in part, to the rarity of good religious poetry, and also to their genuine force and originality. He unhesitatingly made poetry use, always when it was convenient, the familiar forms of common conversation, and he showed yet greater boldness by seeking to interest his readers in the scenes of everyday life. In spite of great faults, the effect of his works is such as only a genuine poet could have produced. His translation of the Iliad has the simplicity of the original, though wanting its warlike fervor, and portions of the Odyssey are rendered with exceeding felicity of poetic effect. Our estimate of Cowper's poems is heightened by our love and pity for the poet, writing not for fame but for consolation, and uttering from the depths of a half-broken heart his reverent homage to the power of religious truth. Our affection is not colder, and our compassion is more profound, when we contemplate the agitated and erring life of Robert Burns (1759-1796), the Scottish peasant, who has given to the literature of the Anglo-Saxon race some of its most precious jewels, although all which this extraordinary man achieved was inadequate to the power and the vast variety of his endowments. It is

on his songs that his fame rests most firmly, and no lyrics in any tongue have a more wonderful union of thrilling passion, melting tenderness, concentrated expressiveness of language, and apt and natural poetic fancy. But neither the song nor the higher kinds of lyrical verse could give scope to the qualities he has elsewhere shown; his aptness in representing the phases of human character, his genial breadth and keenness of humor, and his strength of creative imagination, indicate that if born under a more benignant star he might have been a second Chaucer. 5. THE NINETEENTH CENTURY.--In the illustrious band of poets who enriched the literature of England during the first generation of the present century, there are four who have gained greater fame than any others, and exercised greater influence on their contemporaries. These are Coleridge, Wordsworth, Scott, and Byron, who, though unlike, yet in respect of their ruling spirit and tendencies may be classed in pairs as they have been named; and all whose works call for exact scrutiny may be distributed into four groups. In the first of them stand Thomas Campbell and Robert Southey, dissimilar to each other, and differing as widely from their contemporaries. Campbell (1777-1844) employed an unusually delicate taste in elaborating his verses both in diction and melody. His "Pleasures of Hope" was written between youth and manhood, and "Gertrude of Wyoming," the latest of his productions worthy of him, appeared soon after his thirtieth year. His mind, deficient in manly vigor of thought, had worked itself out in the few first bursts of youthful emotion, but no one has clothed with more of romantic sweetness the feelings and fancies which people the fairy-land of early dreams, or thrown around the enchanted region a purer atmosphere of moral contemplation. Southey (1774-1843), with an ethical tone higher and sterner than Campbell's, offers in other features a marked contrast to him. He is careless in details, and indulges no poetical reveries; he scorns sentimentalism, and throws off rapid sketches of human action with great pomp of imagery, but he seldom touches the key of the pathetic. In much of this he is the man of his age, but in other respects he is above it. He is the only poet of his clay who strove to emulate the great masters of epic song, and to give his works external symmetry of plan. He alone attempted to give poetry internal union, by making it the representation of one leading idea; a loftier theory of poetic art than that which ruled the irregular outbursts of Scott and Byron. But the aspiration was above the competency of the aspirer. He wanted spontaneous depth of sympathy; his emotion has the measured flow of the artificial canal, not the leaping gush of the river in its self-worn channel. In two of the three best poems he has founded the interest on supernatural agency of a kind which cannot command even momentary belief and the splendid panoramas of "Thalaba the Destroyer" pass away like the shadows of a magic lantern. In the "Curse of Kehama," he strives to interest us in the monstrous fables of the Hindoo mythology, and in "Roderick, the Last of the Goths," the story contains circumstances that deform the fairest proof the author gave of the practicability of his poetic theory. The second group of poets, unless Moore find a place in it, will contain only Scott and Byron, who were in succession the most popular of all, and owed their popularity mainly to characteristics which they had in common. They are distinctively the poets of active life. They portray idealized resemblances of the scenes of reality, events which arise out of the universal relations of society, hopes, fears, and wishes which are open to the consciousness of all mankind. The originals of Scott were the romances of chivalry, and this example was applied by Byron to the construction of narratives founded on a different kind of sentiment. Scott, wearying of the narrow round that afforded him no scope for some of his best and strongest powers, turned aside to lavish them on his prose romances, and Byron, as his knowledge grew and his meditations became deeper, rose from Turkish tales to the later cantos of "Childe Harold." Scott (1771-1832), in his poetical narratives, appealed to national sympathies through ennobling historic recollections. He painted the externals of scenery and manners with unrivaled picturesqueness, and embellished all that was generous and brave in the world of chivalry with an infectious enthusiasm. "The Lay of the Last Minstrel," a romance of border chivalry, has a more consistent unity than its successors, and is more faithful to the ancient models. "Marmion" seeks to combine the chivalrous romance with the metrical chronicle. "The Lady of the Lake" is a kind of romantic pastoral, and "Rokeby" is a Waverley novel in verse. The moral faults of the poetry of Byron (1788-1824) became more glaring as he grew older. Starting with the carelessness of ill-trained youth in regard to most serious truths, he provoked censure without scruple, and was censured not without caprice; thus placed in a dangerous and false position, he hardened himself into a contempt for the most sacred laws of society, and although the closing scenes of his life give reason for a belief that purer and more elevated views were beginning to dawn upon his mind, he died before the amendment had found its way into his writings. He endeavored to inculcate lessons that are positively bad; his delinquency did not consist in choosing for representation scenes of violent passion and guilty horror, it lay deeper than in his theatrical fondness for identifying himself with his misanthropes, pirates, and seducers. He sinned more grievously still, against morality as against possibility, by mixing up, in one and the same character, the utmost extremes of vice and virtue, generosity and vindictiveness, of lofty heroism and actual grossness. But with other and great faults, he far excelled all the poets of his time in impassioned strength, varying from vehemence to pathos. He was excelled by few of them in his fine sense of the beautiful, and his combination of passion with beauty, standing unapproachable in his own day, has hardly ever been surpassed. His tales, except "Parisina" and the "Prisoner of Chillon," rise less often than his other poems into that

flow of poetic imagery, prompted by the loveliness of nature, which he had attempted in the two first cantos of "Childe Harold," and poured forth with added fullness of thought and emotion in the last two. "Manfred," with all its shortcomings, shows perhaps most adequately his poetic temperament; and his tragedies, though not worthy of the poet, are of all his works those which do most honor to the man. The third section of this honored file of poets contains the names of Coleridge and Wordsworth; they are characteristically the poets of imagination, of reflection, and of a tone of sentiment that owes its attraction to its ideal elevation. Admired and emulated by a few zealous students, Coleridge became the poetical leader from the very beginning of his age, and effects yet wider have since been worked by the extended study of Wordsworth. Coleridge (1772-1834) is the most original of the poets of his very original time, and among the most original of its thinkers. His most frequent tone of feeling is a kind of romantic tenderness or melancholy, often solemnized by an intense access of religious awe. This fine passion is breathed out most finely when it is associated with some of his airy glimpses of external nature, and his power of suggestive sketching is not more extraordinary than his immaculate taste and nervous precision of language. His images may be obscure, from the moonlight haze in which they float, but they are rarely so through faults of diction. It is disappointing to remember that this gifted man executed little more than fragments; his life ebbed away in the contemplation of undertakings still to be achieved, the result of weakness of will rather than of indolence. The romance of "Christabel," the most powerful of all his works, and the prompter of Scott and Byron, was thrown aside when scarce begun, and stands as an interrupted vision of mysterious adventures clothed in the most exquisite fancies. His tragedy of "Remorse" is full of poetic pictures; the "Ode to the Departing Year" shows his force of thought and moral earnestness; "Khubla Khan" represents in its gorgeous incoherence his singular power of lighting up landscapes with thrilling fancies; and "The Dark Lady" is one of the most tender and romantic love-poems ever written. The most obvious feature of Wordsworth (1770-1850) is the intense and unwearied delight which he takes in all the shapes and appearances of rural and mountain scenery. He is carried away by an almost passionate rapture when he broods over the grandeur and loveliness of the earth and air; his verse lingers with fond reluctance to depart on the wild flowers, the misty lake, the sound of the wailing blast, or the gleam of sunshine breaking through the passes among the hills, and the thoughts and feelings these objects suggest flow forth with an enthusiasm of expression which in a man less pious and rational might be interpreted as a raising of the inanimate world to a level with human dignity and intelligence. The tone which prevails in his contemplation of mortal act and suffering is a serene seriousness, on which there never breaks in anything rightly to be called passion; yet it often rises to an intensely solemn awe, and is not less often relieved by touches of a quiet pathos. Almost all his poems may be called poems of sentiment and reflection, and his own ambition was that of being worthy to be honored as a philosophical poet. His theory that the poet's function is limited to an exact representation of the real and the natural, a heresy which his own best poems triumphantly refute, often led him to triviality and meanness in the choice both of subjects and diction, and marred the beauty of many otherwise fine poems. A fascinating airiness and delicacy of conception prevail in these poems, and the tender sweetness of expression is often wonderfully touching. They were the effusions of early manhood, and the imperfect embodiments of a strength which found a freer outlet in prose. "Laodamia" and "Dion" are classical gems without a flaw; many of the sonnets unite original thought and poetic vividness with a perfection hardly to be surpassed; above all, "The Excursion" rolls on its thousands of blank verse lines with the soul-felt harmony of a divine hymn pealed forth from a cathedral organ. We forget the insignificance characterizing the plan, which embraces nothing but a three days' walk among the mountains, and we refuse to be aroused from our trance of meditative pleasure by the occasional tediousness of dissertation. "The Excursion" abounds in verses and phrases once heard never to be forgotten, and it contains trains of poetical musing through which the poet moves with a majestic fullness of reflection and imagination not paralleled, by very far, in anything else of which our century can boast. Wilson, Shelley, and Keats make up the fourth poetical group. The principal poems of Professor Wilson (1785-1854) are the "Isle of Palms," a romance of shipwreck and solitude, full of rich pictures and delicate pathos, and the "City of the Plague," a series of dramatic scenes, representing with great depth of emotion a domestic tragedy from the plague of London. Shelley was the pure apostle of a noble but ideal philanthropy; yet it is easy to separate his poetry from his philosophy, which, though hostile to existing conditions of society, is so ethereal, so imbued with love for everything noble, and yet so abstract and impracticable, that it is not likely to do much harm. Keats poured forth with great power the dreams of his immature youth, and died in the belief that the radiant forms had been seen in vain. In native felicity of poetic adornment these two were the first minds of their time, but the inadequacy of their performance to their poetic faculties shows how needful to the production of effective poetry is a substratum of solid thought, of practical sense, and of manly and extensive sympathy. If we would apprehend the fullness and firmness of the powers of Shelley (1792-1822) without remaining ignorant of his weakness, we might study the lyrical drama of "Prometheus Unbound," a marvelous galaxy of dazzling images and wildly touching sentiments, or the "Alastor," a scene in which the melancholy quiet of solitude is visited but by the despairing poet who lies down to die. We find here, instead of sympathy with ordinary and

universal feelings, warmth for the abstract and unreal, or, when the poet's own unrest prompts, as in the "Stanzas Written in Dejection near Naples," a strain of lamentation which sounds like a passionate sigh. Instead of clearness of thinking, we find an indistinctness which sometimes amounts to the unintelligible. In the "Revolt of Islam," his most ambitious poem, it is often difficult to apprehend even the outlines of the story. No youthful poet ever exhibited more thorough possession of those faculties that are the foundation of genius than Keats (1798-1820), and it is impossible to say what he might have been had he lived to become acquainted with himself and with mankind. It was said of his "Endymion" most truly, that no book could be more aptly used as a test to determine whether a reader has a genuine love for poetry. His works have no interest of story, no insight into human nature, no clear sequence of thought; they are the rapturous voice of youthful fancy, luxuriating in a world of beautiful unrealities. It may be questioned whether Crabbe and Moore are entitled to rank with the poets already reviewed. Crabbe's (1754-1832) "Metrical Tales," describing everyday life, are striking, natural, and sometimes very touching, but they are warmed by no kindly thoughts and elevated by nothing of ideality. Moore (1780-1851), one of the most popular of English poets, will long be remembered for his songs, so melodious and so elegant in phrase. His fund of imagery is inexhaustible, but oftener ingenious than poetical. His Eastern romances in "Lalla Rookh," with all their occasional felicities, are not powerful poetic narratives. He was nowhere so successful as in his satirical effusions of comic rhyme, in which his fanciful ideas are prompted by a wit so gayly sharp, and expressed with a neatness and pointedness so unusual, that it is to be regretted that these pieces should be condemned to speedy forgetfulness, as they must be, from the temporary interest of their topics. Among the works of the numerous minor poets, the tragedies of Joanna Baillie, with all their faults as plays, are noble additions to the literature, and the closest approach made in recent times to the merit of the old English drama. After these may be named the stately and imposing dramatic poems of Milman, Maturin's impassioned "Bertram," and the finely-conceived "Julian" of Miss Mitford. Rogers and Bowles have given us much of pleasing and reflective sentiment, accompanied with great refinement of taste. To another and more modern school belong Procter (Barry Cornwall) and Leigh Hunt; the former the purer in taste, the latter the more original and inventive. Some of the lyrical and meditative poems of Walter Savage Landor are very beautiful; his longer poems sometimes delight but oftener puzzle us by their obscurity of thought and want of constructive skill. The poems of Mrs. Hemans breathe a singularly attractive tone of romantic and melancholy sweetness, and many of the ballads and songs of Hogg and Cunningham will not soon be forgotten. The poems of Kirke White are more pleasing than original. Montgomery has written, besides many other poems, not a few meditative and devotional pieces among the best in the language. Pollok's "Course of Time" is the immature work of a man of genius who possessed very imperfect cultivation. It is clumsy in plan and tediously dissertative, but it has passages of genuine poetry. The pleasing verses of Bishop Heber and the more recent effusions of Keble may also be named. Of the Scotch poets, James Hogg (d. 1835) is distinguished for the beauty and creative power of his fairy tales, and Allan Cunningham (d. 1842) for the fervor, simplicity, and natural grace of his songs. Edward Lytton Bulwer (Lord Lytton) deserves honorable mention for his high sense of the functions of poetic art; for the skill with which his dramas are constructed, and for the overflowing picturesqueness which fills his "King Arthur." Elliott, the Corn-Law Rhymer, is vigorous in conception, and Hood has a remarkable union of grotesque humor with depth of serious feeling. Henry Taylor (b. 1800) deserves notice for the fine meditateness and well-balanced judgment shown in his dramas and prose essays. "Philip Van Artevelde" is his masterpiece. The poems of Arthur Hugh Clough (d. 1861) are worthy of attention, although it may be doubted if his genius reached its full development; in those of Milnes (Lord Houghton, b. 1809), emotion and intellect are harmoniously blended. R.H. Horne (d. 1884) is the author of some noble poems; Aytoun (d. 1865), of many ballads of note; and in Kingsley (d. 1875) the poetic faculty finds its best expression in his popular lyrics. Alfred Tennyson (b. 1810) is by eminence the representative poet of his era. The central idea of his poetry is that of the dignity and efficiency of law in its widest sense and of the progress of the race. The elements which form his ideal of human character are self-reverence, self-knowledge, self-control, the recognition of a divine order, of one's own place in that order, and a faithful adhesion to the law of one's highest life. "In Memoriam" is his most characteristic work, distinctly a poem of this century, the great threnody of our language. The "Idylls of the King" present in epic form the Christian ideal of chivalry. In Browning (b. 1812) the greatness and glory of man lie not in submission to law, but in infinite aspiration towards something higher than himself. He must perpetually grasp at things attainable by his highest striving, and, finding them unsatisfactory, he is urged on by an endless series of aspirations and endeavors. In his poetry strength of thought struggles through obscurity of expression, and he is at once the most original and unequal of living poets. Elizabeth Barrett Browning (d. 1861) may be regarded as the representative of her sex in the present age. The instinct of worship, the religion of humanity, and a spiritual unity of zeal, love, and worship preside over her work. To this period belong the writings of Mrs. Norton, Mrs. Blackwood, Mrs. Crosland, Mary Howitt, and Eliza Cook.

FICTION.--Previous to the appearance of Scott's novels the department of prose writing had undergone an elevating process in the hands of Godwin, Miss Austen, Miss Porter, and Miss Edgeworth. "Waverley" appeared in 1814, and the series which followed with surprising rapidity obtained universal and unexampled popularity. The Waverley Novels are not merely love stories, but pictures of human life animated by sentiments which are cheerful and correct, and they exhibit history in a most effective light without degrading facts or falsifying them beyond the lawful stretch of poetical embellishment. These novels stand in literary value as far above all other prose works of fiction as those of Fielding stand above all others in the language except these. The novels of Lockhart are strong in the representation of tragic passion. Wilson, in his "Lights and Shadows of Scottish Life," shows the visionary loveliness and pathos which appear in his poems, though they give no scope to those powers of sarcasm and humor which found expression elsewhere. Extremes in the tone of thought and feeling are shown in the despondent imagination of Mrs. Shelley and the coarse and shrewd humor of Galt. To this time belong Hope's "Anastadius," which unites reflectiveness with pathos, and the delightful scenes which Miss Mitford has constructed by embellishing the facts of English rural life. Among the earlier novels of the time, those of Bulwer had more decidedly than the others the stamp of native genius. Though not always morally instructive, they have great force of serious passion, and show unusual skill of design. In some of his later works he rises into a much higher sphere of ethical contemplation. The novels of Theodore Hook, sparkling as they are, have no substance to endure long continuance, nor is there much promise of life in the showy and fluent tales of James, the sea-stories of Marryat, or the gay scenes of Lever. The novels and sketches of Mrs. Marsh and Mrs. Hall are pleasing and tasteful; Mrs. Trollope's portraits of character are rough and clever caricatures. In describing the lower departments of Irish life, Banim is the most original, Griffin weaker, and Carleton better than either. The novels of Disraeli are remarkable for their brilliant sketches of English life and their embodiment of political and social theories. Miss Martineau's stories are full of the writer's clearness and sagacity. Kingsley, the head of the Christian socialistic school, is the author of many romances, and the eloquent preacher of a more earnest and practical Christianity. The narrative sketches of Douglas Jerrold deserve a place among the speculative fictions of the day. Charlotte Brontë (1816-1855) had consummate mastery of expression, and a perception of the depth of human nature that is only revealed through suffering experience. The works of her sister Emily show a powerful imagination, regulated by no consideration of beauty of proportion, or of artistic feeling. Among those writers who aim at making the novel illustrate questions that agitate society most powerfully are the founders of a new school of novelists, Thackeray and Dickens (1812-1870). The former has given his pictures of society all that character they could receive from extraordinary skill of mental analysis, acute observation, and strength of sarcastic irony, but he has never been able to excite continuous and lively sympathy either by interesting incidents or by deep passion. Dickens has done more than all which Thackeray has left unattempted; while his painting of character is as vigorous and natural, his power of exciting emotion ranges with equal success from horror sometimes too intense, to melting pathos, and thence to a breadth of humor which degenerates into caricature. He cannot soar into the higher worlds of imagination, but he becomes strong, inventive, and affecting the moment his foot touches the firm ground of reality, and nowhere is he more at ease, more sharply observant, or more warmly sympathetic, than in scenes whose meanness might have disgusted, or whose moral foulness might have appalled. Of the later novelists, the names of Mrs. Craik (Miss Muloch) and Charles Reade (d. 1884) may be mentioned as having acquired a wide popularity. HISTORY.--In history Niebuhr's masterly researches have communicated their spirit to the "Roman History" of Arnold; the history of Greece has assumed a new aspect in the hands of Thirlwall and Grote; and that of Grecian literature has been in part excellently related by Muir (d. 1860). Modern history has likewise been cultivated with great assiduity, and several works of great literary merit have appeared which are valuable as storehouses of research. Macaulay, in his great work, "The History of England," showed that history might be written as it had not been before, telling the national story with accuracy and force, making it as lively as a novel, through touches of individual interest and teaching precious truths with fascinating eloquence. Alison's "History of Europe" takes its place among the highest works of its kind. Carlyle's "History of the French Revolution" and "Life of Frederic the Great" are most picturesque, attractive, and original works. The History of the Norman Conquest of England is the most important work of Freeman. Buckle (d. 1882) in his Introduction to the projected History of Civilization in Europe reiterated the theory that all events depend upon the action of inevitable law.

CRITICISM AND REVIEWS.--In the art of criticism, Hallam's (d. 1859) "Introduction to the Literature of Europe in the Fifteenth, Sixteenth, and Seventeenth Centuries" has taken its place as a classical standard. Among the fragments of criticism, the most valuable are those of De Quincey (d. 1860). The essays of Macaulay (d. 1860) are among the most impressive of all the periodical papers of our century. In Carlyle, a generous sentiment alternates with despondent gloom and passionate restlessness and inconsistency. But it is impossible to hear, without a deep sense of original power, the oracular voices that issue from the cell; enigmatical, like the ancient responses, and like

them illuminating doubtful vaticination with flashes of wild and half poetic fantasy. His language and thoughts alike set aside hereditary rules, and are compounded of elements, English and German, and elements predominant over all, which no name would fit except that of the author. Among numerous other writers may be mentioned the names of William and Mary Howitt, Isaac Taylor, Arthur Helps, and the brothers Hare, and in art-criticism the brilliant and paradoxical Ruskin (b. 1819) and the accomplished Mrs. Jameson (d. 1860). The writings of Christopher North (Professor Wilson) are characterized by the quaintest humor and the most practical shrewdness combined with tender and passionate emotion (d. 1854). Those of Charles Lamb (d. 1835) it is impossible to describe intelligibly to those who have not read them. Some of his scenes are in sentiment, imagery, and style the most anomalous medleys by which readers were ever alternately perplexed and amused, moved and delighted. No man of his time influenced social science so much as Jeremy Bentham (1748-1832). Of his immediate pupils James Mill is the ablest, Cobbett, a vigorous and idiomatic writer of English, in the course of his long life advocated all varieties of political principle. In political science we have the accurate McCulloch; Malthus, known through his Theory of Population; and Ricardo, the most original thinker in science since Adam Smith. Foster (1770-1843) had originality and a wider grasp of mind than the other two. Hall (1761-1831) is more eloquent, but in oratorical power Chalmers (1780-1847) was one of the great men of our century, which has produced few comparable to him in original keenness of intuition, and who combined so much power of thought with so much power of impressive communication. In philosophy, Dugald Stewart (1753-1828) is one of the most attractive writers. Thomas Brown (1778-1820), his successor in the chair of Edinburgh, exhibited a subtlety of thought hardly ever exceeded in the history of philosophy; probably no writings on mental philosophy were ever so popular. Equally worthy of a place in the annals of their era are those dissertations on the History of Philosophy contributed to the Encyclopaedia Britannica by Playfair, Leslie, and Mackintosh, and a system of Ethics by Bentham. Among the speculations in mental philosophy must also be placed a group of interesting treatises on the "Theory of the Sublime and Beautiful," a matter deeply important to poetry and the other fine arts, represented by Alison's essays on Taste, Jeffrey's on Beauty, and by contributions from Stewart, Thomas Brown, and Payne Knight. In political economy John Mill is one of the most powerful and original minds of the nineteenth century. The pure sciences of mind have been enriched by important accessions; logic has been vigorously cultivated in two departments; on the one hand by Mill and Whewell, the former following the tendencies of Locke and Hobbes, the latter that of the German school; on the other hand, Archbishop Whately has expounded the Aristotelian system with clearness and sagacity, and De Morgan has attempted to supply certain deficiencies in the old analysis. But by far the greatest metaphysician who has appeared in the British empire during the present century is Sir William Hamilton. In his union of powerful thinking with profound and varied erudition, he stands higher, perhaps, than any other man whose name is preserved in the annals of modern speculation.

REVIEWS AND MAGAZINES.--A most curious and important fact in the literary history of the age is the prominence acquired by the leading Reviews and Magazines. Their high position was secured and their power founded beyond the possibility of overturn by the earliest of the series, the "Edinburgh Review." Commenced in 1802, it was placed immediately under the editorship of Francis Jeffrey, who conducted it till 1829. In the earlier part of its history there were not many distinguished men of letters in the empire who did not furnish something to its contents; among others were Sir Walter Scott, Lord Brougham, Malthus, Playfair, Mackintosh, and Sydney Smith. Differences of political opinion led to the establishment of the "London Quarterly," which advocated Tory principles, the Edinburgh being the organ of the Whigs. Its editors were first Gifford and then Lockhart, and it numbered among its contributors many of the most famous men of the time. The "Westminster Review" was established in 1825 as the organ of Jeremy Bentham and his disciples. "Blackwood's Magazine," begun 1817, has contained articles of the highest literary merit. It was the unflinching and idolatrous advocate of Wordsworth, and some of its writers were the first translators of German poetry and the most active introducers of German taste and laws in poetical criticism. The best efforts in literary criticism--the most brilliant department of recent literature, have been with few exceptions essays in the periodicals. Among the essayists the name of Francis Jeffrey (1773-1850) stands highest. In his essays selected for republication we find hardly any branch of general knowledge untouched, and while he treated none without throwing on them some brilliant ray of light, he contributed to many of them truths alike valuable and original. His criticisms on Poetry are flowing and spirited, glittering with a gay wit and an ever-ready fancy, and often blossoming into exquisite felicities of diction. While Macaulay uses poets and their works as hints for constructing picturesque dissertations on man and society, and while poetical reading prompts Wilson to enthusiastic bursts of original poetry, Jeffrey, fervid in his admiration of genius, but conscientiously stern in his respect for art, tries poetry by its own laws, and his writings are invaluable to those who desire to learn the principles of poetical criticism. A high place among the critical essayists must also be assigned to William Hazlitt, who in his lectures and elsewhere did manful service towards reviving the study of ancient poetry,

and who prompts to study and speculation all readers, and not the least those who hesitate to accept his critical opinions.

PHYSICAL SCIENCE.--The spirit of philosophical inquiry and discovery is increasing in England, and is everywhere accompanied by a growing tendency to popularize all branches of science, and to bring them before the general mind in an attractive form.

The physical sciences have made marvelous advances; many brilliant discoveries have been made during the present and last generation, and many scientific men have brought much power of mind to bear on questions lying apart from their principal studies; among them are Sir David Brewster, Sir John Herschel, Sir John Playfair, Sir Charles Lyell, Hugh Miller, Buckland, and Professor Whewell.

SINCE 1860.

1. POETRY.--Matthew Arnold (b. 1822) has written some of the most refined verse of our day, and among critics holds the first rank. Algernon Swinburne (b. 1837) excels all living poets in his marvelous gift of rhythm and command over the resources of the language. Dante Rossetti (d. 1883) had great lyrical power; Robert Buchanan has large freedom and originality of style; Edwin Arnold has extraordinary popularity in the United States for his remarkable poem, "The Light of Asia," and for other poems on Oriental subjects; Lord Lytton ("Owen Meredith") has a place of honor among poets as the author of "Lucile" and other poems; William Morris writes in the choicest fashion of romantic narrative verse. Among other poets of the present generation whose writings are marked by excellences of various kinds are Edmund Gosse, Austin Dobson, Cosmo Monkhouse, Andrew Lang, Philip Marston, and Arthur O'Shaughnessy. The poems of Jean Ingelow have a merited popularity; those of Adelaide Procter (d. 1864) are pervaded by a beautiful spirit of faith and hope; Christina Rossetti shows great originality and deep and serious feeling. The lyrics and dramas of Augusta Webster are marked by strength and breadth of thought; the ballads, sonnets, and other poems of Mary Robinson show that she possesses the true gift of song.

2. FICTION.--The writings of Mrs. Lewes, "George Eliot" (1815-1880), are the work of a woman of rare genius, and place her among the greatest novelists England has produced. They are in sympathy with all the varieties of human character, and written in a spirit of humanity that is allied with every honest aspiration. Anthony Trollope (d. 1884) has produced many works remarkable for their accurate pictures of English life and character. George Macdonald and Wilkie Collins are novelists of great merit, as are William Black, Richard Blackmore, Mrs. Oliphant, Edmund Yates, Justin McCarthy.

3. SCIENCE.--Herbert Spencer (b. 1820) as early as 1852 advanced the theory of the natural and gradual coalition of organic life upon this globe. In 1855, in his "Principles of Psychology," he gave a new exposition of the laws of mind, based upon this principle, and held that it is by experience, registered in the slowly perfecting nervous system, that the mental faculties have been gradually evolved through long courses of descent, each generation inheriting all that had been previously gained, and adding its own increment to the sum of progress; that all knowledge, and even the faculties of knowing, originate in experience, but that the primary elements of thought are *a priori* intuitions to the individual derived from ancestral experience. Thus the intuitional and experience hypotheses, over which philosophers had so long disputed, were here for the first time reconciled. This work, the first permanent scientific result of the application of the law of evolution, formed a turning-point in the thought of the scientific world. Spencer's prospectus of a philosophical system, in which the principles of evolution were applied to the subjects of life, mind, society, and morals, appeared in 1858, maturely elaborated in its scientific proofs and applications, thus preceding the works of other evolutionary writers, the most distinguished of whom, Charles Darwin (1809-1883), has been more identified in the popular mind with the theories of evolution than Spencer himself. The writings of Darwin have had a wider influence and have been the subject of more controversy than those of any other contemporary writer. In his "Origin of Species" he accounts for the diversities of life on our globe by means of continuous development, without the intervention of special creative fiats at the origin of each species, and to this organic evolution he added the important principle of natural selection. He may be regarded as the great reformer of biology and the most distinguished naturalist of the age. Tyndall (b. 1810) has done more than any other writer to popularize great scientific truths. Huxley (b. 1825) stands foremost among physiologists and naturalists. Among numerous other writers distinguished in various branches of science a few only can be here named. Walter Bagehot writes on Political Society; Alexander Bain on Mind and Body; Henry Maudsley on Brain and Mind; Norman Lockyer on Spectrum Analysis; and Sir John Lubbock on Natural History.

4. MISCELLANEOUS.--The most distinguished historian of the times is James Anthony Froude (b. 1818), who, in his "Short Studies," shows the same vigor of thought and power of description that render his history so fascinating. The histories of John Richard Green are valuable for their original research, and have a wide celebrity. Max Müller has rendered important services to the sciences of Philology and Ethnology, by his researches in Oriental languages and literatures. Lecky is eminent for his history of "Rationalism in Europe" and "History of Morals." Leslie Stephen, John Morley, and Addington Symonds are distinguished in various departments of criticism and history. Justin McCarthy, in his "History of our own Times," has skillfully presented an intellectual panorama of the period. Hamerton writes on Art and on general topics with keen and critical observation. Lewes (d. 1878) is the able expounder of the philosophy of Comte. Frances Power Cobbe, in her "Intuitive Morals" and other works, shows strong reasoning powers and great earnestness of purpose. John Stuart Mill (d. 1873) holds a high place as a writer on Political Economy, Liberty, and on the Subjection of Women. The periodicals and newspapers of the day show remarkable intellectual ability, and represent the best contemporary thought in England in all departments.

AMERICAN LITERATURE.

THE COLONIAL PERIOD.--1. The Seventeenth Century. George Sandys; The Bay Psalm Book; Anne Bradstreet, John Eliot, and Cotton Mather.--2. From 1700 to 1770; Jonathan Edwards, Benjamin Franklin, Cadwallader Colden.

FIRST AMERICAN PERIOD FROM 1771 TO 1820.--1. Statesmen and Political Writers: Washington, Jefferson, Hamilton. The Federalist: Jay, Madison, Marshall, Fisher Ames, and others.--2. The Poets: Freneau, Trumbull, Hopkinson, Barlow, Clifton, and Dwight.--3. Writers in other Departments: Bellamy, Hopkins, Dwight, and Bishop White. Rush, McClurg, Lindley Murray, Charles Brockden Brown. Ramsay, Graydon. Count Rumford, Wirt, Ledyard, Pinkney, and Pike.

SECOND AMERICAN PERIOD FROM 1820 TO 1860.--1. History, Biography, and Travels: Bancroft, Prescott, Motley, Godwin, Ticknor, Schoolcraft, Hildreth, Sparks, Irving, Headley, Stephens, Kane, Squier, Perry, Lynch, Taylor, and others.--2. Oratory: Webster, Clay, Calhoun, Benton, Everett, and others.--3. Fiction: Cooper, Irving, Willis, Hawthorne, Poe, Simms, Mrs. Stowe, and others.--4. Poetry: Bryant, Dana, Halleck, Longfellow, Willis, Lowell, Allston, Hillhouse, Drake, Whittier, Hoffman, and others. --5. The Transcendental Movement in New England.--6. Miscellaneous Writings: Whipple, Tuckerman, Curtis, Briggs, Prentice, and others.--7. Encyclopedias, Dictionaries, and Educational Books. The Encyclopaedia Americana. The New American Cyclopaedia. Allibone, Griswold, Duyckinck, Webster, Worcester, Anthon, Felton, Barnard, and others.--8. Theology, Philosophy, Economy, and Jurisprudence: Stuart, Robinson, Wayland, Barnes, Channing, Parker. Tappan, Henry, Hickok, Haven. Carey, Kent, Wheaton, Story, Livingston, Lawrence, Bouvier.--9. Natural Sciences: Franklin, Morse, Fulton, Silliman, Dana, Hitchcock, Rogers, Bowditch, Peirce, Bache, Holbrook, Audubon, Morton, Gliddon, Maury, and others.--10. Foreign Writers: Paine, Witherspoon, Rowson, Priestley, Wilson, Agassiz, Guyot, Mrs. Robinson, Gurowski, and others.--11. Newspapers and Periodicals. --12. Since 1860.

THE COLONIAL PERIOD (1640-1770).

1. THE SEVENTEENTH CENTURY.--Of all the nations which have sprung into existence through the medium of European colonization, since the discovery of America, the United States is the only one having a literature of its own creation, and containing original works of a high order. Its earliest productions, however, are of little value; they belong not to a period of literary leisure, but to one of trial and danger, when the colonist was forced to contend with a savage enemy, a rude soil, and all the privations of pioneer life. It was not until the spirit of freedom began to influence the national character, that the literature of the colonies assumed a distinctive form, although its earliest productions are not without value as marking its subsequent development. Among the bold spirits who, with Captain John Smith, braved the pestilential swamps and wily Indians of Virginia, there were some lovers of literature, the most prominent of whom was George Sandys, who translated Ovid's "Metamorphoses" on the banks of James River. The work, published in London in 1620, was dedicated to Charles I. and received the commendations of Pope and Dryden. The Puritans, too, carried a love of letters with them to the shores of New England, and their literary productions, like their colony, took a far more lasting root than did those of their more southern brethren. The intellect of the colonies first developed itself in a theological form, which was the natural consequence of emigration, induced by difference of religious opinion, the free scope afforded for discussion, and the variety of creeds represented by the different races who thus met on a common soil. The clergy, also, were the best educated and the most influential class, and the colonial era therefore boasted chiefly a theological literature, though for the

most part controversial and fugitive. While there is no want of learning or reasoning power in the tracts of many of the theologians of that day, they are now chiefly referred to by the antiquarian or the curious student of divinity. The first book printed in the colonies was the "Bay Psalm Book," which appeared in 1640; it was reprinted in England, where it passed through seventy editions, and retained its popularity for more than a century, although it was not strictly original, and was devoid of literary merit. This was followed by a volume of original poems, by Mrs. Anne Bradstreet (d. 1672); though not above mediocrity, these effusions are chaste in language and not altogether insipid in ideas. A few years later, John Eliot (1604-1690), the famous Apostle to the Indians, published a version of the Psalms and of the Old and New Testaments in the Indian tongue, which was the first Bible printed in America. The next production of value was a "Concordance of the Scriptures," by John Newman (d. 1663), compiled by the light of pine knots in one of the frontier settlements of New England; the first work of its kind, and for more than a century the most perfect. Cotton Mather (d. 1728) was one of the most learned men of his age, and one of its representative writers. His principal work is the "Magnalia Christi Americana," an ecclesiastical history of New England, from 1620 to 1698, including the civil history of the times, several biographies, and an account of the Indian wars, and of New England witchcraft. Eliot and Mather were the most prominent colonial writers down to 1700.

2. FROM 1700 TO 1770.--From the year 1700 to the breaking out of the Revolution, it was the custom of many of the colonists to send their sons to England to be educated. Yale College and other institutions of learning were established at home, from which many eminent scholars graduated, and, although it was the fashion of the day to imitate the writers of the time of Queen Anne and the two Georges, the productions of this age exhibit a manly vigor of thought, and mark a transition from the theological to the more purely literary era of American authorship. Jonathan Edwards (1703-1785) was the first native writer who gave unequivocal evidence of great reasoning power and originality of thought; he may not unworthily be styled the first man of the world during the second quarter of the eighteenth century; and as a theologian, Dr. Chalmers and Robert Hall declare him to have been the greatest in all Christian ages. Of the works of Edwards, consisting of diaries, discourses, and treatises, that on "The Will" is the most celebrated. Benjamin Franklin (1706-1790) was equally illustrious in statesmanship and philosophy. The style of his political and philosophical writings is admirable for its simplicity, clearness, precision, and condensation; and that of his letters and essays has all the wit and elegance that characterize the best writers of Queen Anne's time. His autobiography is one of the most pleasing compositions in the English language, and his moral writings have had a powerful influence on the character of the American people. >From the early youth of Franklin until about the year 1770, general literature received much attention, and numerous productions of merit both in prose and verse appeared, which, if not decidedly great, were interesting for the progress they displayed. Many practical minds devoted themselves to colonial history, and their labors have been of great value to subsequent historians. Among these historical writings, those of Cadwallader Colden (1688-1776) take the first rank. As we approach the exciting dawn of the Revolution, the growing independence of thought becomes more and more manifest.

FIRST AMERICAN PERIOD (1770-1820).

1. STATESMEN AND POLITICAL WRITERS.--Among the causes which rapidly developed literature and eloquence in the colonies, the most important were the oppressions of the mother country, at first silently endured, then met with murmurs of dissatisfaction, and finally with manful and boldly-expressed opposition. Speeches and pamphlets were the weapons of attack, and treating as they did upon subjects affecting the individual liberty of every citizen, they had a powerful influence on the public mind, and went far towards severing that mental reliance upon Europe which American authorship is now so rapidly consummating. The conventionalism of European literature was cast aside, and the first fruits of native genius appeared. The public documents of the principal statesmen of the age of the Revolution were declared by Lord Chatham to equal the finest specimens of Greek or Roman wisdom. The historical correspondence of this period constitutes a remarkable portion of American literature, and is valuable not only for its high qualities of wisdom and patriotism, but for its graces of expression and felicitous illustration. The letters of Washington, Adams, Jefferson, Franklin, Jay, Morris, Hamilton, and many of their compatriots, possess a permanent literary value aside from that which they derive from their authorship and the gravity of their subjects. The speeches of many of the great orators of the age of the Revolution are not preserved, and are known only by tradition. Of the eloquence of Otis, which was described as "flames of fire," there are but a few meagre reports; the passionate appeals of Patrick Henry and of the elder Adams, which "moved the hearers from their seats," and the resistless declamation of Pinkney and Rutledge, are preserved only in the history of the effects which these orators produced. The writings of Washington (1732-1799), produced chiefly in the camp surrounded by the din of arms, are remarkable for clearness of expression, force of language, and a tone of lofty

patriotism. They are second to none of similar character in any nation, and they display powers which, had they been devoted to literature, would have achieved a position of no secondary character. Jefferson (1743-1826) early published a "Summary View of the Rights of British America," which passed through several editions in London, under the supervision of Burke. His "Notes on Virginia" is still a standard work, and his varied and extensive correspondence is a valuable contribution to American political history. Hamilton (1757-1804) was one of the most remarkable men of the time, and to his profound sagacity the country was chiefly indebted for a regulated currency and an established credit after the conclusion of the war. During a life of varied and absorbing occupation as a soldier, lawyer, and statesman, he found time to record his principles; and his writings, full of energy and sound sense, are noble in tone, and deep in wisdom and insight. "The Federalist," a joint production of Hamilton, Madison, and Jay, exhibits a profundity of research and an acuteness of understanding which would do honor to the most illustrious statesmen of any age. The name of Madison (1751-1836) is one of the most prominent in the history of the country, and his writings, chiefly on political, constitutional, and historical subjects, are of extraordinary value to the student in history and political philosophy. Marshall (1755-1835) was for thirty-five years chief-justice of the Supreme Court of the United States; a court, the powers of which are greater than were ever before confided to a judicial tribunal. Determining, without appeal, its own jurisdiction and that of the legislative and executive departments, this court is not merely the highest estate in the country, but it settles and continually moulds the constitution of the government. To the duties of his office, Judge Marshall brought a quickness of conception commensurate with their difficulty, and the spirit and strength of one capable of ministering to the development of a nation. The vessel of state, it has been said, was launched by the patriotism of many; the chart of her course was designed chiefly by Hamilton; but when the voyage was begun, the eye that observed, the head that reckoned, and the hand that compelled the ship to keep her course amid tempests without, and threats of mutiny within, were those of the great chief-justice, whom posterity will reverence as one of the founders of the nation. Marshall's "Life of Washington" is a faithful and conscientious narrative, written in a clear, unpretending style, and possesses much literary merit. Fisher Ames (1758-1808), one of the leaders of the federal party during the administration of Washington, was equally admired for his learning and eloquence; although, owing to the temporary interest of many of the subjects on which he wrote, his reputation has somewhat declined. Among other writers and orators of the age of the Revolution were Warren, Adams, and Otis, Patrick Henry, Rutledge, Livingston, Drayton, Quincy, Dickinson, and numerous firm and gifted men, who, by their logical and earnest appeals roused the country to the assertion of its rights and gave a wise direction to the power they thus evoked.

2. THE POETS.--One of the most distinguished poets of the Age of the Revolution was Philip Freneau (1752-1832). Although many of his compositions which had great political effect at the time they were written have little merit, or relate to forgotten events, enough remains to show that he was not wanting in genius and enthusiasm. John Trumbull (1750-1831) was the author of "McFingal," a humorous poem in the style of Butler's Hudibras, the object of which was to render ludicrous the zeal and logic of the Tories. There is no contemporaneous record which supplies so vivid a representation of the manners of the age, and the habits and modes of thinking that then prevailed. The popularity of *McFingal* was extraordinary, and it had an important influence on the great events of the time. Trumbull was a tutor in Yale College, and attempted to introduce an improved course of study and discipline into the institution, which met with much opposition. His most finished poem, "The Progress of Dullness," was hardly less serviceable to the cause of education than his *McFingal* was to that of liberty. Francis Hopkinson (1738-1791), another wit of the Revolution, may be ranked beside Trumbull for his efficiency in the national cause. Joel Barlow (1755-1812) as an author was among the first of his time. His principal work is the "Columbiad," an epic poem which, with many faults, has occasional bursts of patriotism and true eloquence, which should preserve it from oblivion. His pleasing poem celebrating "Hasty Pudding" has gained a more extensive popularity. The few songs of William Clifton (1772-1799), a more original and vigorous poet, are imbued with the true spirit of lyric poetry. Timothy Dwight (1752-1819) was the author of "Greenfield Hill," the "Conquest of Canaan," an epic poem, and several other productions; but his fame rests chiefly on his merits as a theologian, in which department he had few if any equals. Many other names might be cited, but none of commanding excellence.

3. WRITERS IN OTHER DEPARTMENTS.--Although in the period immediately succeeding the Revolution there was a strong tendency to political discussion, not a few writers found exercise in other departments. Theology had its able expounders in Bellamy, Hopkins, Dwight, and Bishop White. Barton merits especial notice for his work on botany, and for his ethnological investigations concerning the Indian race, and Drs. Rush and McClurg were eminent in various departments of medical science. In 1795, Lindley Murray (1745-1826) published his English Grammar, which for a long time held its place as the best work of the kind in the language. It should be borne in mind, however, that during this period very few writers devoted themselves exclusively to literature. Charles Brockden

Brown (1771-1810) was the first purely professional author. His chief productions are two works of fiction, "Wieland" and "Arthur Mervyn," which from their merit, and as the first of American creations in the world of romance, were favorably received, and early attracted attention in England. One of the earliest laborers in the field of history was David Ramsay (1749-1815), and his numerous works are monuments of his unwearied research and patient labor for the public good and the honor of his country. Graydon's (1742-1818) "Memoirs of his own Times, with Reminiscences of Men and Events of the Revolution," illustrates the most interesting and important period of our history, and combines the various excellences of style, scholarship, and impartiality. Benjamin Thompson (1753-1814), better known by his title of Count Rumford, acquired an extensive reputation in the scientific world for his various philosophical improvements in private and political economy. William Wirt was the author of the "Letters of the British Spy," which derives its interest from its descriptions and notices of individuals. His "Life of Patrick Henry" is a finished piece of biography, surpassed by few works of its kind in elegance of style and force of narrative. John Ledyard (1751-1788), who died in Egypt while preparing for the exploration of Central Africa, was the first important contributor to the literature of travel, in America, and his journals, abounding in pleasing description and truthful narratives, have become classic in this department of letters. A captivating book of travels in France, by Lieutenant Pinkney, which appeared in 1809, created such a sensation in England, that Leigh Hunt tells us it set all the idle world going to France. Zebulon Pike, under the auspices of the government, published the first book ever written on the country between the Mississippi and the Rocky Mountains.

SECOND AMERICAN PERIOD (1820-1860).

1. HISTORY, BIOGRAPHY, AND TRAVELS.--From the year 1820, American literature may be considered as fairly launched upon its national career. The early laborers in the field had immense difficulties to encounter from ridicule abroad and want of appreciation at home; but they at last succeeded in dispelling all doubts as to the capability of the American mind for the exercise of original power, and to some extent diverted public thought from Europe as an exclusive source of mental supplies. The era we are now to consider will be found prolific in works of merit, and the expansion of mind will be seen to have kept pace with the political, social, and commercial progress of the nation. No subject of human knowledge has been overlooked; many European works have been elucidated by the fresh light of the American mind; a new style of thought has been developed; new scenes have been opened to the world, and Europe is receiving compensation in kind for the intellectual treasures she has heretofore sent to America. The marvelous growth of the United States, its relations to the past and future, and to the great problem of humanity, render its history one of the most suggestive episodes in the annals of the world, and give to it a universal as well as a special dignity. Justly interpreted, it is the practical demonstration of principles which the noblest spirits of England advocated with their pens, and often sealed with their blood. The early colonists were familiar with the responsibilities and progressive tendency of liberal institutions, and in achieving the Revolution they only carried out what had long existed in idea, and actualized the views of Sidney and his illustrious compeers. Through this intimate relation with the past of the Old World, and as initiative to its future self-enfranchisement, our history daily unfolds new meaning and increases in importance and interest. It is only within the last quarter of a century, however, that this theme has found any adequate illustration. Before that time the labors of American historians had been chiefly confined to the collection of materials, the unadorned record of facts which rarely derived any charm from the graces of style or the resources of philosophy. The most successful attempt to reduce the chaotic but rich materials of American history to order, beauty, and moral significance has been made by Bancroft (b. 1800), who has brought to the work not only talent and scholarship of high order, but an earnest sympathy with the spirit of the age he was to illustrate. In sentiment and principle his history is thoroughly American, although in its style and philosophy it has that broad and eclectic spirit appropriate to the general interest of the subject, and the enlightened sympathies of the age. Unwearied and patient in research, discriminating and judicious in the choice of authorities, and possessed of all the qualities required to fuse into a vital unity the narrative thus carefully gleaned, Bancroft has written the most accurate and philosophical account that has been given of the United States. The works of Prescott (1796-1858) are among the finest models of historical composition, and they breathe freely the spirit of our liberal institutions. His "History of Ferdinand and Isabella," of the "Conquest of Mexico," and the "Conquest of Peru," unite all the fascination of romantic fiction with the grave interest of authentic events. The picturesque and romantic character of his subjects, the harmony and beauty of his style, the dramatic interest of his narrative, and the careful research which renders his works as valuable for their accuracy as they are attractive for their style, have given Prescott's histories a brilliant and extensive reputation; and it is a matter of deep regret that his last and crowning work, "The History of Philip II.," should remain uncompleted. Another important contribution to the literature of the country is Motley's (1814- 1877) "History of the Rise of the Dutch Republic," a work distinguished for its historical accuracy, philosophical breadth of treatment, and clearness and vigor of style. The narrative proceeds with a steady

and easy flow, and the scenes it traces are portrayed with the hand of a master; while the whole work is pervaded by a spirit of humanity and a genuine sympathy with liberty. Parke Godwin's "History of France" is remarkable for its combination of deep research, picturesqueness of style; and John Poster Kirk is the author of a valuable history of Charles the Bold. Ticknor's (1791-1871) "History of Spanish Literature," as an intellectual achievement, ranks with the best productions of its kind, and is everywhere regarded by scholars as a standard authority. It is thoroughly penetrated with the true Castilian spirit, and is a complete record of Spanish civilization, both social and intellectual, equally interesting to the general reader and to the student of civil history. It has been translated into several languages. Henry R. Schoolcraft has devoted much time to researches among the Indian tribes of North America, and embodied the result of his labors in many volumes, containing their traditions, and the most interesting facts of their history. Catlin's "Notes on the Manners, Customs, and Conditions of the North American Indians," though without literary pretensions or literary merit; fills an important place in ethnological literature. Another work of a more historical character is "The History of the Indian Tribes of North America," the joint production of Hall and McKinney. Bradford's "American Antiquities and Researches into the Origin of the Red Race" is also an able and instructive work. In Hildreth's "History of the United States," rhetorical grace and effect give way to a plain narrative confined to facts gleaned with great care and conscientiousness. The "Field-Book of the Revolution," by Lossing, who has visited all the scenes of that memorable war, and delineated them with pen and pencil, is a work which finds its way to all the school libraries of the country. Cooper's "Naval History of the United States" abounds in picturesque and thrilling descriptions of naval warfare, and is one of the most characteristic histories, both in regard to style and subject, yet produced in America. S. G. Goodrich (1793-1860), who, under the name of Peter Parley, has acquired an extensive popularity in England and the United States, was the pioneer in the important reform of rendering historical school-books attractive, and his numerous works occupy a prominent place in the literature designed for the young. Two other able writers in this department are John S.C. and Jacob Abbott. Among the numerous local and special histories, valuable for their correctness and literary merit, are Brodhead's "History of New York," Palfrey's and Elliott's Histories of New England, Trumbull's "History of Connecticut," Hawks's "History of North Carolina," and Dr. Francis's "Historical Sketches." To the department of Biography, Jared Sparks has made many valuable contributions. Washington Irving's "Life and Voyages of Columbus" and "Life of Washington" have gained a popularity as extensive as the fame of this charming writer. Mrs. Kirkland, also, has written a popular "Life of Washington." The biographies and histories of J.T. Headley are remarkable for a vivacity and energy, which have given them great popularity. The "Biographical and Historical Studies" of G.W. Greene, Randall's "Life of Jefferson," Parton's Biographies of Aaron Burr and other celebrated men, Mrs. Ellet's "Women of the Revolution" and "Women Artists in all Ages," and Mrs. Hale's "Sketches of Distinguished Women in all Ages," are among the numerous works belonging to this department. The restlessness of the American character finds a mode of expression in the love of travel and adventure, and within the last thirty years no nation has contributed to literature more interesting books of travel than the United States. Flint's "Wanderings in the Valley of the Mississippi," Schoolcraft's "Discoveries and Adventures in the Northwest," Irving's "Astoria," and Fremont's Reports are instructive and entertaining accounts of the West. The "Incidents of Travel" of John L. Stephens (1805-1857) has had remarkable success in Europe as well as in this country. The adventurous Arctic explorations of E.K. Kane (1822-1857) have elicited universal admiration for the interest of their descriptions and for the heroism and indomitable energy of the writer. These narratives have been followed by those of Hayes in the same field of adventure. The scientific explorations of E.G. Squier have thrown new light on the antiquities and ethnology of the aboriginal tribes of America. Wilkes's "Narrative of the United States Exploring Expedition" and Perry's "Narrative of an Expedition to Japan" are full of scientific and general information. Lynch's "Exploration of the Dead Sea" and Herndon's "Valley of the Amazon" belong to the same class. Bartlett's "Explorations in Texas and New Mexico" is interesting from the accuracy of its descriptions and the novelty of the scenes it describes. Among the numerous other entertaining books of travel in foreign countries are those of Bayard Taylor, who has left few parts of the world unvisited; Dana's "Two Years Before the Mast;" Curtis's "Nile Notes;" Norman's "Cities of Yucatan;" Dix's "Winter in Madeira;" Brace's "Hungary," "Home Life in Germany," and "Norse Folk;" Olmsted's "Travels in the Seaboard Slave States," and other works; Ross Browne's "Notes," Prime's "Boat" and "Tent Life," and "Letters of Irenaeus;" Slidell's "Year in Spain;" Willis's "Pencilings by the Way;" Hillard's "Six Months in Italy" and "Letters;" "Memories" and "Souvenirs," by Catherine M. Sedgwick, Sarah Haight, Harriet Beecher Stowe, Grace Greenwood, and Octavia Walton Le Vert.

2. ORATORY.--The public speeches of a nation's chief legislators are shining landmarks of its policy and lucid developments of the character and genius of its institutions. Of the statesmen of the present century, the most eminent are Webster, Clay, and Calhoun. Daniel Webster (1782- 1852) is acknowledged to be one of the greatest men America has produced. His speeches and forensic arguments constitute a characteristic as well as an

intrinsically valuable and interesting portion of our native literature, and some of his orations on particular occasions are everywhere recognized as among the greatest instances of genius in this branch of letters to be met with in modern times. The style of Webster is remarkable for its clearness and impressiveness, and rises occasionally to absolute grandeur. His dignity of expression, breadth and force of thought realize the ideal of a republican statesman; his writings, independent of their literary merit, are invaluable for the nationality of their tone and spirit. The speeches of Henry Clay (1777-1852) are distinguished by a sincerity and warmth which were characteristic of the man, who united the gentlest affections with the pride of the haughtiest manhood. His style of oratory, full, flowing, and sensuous, was modulated by a voice of sustained power and sweetness and a heart of chivalrous courtesy, and his eloquence reached the heart of the whole nation. The style of John C. Calhoun (1782-1850) was terse and condensed, and his eloquence, though sometimes impassioned, was always severe. He had great skill as a dialectician and remarkable power of analysis, and his works will have a permanent place in American literature. The writings and speeches of John Quincy Adams (1769-1848) are distinguished by universality of knowledge and independence of judgment, and they are repositories of rich materials for the historian and political philosopher. Benton's (1783-1858) "Thirty Years' View" of the working of the American government is a succession of historical pictures which will increase in value as the scenes they portray become more distant. Edward Everett (1794-1865), as an orator, has few living equals, and his occasional addresses and orations have become permanent memorials of many important occasions of public interest. Of the numerous other orators, eminent as rhetoricians or debaters, a few only can be named; among them are Legaré, Randolph, Choate, Sumner, Phillips, Preston, and Prentiss.

3. FICTION.--Romantic fiction found its first national development in the writings of James Fenimore Cooper (1789-1851), and through his works American literature first became widely known in Europe. His nautical and Indian tales; his delineations of the American mind in its adventurous character, and his vivid pictures of the aborigines, and of forest and frontier life, from their freshness, power, and novelty, attracted universal attention, and were translated into the principal European languages as soon as they appeared. "The Spy," "The Pioneers," "The Last of the Mohicans," and numerous other productions of Cooper, must hold a lasting place in English literature. The genial and refined humor of Washington Irving (1783-1859), his lively fancy and poetic imagination, have made his name a favorite wherever the English language is known. He depicts a great variety of scenes and character with singular skill and felicity, and his style has all the ease and grace, the purity and charm, that distinguish that of Goldsmith, with whom he may justly be compared. "The Sketch-Book" and "Knickerbocker's History of New York" are among the most admired of his earlier writings, and his later works have more than sustained his early fame. The tales and prose sketches of N.P. Willis are characterized by genial wit, and a delicate rather than a powerful imagination, while beneath his brilliant audacities of phrase there is a current of original thought and genuine feeling. Commanding all the resources of passion, while he is at the same time master of all the effects of manner, in the power of ingenious and subtle comment on passing events, of sketching the lights and shadows which flit over the surface of society, of playful and felicitous portraiture of individual traits, and of investing his descriptions with the glow of vitality, this writer is unsurpassed. Hawthorne is remarkable for the delicacy of his psychological insight, his power of intense characterization, and for his mastery of the spiritual and the supernatural. His genius is most at home when delineating the darker passages of life and the enactments of guilt and pain. He does not feel the necessity of time or space to realize his spells, and the early history of New England and its stern people have found no more vivid illustration than his pages afford. The style of Hawthorne is the pure colorless medium of his thought; the plain current of his language is always equable, full and unvarying, whether in the company of playful children, among the ancestral associations of family or history, or in grappling with the mysteries and terrors of the supernatural world. "The Scarlet Letter" is a psychological romance, a study of character in which the human heart is anatomized with striking poetic and dramatic power. "The House of the Seven Gables" is a tale of retribution and expiation, dating from the time of the Salem witchcraft. "The Marble Faun" is the most elaborate and powerfully drawn of his later works. Edgar A. Poe (1811-1849) acquired much reputation as a writer of tales and many of his productions exhibit extraordinary metaphysical acuteness, and an imagination that delights to dwell in the shadowy confines of human experience, among the abodes of crime and horror. A subtle power of analysis, a minuteness of detail, a refinement of reasoning in the anatomy of mystery, give to his most improbable inventions a wonderful reality. Of the numerous writings of William Gilmore Simms, historical or imaginative romances form no inconsiderable part. As a novelist he is vigorous in delineation, dramatic in action, poetic in description, and skilled in the art of story-telling. His pictures of Southern border scenery and life are vivid and natural. Harriet Beecher Stowe was well known as a writer before the appearance of the work which has given her a world-wide reputation. No work of fiction of any age ever attained so immediate and extensive a popularity as "Uncle Tom's Cabin;" before the close of the first year after its publication it had been translated into all the languages of Europe; many millions of copies had been sold, and it had been dramatized in twenty different forms,

and performed in every capital of Europe. Besides the authors already named, there is a crowd of others of various and high degrees of merit and reputation, but whose traits are chiefly analogous to those already described. Paulding, in "Westward Ho" and "The Dutchman's Fireside," has drawn admirable pictures of colonial life; Dana, in "The Idle Man," has two or three remarkable tales; Flint, Hall, and Webber have written graphic and spirited tales of Western life. Kennedy has described Virginia life in olden times in "Swallow Barn;" and Fay has described "Life in New York;" Hoffman has embodied the early history of New York in a romantic form, and Dr. Bird, that of Mexico. William Ware's "Probus" and "Letters from Palmyra" are classical romances, and Judd's "Margaret" is a tragic story of New England life. Cornelius Mathews has chosen new subjects, and treated them in an original way; John Neal has written many novels full of power and incident. The "Hyperion" and "Kavanagh" of Longfellow establish his success as a writer of fiction; and in adventurous description, the "Omoo" and "Typee" of Melville, and the "Kaloolah" and "Berber" of Mayo have gained an extensive popularity. This department of literature has been ably represented by the women of the United States, and their contributions form an important part of our national literature. Catharine M. Sedgwick has written the most pleasing and graphic tales of New England life. Lydia M. Child is the author of several fictions, as well as other prose works, which evince great vigor, beauty, and grace. Maria J. McIntosh has written many charming tales; the "New Home" of Mrs. Kirkland, an admirable picture of frontier life, was brilliantly successful, and will be permanently valuable as representing scenes most familiar to the early settlers of the Western States. The works of the Misses Warner are equally popular in England and the United States. Among numerous other names are those of Eliza Leslie, Lydia H. Sigourney, Caroline Gilman, E. Oakes Smith, Alice and Phoebe Cary, Elizabeth F. Ellet, Sarah J. Hale, Emma Willard, Caroline Lee Hentz, Alice B. Neal, Caroline Chesebro, Emma Southworth, Ann S. Stephens, Maria Cummings, Anna Mowatt Ritchie, Rose Terry Cooke, Harriet Prescott Spofford, Augusta J. Evans, Catharine A. Warfield, and the writers under the assumed names of Fanny Forrester, Grace Greenwood, Fanny Fern, Marion Harland, and Mary Forrest, besides many anonymous writers.

4. POETRY.--America has as yet produced no great epic poet, although the existence of a high degree of poetical talent cannot be denied. Carrying the same enthusiasm into the world of fancy that he does into the world of fact, the American finds in the cultivation of the poetic faculty a pleasant relief from the absorbing pursuits of daily life; hence, while poetry is sometimes cultivated as an art, it is oftener resorted to as a pastime; the number of writers is more numerous here than in any other country, and the facility of poetical expression more universal. William C. Bryant (1794-1878) is recognized as the best representative of American poetry. He is extremely felicitous in the use of native materials, and he has a profound love of nature and of freedom united with great artistic skill. He is eminently a contemplative poet; in his writings there is a remarkable absence of those bursts of tenderness and passion which constitute the essence of a large portion of modern verse. His strength lies in his descriptive power, in his serene and elevated philosophy, and in his noble simplicity of language. Richard H. Dana (1787-1879) is the most psychological of the American poets; the tragic and remorseful elements of humanity exert a powerful influence over his imagination, while the mysteries and aspirations of the human soul fill and elevate his mind. His verse is sometimes abrupt, but never feeble, The poems of Fitz-Greene Halleck are spirited and warm with emotion, or sparkling with genuine wit. His humorous poems are marked by an uncommon ease of versification, a natural flow of language, and a playful felicity of jest; his serious poems are distinguished for manly vigor of thought and language, and a beauty of imagery. The poems of Henry W. Longfellow (1807- 1882) are chiefly meditative, and often embody and illustrate significant truths. They give little evidence of the power of overmastering passion, but they are pervaded with an earnestness and beauty of sentiment, expressed in a finished and artistic form, which at once wins the ear and impresses the memory and heart. In "Evangeline" and "Hiawatha," the most popular of his later productions, he has skillfully succeeded in the use of metres unusual in English. The poems of N. P. Willis (1807-1867) are characterized by a vivid imagination and a brilliant wit, combined with grace of utterance and artistic finish. His picturesque elaborations of some of the incidents recorded in the Bible are the best of his poetical compositions. His dramas are delicate creations of sentiment and passion with a relish of the Elizabethan age. J. R. Lowell (b. 1819) unites in his most effective poems a philosophic simplicity with a transcendental suggestiveness. Imagination and philanthropy are the dominant elements in his writings, which are marked by a graceful flow and an earnest tone. His satires contain many sharply-drawn portraits, and his humorous poems are replete with wit. Washington Allston (1779-1843) owed his chief celebrity to his paintings, but his literary works alone would have given him high rank among men of genius. His poems are delicate, subtle, and philosophical, and though few in number, they are exquisite in finish and in the thoughts which they embody. James A. Hillhouse (1789-1841) excelled in what may be called the written drama, which, though unsuited to representation, is characterized by noble sentiment and imagery. His dramatic and other poems are the first instances in this country of artistic skill in the higher and more elaborate spheres of poetic writing, and have gained for him a permanent place among the

American poets. The "Culprit Fay" of Joseph Rodman Drake (1795-1820) is a poem exhibiting a most delicate fancy and much artistic skill. It was a sudden and brilliant flash of a highly poetical mind which was extinguished before its powers were fully expanded. The poetry of John G. Whittier (b. 1809) is characterized by boldness, energy, and simplicity, often united with tenderness and grace; that of Oliver Wendell Holmes, by humor and genial sentiment. In poetry, as in prose, Edgar A. Poe was most successful in the metaphysical treatment of the passions. His poems, which are constructed with great ingenuity, illustrate a morbid sensitiveness and a shadowy and gloomy imagination. The poems of Henry T. Tuckerman (1813-1871) are expressions of graceful and romantic sentiment or the fruits of reflection, illustrated with a scholar's taste. Charles Fenno Hoffman (1806-1884) is the author of many admired convivial and amatory poems, and George P. Morris is a recognized song-writer of America. Of numerous other poets, whose names are familiar to all readers of American literature, a few only can be named; among them are John G.C. Brainerd, James G. Percival, Richard H. Wilde, James G. Brooks, Charles Sprague, Alfred B. Street, T. Buchanan Read, T.B. Aldrich, William Allen Butler, Albert G. Greene, George D. Prentice, William J. Pabodie, Park Benjamin, William Gilmore Simms, John R. Thompson, William Ross Wallace, Charles G. Leland, Thomas Dunn English, William D. Gallagher, Albert Pike, John G. Saxe, James T. Fields, Arthur Cleveland Coxe, Cornelius Mathews, John Neal, and Ralph Waldo Emerson. Among the literary women of the United States are many graceful writers who possess true poetical genius, and enjoy a high local reputation. The "Zophiel" of Maria Brooks (1795-1845) evinces an uncommon degree of power in one of the most refined and difficult provinces of creative art. Frances S. Osgood (1812-1850) was endowed with great playfulness of fancy, and a facility of expression which rendered her almost an improvisatrice. Her later poems are marked by great intensity of feeling and power of expression. The "Sinless Child" of Elizabeth Oakes Smith is a melodious and imaginative poem, with many passages of deep significance. Amelia B. Welby's poems are distinguished for sentiment and melody. The "Passion Flowers" and other poems of Julia Ward Howe are full of ardor and earnestness. Mrs. Sigourney's metrical writings are cherished by a large class of readers. Hannah F. Gould has written many pretty and fanciful poems, and Grace Greenwood's "Ariadne" is a fine burst of womanly pride and indignation. Among many other equally well known and honored names, there are those of Elizabeth F. Ellet, Emma C. Embury, Sarah J. Hale, Anna Mowatt Ritchie, Ann S. Stephens, Sarah H. Whitman, Catharine A. Warfield, and Eleanor Lee, ("Two Sisters of the West") Alice and Phoebe Cary, "Edith May," Caroline C. Marsh, Elizabeth C. Kinney, and Maria Lowell. Nothing of very decided mark has been contributed to dramatic literature by American writers, though this branch of letters has been cultivated with some success. John Howard Payne wrote several successful plays; George H. Boker is the author of many dramatic works which establish his claim to an honorable rank among the dramatic writers of the age. Single dramas by Bird, Sargent, Conrad, and other writers still keep their place upon the stage; with many faults, they abound in beauties, and they are valuable as indications of awakening genius.

5. THE TRANSCENDENTAL MOVEMENT IN NEW ENGLAND.--The Transcendental Philosophy, so-called, had its distinct origin in the "Critique of Pure Reason," the work of Immanuel Kant, which appeared in Germany in 1781, although, under various forms, the questions it discussed are as old as Plato and Aristotle. The first principle of this philosophy is that ideas exist in the soul which transcend the senses, while that of the school of Locke, or the School of Sensation, is that there is nothing in the intellect that was not first in the senses. The Transcendentalist claimed an intuitive knowledge of God, belief in immortality, and in man's ability to apprehend absolute ideas of truth, justice, and rectitude. The one regarded expediency, prudence, caution, and practical wisdom as the highest of the virtues, and distrusted alike the seer, the prophet, and the reformer. The other was by nature a reformer and dissatisfied with men as they are, but with passionate aspirations for a pure social state, he recognized, above all, the dignity of the individual man. These two schools of philosophy aimed at the same results, but by different methods. The one worked up from beneath by material processes, the other worked down from above by intellectual ones. There had been in other countries a transcendental philosophy, but, in New England alone, where the sense of individual freedom was active, and where there were no fixed and unalterable social conditions, was this philosophy applied to actual life. Of late the scientific method, so triumphant in the natural world, has been applied to the spiritual, and the principles of the sensational philosophy have been, re-stated by Bain, Mill, Spencer, and other leaders of speculative opinion, who present it under the name of the "Philosophy of Experience," and resolve the intuitions of the Ideal into the results of experience and the processes of organic, life. Mill was the first to organize the psychological side, while Lewes, Spencer, and Tyndall have approached the same problem from the side of organization. Should these analyses be accepted, Idealism as a philosophy must disappear. There is, however, no cause to apprehend a return to the demoralization which the sensualist doctrines of the last century were accused of encouraging. The attitude of the human mind towards the great problems of destiny has so far altered, and the problems themselves have so far changed their face, that no shock will be felt in the passage from the philosophy of intuition to that of experience. Early in the second quarter of our century the doctrines of Kant and of his German

followers, Jacobi, Fichte, and Schelling, found their way into New England, and their influence on thought and life was immediate and powerful, affecting religion, literature, laws, and institutions. As an episode or special phase of thought, it was of necessity transient, but had it bequeathed nothing more than the literature that sprang from it and the lives of the men and women who had their intellectual roots in it, it would have conferred a lasting benefit on America. Among the first to plant the seeds of the Transcendental Philosophy in New England was George Ripley (1802-1880), a philanthropist on ideal principles, whose faith blossomed into works, and whose well known attempt to create a new earth in preparation for a new heaven, although it ended in failure, commanded sympathy and respect. Later, as a critic, he aided the development of literature in America by erecting a high standard of judgment and by his just estimation of the rights and duties of literary men. Theodore Parker (d. 1860) owed his great power as a preacher to his faith in the Transcendental philosophy. The Absolute God, the Moral Law, and the Immortal Life he held to be the three cardinal attestations of the universal consciousness. The authority of the "higher law," the absolute necessity of religion for safely conducting the life of the individual and the life of the state, he asseverated with all the earnestness of an enthusiastic believer. A. Bronson Alcott (b. 1799) is a philosopher of the Mystic school. Seeking wisdom, not through books, but by intellectual processes, he appeals at once to consciousness, claims immediate insight, and contemplates ultimate laws in his own soul. His "Orphic Sayings" amused and perplexed the critics, who made them an excuse for assailing the entire Transcendental school. Margaret Fuller (1810-1850) adopted the spiritual philosophy, and had the subtlest perception of its bearings. Her vigorous and original writings possess a lasting value, although they imperfectly represent her remarkable powers. Among the representatives of the Spiritual Philosophy the first place belongs to Ralph Waldo Emerson (1803-1882), who lighted up its doctrines with the rays of ethical and poetical imagination. Without the formality of dogma, he was a teacher of vigorous morality in line with the ruling tendencies of the age, and bringing all the aid of abstract teaching towards the solution of the moral problems of society. The first article of his faith is the primacy of Mind; that Mind is supreme, eternal, absolute, one, manifold, subtle, living, immanent in all things, permanent, flowing, self-manifesting; that the universe is the result of mind; that nature is the symbol of mind; that finite minds live and act through concurrence with infinite mind. His second is the connection of the individual intellect with the primal mind and its ability to draw thence wisdom, will, virtue, prudence, heroism, all active and passive qualities. In his essays, which are prose poems, he lays incessant emphasis on the cardinal virtues of humility, sincerity, obedience, aspiration, and acquiescence to the will of the Supreme Power, and he sustains the mind at an elevation that makes the heights of accepted morality disappear in the level of the plain. With many inconsistencies to be allowed for, Emerson still remains the highest mind that the world of letters has produced in America, inspiring men by word and example, rebuking their despondency, awakening them from the slumber of conformity and convention, and lifting them from low thoughts and sullen moods of helplessness and impiety. Among other writers identified with the Transcendental movement in New England are O. B. Frothingham, Orestes A. Brownson, James Freeman Clarke, William H. Channing, Henry Thoreau, John S. Dwight, C. P. Cranch, W. E. Channing, T. W. Higginson, C. A. Bartol, D. A. Wasson, John Weiss, and Samuel Longfellow.

6. MISCELLANEOUS WRITINGS.--Of the essayists, critics, and miscellaneous writers of the United States, a few only may be here characterized. Parke Godwin is a brilliant political essayist. E. P. Whipple is an able critic and an essayist of great acuteness, insight, and logical power. H. T. Tuckerman is a genial and appreciative writer, combining extensive scholarship with elevated sentiment and feeling. Richard Grant White's "Commentaries on Shakspeare" have met with a cordial reception from all Shakspearean scholars. Oliver Wendell Holmes conceals under the garb of wit and humor an earnest sympathy and a deep knowledge of human nature; George W. Curtis combines fine powers of observation and satire with delicacy of taste and refinement of feeling; and Donald G. Mitchell gives to the world his "Reveries" in a pleasing and attractive manner. The writings of A. J. Downing, on subjects relating to rural life and architecture, have exercised a wide and salutary influence on the taste of the country. Willis Gaylord Clark (1810-1841) is best remembered by his "Ollapodiana" and his occasional poems, in which humor and pathos alternately prevail. The "Charcoal Sketches" of Joseph C. Neal (1807-1847) exhibit a genial humor, and will be remembered for the curious specimens of character they embody. Seba Smith has been most successful in adapting the Yankee dialect to the purposes of humorous writing in his "Jack Downing's Letters" and other productions. The writings of Henry D. Thoreau, combining essay and description, are quaint and humorous, while those of "Timothy Titcomb" (J.G. Holland) are addressed to the practical common sense of the American people. Charles T. Brooks (d. 1883) is distinguished for his felicitous translations from the German poets and writers. The writings of George D. Prentice abound in wit and humor. W.H. Hurlburt is an able expositor of political affairs and a brilliant descriptive writer.

7. ENCYCLOPAEDIAS, DICTIONARIES, AND EDUCATIONAL BOOKS. The Encyclopaedia Americana, the first work of the kind undertaken in America, appeared in 1829, under the auspices of Dr. Lieber, and contains articles on almost every subject of human knowledge. The New American Cyclopaedia, edited by George Ripley and Charles A. Dana, is a work on a larger and more original plan, and is particularly valuable as the repository of all knowledge bearing upon American civilization, while at the same time it embodies a great amount of interesting and valuable information on all subjects. Allibone's "Dictionary of English Authors," completed in four large volumes, exceeds all similar works in the number of authors it describes and the details it contains. Among the works containing abundant materials for the history of American literature are the several volumes of Rufus W. Griswold, the "Cyclopaedia of American Literature," by G.L. and E.A. Duyckinck, and other collections or sketches by Hart, Cleveland, Tuckerman, Everest, and Caroline May. The Dictionary of Noah Webster (1778-1843), an elaborate and successful undertaking, has exercised an influence over the English language which will probably endure for generations. The more recent publication of Worcester's Dictionary, which adds many thousand words to the registered English vocabulary, marks an epoch in the history of the language. It is regarded by competent critics as the first of all English dictionaries in point of merit, and as the fitting representative of the language of the two great branches of the Anglican stock. The "Lectures on the English Language," by George P. Marsh, exhibit a thorough knowledge of the subject, and are admirably designed to render the study attractive to all persons of taste and culture. The scholars of Europe are much indebted to those of America for their investigations of the Karen, the Siamese, Asamese, Chinese, and numerous African languages; and for grammars and dictionaries of the Burmese, Chinese, the Hawaiian, and the modern Armenian, Syrian, and Chaldee tongues. Foreign and comparatively unknown languages have thus been reduced to a system and grammar by which they can readily be acquired by Europeans. Many valuable works have also appeared on the language of the American Indians. The text-books of the United States are unsurpassed by those of any country, and many of them are in use in England. Among them are Anthon's admirable series of Latin and Greek Classics and Classical Dictionary, Robinson's Hebrew and English Dictionary of Gesenius, and the Latin and English Dictionary of Andrews, founded on the celebrated work of Freund. Felton's "Classical Studies," and his various editions of the classics, have been ably prepared and evince a scholar's enthusiasm. Henry Barnard, by his "Journal of Education" and numerous other writings, is identified with the cause of popular education and has acquired an extensive reputation in Europe and the United States. Horace Mann is also widely known through his "Reports" on education; and in the practical carrying out of profound liberal and national views in our colleges, Presidents Nott, Tappan, Wayland, Sears, King, and Barnard have been eminently successful.

8. THEOLOGY, PHILOSOPHY, ECONOMY, AND JURISPRUDENCE. It is generally conceded that the theological writers of this country are among the ablest of modern times, and the diversity of sects, a curious and striking fact in our social history, is fully illustrated by the literary organs of each denomination, from the spiritual commentaries of Bush to the ardent Catholicism of Brownson. The works of Moses Stuart (1780-1852), Edward Robinson, Francis Wayland, and Albert Barnes are standard authorities with all classes of Protestant Christians. William Ellery Channing (1780-1842) achieved a wide reputation for genius in ethical literature, and as a moral essayist will hold a permanent place in English letters. Among other members of the clerical profession who have had a marked influence on the mind of the age by their scholarship or eloquence are Drs. Hickok, C.S. Henry, Tappan, H.B. Smith, Hitchcock, W.R. Williams, Alexander, Bethune, Hawks, Sprague, Bushnell, Thompson, Tyng, Bartol, Dewey, Norton, Frothingham, Osgood, Chapin, Bellows, Furness, Livermore, Ware, Peabody, and Henry Ward Beecher. The philosophical writings of Dr. Tappan, the author of a "Treatise on the Will" and a work on the "Elements of Logic," those of C.S. Henry, Wayland, Hickok, and Haven have an extensive reputation; and of the various works on political economy those of Henry C. Carey are most widely known. Most prominent among the writings of American jurists are those of Kent, Wheaton, Story, Livingston, Lawrence, and Bouvier. Kent's (1768-1847) "Commentaries" on American Law at once took a prominent place in legal literature, and are now universally considered of the highest authority. Of Wheaton's (1785-1848) great works on International Law, it is sufficient to say that one has been formally adopted by the University of Cambridge, England, as the best work of its kind extant, and as a manual for tuition by the professors of legal science. Among modern legal writers, Story (1779-1845) occupies a distinguished position. His "Commentaries" have acquired a European reputation, and have been translated into French and German. Livingston's (1764-1833) "System of Penal Laws for the United States," since its publication in 1828, has materially modified the penal laws of the world, and may be considered the first complete penal system based upon philanthropy, and designed to substitute mildness for severity in the punishment of criminals. Bouvier's "Institutes of American Law" and "Dictionary of Law" are considered as among the best works of their kind, both in the United States and Europe. Other branches of legal research have been treated in a masterly manner by American writers, and many authors might be named whose works take a high rank in both hemispheres.

9. NATURAL SCIENCES.--The physical sciences, from an early period, have found able investigators in the United States. Benjamin Thompson (Count Rumford) successfully applied his knowledge to increase the convenience, economy, and comfort of mankind. Franklin's discoveries in electricity, the most brilliant which had yet been made, have been followed by those of Morse, whose application of that power to the telegraphic wire is one of the most wonderful achievements of modern science. Fitch and Fulton were the first to apply steam to navigation, a force which has become one of the most powerful levers of civilization. In chemistry the works of Hare, Silliman, Henry, Hunt, and Morfit are equally honorable to themselves and the country. The names of Dana, Hitchcock, Hall, the brothers Rogers, Eaton, Hodge, Owen, and Whitney are identified with the science of geology in the United States. The names of Torrey and Gray are eminent in botany, and the writings of the latter especially rank among the most valuable botanical works of the age. The mathematical sciences have found able expounders. The merits of Dr. Bowditch (1773-1838) entitle him to a high rank among the mathematicians of the world. His *Commentary on the "Mécanique Céleste" of La Place*, which he translated, is an original work, and contains many discoveries of his own. His *"Practical Navigator"* is the universally adopted guide in the American marine, and to a great extent in the naval service of England and France. In mathematics as well as astronomy, Peirce and Hill have shown themselves able investigators. Bache, of the United States Coast Survey, has made many valuable contributions to physical science. The astronomical works of Professors Loewis, Gould, Norton, Olmsted, and Mitchell hold a high position in the United States and Europe; and valuable astronomical observations have been made by Lieutenants Maury and Gillies, and Maria Mitchell. In natural history, Holbrook's *"North American Herpetology,"* or a description of the reptiles of the United States, is a work of great magnitude, and sustains a high scientific reputation. Audubon's (1780- 1851) *"Birds of America"* is the most magnificent work on ornithology ever published. Since the death of Audubon, the subject to which he devoted his life has been pursued by Cassin and Girard, who rank with him as naturalists. Goodrich's *"Animal Kingdom"* is a recent popular work in this department. The *"Crania Americana"* of Dr. Morton, the *"Crania Egyptiaca"* of Gliddon, and the *"Types of Mankind,"* the joint production of the above writers and Dr. Nott, are important contributions to the department of ethnology. De Vere and Dwight are eminent writers on philology; Jarvis, Hough, Tucker, De Bow, Kennedy, and Wynne, on statistics. Medical literature has been ably illustrated, and American writers on naval and military affairs have contributed largely to the effectiveness of modern warfare. Geographical knowledge has been greatly increased. Many explorations and publications have been made under the patronage of the government, and many excellent maps and charts have been executed from actual surveys. The *Wind Charts* and other works of Lieutenant Maury have greatly advanced the science of navigation, and his *"Physical Geography of the Sea"* has revealed the mysteries of the submarine world with graphic power.

10. FOREIGN WRITERS.--Many foreign writers in the United States, some of whom have had their tastes formed here, and are essentially American in principle and feeling, have contributed to the literature of the country. The celebrated Bishop Berkeley (1684-1753), whose prophetic verses on America are so often quoted, brought with him the prestige which attached to high literary reputation, and had an influence on the progress of literature in the colonies. His *"Minute Philosopher"* contains many passages descriptive of the scene at Newport, in the midst of which it was written. Thomas Paine (1736-1809) wrote his pamphlet entitled *"Common Sense,"* and his *"Crisis,"* in America, the former of which, especially, powerfully affected the political condition of the country. John Witherspoon (1722-1794), lineal descendant of John Knox, was the author of many religious works, and of some valuable political essays. Susanna Rowson (1762-1824) was the author of *"Charlotte Temple,"* a novel which had extraordinary success in its day, and of many books of less fame. Joseph Priestley (1733-1804) wrote and published many of his most valuable works in the United States. His friend Thomas Cooper (1759-1840) was one of the most active minds of the age, and his religious, political, and scientific writings were not without their influence on the national literature. *"The American Ornithology"* of Alexander Wilson (1766-1813), a native of Scotland, is second only to the great work of Audubon. The names of Matthew Carey, Peter Duponceau, and Albert Gallatin are also honorably associated with American letters. Of the more recent writers, Dr. Lieber has done much for the advancement of political and philosophical science in the United States. The names of Agassiz, father and son, and Guyot, prominent among the scientific investigators of the age, are indissolubly connected with science in America; and Drs. Draper and Dunglison have made valuable contributions to the medical literature of the world. Count A. de Gurowski, an able scholar, has published a work on *"Russia as it is,"* and another on *"America and Europe."* Mrs. Robinson's various works entitle her to high distinction in the more grave as well as the lighter departments of literature. Professor Koeppen has written two valuable works on the *"World in the Middle Ages."* Dr. Brunow has brought a European reputation to the aid of one of our Western universities. Henry Giles has gained distinction by

his essays and criticisms, and Henry William Herbert by his novels and miscellaneous writings. Many other foreign men of letters might be named, who, in various ways, aid the development of the national literature.

11. NEWSPAPERS AND PERIODICALS.--One of the most powerful engines in creating a taste for literature among the people of the United States is the newspaper and periodical press. Every interest, every social and political doctrine has its organ, and every village has its newspaper; not devoted solely to special, local, or even to national topics, but registering the principal passing events of the actual as well as of the intellectual world, and in this respect differing essentially from the press of all other countries. These papers are offered at so small a price as to place them within the reach of all; and in a country where every one reads, the influence of such a power as a public educator, in stimulating and diffusing mental activity, and in creating cosmopolitan interests, can scarcely be comprehended in its full significance. While there is much in these publications that is necessarily of an evanescent character, and much that might perhaps be better excluded, it cannot be denied that the best of our daily and weekly papers often contain literary matter which in a less fugitive form would become a permanent and valuable contribution to the national literature. The magazines and reviews of the United States take a worthy place beside those of Great Britain, and present a variety of reading which exhibits at once the versatility of the people and the cosmopolitan tendency of the literature which addresses itself to the sympathies of the most diversified classes of readers. Among the quarterly reviews, the *North American* occupies a prominent position. It is associated with the earliest dawnings of the national literature, and in the list of its contributors is found almost every name of note in American letters. The *Scientific American* and the *Popular Science Monthly* are the most eminent of the scientific periodicals; the *Bibliotheca Sacra*, the *Andover* and *Princeton Reviews*, the *Christian Union*, the *Independent*, the *Churchman* are among the ablest religious journals. With the decease of H.S. Legaré, one of the most finished scholars of the South, the *Southern Quarterly*, which had been indebted to his pen for many of its ablest articles, ceased its existence. *Putnam's Magazine* was long the medium of the most valuable and interesting fugitive literature; and the *Atlantic Monthly*, which has succeeded it, is under the auspices of the most eminent men of letters in New England, and has become the nucleus of a number of young and able writers. The *Magazine of American History* is the repository of much valuable information and many curious incidents in the history of the country. *Harper's Magazine* and the *Century* are periodicals of high literary character and of wide circulation both in this country and in England. They have by means of their illustrations done much to advance and develop the art of engraving. The language of American literature being that of England, its early productions were naturally modeled after those of the mother-country. But the cosmopolitan elements of which the nation is composed, and the peculiar influences of American civilization in holding out to the human race opportunities and destinies unparalleled in history, are rapidly developing a distinct national character which in the future must be reflected in American literature, and cannot fail to produce great results. This at least is the belief of all those who have faith in humanity and in the spirit which laid the foundation of our Republic.

12. SINCE 1800.--The period intervening between 1860 and 1885 has not been marked by any important literary development. In the great war for the support of the institution of slavery on one hand and for national existence on the other, history was enacted rather than written, and the sudden and rapid development of material interests succeeding the war have absorbed, to a great extent, the energies of the people. Many histories of special occurrences of the war have since appeared, and many biographies of those who played prominent parts in it, and when time shall have given these, and the great events they commemorate, their true perspective, the poet, novelist, and historian of the future will find in them ample material for a truly national literature. Among the poets of the time only a few of the more prominent can be named. Bayard Taylor (1825-1878) is equally distinguished as a poet and prose writer of fiction and travels. His translation of *Faust* in the original metre is accepted as the best representation of the German master in the English tongue, and apart from its merits as a translation, it has added to the literature by the beauty and power of its versification. His poem of "*Deukalion*" shows great originality and power of imagination. Richard H. Stoddard (b. 1825) is a poet and critic, equally distinguished in both departments. Edmund C. Stedman (b. 1833) is known by his translations from the Greek poets and his original poems marked by vigor and spontaneity of thought, poetic power, and precision in art. His critical volume on the Victorian poets is notable for dispassionate, conscientious, and skillful and sympathetic criticism. Walt Whitman (b. 1819) writes with great force, originality, and sympathy with all forms of struggle and suffering, but with utter contempt for conventionalities and for the acknowledged limits of true art. Richard W. Gilder has a delicate fancy and power of poetic expression. William Winter, as a writer of occasional verses, has rare felicity of thought and execution. William W. Story adds to his many other gifts those of a true poet. Charles De Kay is the author of many poems original in conception and execution. Thomas Bailey Aldrich has written much dainty and musical verse and several successful novels. Will Carleton, the author of "*Farm Ballads*," displays a keen sympathy for the harder phases of

common life. Charles G. Leland, in prose and humorous poetry, is widely read, and known also by his efforts to introduce industrial art into schools. Henry Howard Brownell is the author of "War Lyrics," among the best of their kind. Edgar Fawcett is equally known as a poet and novelist. Joaquin Miller, in his poems, gives pictures of lawless and adventurous life. Of the many distinguished women in contemporary American literature only a few can here be named. Helen Jackson (H. H.) is a brilliant prose writer and a poet of originality and power. She is the author of many essays and works of fiction, and of an exhaustive work on the Indian question. Emma Lazarus has written many poems of a high order. Annie Fields recalls the spirit and imagination of the Greek mythology. Edith M. Thomas, in her poems, shows high culture, originality, and imagination. Those of Lucy Larcom belong to every-day life, and are truthful and pathetic. Mary Mapes Dodge is a charming writer of tales and poems for children, and of other poems, Celia Thaxter dwells on the picturesque features of nature on sea and land. Julia Dorr in her novels and poems gives proof of great versatility of talents. Ellen Hutchinson is a writer of imaginative and musical verses. Elizabeth Stoddard is the author of several powerful novels and of some fine poems. Of equal merit are the productions of Louise Chandler Moulton, Nora Perry, Edna Dean Proctor, S. M. B. Piatt, Margaret Preston, Harriet Preston, Elizabeth Akers Allen, Sarah Woolsey (Susan Coolidge), Laura Johnson, Mary Clemmer, Mary C. Bradley, Kate Putnam Osgood, Harriet Kimball, Marian Douglas, Mary Prescott, Laura C. Redden. In prose Frances Hodgson Burnett is the author of many interesting novels and stories; Harriet Spofford, of original tales; Elizabeth Stuart Phelps, of popular and highly wrought novels; Adeline Whitney, of entertaining novels of every-day life; Rebecca Harding Davis, of powerful though sombre novels, of pictures of contemporary life, society, and thought; Louisa Alcott, of a series of charming New England stories for the young. Rose Terry Cooke, in her short stories, has presented many striking studies of New England life and character; and Sarah Orne Jewett deals with the same material in a manner both strong and refined. Julia Fletcher and Blanche Willis Howard have each written successful novels, and Constance Fenimore Woolson is the author of many vivid and well written tales. Mary A. Dudge (Gail Hamilton) is a writer on many subjects, sparkling, witty, aggressive; Clara Erskine Waters writes ably on art; Kate Field is a vigorous and brilliant writer in journalism, travels, and criticism.

FICTION.--Theodore Winthrop (1828-1861) fell an early sacrifice in the war. His descriptions of prairie life, his fresh and vigorous individualization of character and power of narrative indicate a vein of original genius which was foil of promise. William Dean Howells and Henry James are foremost as writers of the analytic and realistic school. Their studies of character are life-like and finished, their satire keen and good-natured. The romances of Julian Hawthorne deal with the marvelous and unreal. Bret Harte (b. 1839) presents us with vivid and lifelike pictures of wild Californian life, of the rude hate and love which prevail in an atmosphere of lawlessness, redeemed by touching exhibitions of gratitude and magnanimity. His dialect poems and those of John Hay enjoy a wide popularity. The latter will also be remembered for his "Castilian Days," a volume of fascinating studies of Spanish subjects. George W. Cable is known for his pictures of Creole life; Edward Eggleston, for his sketches of the shrewd and kindly humorous Western life. Albion Tourgée has been the first to avail himself in fiction of the political conditions growing out of the war. Joel Chandler Harris delineates the character, dialect, and peculiarities of the negro race in his "Sketches in Black and White," and Richard Malcolm Johnston has graphically described phases of Southern life which have almost passed away. F. Marion Crawford shows originality and promise in the novels he has so far given to the public; the same may be said of Arthur S. Hardy, George P. Lathrop, W.H. Bishop, Frank R. Stockton, and F.J. Stinson.

SCIENCE.--In astronomy, Young, Henry Draper, and Langley may be named; in geology, Dana and Leconte; in physiology, Flint and Dalton; Marsh, in palaeontology, and Leidy, in zöology; Professor Whitney is an able writer on philology and Oriental literature. Professor E.L. Youmans has organized the simultaneous publication, in this country, England, France, Germany, Italy, and Russia, of an international series of scientific works by the ablest living writers, which has proved eminently successful. Among the theologians representing various schools may be named, Philip Schaff, Roswell D. Hitchcock, Samuel Osgood, Henry W. Bellows, Frederick H. Hedge, Edward E. Hale, Newman Smyth, William R. Alger, and Octavius B. Frothingham.

MISCELLANEOUS.--John Fiske is an able and versatile thinker and an expounder of the philosophy of Herbert Spencer, and a writer on American history, and on the leading subjects of scientific thought. Charles Brace is the author of many volumes on various social problems. Moses Coit Tyler is a writer on American literature and history; Andrew D. White, on French history, and on science and religion. Professor McMaster's "History of the People of the United States" is considered a scholarly and picturesque work. Professor Lounsbury has written, in his "Cooper," one of the best of modern biographies. Charles Dudley Warner is distinguished by the great geniality and humor of his writings, alternately quaint, delicate, and pungent. The charm and purity of his diction recall the best school of English essayists. Paul Du Chaillu is widely known for his accounts of travel in Africa and elsewhere;

Moncure D. Conway, as a writer on social, literary, and artistic themes. John Burroughs is a close observer of nature; Eugene Schuyler is the author of a history of Peter the Great; Parkman throws much light on early American history; Parton is the author of many attractive biographies; Samuel Clemens (Mark Twain) is known for his humorous writings.

CONCLUSION.

In the preceding pages the progress of literature has been briefly traced through its various periods--from the time when its meagre records were confined to inscriptions engraved on stone, or inscribed on clay tablets or papyrus leaves, or in its later and more perfect development when, written on parchment, it was the possession of the learned few, hidden in libraries and so precious that a book was sometimes the ransom of a city-- till the invention of printing gave to the world the accumulated treasures of the past; and from that time to the present, when the press has poured forth from year to year an ever increasing succession of books, the records of human thought, achievement, and emotion which constitute literature. The question here naturally arises as to whether the human mind has now reached its highest development in this direction, whether it is henceforth to retrograde or to advance. It was only towards the close of the last century that the idea of human progress gained ground, after the American and French revolutions had broken down old barriers, inaugurated new systems, inspired new hopes, and revealed new possibilities. What was then but a feeble sentiment, later advances in the direction of science have confirmed. Among them are the discovery of the correlation and conservation of force, according to Faraday the highest law which our faculties permit us to perceive; the spectroscope, that gives the chemist power to analyze the stars; the microscope, that lays bare great secrets of nature, and almost penetrates the mystery of life itself; the application of steam and electricity, that puts all nations into communication and binds mankind together with nerves of steel; above all, the theory of evolution, which opens to man an almost illimitable vista of progress and development. It is true that these great intellectual triumphs of the nineteenth century are all in the direction of science; but literature in its true sense embraces both science and art; science which discovers through the intellect, and art which transmutes, through the imagination, knowledge and emotion into beauty. When the stupendous discoveries of our time have been fully recognized and appreciated and followed, as they doubtless will be, by a long series of others equally great, a higher order of thought must follow, and literature, which, is but the reflection of the thought of any age, cannot but be in harmony with it. This consummation more than one poet, with the prescience of genius, has already foretold. "Poetry," says Wordsworth, "is the first and last of all knowledge, immortal as the heart of man. If the labors of men of science should ever create any material revolution, direct or indirect, in our condition and in the impressions we habitually receive, the poet will sleep no more then than at present; he will be ready to follow the steps of the man of science, and if the time should ever come when what is now called science shall be ready to put on, as it were, a form of flesh and blood, the poet will lend his divine spirit to aid the transfiguration." "The sublime and all reconciling revelations of nature," writes Emerson, "will exact of poetry a corresponding height and scope, or put an end to it." George Eliot says,-- "Presentiment of better things on earth Sweeps in with every force that stirs our souls." Throughout the verse of Tennyson the idea of progress is variously expressed. He dreams of a future "When the war-drum throbs no longer and the battle-flags are furled." "When comes the statelier Eden back to man." "When springs the crowning race of human kind." Thus the inspirations of poetry not less than the conclusions of science indicate that we must look for the Golden Age, not in a mythical past, but in an actual though far-off future.

3. 19th Century: Gilbert Keith Chesterton. *The Victorian Age in Literature*

Introduction

The Victorian Age in Literature

A section of a long and splendid literature can be most conveniently treated in one of two ways. It can be divided as one cuts a currant cake or a Gruyère cheese, taking the currants (or the holes) as they come. Or it can be divided as one cuts wood--along the grain: if one thinks that there is a grain. But the two are never the same: the names never come in the same order in actual time as they come in any serious study of a spirit or a tendency. The critic who wishes to move onward with the life of an epoch, must be always running backwards and forwards among its mere dates; just as a branch bends back and forth continually; yet the grain in the branch runs true like an unbroken river. Mere chronological order, indeed, is almost as arbitrary as alphabetical order. To deal with Darwin, Dickens, Browning, in the sequence of the birthday book would be to forge about as real a chain as the "Tacitus, Tolstoy, Tupper" of a biographical dictionary. It might lend itself more, perhaps, to accuracy: and it might satisfy that school of critics who hold that every artist should be treated as a solitary craftsman, indifferent to the commonwealth and unconcerned about moral things. To write on that principle in the present case, however, would involve all those delicate difficulties, known to politicians, which beset the public defence of a doctrine which one heartily disbelieves. It is quite needless here to go into the old "art for art's sake"--business, or explain at length why individual artists cannot be reviewed without reference to their traditions and creeds. It is enough to say that with other creeds they would have been, for literary purposes, other individuals. Their views do not, of course, make the brains in their heads any more than the ink in their pens. But it is equally evident that mere brain-power, without attributes or aims, a wheel revolving in the void, would be a subject about as entertaining as ink. The moment we differentiate the minds, we must differentiate by doctrines and moral sentiments. A mere sympathy for democratic merry-making and mourning will not make a man a writer like Dickens. But without that sympathy Dickens would not be a writer like Dickens; and probably not a writer at all. A mere conviction that Catholic thought is the clearest as well as the best disciplined, will not make a man a writer like Newman. But without that conviction Newman would not be a writer like Newman; and probably not a writer at all. It is useless for the aesthete (or any other anarchist) to urge the isolated individuality of the artist, apart from his attitude to his age. His attitude to his age is his individuality: men are never individual when alone. It only remains for me, therefore, to take the more delicate and entangled task; and deal with the great Victorians, not only by dates and names, but rather by schools and streams of thought. It is a task for which I feel myself wholly incompetent; but as that applies to every other literary enterprise I ever went in for, the sensation is not wholly novel: indeed, it is rather reassuring than otherwise to realise that I am now doing something that nobody could do properly. The chief peril of the process, however, will be an inevitable tendency to make the spiritual landscape too large for the figures. I must ask for indulgence if such criticism traces too far back into politics or ethics the roots of which great books were the blossoms; makes Utilitarianism more important than Liberty or talks more of the Oxford Movement than of The Christian Year. I can only answer in the very temper of the age of which I write: for I also was born a Victorian; and sympathise not a little with the serious Victorian spirit. I can only answer, I shall not make religion more important than it was to Keble, or politics more sacred than they were to Mill.

CHAPTER I

THE VICTORIAN COMPROMISE AND ITS ENEMIES

The previous literary life of this country had left vigorous many old forces in the Victorian time, as in our time. Roman Britain and Mediæval England are still not only alive but lively; for real development is not leaving things behind, as on a road, but drawing life from them, as from a root. Even when we improve we never progress. For progress, the metaphor from the road, implies a man leaving his home behind him: but improvement means a man exalting the towers or extending the gardens of his home. The ancient English literature was like all the several literatures of Christendom, alike in its likeness, alike in its very unlikeness. Like all European cultures, it was European; like all European cultures, it was something more than European. A most marked and unmanageable national temperament is plain in Chaucer and the ballads of Robin Hood; in spite of deep and sometimes disastrous changes of national policy, that note is still unmistakable in Shakespeare, in Johnson and his friends, in Cobbett, in Dickens. It is vain to dream of defining such vivid things; a national soul is as indefinable as a smell, and as unmistakable. I remember a friend who tried impatiently to explain the word "mistletoe" to a German, and cried at

last, despairing, "Well, you know holly--mistletoe's the opposite!" I do not commend this logical method in the comparison of plants or nations. But if he had said to the Teuton, "Well, you know Germany--England's the opposite"--the definition, though fallacious, would not have been wholly false. England, like all Christian countries, absorbed valuable elements from the forests and the rude romanticism of the North; but, like all Christian countries, it drank its longest literary draughts from the classic fountains of the ancients: nor was this (as is so often loosely thought) a matter of the mere "Renaissance." The English tongue and talent of speech did not merely flower suddenly into the gargantuan polysyllables of the great Elizabethans; it had always been full of the popular Latin of the Middle Ages. But whatever balance of blood and racial idiom one allows, it is really true that the only suggestion that gets near the Englishman is to hint how far he is from the German. The Germans, like the Welsh, can sing perfectly serious songs perfectly seriously in chorus: can with clear eyes and clear voices join together in words of innocent and beautiful personal passion, for a false maiden or a dead child. The nearest one can get to defining the poetic temper of Englishmen is to say that they couldn't do this even for beer. They can sing in chorus, and louder than other Christians: but they must have in their songs something, I know not what, that is at once shamefaced and rowdy. If the matter be emotional, it must somehow be also broad, common and comic, as "Wapping Old Stairs" and "Sally in Our Alley." If it be patriotic, it must somehow be openly bombastic and, as it were, indefensible, like "Rule Britannia" or like that superb song (I never knew its name, if it has one) that records the number of leagues from Ushant to the Scilly Isles. Also there is a tender love-lyric called "O Tarry Trousers" which is even more English than the heart of The Midsummer Night's Dream. But our greatest bards and sages have often shown a tendency to rant it and roar it like true British sailors; to employ an extravagance that is half conscious and therefore half humorous. Compare, for example, the rants of Shakespeare with the rants of Victor Hugo. A piece of Hugo's eloquence is either a serious triumph or a serious collapse: one feels the poet is offended at a smile. But Shakespeare seems rather proud of talking nonsense: I never can read that rousing and mounting description of the storm, where it comes to-- "Who take the ruffian billows by the top, Curling their monstrous heads, and hanging them With deafening clamour in the slippery clouds." without seeing an immense balloon rising from the ground, with Shakespeare grinning over the edge of the car, and saying, "You can't stop me: I am above reason now." That is the nearest we can get to the general national spirit, which we have now to follow through one brief and curious but very national episode. Three years before the young queen was crowned, William Cobbett was buried at Farnham. It may seem strange to begin with this great neglected name, rather than the old age of Wordsworth or the young death of Shelley. But to any one who feels literature as human, the empty chair of Cobbett is more solemn and significant than the throne. With him died the sort of democracy that was a return to Nature, and which only poets and mobs can understand. After him Radicalism is urban--and Toryism suburban. Going through green Warwickshire, Cobbett might have thought of the crops and Shelley of the clouds. But Shelley would have called Birmingham what Cobbett called it--a hell-hole. Cobbett was one with after Liberals in the ideal of Man under an equal law, a citizen of no mean city. He differed from after Liberals in strongly affirming that Liverpool and Leeds are mean cities. It is no idle Hibernianism to say that towards the end of the eighteenth century the most important event in English history happened in France. It would seem still more perverse, yet it would be still more precise, to say that the most important event in English history was the event that never happened at all--the English Revolution on the lines of the French Revolution. Its failure was not due to any lack of fervour or even ferocity in those who would have brought it about: from the time when the first shout went up for Wilkes to the time when the last Luddite fires were quenched in a cold rain of rationalism, the spirit of Cobbett, of rural republicanism, of English and patriotic democracy, burned like a beacon. The revolution failed because it was foiled by another revolution; an aristocratic revolution, a victory of the rich over the poor. It was about this time that the common lands were finally enclosed; that the more cruel game laws were first established; that England became finally a land of landlords instead of common land-owners. I will not call it a Tory reaction; for much of the worst of it (especially of the land-grabbing) was done by Whigs; but we may certainly call it Anti-Jacobin. Now this fact, though political, is not only relevant but essential to everything that concerned literature. The upshot was that though England was full of the revolutionary ideas, nevertheless there was no revolution. And the effect of this in turn was that from the middle of the eighteenth century to the middle of the nineteenth the spirit of revolt in England took a wholly literary form. In France it was what people did that was wild and elemental; in England it was what people wrote. It is a quaint comment on the notion that the English are practical and the French merely visionary, that we were rebels in arts while they were rebels in arms. It has been well and wittily said (as illustrating the mildness of English and the violence of French developments) that the same Gospel of Rousseau which in France produced the Terror, in England produced Sandford and Merton. But people forget that in literature the English were by no means restrained by Mr. Barlow; and that if we turn from politics to art, we shall find the two parts peculiarly reversed. It would be equally true to say that the same eighteenth-century emancipation which in France produced the pictures of David, in England produced the pictures of Blake. There never were, I think, men who gave to the imagination so

much of the sense of having broken out into the very borderlands of being, as did the great English poets of the romantic or revolutionary period; than Coleridge in the secret sunlight of the Antarctic, where the waters were like witches' oils; than Keats looking out of those extreme mysterious casements upon that ultimate sea. The heroes and criminals of the great French crisis would have been quite as incapable of such imaginative independence as Keats and Coleridge would have been incapable of winning the battle of Wattignies. In Paris the tree of liberty was a garden tree, clipped very correctly; and Robespierre used the razor more regularly than the guillotine. Danton, who knew and admired English literature, would have cursed freely over *Kubla Khan*; and if the Committee of Public Safety had not already executed Shelley as an aristocrat, they would certainly have locked him up for a madman. Even Hébert (the one really vile Revolutionist), had he been reproached by English poets with worshipping the Goddess of Reason, might legitimately have retorted that it was rather the Goddess of Unreason that they set up to be worshipped. Verbally considered, Carlyle's *French Revolution* was more revolutionary than the real French Revolution: and if Carrier, in an exaggerative phrase, empurpled the Loire with carnage, Turner almost literally set the Thames on fire. This trend of the English Romantics to carry out the revolutionary idea not savagely in works, but very wildly indeed in words, had several results; the most important of which was this. It started English literature after the Revolution with a sort of bent towards independence and eccentricity, which in the brighter wits became individuality, and in the duller ones, Individualism. English Romantics, English Liberals, were not public men making a republic, but poets, each seeing a vision. The lonelier version of liberty was a sort of aristocratic anarchism in Byron and Shelley; but though in Victorian times it faded into much milder prejudices and much more *bourgeois* crotchets, England retained from that twist a certain odd separation and privacy. England became much more of an island than she had ever been before. There fell from her about this time, not only the understanding of France or Germany, but to her own long and yet lingering disaster, the understanding of Ireland. She had not joined in the attempt to create European democracy; nor did she, save in the first glow of Waterloo, join in the counter-attempt to destroy it. The life in her literature was still, to a large extent, the romantic liberalism of Rousseau, the free and humane truisms that had refreshed the other nations, the return to Nature and to natural rights. But that which in Rousseau was a creed, became in Hazlitt a taste and in Lamb little more than a whim. These latter and their like form a group at the beginning of the nineteenth century of those we may call the Eccentrics: they gather round Coleridge and his decaying dreams or linger in the tracks of Keats and Shelley and Godwin; Lamb with his bibliomania and creed of pure caprice, the most unique of all geniuses; Leigh Hunt with his Bohemian impecuniosity; Landor with his tempestuous temper, throwing plates on the floor; Hazlitt with his bitterness and his low love affair; even that healthier and happier Bohemian, Peacock. With these, in one sense at least, goes De Quincey. He was, unlike most of these embers of the revolutionary age in letters, a Tory; and was attached to the political army which is best represented in letters by the virile laughter and leisure of Wilson's *Noctes Ambrosianæ*. But he had nothing in common with that environment. It remained for some time as a Tory tradition, which balanced the cold and brilliant aristocracy of the Whigs. It lived on the legend of Trafalgar; the sense that insularity was independence; the sense that anomalies are as jolly as family jokes; the general sense that old salts are the salt of the earth. It still lives in some old songs about Nelson or Waterloo, which are vastly more pompous and vastly more sincere than the cockney cocksureness of later Jingo lyrics. But it is hard to connect De Quincey with it; or, indeed, with anything else. De Quincey would certainly have been a happier man, and almost certainly a better man, if he had got drunk on toddy with Wilson, instead of getting calm and clear (as he himself describes) on opium, and with no company but a book of German metaphysics. But he would hardly have revealed those wonderful vistas and perspectives of prose, which permit one to call him the first and most powerful of the decadents: those sentences that lengthen out like nightmare corridors, or rise higher and higher like impossible eastern pagodas. He was a morbid fellow, and far less moral than Burns; for when Burns confessed excess he did not defend it. But he has cast a gigantic shadow on our literature, and was as certainly a genius as Poe. Also he had humour, which Poe had not. And if any one still smarting from the pinpricks of Wilde or Whistler, wants to convict them of plagiarism in their "art for art" epigrams--he will find most of what they said better in *Murder as One of the Fine Arts*. One great man remains of this elder group, who did their last work only under Victoria; he knew most of the members of it, yet he did not belong to it in any corporate sense. He was a poor man and an invalid, with Scotch blood and a strong, though perhaps only inherited, quarrel with the old Calvinism; by name Thomas Hood. Poverty and illness forced him to the toils of an incessant jester; and the revolt against gloomy religion made him turn his wit, whenever he could, in the direction of a defence of happier and humaner views. In the long great roll that includes Homer and Shakespeare, he was the last great man who really employed the pun. His puns were not all good (nor were Shakespeare's), but the best of them were a strong and fresh form of art. The pun is said to be a thing of two meanings; but with Hood there were three meanings, for there was also the abstract truth that would have been there with no pun at all. The pun of Hood is underrated, like the "wit" of Voltaire, by those who forget that the words of Voltaire were not pins, but swords. In Hood at his best the verbal neatness only gives to the satire or the scorn a ring

of finality such as is given by rhyme. For rhyme does go with reason, since the aim of both is to bring things to an end. The tragic necessity of puns tautened and hardened Hood's genius; so that there is always a sort of shadow of that sharpness across all his serious poems, falling like the shadow of a sword. "Sewing at once with a double thread a shroud as well as a shirt"--"We thought her dying when she slept, and sleeping when she died"--"Oh God, that bread should be so dear and flesh and blood so cheap"--none can fail to note in these a certain fighting discipline of phrase, a compactness and point which was well trained in lines like "A cannon-ball took off his legs, so he laid down his arms." In France he would have been a great epigrammatist, like Hugo. In England he is a punster. There was nothing at least in this group I have loosely called the Eccentrics that disturbs the general sense that all their generation was part of the sunset of the great revolutionary poets. This fading glamour affected England in a sentimental and, to some extent, a snobbish direction; making men feel that great lords with long curls and whiskers were naturally the wits that led the world. But it affected England also negatively and by reaction; for it associated such men as Byron with superiority, but not with success. The English middle classes were led to distrust poetry almost as much as they admired it. They could not believe that either vision at the one end or violence at the other could ever be practical. They were deaf to that great warning of Hugo: "You say the poet is in the clouds; but so is the thunderbolt." Ideals exhausted themselves in the void; Victorian England, very unwisely, would have no more to do with idealists in politics. And this, chiefly, because there had been about these great poets a young and splendid sterility; since the pantheist Shelley was in fact washed under by the wave of the world, or Byron sank in death as he drew the sword for Hellas. The chief turn of nineteenth-century England was taken about the time when a footman at Holland House opened a door and announced "Mr. Macaulay." Macaulay's literary popularity was representative and it was deserved; but his presence among the great Whig families marks an epoch. He was the son of one of the first "friends of the negro," whose honest industry and philanthropy were darkened by a religion of sombre smugness, which almost makes one fancy they loved the negro for his colour, and would have turned away from red or yellow men as needlessly gaudy. But his wit and his politics (combined with that dropping of the Puritan tenets but retention of the Puritan tone which marked his class and generation), lifted him into a sphere which was utterly opposite to that from which he came. This Whig world was exclusive; but it was not narrow. It was very difficult for an outsider to get into it; but if he did get into it he was in a much freer atmosphere than any other in England. Of those aristocrats, the Old Guard of the eighteenth century, many denied God, many defended Bonaparte, and nearly all sneered at the Royal Family. Nor did wealth or birth make any barriers for those once within this singular Whig world. The platform was high, but it was level. Moreover the upstart nowadays pushes himself by wealth: but the Whigs could choose their upstarts. In that world Macaulay found Rogers, with his phosphorescent and corpse-like brilliancy; there he found Sydney Smith, bursting with crackers of common sense, an admirable old heathen; there he found Tom Moore, the romantic of the Regency, a shortened shadow of Lord Byron. That he reached this platform and remained on it is, I say, typical of a turning-point in the century. For the fundamental fact of early Victorian history was this: the decision of the middle classes to employ their new wealth in backing up a sort of aristocratical compromise, and not (like the middle class in the French Revolution) insisting on a clean sweep and a clear democratic programme. It went along with the decision of the aristocracy to recruit itself more freely from the middle class. It was then also that Victorian "prudery" began: the great lords yielded on this as on Free Trade. These two decisions have made the doubtful England of to-day; and Macaulay is typical of them; he is the bourgeois in Belgravia. The alliance is marked by his great speeches for Lord Grey's Reform Bill: it is marked even more significantly in his speech against the Chartists. Cobbett was dead. Macaulay makes the foundation of the Victorian age in all its very English and unique elements: its praise of Puritan politics and abandonment of Puritan theology; its belief in a cautious but perpetual patching up of the Constitution; its admiration for industrial wealth. But above all he typifies the two things that really make the Victorian Age itself, the cheapness and narrowness of its conscious formulæ; the richness and humanity of its unconscious tradition. There were two Macaulays, a rational Macaulay who was generally wrong, and a romantic Macaulay who was almost invariably right. All that was small in him derives from the dull parliamentarism of men like Sir James Mackintosh; but all that was great in him has much more kinship with the festive antiquarianism of Sir Walter Scott. As a philosopher he had only two thoughts; and neither of them is true. The first was that politics, as an experimental science, must go on improving, along with clocks, pistols or penknives, by the mere accumulation of experiment and variety. He was, indeed, far too strong-minded a man to accept the hazy modern notion that the soul in its highest sense can change: he seems to have held that religion can never get any better and that poetry rather tends to get worse. But he did not see the flaw in his political theory; which is that unless the soul improves with time there is no guarantee that the accumulations of experience will be adequately used. Figures do not add themselves up; birds do not label or stuff themselves; comets do not calculate their own courses; these things are done by the soul of man. And if the soul of man is subject to other laws, is liable to sin, to sleep, to anarchism or to suicide, then all sciences including politics may fall as sterile and lie as fallow as before man's reason was made. Macaulay seemed sometimes to talk as if clocks produced

clocks, or guns had families of little pistols, or a penknife littered like a pig. The other view he held was the more or less utilitarian theory of toleration; that we should get the best butcher whether he was a Baptist or a Muggletonian, and the best soldier whether he was a Wesleyan or an Irvingite. The compromise worked well enough in an England Protestant in bulk; but Macaulay ought to have seen that it has its limitations. A good butcher might be a Baptist; he is not very likely to be a Buddhist. A good soldier might be a Wesleyan; he would hardly be a Quaker. For the rest, Macaulay was concerned to interpret the seventeenth century in terms of the triumph of the Whigs as champions of public rights; and he upheld this one-sidedly but not malignantly in a style of rounded and ringing sentences, which at its best is like steel and at its worst like tin. This was the small conscious Macaulay; the great unconscious Macaulay was very different. His noble enduring quality in our literature is this: that he truly had an abstract passion for history; a warm, poetic and sincere enthusiasm for great things as such; an ardour and appetite for great books, great battles, great cities, great men. He felt and used names like trumpets. The reader's greatest joy is in the writer's own joy, when he can let his last phrase fall like a hammer on some resounding name like Hildebrand or Charlemagne, on the eagles of Rome or the pillars of Hercules. As with Walter Scott, some of the best things in his prose and poetry are the surnames that he did not make. And it is remarkable to notice that this romance of history, so far from making him more partial or untrustworthy, was the only thing that made him moderately just. His reason was entirely one-sided and fanatical. It was his imagination that was well-balanced and broad. He was monotonously certain that only Whigs were right; but it was necessary that Tories should at least be great, that his heroes might have foemen worthy of their steel. If there was one thing in the world he hated it was a High Church Royalist parson; yet when Jeremy Collier the Jacobite priest raises a real banner, all Macaulay's blood warms with the mere prospect of a fight. "It is inspiring to see how gallantly the solitary outlaw advances to attack enemies formidable separately, and, it might have been thought, irresistible when combined; distributes his swashing blows right and left among Wycherley, Congreve and Vanbrugh, treads the wretched D'Urfey down in the dirt beneath his feet; and strikes with all his strength full at the towering crest of Dryden." That is exactly where Macaulay is great; because he is almost Homeric. The whole triumph turns upon mere names; but men are commanded by names. So his poem on the Armada is really a good geography book gone mad; one sees the map of England come alive and march and mix under the eye. The chief tragedy in the trend of later literature may be expressed by saying that the smaller Macaulay conquered the larger. Later men had less and less of that hot love of history he had inherited from Scott. They had more and more of that cold science of self-interests which he had learnt from Bentham. The name of this great man, though it belongs to a period before the Victorian, is, like the name of Cobbett, very important to it. In substance Macaulay accepted the conclusions of Bentham; though he offered brilliant objections to all his arguments. In any case the soul of Bentham (if he had one) went marching on, like John Brown; and in the central Victorian movement it was certainly he who won. John Stuart Mill was the final flower of that growth. He was himself fresh and delicate and pure; but that is the business of a flower. Though he had to preach a hard rationalism in religion, a hard competition in economics, a hard egoism in ethics, his own soul had all that silvery sensitiveness that can be seen in his fine portrait by Watts. He boasted none of that brutal optimism with which his friends and followers of the Manchester School expounded their cheery negations. There was about Mill even a sort of embarrassment; he exhibited all the wheels of his iron universe rather reluctantly, like a gentleman in trade showing ladies over his factory. There shone in him a beautiful reverence for women, which is all the more touching because, in his department, as it were, he could only offer them so dry a gift as the Victorian Parliamentary Franchise. Now in trying to describe how the Victorian writers stood to each other, we must recur to the very real difficulty noted at the beginning: the difficulty of keeping the moral order parallel with the chronological order. For the mind moves by instincts, associations, premonitions and not by fixed dates or completed processes. Action and reaction will occur simultaneously: or the cause actually be found after the effect. Errors will be resisted before they have been properly promulgated: notions will be first defined long after they are dead. It is no good getting the almanac to look up moonshine; and most literature in this sense is moonshine. Thus Wordsworth shrank back into Toryism, as it were, from a Shelleyan extreme of pantheism as yet disembodied. Thus Newman took down the iron sword of dogma to parry a blow not yet delivered, that was coming from the club of Darwin. For this reason no one can understand tradition, or even history, who has not some tenderness for anachronism. Now for the great part of the Victorian era the utilitarian tradition which reached its highest in Mill held the centre of the field; it was the philosophy in office, so to speak. It sustained its march of codification and inquiry until it had made possible the great victories of Darwin and Huxley and Wallace. If we take Macaulay at the beginning of the epoch and Huxley at the end of it, we shall find that they had much in common. They were both square-jawed, simple men, greedy of controversy but scornful of sophistry, dead to mysticism but very much alive to morality; and they were both very much more under the influence of their own admirable rhetoric than they knew. Huxley, especially, was much more a literary than a scientific man. It is amusing to note that when Huxley was charged with being rhetorical, he expressed his horror of "plastering the fair face of truth with that pestilent cosmetic, rhetoric," which is itself about as well-plastered a piece

of rhetoric as Ruskin himself could have managed. The difference that the period had developed can best be seen if we consider this: that while neither was of a spiritual sort, Macaulay took it for granted that common sense required some kind of theology, while Huxley took it for granted that common sense meant having none. Macaulay, it is said, never talked about his religion: but Huxley was always talking about the religion he hadn't got. But though this simple Victorian rationalism held the centre, and in a certain sense was the Victorian era, it was assailed on many sides, and had been assailed even before the beginning of that era. The rest of the intellectual history of the time is a series of reactions against it, which come wave after wave. They have succeeded in shaking it, but not in dislodging it from the modern mind. The first of these was the Oxford Movement; a bow that broke when it had let loose the flashing arrow that was Newman. The second reaction was one man; without teachers or pupils--Dickens. The third reaction was a group that tried to create a sort of new romantic Protestantism, to pit against both Reason and Rome--Carlyle, Ruskin, Kingsley, Maurice--perhaps Tennyson. Browning also was at once romantic and Puritan; but he belonged to no group, and worked against materialism in a manner entirely his own. Though as a boy he bought eagerly Shelley's revolutionary poems, he did not think of becoming a revolutionary poet. He concentrated on the special souls of men; seeking God in a series of private interviews. Hence Browning, great as he is, is rather one of the Victorian novelists than wholly of the Victorian poets. From Ruskin, again, descend those who may be called the Pre-Raphaelites of prose and poetry. It is really with this rationalism triumphant, and with the romance of these various attacks on it, that the study of Victorian literature begins and proceeds. Bentham was already the prophet of a powerful sect; Macaulay was already the historian of an historic party, before the true Victorian epoch began. The middle classes were emerging in a state of damaged Puritanism. The upper classes were utterly pagan. Their clear and courageous testimony remains in those immortal words of Lord Melbourne, who had led the young queen to the throne and long stood there as her protector. "No one has more respect for the Christian religion than I have; but really, when it comes to intruding it into private life----" What was pure paganism in the politics of Melbourne became a sort of mystical cynicism in the politics of Disraeli; and is well mirrored in his novels--for he was a man who felt at home in mirrors. With every allowance for aliens and eccentrics and all the accidents that must always eat the edges of any systematic circumference, it may still be said that the Utilitarians held the fort. Of the Oxford Movement what remains most strongly in the Victorian Epoch centres round the challenge of Newman, its one great literary man. But the movement as a whole had been of great significance in the very genesis and make up of the society: yet that significance is not quite easy immediately to define. It was certainly not æsthetic ritualism; scarcely one of the Oxford High Churchmen was what we should call a Ritualist. It was certainly not a conscious reaching out towards Rome: except on a Roman Catholic theory which might explain all our unrests by that dim desire. It knew little of Europe, it knew nothing of Ireland, to which any merely Roman Catholic revulsion would obviously have turned. In the first instance, I think, the more it is studied, the more it would appear that it was a movement of mere religion as such. It was not so much a taste for Catholic dogma, but simply a hunger for dogma. For dogma means the serious satisfaction of the mind. Dogma does not mean the absence of thought, but the end of thought. It was a revolt against the Victorian spirit in one particular aspect of it; which may roughly be called (in a cosy and domestic Victorian metaphor) having your cake and eating it too. It saw that the solid and serious Victorians were fundamentally frivolous--because they were fundamentally inconsistent. A man making the confession of any creed worth ten minutes' intelligent talk, is always a man who gains something and gives up something. So long as he does both he can create: for he is making an outline and a shape. Mahomet created, when he forbade wine but allowed five wives: he created a very big thing, which we have still to deal with. The first French Republic created, when it affirmed property and abolished peerages; France still stands like a square, four-sided building which Europe has besieged in vain. The men of the Oxford Movement would have been horrified at being compared either with Moslems or Jacobins. But their sub-conscious thirst was for something that Moslems and Jacobins had and ordinary Anglicans had not: the exalted excitement of consistency. If you were a Moslem you were not a Bacchanal. If you were a Republican you were not a peer. And so the Oxford men, even in their first and dimmest stages, felt that if you were a Churchman you were not a Dissenter. The Oxford Movement was, out of the very roots of its being, a rational movement; almost a rationalist movement. In that it differed sharply from the other reactions that shook the Utilitarian compromise; the blinding mysticism of Carlyle, the mere manly emotionalism of Dickens. It was an appeal to reason: reason said that if a Christian had a feast day he must have a fast day too. Otherwise, all days ought to be alike; and this was that very Utilitarianism against which their Oxford Movement was the first and most rational assault. This idea, even by reason of its reason, narrowed into a sort of sharp spear, of which the spear blade was Newman. It did forget many of the other forces that were fighting on its side. But the movement could boast, first and last, many men who had this eager dogmatic quality: Keble, who spoilt a poem in order to recognise a doctrine; Faber, who told the rich, almost with taunts, that God sent the poor as eagles to strip them; Froude, who with Newman announced his return in the arrogant motto of Achilles. But the greater part of all this happened before what is properly our period; and in that period Newman, and perhaps Newman alone, is the expression and summary

of the whole school. It was certainly in the Victorian Age, and after his passage to Rome, that Newman claimed his complete right to be in any book on modern English literature. This is no place for estimating his theology: but one point about it does clearly emerge. Whatever else is right, the theory that Newman went over to Rome to find peace and an end of argument, is quite unquestionably wrong. He had far more quarrels after he had gone over to Rome. But, though he had far more quarrels, he had far fewer compromises: and he was of that temper which is tortured more by compromise than by quarrel. He was a man at once of abnormal energy and abnormal sensibility: nobody without that combination could have written the *Apologia*. If he sometimes seemed to skin his enemies alive, it was because he himself lacked a skin. In this sense his *Apologia* is a triumph far beyond the ephemeral charge on which it was founded; in this sense he does indeed (to use his own expression) vanquish not his accuser but his judges. Many men would shrink from recording all their cold fits and hesitations and prolonged inconsistencies: I am sure it was the breath of life to Newman to confess them, now that he had done with them for ever. His *Lectures on the Present Position of English Catholics*, practically preached against a raging mob, rise not only higher but happier, as his instant unpopularity increases. There is something grander than humour, there is fun, in the very first lecture about the British Constitution as explained to a meeting of Russians. But always his triumphs are the triumphs of a highly sensitive man: a man must feel insults before he can so insultingly and splendidly avenge them. He is a naked man, who carries a naked sword. The quality of his literary style is so successful that it succeeds in escaping definition. The quality of his logic is that of a long but passionate patience, which waits until he has fixed all the corners of an iron trap. But the quality of his moral comment on the age remains what I have said: a protest of the rationality of religion as against the increasing irrationality of mere Victorian comfort and compromise. So far as the present purpose is concerned, his protest died with him: he left few imitators and (it may easily be conceived) no successful imitators. The suggestion of him lingers on in the exquisite Elizabethan perversity of Coventry Patmore; and has later flamed out from the shy volcano of Francis Thompson. Otherwise (as we shall see in the parallel case of Ruskin's Socialism) he has no followers in his own age: but very many in ours. The next group of reactionaries or romantics or whatever we elect to call them, gathers roughly around one great name. Scotland, from which had come so many of those harsh economists who made the first Radical philosophies of the Victorian Age, was destined also to fling forth (I had almost said to spit forth) their fiercest and most extraordinary enemy. The two primary things in Thomas Carlyle were his early Scotch education and his later German culture. The first was in almost all respects his strength; the latter in some respects his weakness. As an ordinary lowland peasant, he inherited the really valuable historic property of the Scots, their independence, their fighting spirit, and their instinctive philosophic consideration of men merely as men. But he was not an ordinary peasant. If he had laboured obscurely in his village till death, he would have been yet locally a marked man; a man with a wild eye, a man with an air of silent anger; perhaps a man at whom stones were sometimes thrown. A strain of disease and suffering ran athwart both his body and his soul. In spite of his praise of silence, it was only through his gift of utterance that he escaped madness. But while his fellow-peasants would have seen this in him and perhaps mocked it, they would also have seen something which they always expect in such men, and they would have got it: vision, a power in the mind akin to second sight. Like many ungainly or otherwise unattractive Scotchmen, he was a seer. By which I do not mean to refer so much to his transcendental rhapsodies about the World-soul or the Nature-garment or the Mysteries and Eternities generally, these seem to me to belong more to his German side and to be less sincere and vital. I mean a real power of seeing things suddenly, not apparently reached by any process; a grand power of guessing. He *saw* the crowd of the new States General, Danton with his "rude flattened face," Robespierre peering mistily through his spectacles. He *saw* the English charge at Dunbar. He *guessed* that Mirabeau, however dissipated and diseased, had something sturdy inside him. He *guessed* that Lafayette, however brave and victorious, had nothing inside him. He supported the lawlessness of Cromwell, because across two centuries he almost physically *felt* the feebleness and hopelessness of the moderate Parliamentarians. He said a word of sympathy for the universally vituperated Jacobins of the Mountain, because through thick veils of national prejudice and misrepresentation, he felt the impossibility of the Gironde. He was wrong in denying to Scott the power of being inside his characters: but he really had a good deal of that power himself. It was one of his innumerable and rather provincial crotchets to encourage prose as against poetry. But, as a matter of fact, he himself was much greater considered as a kind of poet than considered as anything else; and the central idea of poetry is the idea of guessing right, like a child. He first emerged, as it were, as a student and disciple of Goethe. The connection was not wholly fortunate. With much of what Goethe really stood for he was not really in sympathy; but in his own obstinate way, he tried to knock his idol into shape instead of choosing another. He pushed further and further the extravagances of a vivid but very unbalanced and barbaric style, in the praise of a poet who really represented the calmest classicism and the attempt to restore a Hellenic equilibrium in the mind. It is like watching a shaggy Scandinavian decorating a Greek statue washed up by chance on his shores. And while the strength of Goethe was a strength of completion and serenity, which Carlyle not only never found but never even sought, the weaknesses of

Goethe were of a sort that did not draw the best out of Carlyle. The one civilised element that the German classicists forgot to put into their beautiful balance was a sense of humour. And great poet as Goethe was, there is to the last something faintly fatuous about his half sceptical, half sentimental self-importance; a Lord Chamberlain of teacup politics; an earnest and elderly flirt; a German of the Germans. Now Carlyle had humour; he had it in his very style, but it never got into his philosophy. His philosophy largely remained a heavy Teutonic idealism, absurdly unaware of the complexity of things; as when he perpetually repeated (as with a kind of flat-footed stamping) that people ought to tell the truth; apparently supposing, to quote Stevenson's phrase, that telling the truth is as easy as blind hookey. Yet, though his general honesty is unquestionable, he was by no means one of those who will give up a fancy under the shock of a fact. If by sheer genius he frequently guessed right, he was not the kind of man to admit easily that he had guessed wrong. His version of Cromwell's filthy cruelties in Ireland, or his impatient slurring over of the most sinister riddle in the morality of Frederick the Great--these passages are, one must frankly say, disingenuous. But it is, so to speak, a generous disingenuousness; the heat and momentum of sincere admirations, not the shuffling fear and flattery of the constitutional or patriotic historian. It bears most resemblance to the incurable prejudices of a woman. For the rest there hovered behind all this transcendental haze a certain presence of old northern paganism; he really had some sympathy with the vast vague gods of that moody but not unmanly Nature-worship which seems to have filled the darkness of the North before the coming of the Roman Eagle or the Christian Cross. This he combined, allowing for certain sceptical omissions, with the grisly Old Testament God he had heard about in the black Sabbaths of his childhood; and so promulgated (against both Rationalists and Catholics) a sort of heathen Puritanism: Protestantism purged of its evidences of Christianity. His great and real work was the attack on Utilitarianism: which did real good, though there was much that was muddled and dangerous in the historical philosophy which he preached as an alternative. It is his real glory that he was the first to see clearly and say plainly the great truth of our time; that the wealth of the state is not the prosperity of the people. Macaulay and the Mills and all the regular run of the Early Victorians, took it for granted that if Manchester was getting richer, we had got hold of the key to comfort and progress. Carlyle pointed out (with stronger sagacity and humour than he showed on any other question) that it was just as true to say that Manchester was getting poorer as that it was getting richer: or, in other words, that Manchester was not getting richer at all, but only some of the less pleasing people in Manchester. In this matter he is to be noted in connection with national developments much later; for he thus became the first prophet of the Socialists. *Sartor Resartus* is an admirable fantasia; *The French Revolution* is, with all its faults, a really fine piece of history; the lectures on Heroes contain some masterly sketches of personalities. But I think it is in *Past and Present*, and the essay on *Chartism*, that Carlyle achieves the work he was chosen by gods and men to achieve; which possibly might not have been achieved by a happier or more healthy-minded man. He never rose to more deadly irony than in such *macabre* descriptions as that of the poor woman proving her sisterhood with the rich by giving them all typhoid fever; or that perfect piece of *badinage* about "Overproduction of Shirts"; in which he imagines the aristocrats claiming to be quite clear of this offence. "Will you bandy accusations, will you accuse *us* of overproduction? We take the Heavens and the Earth to witness that we have produced nothing at all.... He that accuses us of producing, let him show himself. Let him say what and when." And he never wrote so sternly and justly as when he compared the "divine sorrow" of Dante with the "undivine sorrow" of Utilitarianism, which had already come down to talking about the breeding of the poor and to hinting at infanticide. This is a representative quarrel; for if the Utilitarian spirit reached its highest point in Mill, it certainly reached its lowest point in Malthus. One last element in the influence of Carlyle ought to be mentioned; because it very strongly dominated his disciples--especially Kingsley, and to some extent Tennyson and Ruskin. Because he frowned at the cockney cheerfulness of the cheaper economists, they and others represented him as a pessimist, and reduced all his azure infinities to a fit of the blues. But Carlyle's philosophy, more carefully considered, will be found to be dangerously optimist rather than pessimist. As a thinker Carlyle is not sad, but recklessly and rather unscrupulously satisfied. For he seems to have held the theory that good could not be definitely defeated in this world; and that everything in the long run finds its right level. It began with what we may call the "Bible of History" idea: that all affairs and politics were a clouded but unbroken revelation of the divine. Thus any enormous and unaltered human settlement--as the Norman Conquest or the secession of America--we must suppose to be the will of God. It lent itself to picturesque treatment; and Carlyle and the Carlyleans were above all things picturesque. It gave them at first a rhetorical advantage over the Catholic and other older schools. They could boast that their Creator was still creating; that he was in Man and Nature, and was not hedged round in a Paradise or imprisoned in a pyx. They could say their God had not grown too old for war: that He was present at Gettysburg and Gravelotte as much as at Gibeon and Gilboa. I do not mean that they literally said these particular things: they are what I should have said had I been bribed to defend their position. But they said things to the same effect: that what manages finally to happen, happens for a higher purpose. Carlyle said the French Revolution was a thing settled in the eternal councils to be; and therefore (and not because it was right) attacking it was "fighting against God." And

Kingsley even carried the principle so far as to tell a lady she should remain in the Church of England mainly because God had put her there. But in spite of its superficial spirituality and encouragement, it is not hard to see how such a doctrine could be abused. It practically comes to saying that God is on the side of the big battalions--or at least, of the victorious ones. Thus a creed which set out to create conquerors would only corrupt soldiers; corrupt them with a craven and unsoldierly worship of success: and that which began as the philosophy of courage ends as the philosophy of cowardice. If, indeed, Carlyle were right in saying that right is only "rightly articulated" might, men would never articulate or move in any way. For no act can have might before it is done: if there is no right, it cannot rationally be done at all. This element, like the Anti-Utilitarian element, is to be kept in mind in connection with after developments: for in this Carlyle is the first cry of Imperialism, as (in the other case) of Socialism: and the two babes unborn who stir at the trumpet are Mr. Bernard Shaw and Mr. Rudyard Kipling. Kipling also carries on from Carlyle the concentration on the purely Hebraic parts of the Bible. The fallacy of this whole philosophy is that if God is indeed present at a modern battle, He may be present not as on Gilboa but Golgotha. Carlyle's direct historical worship of strength and the rest of it was fortunately not very fruitful; and perhaps lingered only in Froude the historian. Even he is more an interruption than a continuity. Froude develops rather the harsher and more impatient moral counsels of his master than like Ruskin the more romantic and sympathetic. He carries on the tradition of Hero Worship: but carries far beyond Carlyle the practice of worshipping people who cannot rationally be called heroes. In this matter that eccentric eye of the seer certainly helped Carlyle: in Cromwell and Frederick the Great there was at least something self-begotten, original or mystical; if they were not heroes they were at least demigods or perhaps demons. But Froude set himself to the praise of the Tudors, a much lower class of people; ill-conditioned prosperous people who merely waxed fat and kicked. Such strength as Henry VIII had was the strength of a badly trained horse that bolts, not of any clear or courageous rider who controls him. There is a sort of strong man mentioned in Scripture who, because he masters himself, is more than he that takes a city. There is another kind of strong man (known to the medical profession) who cannot master himself; and whom it may take half a city to take alive. But for all that he is a low lunatic, and not a hero; and of that sort were too many of the heroes whom Froude attempted to praise. A kind of instinct kept Carlyle from over-praising Henry VIII; or that highly cultivated and complicated liar, Queen Elizabeth. Here, the only importance of this is that one of Carlyle's followers carried further that "strength" which was the real weakness of Carlyle. I have heard that Froude's life of Carlyle was unsympathetic; but if it was so it was a sort of parricide. For the rest, like Macaulay, he was a picturesque and partisan historian: but, like Macaulay (and unlike the craven scientific historians of to-day) he was not ashamed of being partisan or of being picturesque. Such studies as he wrote on the Elizabethan seamen and adventurers, represent very triumphantly the sort of romance of England that all this school was attempting to establish; and link him up with Kingsley and the rest. Ruskin may be very roughly regarded as the young lieutenant of Carlyle in his war on Utilitarian Radicalism: but as an individual he presents many and curious divergences. In the matter of style, he enriched English without disordering it. And in the matter of religion (which was the key of this age as of every other) he did not, like Carlyle, set up the romance of the great Puritans as a rival to the romance of the Catholic Church. Rather he set up and worshipped all the arts and trophies of the Catholic Church as a rival to the Church itself. None need dispute that he held a perfectly tenable position if he chose to associate early Florentine art with a Christianity still comparatively pure, and such sensualities as the Renaissance bred with the corruption of a Papacy. But this does not alter, as a merely artistic fact, the strange air of ill-ease and irritation with which Ruskin seems to tear down the gargoyles of Amiens or the marbles of Venice, as things of which Europe is not worthy; and take them away with him to a really careful museum, situated dangerously near Clapham. Many of the great men of that generation, indeed, had a sort of divided mind; an ethical headache which was literally a "splitting headache"; for there was a schism in the sympathies. When these men looked at some historic object, like the Catholic Church or the French Revolution, they did not know whether they loved or hated it most. Carlyle's two eyes were out of focus, as one may say, when he looked at democracy: he had one eye on Valmy and the other on Sedan. In the same way, Ruskin had a strong right hand that wrote of the great mediæval minsters in tall harmonies and traceries as splendid as their own; and also, so to speak, a weak and feverish left hand that was always fidgeting and trying to take the pen away--and write an evangelical tract about the immorality of foreigners. Many of their contemporaries were the same. The sea of Tennyson's mind was troubled under its serene surface. The incessant excitement of Kingsley, though romantic and attractive in many ways, was a great deal more like Nervous Christianity than Muscular Christianity. It would be quite unfair to say of Ruskin that there was any major inconsistency between his mediæval tastes and his very unmediæval temper: and minor inconsistencies do not matter in anybody. But it is not quite unfair to say of him that he seemed to want all parts of the Cathedral except the altar. As an artist in prose he is one of the most miraculous products of the extremely poetical genius of England. The length of a Ruskin sentence is like that length in the long arrow that was boasted of by the drawers of the long bow. He draws, not a cloth-yard shaft but a long lance to his ear: he shoots a spear. But the whole goes light as a bird and straight as a bullet. There is no

Victorian writer before him to whom he even suggests a comparison, technically considered, except perhaps De Quincey; who also employed the long rich rolling sentence that, like a rocket, bursts into stars at the end. But De Quincey's sentences, as I have said, have always a dreamy and insecure sense about them, like the turret on toppling turret of some mad sultan's pagoda. Ruskin's sentence branches into brackets and relative clauses as a straight strong tree branches into boughs and bifurcations, rather shaking off its burden than merely adding to it. It is interesting to remember that Ruskin wrote some of the best of these sentences in the attempt to show that he did understand the growth of trees, and that nobody else did--except Turner, of course. It is also (to those acquainted with his perverse and wild rhetorical prejudices) even more amusing to remember that if a Ruskin sentence (occupying one or two pages of small print) does not remind us of the growth of a tree, the only other thing it does remind of is the triumphant passage of a railway train. Ruskin left behind him in his turn two quite separate streams of inspiration. The first and more practical was concerned, like Carlyle's *Chartism*, with a challenge to the social conclusions of the orthodox economists. He was not so great a man as Carlyle, but he was a much more clear-headed man; and the point and stab of his challenge still really stands and sticks, like a dagger in a dead man. He answered the theory that we must always get the cheapest labour we can, by pointing out that we never do get the cheapest labour we can, in any matter about which we really care twopence. We do not get the cheapest doctor. We either get a doctor who charges nothing or a doctor who charges a recognised and respectable fee. We do not trust the cheapest bishop. We do not allow admirals to compete. We do not tell generals to undercut each other on the eve of a war. We either employ none of them or we employ all of them at an official rate of pay. All this was set out in the strongest and least sentimental of his books, *Unto this Last*; but many suggestions of it are scattered through *Sesame and Lilies*, *The Political Economy of Art*, and even *Modern Painters*. On this side of his soul Ruskin became the second founder of Socialism. The argument was not by any means a complete or unconquerable weapon, but I think it knocked out what little remained of the brains of the early Victorian rationalists. It is entirely nonsensical to speak of Ruskin as a lounging æsthete, who strolled into economics, and talked sentimentalism. In plain fact, Ruskin was seldom so sensible and logical (right or wrong) as when he was talking about economics. He constantly talked the most glorious nonsense about landscape and natural history, which it was his business to understand. Within his own limits, he talked the most cold common sense about political economy, which was no business of his at all. On the other side of his literary soul, his mere unwrapping of the wealth and wonder of European art, he set going another influence, earlier and vaguer than his influence on Socialism. He represented what was at first the Pre-Raphaelite School in painting, but afterwards a much larger and looser Pre-Raphaelite School in poetry and prose. The word "looser" will not be found unfair if we remember how Swinburne and all the wildest friends of the Rossettis carried this movement forward. They used the mediæval imagery to blaspheme the mediæval religion. Ruskin's dark and doubtful decision to accept Catholic art but not Catholic ethics had borne rapid or even flagrant fruit by the time that Swinburne, writing about a harlot, composed a learned and sympathetic and indecent parody on the Litany of the Blessed Virgin. With the poets I deal in another part of this book; but the influence of Ruskin's great prose touching art criticism can best be expressed in the name of the next great prose writer on such subjects. That name is Walter Pater: and the name is the full measure of the extent to which Ruskin's vague but vast influence had escaped from his hands. Pater eventually joined the Church of Rome (which would not have pleased Ruskin at all), but it is surely fair to say of the mass of his work that its moral tone is neither Puritan nor Catholic, but strictly and splendidly Pagan. In Pater we have Ruskin without the prejudices, that is, without the funny parts. I may be wrong, but I cannot recall at this moment a single passage in which Pater's style takes a holiday or in which his wisdom plays the fool. Newman and Ruskin were as careful and graceful stylists as he. Newman and Ruskin were as serious, elaborate, and even academic thinkers as he. But Ruskin let himself go about railways. Newman let himself go about Kingsley. Pater cannot let himself go for the excellent reason that he wants to stay: to stay at the point where all the keenest emotions meet, as he explains in the splendid peroration of *The Renaissance*. The only objection to being where all the keenest emotions meet is that you feel none of them. In this sense Pater may well stand for a substantial summary of the æsthetes, apart from the purely poetical merits of men like Rossetti and Swinburne. Like Swinburne and others he first attempted to use mediæval tradition without trusting it. These people wanted to see Paganism through Christianity: because it involved the incidental amusement of seeing through Christianity itself. They not only tried to be in all ages at once (which is a very reasonable ambition, though not often realised), but they wanted to be on all sides at once: which is nonsense. Swinburne tries to question the philosophy of Christianity in the metres of a Christmas carol: and Dante Rossetti tries to write as if he were Christina Rossetti. Certainly the almost successful summit of all this attempt is Pater's superb passage on the Mona Lisa; in which he seeks to make her at once a mystery of good and a mystery of evil. The philosophy is false; even evidently false, for it bears no fruit to-day. There never was a woman, not Eve herself in the instant of temptation, who could smile the same smile as the mother of Helen and the mother of Mary. But it is the high-water mark of that vast attempt at an impartiality reached through art: and no other mere artist ever rose so high again. Apart from this Ruskinian offshoot through Pre-

Raphaelitism into what was called Æstheticism, the remains of the inspiration of Carlyle fill a very large part in the Victorian life, but not strictly so large a part in the Victorian literature. Charles Kingsley was a great publicist; a popular preacher; a popular novelist; and (in two cases at least) a very good novelist. His *Water Babies* is really a breezy and roaring freak; like a holiday at the seaside--a holiday where one talks natural history without taking it seriously. Some of the songs in this and other of his works are very real songs: notably, "When all the World is Young, Lad," which comes very near to being the only true defence of marriage in the controversies of the nineteenth century. But when all this is allowed, no one will seriously rank Kingsley, in the really literary sense, on the level of Carlyle or Ruskin, Tennyson or Browning, Dickens or Thackeray: and if such a place cannot be given to him, it can be given even less to his lusty and pleasant friend, Tom Hughes, whose personality floats towards the frankness of the *Boy's Own Paper*; or to his deep, suggestive metaphysical friend Maurice, who floats rather towards *The Hibbert Journal*. The moral and social influence of these things is not to be forgotten: but they leave the domain of letters. The voice of Carlyle is not heard again in letters till the coming of Kipling and Henley. One other name of great importance should appear here, because it cannot appear very appropriately anywhere else: the man hardly belonged to the same school as Ruskin and Carlyle, but fought many of their battles, and was even more concentrated on their main task--the task of convicting liberal *bourgeois* England of priggishness and provinciality. I mean, of course, Matthew Arnold. Against Mill's "liberty" and Carlyle's "strength" and Ruskin's "nature," he set up a new presence and entity which he called "culture," the disinterested play of the mind through the sifting of the best books and authorities. Though a little dandified in phrase, he was undoubtedly serious and public-spirited in intention. He sometimes talked of culture almost as if it were a man, or at least a church (for a church has a sort of personality): some may suspect that culture was a man, whose name was Matthew Arnold. But Arnold was not only right but highly valuable. If we have said that Carlyle was a man that saw things, we may add that Arnold was chiefly valuable as a man who knew things. Well as he was endowed intellectually, his power came more from information than intellect. He simply happened to know certain things, that Carlyle didn't know, that Kingsley didn't know, that Huxley and Herbert Spencer didn't know: that England didn't know. He knew that England was a part of Europe: and not so important a part as it had been the morning after Waterloo. He knew that England was then (as it is now) an oligarchical State, and that many great nations are not. He knew that a real democracy need not live and does not live in that perpetual panic about using the powers of the State, which possessed men like Spencer and Cobden. He knew a rational minimum of culture and common courtesy could exist and did exist throughout large democracies. He knew the Catholic Church had been in history "the Church of the multitude": he knew it was not a sect. He knew that great landlords are no more a part of the economic law than nigger-drivers: he knew that small owners could and did prosper. He was not so much the philosopher as the man of the world: he reminded us that Europe was a society while Ruskin was treating it as a picture gallery. He was a sort of Heaven-sent courier. His frontal attack on the vulgar and sullen optimism of Victorian utility may be summoned up in the admirable sentence, in which he asked the English what was the use of a train taking them quickly from Islington to Camberwell, if it only took them "from a dismal and illiberal life in Islington to a dismal and illiberal life in Camberwell?" His attitude to that great religious enigma round which all these great men were grouped as in a ring, was individual and decidedly curious. He seems to have believed that a "Historic Church," that is, some established organisation with ceremonies and sacred books, etc., could be perpetually preserved as a sort of vessel to contain the spiritual ideas of the age, whatever those ideas might happen to be. He clearly seems to have contemplated a melting away of the doctrines of the Church and even of the meaning of the words: but he thought a certain need in man would always be best satisfied by public worship and especially by the great religious literatures of the past. He would embalm the body that it might often be revisited by the soul--or souls. Something of the sort has been suggested by Dr. Coit and others of the ethical societies in our own time. But while Arnold would loosen the theological bonds of the Church, he would not loosen the official bonds of the State. You must not disestablish the Church: you must not even leave the Church: you must stop inside it and think what you choose. Enemies might say that he was simply trying to establish and endow Agnosticism. It is fairer and truer to say that unconsciously he was trying to restore Paganism: for this State Ritualism without theology, and without much belief, actually was the practice of the ancient world. Arnold may have thought that he was building an altar to the Unknown God; but he was really building it to Divus Cæsar. As a critic he was chiefly concerned to preserve criticism itself; to set a measure to praise and blame and support the classics against the fashions. It is here that it is specially true of him, if of no writer else, that the style was the man. The most vital thing he invented was a new style: founded on the patient unravelling of the tangled Victorian ideas, as if they were matted hair under a comb. He did not mind how elaborately long he made a sentence, so long as he made it clear. He would constantly repeat whole phrases word for word in the same sentence, rather than risk ambiguity by abbreviation. His genius showed itself in turning this method of a laborious lucidity into a peculiarly exasperating form of satire and controversy. Newman's strength was in a sort of stifled passion, a dangerous patience of polite logic and then: "Cowards! if I advanced a step you would

run away: it is not you I fear. *_Di me terrent, et Jupiter hostis._*" If Newman seemed suddenly to fly into a temper, Carlyl

e seemed never to fly out of one. But Arnold kept a smile of heart-broken forbearance, as of the teacher in an idiot school, that was enormously insulting. One trick he often tried with success. If his opponent had said something foolish, like "the destiny of England is in the great heart of England," Arnold would repeat the phrase again and again until it looked more foolish than it really was. Thus he recurs again and again to "the British College of Health in the New Road" till the reader wants to rush out and burn the place down. Arnold's great error was that he sometimes thus wearied us of his own phrases, as well as of his enemies'. These names are roughly representative of the long series of protests against the cold commercial rationalism which held Parliament and the schools through the earlier Victorian time, in so far as those protests were made in the name of neglected intellect, insulted art, forgotten heroism and desecrated religion. But already the Utilitarian citadel had been more heavily bombarded on the other side by one lonely and unlettered man of genius. The rise of Dickens is like the rising of a vast mob. This is not only because his tales are indeed as crowded and populous as towns: for truly it was not so much that Dickens appeared as that a hundred Dickens characters appeared. It is also because he was the sort of man who has the impersonal impetus of a mob: what Poe meant when he truly said that popular rumour, if really spontaneous, was like the intuition of the individual man of genius. Those who speak scornfully of the ignorance of the mob do not err as to the fact itself; their error is in not seeing that just as a crowd is comparatively ignorant, so a crowd is comparatively innocent. It will have the old and human faults; but it is not likely to specialise in the special faults of that particular society: because the effort of the strong and successful in all ages is to keep the poor out of society. If the higher castes have developed some special moral beauty or grace, as they occasionally do (for instance, mediæval chivalry), it is likely enough, of course, that the mass of men will miss it. But if they have developed some perversion or over-emphasis, as they much more often do (for instance, the Renaissance poisoning), then it will be the tendency of the mass of men to miss that too. The point might be put in many ways; you may say if you will that the poor are always at the tail of the procession, and that whether they are morally worse or better depends on whether humanity as a whole is proceeding towards heaven or hell. When humanity is going to hell, the poor are always nearest to heaven. Dickens was a mob--and a mob in revolt; he fought by the light of nature; he had not a theory, but a thirst. If any one chooses to offer the cheap sarcasm that his thirst was largely a thirst for milk-punch, I am content to reply with complete gravity and entire contempt that in a sense this is perfectly true. His thirst was for things as humble, as human, as laughable as that daily bread for which we cry to God. He had no particular plan of reform; or, when he had, it was startlingly petty and parochial compared with the deep, confused clamour of comradeship and insurrection that fills all his narrative. It would not be gravely unjust to him to compare him to his own heroine, Arabella Allen, who "didn't know what she did like," but who (when confronted with Mr. Bob Sawyer) "did know what she didn't like." Dickens did know what he didn't like. He didn't like the Unrivalled Happiness which Mr. Roebuck praised; the economic laws that were working so faultlessly in Fever Alley; the wealth that was accumulating so rapidly in Bleeding Heart Yard. But, above all, he didn't like the *_mean_* side of the Manchester philosophy: the preaching of an impossible thrift and an intolerable temperance. He hated the implication that because a man was a miser in Latin he must also be a miser in English. And this meanness of the Utilitarians had gone very far--infecting many finer minds who had fought the Utilitarians. In the *_Edinburgh Review_*, a thing like Malthus could be championed by a man like Macaulay. The twin root facts of the revolution called Dickens are these: first, that he attacked the cold Victorian compromise; second, that he attacked it without knowing he was doing it--certainly without knowing that other people were doing it. He was attacking something which we will call Mr. Gradgrind. He was utterly unaware (in any essential sense) that any one else had attacked Mr. Gradgrind. All the other attacks had come from positions of learning or cultured eccentricity of which he was entirely ignorant, and to which, therefore (like a spirited fellow), he felt a furious hostility. Thus, for instance, he hated that Little Bethel to which Kit's mother went: he hated it simply as Kit hated it. Newman could have told him it was hateful, because it had no root in religious history; it was not even a sapling sprung of the seed of some great human and heathen tree: it was a monstrous mushroom that grows in the moonshine and dies in the dawn. Dickens knew no more of religious history than Kit; he simply smelt the fungus, and it stank. Thus, again, he hated that insolent luxury of a class counting itself a comfortable exception to all mankind; he hated it as Kate Nickleby hated Sir Mulberry Hawke--by instinct. Carlyle could have told him that all the world was full of that anger against the impudent fatness of the few. But when Dickens wrote about Kate Nickleby, he knew about as much of the world--as Kate Nickleby. He did write *_The Tale of Two Cities_* long afterwards; but that was when he *_had_* been instructed by Carlyle. His first revolutionism was as private and internal as feeling sea-sick. Thus, once more, he wrote against Mr. Gradgrind long before he created him. In *_The Chimes_*, conceived in quite his casual and charitable season, with the *_Christmas Carol_* and the *_Cricket on the Hearth_*, he hit hard at the economists. Ruskin, in the same fashion, would have told him that the worst thing about the economists was that they were not economists: that they missed many essential

things even in economics. But Dickens did not know whether they were economists or not: he only knew that they wanted hitting. Thus, to take a last case out of many, Dickens travelled in a French railway train, and noticed that this eccentric nation provided him with wine that he could drink and sandwiches he could eat, and manners he could tolerate. And remembering the ghastly sawdust-eating waiting-rooms of the North English railways, he wrote that rich chapter in *Mugby Junction*. Matthew Arnold could have told him that this was but a part of the general thinning down of European civilisation in these islands at the edge of it; that for two or three thousand years the Latin society has learnt how to drink wine, and how not to drink too much of it. Dickens did not in the least understand the Latin society: but he did understand the wine. If (to prolong an idle but not entirely false metaphor) we have called Carlyle a man who saw and Arnold a man who knew, we might truly call Dickens a man who tasted, that is, a man who really felt. In spite of all the silly talk about his vulgarity, he really had, in the strict and serious sense, good taste. All real good taste is gusto--the power of appreciating the presence--or the absence--of a particular and positive pleasure. He had no learning; he was not misled by the label on the bottle--for that is what learning largely meant in his time. He opened his mouth and shut his eyes and saw what the Age of Reason would give him. And, having tasted it, he spat it out. I am constrained to consider Dickens here among the fighters; though I ought (on the pure principles of Art) to be considering him in the chapter which I have allotted to the story-tellers. But we should get the whole Victorian perspective wrong, in my opinion at least, if we did not see that Dickens was primarily the most successful of all the onslaughts on the solid scientific school; because he did not attack from the standpoint of extraordinary faith, like Newman; or the standpoint of extraordinary inspiration, like Carlyle; or the standpoint of extraordinary detachment or serenity, like Arnold; but from the standpoint of quite ordinary and quite hearty dislike. To give but one instance more, Matthew Arnold, trying to carry into England constructive educational schemes which he could see spread like a clear railway map all over the Continent, was much badgered about what he really thought was *wrong* with English middle-class education. Despairing of explaining to the English middle class the idea of high and central public instruction, as distinct from coarse and hole-and-corner private instruction, he invoked the aid of Dickens. He said the English middle-class school was the sort of school where Mr. Creakle sat, with his buttered toast and his cane. Now Dickens had probably never seen any other kind of school--certainly he had never understood the systematic State Schools in which Arnold had learnt his lesson. But he saw the cane and the buttered toast, and he *knew* that it was all wrong. In this sense, Dickens, the great romanticist, is truly the great realist also. For he had no abstractions: he had nothing except realities out of which to make a romance. With Dickens, then, re-arises that reality with which I began and which (curtly, but I think not falsely) I have called Cobbett. In dealing with fiction as such, I shall have occasion to say wherein Dickens is weaker and stronger than that England of the eighteenth century: here it is sufficient to say that he represents the return of Cobbett in this vital sense; that he is proud of being the ordinary man. No one can understand the thousand caricatures by Dickens who does not understand that he is comparing them all with his own common sense. Dickens, in the bulk, liked the things that Cobbett had liked; what is perhaps more to the point, he hated the things that Cobbett had hated; the Tudors, the lawyers, the leisurely oppression of the poor. Cobbett's fine fighting journalism had been what is nowadays called "personal," that is, it supposed human beings to be human. But Cobbett was also personal in the less satisfactory sense; he could only multiply monsters who were exaggerations of his enemies or exaggerations of himself. Dickens was personal in a more godlike sense; he could multiply persons. He could create all the farce and tragedy of his age over again, with creatures unborn to sin and creatures unborn to suffer. That which had not been achieved by the fierce facts of Cobbett, the burning dreams of Carlyle, the white-hot proofs of Newman, was really or very nearly achieved by a crowd of impossible people. In the centre stood that citadel of atheist industrialism: and if indeed it has ever been taken, it was taken by the rush of that unreal army.

CHAPTER II

THE GREAT VICTORIAN NOVELISTS

The Victorian novel was a thing entirely Victorian; quite unique and suited to a sort of cosiness in that country and that age. But the novel itself, though not merely Victorian, is mainly modern. No clear-headed person wastes his time over definitions, except where he thinks his own definition would probably be in dispute. I merely say, therefore, that when I say "novel," I mean a fictitious narrative (almost invariably, but not necessarily, in prose) of which the essential is that the story is not told for the sake of its naked pointedness as an anecdote, or for the sake of the irrelevant landscapes and visions that can be caught up in it, but for the sake of some study of the difference

between human beings. There are several things that make this mode of art unique. One of the most conspicuous is that it is the art in which the conquests of woman are quite beyond controversy. The proposition that Victorian women have done well in politics and philosophy is not necessarily an untrue proposition; but it is a partisan proposition. I never heard that many women, let alone men, shared the views of Mary Wollstonecraft; I never heard that millions of believers flocked to the religion tentatively founded by Miss Frances Power Cobbe. They did, undoubtedly, flock to Mrs. Eddy; but it will not be unfair to that lady to call her following a sect, and not altogether unreasonable to say that such insane exceptions prove the rule. Nor can I at this moment think of a single modern woman writing on politics or abstract things, whose work is of undisputed importance; except perhaps Mrs. Sidney Webb, who settles things by the simple process of ordering about the citizens of a state, as she might the servants in a kitchen. There has been, at any rate, no writer on moral or political theory that can be mentioned, without seeming comic, in the same breath with the great female novelists. But when we come to the novelists, the women have, on the whole, equality; and certainly, in some points, superiority. Jane Austen is as strong in her own way as Scott is in his. But she is, for all practical purposes, never weak in her own way--and Scott very often is. Charlotte Brontë dedicated *Jane Eyre* to the author of *Vanity Fair*. I should hesitate to say that Charlotte Brontë's is a better book than Thackeray's, but I think it might well be maintained that it is a better story. All sorts of inquiring asses (equally ignorant of the old nature of woman and the new nature of the novel) whispered wisely that George Eliot's novels were really written by George Lewes. I will cheerfully answer for the fact that, if they had been written by George Lewes, no one would ever have read them. Those who have read his book on Robespierre will have no doubt about my meaning. I am no idolater of George Eliot; but a man who could concoct such a crushing opiate about the most exciting occasion in history certainly did not write *The Mill on the Floss*. This is the first fact about the novel, that it is the introduction of a new and rather curious kind of art; and it has been found to be peculiarly feminine, from the first good novel by Fanny Burney to the last good novel by Miss May Sinclair. The truth is, I think, that the modern novel is a new thing; not new in its essence (for that is a philosophy for fools), but new in the sense that it lets loose many of the things that are old. It is a hearty and exhaustive overhauling of that part of human existence which has always been the woman's province, or rather kingdom; the play of personalities in private, the real difference between Tommy and Joe. It is right that womanhood should specialise in individuals, and be praised for doing so; just as in the Middle Ages she specialised in dignity and was praised for doing so. People put the matter wrong when they say that the novel is a study of human nature. Human nature is a thing that even men can understand. Human nature is born of the pain of a woman; human nature plays at peep-bo when it is two and at cricket when it is twelve; human nature earns its living and desires the other sex and dies. What the novel deals with is what women have to deal with; the differentiations, the twists and turns of this eternal river. The key of this new form of art, which we call fiction, is sympathy. And sympathy does not mean so much feeling with all who feel, but rather suffering with all who suffer. And it was inevitable, under such an inspiration, that more attention should be given to the awkward corners of life than to its even flow. The very promising domestic channel dug by the Victorian women, in books like *Cranford*, by Mrs. Gaskell, would have got to the sea, if they had been left alone to dig it. They might have made domesticity a fairyland. Unfortunately another idea, the idea of imitating men's cuffs and collars and documents, cut across this purely female discovery and destroyed it. It may seem mere praise of the novel to say it is the art of sympathy and the study of human variations. But indeed, though this is a good thing, it is not universally good. We have gained in sympathy; but we have lost in brotherhood. Old quarrels had more equality than modern exonerations. Two peasants in the Middle Ages quarrelled about their two fields. But they went to the same church, served in the same semi-feudal militia, and had the same morality, which ever might happen to be breaking it at the moment. The very cause of their quarrel was the cause of their fraternity; they both liked land. But suppose one of them a teetotaler who desired the abolition of hops on both farms; suppose the other a vegetarian who desired the abolition of chickens on both farms: and it is at once apparent that a quarrel of quite a different kind would begin; and that in that quarrel it would not be a question of farmer against farmer, but of individual against individual. This fundamental sense of human fraternity can only exist in the presence of positive religion. Man is merely man only when he is seen against the sky. If he is seen against any landscape, he is only a man of that land. If he is seen against any house, he is only a householder. Only where death and eternity are intensely present can human beings fully feel their fellowship. Once the divine darkness against which we stand is really dismissed from the mind (as it was very nearly dismissed in the Victorian time) the differences between human beings become overpoweringly plain; whether they are expressed in the high caricatures of Dickens or the low lunacies of Zola. This can be seen in a sort of picture in the Prologue of the *Canterbury Tales*; which is already pregnant with the promise of the English novel. The characters there are at once graphically and delicately differentiated; the Doctor with his rich cloak, his careful meals, his coldness to religion; the Franklin, whose white beard was so fresh that it recalled the daisies, and in whose house it snowed meat and drink; the Summoner, from whose fearful face, like a red cherub's, the children fled, and who wore a garland like a hoop; the Miller with his

short red hair and bagpipes and brutal head, with which he could break down a door; the Lover who was as sleepless as a nightingale; the Knight, the Cook, the Clerk of Oxford. Pendennis or the Cook, M. Mirabolant, is nowhere so vividly varied by a few merely verbal strokes. But the great difference is deeper and more striking. It is simply that Pendennis would never have gone riding with a cook at all. Chaucer's knight rode with a cook quite naturally; because the thing they were all seeking together was as much above knighthood as it was above cookery. Soldiers and swindlers and bullies and outcasts, they were all going to the shrine of a distant saint. To what sort of distant saint would Pendennis and Colonel Newcome and Mr. Moss and Captain Costigan and Ridley the butler and Bayham and Sir Barnes Newcome and Laura and the Duchess d'Ivry and Warrington and Captain Blackball and Lady Kew travel, laughing and telling tales together? The growth of the novel, therefore, must not be too easily called an increase in the interest in humanity. It is an increase in the interest in the things in which men differ; much fuller and finer work had been done before about the things in which they agree. And this intense interest in variety had its bad side as well as its good; it has rather increased social distinctions in a serious and spiritual sense. Most of the oblivion of democracy is due to the oblivion of death. But in its own manner and measure, it was a real advance and experiment of the European mind, like the public art of the Renaissance or the fairyland of physical science explored in the nineteenth century. It was a more unquestionable benefit than these: and in that development women played a peculiar part, English women especially, and Victorian women most of all. It is perhaps partly, though certainly not entirely, this influence of the great women writers that explains another very arresting and important fact about the emergence of genuinely Victorian fiction. It had been by this time decided, by the powers that had influence (and by public opinion also, at least in the middle-class sense), that certain verbal limits must be set to such literature. The novel must be what some would call pure and others would call prudish; but what is not, properly considered, either one or the other: it is rather a more or less business proposal (right or wrong) that every writer shall draw the line at literal physical description of things socially concealed. It was originally merely verbal; it had not, primarily, any dream of purifying the topic or the moral tone. Dickens and Thackeray claimed very properly the right to deal with shameful passions and suggest their shameful culminations; Scott sometimes dealt with ideas positively horrible--as in that grand Glenallan tragedy which is as appalling as the Oedipus or The Cenci. None of these great men would have tolerated for a moment being talked to (as the muddle-headed amateur censors talk to artists to-day) about "wholesome" topics and suggestions "that cannot elevate." They had to describe the great battle of good and evil and they described both; but they accepted a working Victorian compromise about what should happen behind the scenes and what on the stage. Dickens did not claim the license of diction Fielding might have claimed in repeating the senile ecstasies of Gride (let us say) over his purchased bride: but Dickens does not leave the reader in the faintest doubt about what sort of feelings they were; nor is there any reason why he should. Thackeray would not have described the toilet details of the secret balls of Lord Steyne: he left that to Lady Cardigan. But no one who had read Thackeray's version would be surprised at Lady Cardigan's. But though the great Victorian novelists would not have permitted the impudence of the suggestion that every part of their problem must be wholesome and innocent in itself, it is still tenable (I do not say it is certain) that by yielding to the Philistines on this verbal compromise, they have in the long run worked for impurity rather than purity. In one point I do certainly think that Victorian Bowdlerism did pure harm. This is the simple point that, nine times out of ten, the coarse word is the word that condemns an evil and the refined word the word that excuses it. A common evasion, for instance, substitutes for the word that brands self-sale as the essential sin, a word which weakly suggests that it is no more wicked than walking down the street. The great peril of such soft mystifications is that extreme evils (they that are abnormal even by the standard of evil) have a very long start. Where ordinary wrong is made unintelligible, extraordinary wrong can count on remaining more unintelligible still; especially among those who live in such an atmosphere of long words. It is a cruel comment on the purity of the Victorian Age, that the age ended (save for the bursting of a single scandal) in a thing being everywhere called "Art," "The Greek Spirit," "The Platonic Ideal" and so on--which any navvy mending the road outside would have stamped with a word as vile and as vulgar as it deserved. This reticence, right or wrong, may have been connected with the participation of women with men in the matter of fiction. It is an important point: the sexes can only be coarse separately. It was certainly also due, as I have already suggested, to the treaty between the rich bourgeoisie and the old aristocracy, which both had to make, for the common and congenial purpose of keeping the English people down. But it was due much more than this to a general moral atmosphere in the Victorian Age. It is impossible to express that spirit except by the electric bell of a name. It was latitudinarian, and yet it was limited. It could be content with nothing less than the whole cosmos: yet the cosmos with which it was content was small. It is false to say it was without humour: yet there was something by instinct unsmiling in it. It was always saying solidly that things were "enough"; and proving by that sharpness (as of the shutting of a door) that they were not enough. It took, I will not say its pleasures, but even its emancipations, sadly. Definitions seem to escape this way and that in the attempt to locate it as an idea. But every one will understand me if I call it George Eliot. I begin with this great woman of letters for both the two reasons already

mentioned. She represents the rationalism of the old Victorian Age at its highest. She and Mill are like two great mountains at the end of that long, hard chain which is the watershed of the Early Victorian time. They alone rise high enough to be confused among the clouds--or perhaps confused among the stars. They certainly were seeking truth, as Newman and Carlyle were; the slow slope of the later Victorian vulgarity does not lower their precipice and pinnacle. But I begin with this name also because it emphasises the idea of modern fiction as a fresh and largely a female thing. The novel of the nineteenth century was female; as fully as the novel of the eighteenth century was male. It is quite certain that no woman could have written *Roderick Random*. It is not quite so certain that no woman could have written *Esmond*. The strength and subtlety of woman had certainly sunk deep into English letters when George Eliot began to write. Her originals and even her contemporaries had shown the feminine power in fiction as well or better than she. Charlotte Brontë, understood along her own instincts, was as great; Jane Austen was greater. The latter comes into our present consideration only as that most exasperating thing, an ideal unachieved. It is like leaving an unconquered fortress in the rear. No woman later has captured the complete common sense of Jane Austen. She could keep her head, while all the after women went about looking for their brains. She could describe a man coolly; which neither George Eliot nor Charlotte Brontë could do. She knew what she knew, like a sound dogmatist: she did not know what she did not know--like a sound agnostic. But she belongs to a vanished world before the great progressive age of which I write. One of the characteristics of the central Victorian spirit was a tendency to substitute a certain more or less satisfied seriousness for the extremes of tragedy and comedy. This is marked by a certain change in George Eliot; as it is marked by a certain limitation or moderation in Dickens. Dickens was the People, as it was in the eighteenth century and still largely is, in spite of all the talk for and against Board School Education: comic, tragic, realistic, free-spoken, far looser in words than in deeds. It marks the silent strength and pressure of the spirit of the Victorian middle class that even to Dickens it never occurred to revive the verbal coarseness of Smollett or Swift. The other proof of the same pressure is the change in George Eliot. She was not a genius in the elemental sense of Dickens; she could never have been either so strong or so soft. But she did originally represent some of the same popular realities: and her first books (at least as compared with her latest) were full of sound fun and bitter pathos. Mr. Max Beerbohm has remarked (in his glorious essay called *Ichabod*, I think), that Silas Marner would not have forgotten his miserliness if George Eliot had written of him in her maturity. I have a great regard for Mr. Beerbohm's literary judgments; and it may be so. But if literature means anything more than a cold calculation of the chances, if there is in it, as I believe, any deeper idea of detaching the spirit of life from the dull obstacles of life, of permitting human nature really to reveal itself as human, if (to put it shortly) literature has anything on earth to do with being *interesting*--then I think we would rather have a few more Marners than that rich maturity that gave us the analysed dust-heaps of *Daniel Deronda*. In her best novels there is real humour, of a cool sparkling sort; there is a strong sense of substantial character that has not yet degenerated into psychology; there is a great deal of wisdom, chiefly about women; indeed there is almost every element of literature except a certain indescribable thing called *glamour*; which was the whole stock-in-trade of the Brontës, which we feel in Dickens when Quilp clammers amid rotten wood by the desolate river; and even in Thackeray when Esmond with his melancholy eyes wanders like some swarthy crow about the dismal avenues of Castlewood. Of this quality (which some have called, but hastily, the essential of literature) George Eliot had not little but nothing. Her air is bright and intellectually even exciting; but it is like the air of a cloudless day on the parade at Brighton. She sees people clearly, but not through an atmosphere. And she can conjure up storms in the conscious, but not in the subconscious mind. It is true (though the idea should not be exaggerated) that this deficiency was largely due to her being cut off from all those conceptions that had made the fiction of a Muse; the deep idea that there are really demons and angels behind men. Certainly the increasing atheism of her school spoilt her own particular imaginative talent: she was far less free when she thought like Ladislaw than when she thought like Casaubon. It also betrayed her on a matter specially requiring common sense; I mean sex. There is nothing that is so profoundly false as rationalist flirtation. Each sex is trying to be both sexes at once; and the result is a confusion more untruthful than any conventions. This can easily be seen by comparing her with a greater woman who died before the beginning of our present problem. Jane Austen was born before those bonds which (we are told) protected woman from truth, were burst by the Brontës or elaborately untied by George Eliot. Yet the fact remains that Jane Austen knew much more about men than either of them. Jane Austen may have been protected from truth: but it was precious little of truth that was protected from her. When Darcy, in finally confessing his faults, says, "I have been a selfish being all my life, in practice *though not in theory*," he gets nearer to a complete confession of the intelligent male than ever was even hinted by the Byronic lapses of the Brontës' heroes or the elaborate exculpations of George Eliot's. Jane Austen, of course, covered an infinitely smaller field than any of her later rivals; but I have always believed in the victory of small nationalities. The Brontës suggest themselves here; because their superficial qualities, the qualities that can be seized upon in satire, were in this an exaggeration of what was, in George Eliot, hardly more than an omission. There was perhaps a time when Mr. Rawjester was more widely known

than Mr. Rochester. And certainly Mr. Rochester (to adopt the diction of that other eminent country gentleman, Mr. Darcy) was simply individualistic not only in practice, but in theory. Now any one may be so in practice: but a man who is simply individualistic in theory must merely be an ass. Undoubtedly the Brontës exposed themselves to some misunderstanding by thus perpetually making the masculine creature much more masculine than he wants to be. Thackeray (a man of strong though sleepy virility) asked in his exquisite plaintive way: "Why do our lady novelists make the men bully the women?" It is, I think, unquestionably true that the Brontës treated the male as an almost anarchic thing coming in from outside nature; much as people on this planet regard a comet. Even the really delicate and sustained comedy of Paul Emanuel is not quite free from this air of studying something alien. The reply may be made that the women in men's novels are equally fallacious. The reply is probably just. What the Brontës really brought into fiction was exactly what Carlyle brought into history; the blast of the mysticism of the North. They were of Irish blood settled on the windy heights of Yorkshire; in that country where Catholicism lingered latest, but in a superstitious form; where modern industrialism came earliest and was more superstitious still. The strong winds and sterile places, the old tyranny of barons and the new and blacker tyranny of manufacturers, has made and left that country a land of barbarians. All Charlotte Brontë's earlier work is full of that sullen and unmanageable world; moss-troopers turned hurriedly into miners; the last of the old world forced into supporting the very first crudities of the new. In this way Charlotte Brontë represents the Victorian settlement in a special way. The Early Victorian Industrialism is to George Eliot and to Charlotte Brontë, rather as the Late Victorian Imperialism would have been to Mrs. Humphry Ward in the centre of the empire and to Miss Olive Schreiner at the edge of it. The real strength there is in characters like Robert Moore, when he is dealing with anything except women, is the romance of industry in its first advance: a romance that has not remained. On such fighting frontiers people always exaggerate the strong qualities the masculine sex does possess, and always add a great many strong qualities that it does not possess. That is, briefly, all the reason in the Brontës on this special subject: the rest is stark unreason. It can be most clearly seen in that sister of Charlotte Brontë's who has achieved the real feat of remaining as a great woman rather than a great writer. There is really, in a narrow but intense way, a tradition of Emily Brontë: as there is a tradition of St. Peter or Dr. Johnson. People talk as if they had known her, apart from her works. She must have been something more than an original person; perhaps an origin. But so far as her written works go she enters English letters only as an original person--and rather a narrow one. Her imagination was sometimes superhuman--always inhuman. Wuthering Heights might have been written by an eagle. She is the strongest instance of these strong imaginations that made the other sex a monster: for Heathcliff fails as a man as catastrophically as he succeeds as a demon. I think Emily Brontë was further narrowed by the broadness of her religious views; but never, of course, so much as George Eliot. In any case, it is Charlotte Brontë who enters Victorian literature. The shortest way of stating her strong contribution is, I think, this: that she reached the highest romance through the lowest realism. She did not set out with Amadis of Gaul in a forest or with Mr. Pickwick in a comic club. She set out with herself, with her own dingy clothes, and accidental ugliness, and flat, coarse, provincial household; and forcibly fused all such muddy materials into a spirited fairy-tale. If the first chapters on the home and school had not proved how heavy and hateful sanity can be, there would really be less point in the insanity of Mr. Rochester's wife--or the not much milder insanity of Mrs. Rochester's husband. She discovered the secret of hiding the sensational in the commonplace: and Jane Eyre remains the best of her books (better even than Villette) because while it is a human document written in blood, it is also one of the best blood-and-thunder detective stories in the world. But while Emily Brontë was as unsociable as a storm at midnight, and while Charlotte Brontë was at best like that warmer and more domestic thing, a house on fire--they do connect themselves with the calm of George Eliot, as the forerunners of many later developments of the feminine advance. Many forerunners (if it comes to that) would have felt rather ill if they had seen the things they foreran. This notion of a hazy anticipation of after history has been absurdly overdone: as when men connect Chaucer with the Reformation; which is like connecting Homer with the Syracusan Expedition. But it is to some extent true that all these great Victorian women had a sort of unrest in their souls. And the proof of it is that (after what I will claim to call the healthier time of Dickens and Thackeray) it began to be admitted by the great Victorian men. If there had not been something in that irritation, we should hardly have had to speak in these pages of Diana of the Crossways or of Tess of the D'Urbervilles. To what this strange and very local sex war has been due I shall not ask, because I have no answer. That it was due to votes or even little legal inequalities about marriage, I feel myself here too close to realities even to discuss. My own guess is that it has been due to the great neglect of the military spirit by the male Victorians. The woman felt obscurely that she was still running her mortal risk, while the man was not still running his. But I know nothing about it; nor does anybody else. In so short a book on so vast, complex and living a subject, it is impossible to drop even into the second rank of good authors, whose name is legion; but it is impossible to leave that considerable female force in fiction which has so largely made the very nature of the modern novel, without mentioning two names which almost brought that second rank up to the first rank. They were at utterly opposite poles. The one succeeded by being a much mellower and more Christian George

Eliot; the other succeeded by being a much more mad and unchristian Emily Brontë. But Mrs. Oliphant and the author calling herself "Ouida" both forced themselves well within the frontier of fine literature. *The Beleaguered City* is literature in its highest sense; the other works of its author tend to fall into fiction in its best working sense. Mrs. Oliphant was infinitely saner in that city of ghosts than the cosmopolitan Ouida ever was in any of the cities of men. Mrs. Oliphant would never have dared to discover, either in heaven or hell, such a thing as a hairbrush with its back encrusted with diamonds. But though Ouida was violent and weak where Mrs. Oliphant might have been mild and strong, her own triumphs were her own. She had a real power of expressing the senses through her style; of conveying the very heat of blue skies or the bursting of palpable pomegranates. And just as Mrs. Oliphant transfused her more timid Victorian tales with a true and intense faith in the Christian mystery--so Ouida, with infinite fury and infinite confusion of thought, did fill her books with Byron and the remains of the French Revolution. In the track of such genius there has been quite an accumulation of true talent as in the children's tales of Mrs. Ewing, the historical tales of Miss Yonge, the tales of Mrs. Molesworth, and so on. On a general review I do not think I have been wrong in taking the female novelists first. I think they gave its special shape, its temporary twist, to the Victorian novel. Nevertheless it is a shock (I almost dare to call it a relief) to come back to the males. It is the more abrupt because the first name that must be mentioned derives directly from the mere maleness of the Sterne and Smollett novel. I have already spoken of Dickens as the most homely and instinctive, and therefore probably the heaviest, of all the onslaughts made on the central Victorian satisfaction. There is therefore the less to say of him here, where we consider him only as a novelist; but there is still much more to say than can even conceivably be said. Dickens, as we have stated, inherited the old comic, rambling novel from Smollett and the rest. Dickens, as we have also stated, consented to expurgate that novel. But when all origins and all restraints have been defined and allowed for, the creature that came out was such as we shall not see again. Smollett was coarse; but Smollett was also cruel. Dickens was frequently horrible; he was never cruel. The art of Dickens was the most exquisite of arts: it was the art of enjoying everybody. Dickens, being a very human writer, had to be a very human being; he had his faults and sensibilities in a strong degree; and I do not for a moment maintain that he enjoyed everybody in his daily life. But he enjoyed everybody in his books: and everybody has enjoyed everybody in those books even till to-day. His books are full of baffled villains stalking out or cowardly bullies kicked downstairs. But the villains and the cowards are such delightful people that the reader always hopes the villain will put his head through a side window and make a last remark; or that the bully will say one thing more, even from the bottom of the stairs. The reader really hopes this; and he cannot get rid of the fancy that the author hopes so too. I cannot at the moment recall that Dickens ever killed a comic villain, except Quilp, who was deliberately made even more villainous than comic. There can be no serious fears for the life of Mr. Wegg in the muckcart; though Mr. Pecksniff fell to be a borrower of money, and Mr. Mantalini to turning a mangle, the human race has the comfort of thinking they are still alive: and one might have the rapture of receiving a begging letter from Mr. Pecksniff, or even of catching Mr. Mantalini collecting the washing, if one always lurked about on Monday mornings. This sentiment (the true artist will be relieved to hear) is entirely unmoral. Mrs. Wilfer deserved death much more than Mr. Quilp, for she had succeeded in poisoning family life persistently, while he was (to say the least of it) intermittent in his domesticity. But who can honestly say he does not hope Mrs. Wilfer is still talking like Mrs. Wilfer--especially if it is only in a book? This is the artistic greatness of Dickens, before and after which there is really nothing to be said. He had the power of creating people, both possible and impossible, who were simply precious and priceless people; and anything subtler added to that truth really only weakens it. The mention of Mrs. Wilfer (whom the heart is loth to leave) reminds one of the only elementary ethical truth that is essential in the study of Dickens. That is that he had broad or universal sympathies in a sense totally unknown to the social reformers who wallow in such phrases. Dickens (unlike the social reformers) really did sympathise with every sort of victim of every sort of tyrant. He did truly pray for all who are desolate and oppressed. If you try to tie him to any cause narrower than that Prayer Book definition, you will find you have shut out half his best work. If, in your sympathy for Mrs. Quilp, you call Dickens the champion of downtrodden woman, you will suddenly remember Mr. Wilfer, and find yourself unable to deny the existence of downtrodden man. If in your sympathy for Mr. Rouncewell you call Dickens the champion of a manly middle-class Liberalism against Chesney Wold, you will suddenly remember Stephen Blackpool--and find yourself unable to deny that Mr. Rouncewell might be a pretty insupportable cock on his own dung-hill. If in your sympathy for Stephen Blackpool you call Dickens a Socialist (as does Mr. Pugh), and think of him as merely heralding the great Collectivist revolt against Victorian Individualism and Capitalism, which seemed so clearly to be the crisis at the end of this epoch--you will suddenly remember the agreeable young Barnacle at the Circumlocution Office: and you will be unable, for very shame, to assert that Dickens would have trusted the poor to a State Department. Dickens did not merely believe in the brotherhood of men in the weak modern way; he was the brotherhood of men, and knew it was a brotherhood in sin as well as in aspiration. And he was not only larger than the old factions he satirised; he was larger than any of our great social schools that have gone forward since he died. The seemingly quaint custom of

comparing Dickens and Thackeray existed in their own time, and no one will dismiss it with entire disdain who remembers that the Victorian tradition was domestic and genuine, even when it was hoodwinked and unworldly. There must have been some reason for making this imaginary duel between two quite separate and quite amiable acquaintances. And there is, after all, some reason for it. It is not, as was once cheaply said, that Thackeray went in for truth, and Dickens for mere caricature. There is a huge accumulation of truth, down to the smallest detail, in Dickens: he seems sometimes a mere mountain of facts. Thackeray, in comparison, often seems quite careless and elusive; almost as if he did not quite know where all his characters were. There is a truth behind the popular distinction; but it lies much deeper. Perhaps the best way of stating it is this: that Dickens used reality, while aiming at an effect of romance; while Thackeray used the loose language and ordinary approaches of romance, while aiming at an effect of reality. It was the special and splendid business of Dickens to introduce us to people who would have been quite incredible if he had not told us so much truth about them. It was the special and not less splendid task of Thackeray to introduce us to people whom we knew already. Paradoxically, but very practically, it followed that his introductions were the longer of the two. When we hear of Aunt Betsy Trotwood, we vividly envisage everything about her, from her gardening gloves to her seaside residence, from her hard, handsome face to her tame lunatic laughing at the bedroom window. It is all so minutely true that she must be true also. We only feel inclined to walk round the English coast until we find that particular garden and that particular aunt. But when we turn from the aunt of Copperfield to the uncle of Pendennis, we are more likely to run round the coast trying to find a watering-place where he isn't than one where he is. The moment one sees Major Pendennis, one sees a hundred Major Pendennises. It is not a matter of mere realism. Miss Trotwood's bonnet and gardening tools and cupboard full of old-fashioned bottles are quite as true in the materialistic way as the Major's cuffs and corner table and toast and newspaper. Both writers are realistic: but Dickens writes realism in order to make the incredible credible. Thackeray writes it in order to make us recognise an old friend. Whether we shall be pleased to meet the old friend is quite another matter: I think we should be better pleased to meet Miss Trotwood, and find, as David Copperfield did, a new friend, a new world. But we recognise Major Pendennis even when we avoid him. Henceforth Thackeray can count on our seeing him from his wig to his well-blacked boots whenever he chooses to say "Major Pendennis paid a call." Dickens, on the other hand, had to keep up an incessant excitement about his characters; and no man on earth but he could have kept it up. It may be said, in approximate summary, that Thackeray is the novelist of memory--of our memories as well as his own. Dickens seems to expect all his characters, like amusing strangers arriving at lunch: as if they gave him not only pleasure, but surprise. But Thackeray is everybody's past--is everybody's youth. Forgotten friends flit about the passages of dreamy colleges and unremembered clubs; we hear fragments of unfinished conversations, we see faces without names for an instant, fixed for ever in some trivial grimace: we smell the strong smell of social cliques now quite incongruous to us; and there stir in all the little rooms at once the hundred ghosts of oneself. For this purpose Thackeray was equipped with a singularly easy and sympathetic style, carved in slow soft curves where Dickens hacked out his images with a hatchet. There was a sort of avuncular indulgence about his attitude; what he called his "preaching" was at worst a sort of grumbling, ending with the sentiment that boys will be boys and that there's nothing new under the sun. He was not really either a cynic or a *_censor morum_*; but (in another sense than Chaucer's) a gentle pardoner: having seen the weaknesses he is sometimes almost weak about them. He really comes nearer to exculpating Pendennis or Ethel Newcome than any other author, who saw what he saw, would have been. The rare wrath of such men is all the more effective; and there are passages in *_Vanity Fair_* and still more in *_The Book of Snobs_*, where he does make the dance of wealth and fashion look stiff and monstrous, like a Babylonian masquerade. But he never quite did it in such a way as to turn the course of the Victorian Age. It may seem strange to say that Thackeray did not know enough of the world; yet this was the truth about him in large matters of the philosophy of life, and especially of his own time. He did not know the way things were going: he was too Victorian to understand the Victorian epoch. He did not know enough ignorant people to have heard the news. In one of his delightful asides he imagines two little clerks commenting erroneously on the appearance of Lady Kew or Sir Brian Newcome in the Park, and says: "How should Jones and Brown, who are not, *_vous comprenez, du monde_*, understand these mysteries?" But I think Thackeray knew quite as little about Jones and Brown as they knew about Newcome and Kew; his world was *_le monde_*. Hence he seemed to take it for granted that the Victorian compromise would last; while Dickens (who knew his Jones and Brown) had already guessed that it would not. Thackeray did not realise that the Victorian platform was a moving platform. To take but one instance, he was a Radical like Dickens; all really representative Victorians, except perhaps Tennyson, were Radicals. But he seems to have thought of all reform as simple and straightforward and all of a piece; as if Catholic Emancipation, the New Poor Law, Free Trade and the Factory Acts and Popular Education were all parts of one almost self-evident evolution of enlightenment. Dickens, being in touch with the democracy, had already discovered that the country had come to a dark place of divided ways and divided counsels. In *_Hard Times_* he realised Democracy at war with Radicalism; and became, with so incompatible an ally as Ruskin, not

indeed a Socialist, but certainly an anti-Individualist. In *Our Mutual Friend* he felt the strength of the new rich, and knew they had begun to transform the aristocracy, instead of the aristocracy transforming them. He knew that Veneering had carried off Twemlow in triumph. He very nearly knew what we all know to-day: that, so far from it being possible to plod along the progressive road with more votes and more Free Trade, England must either sharply become very much more democratic or as rapidly become very much less so. There gathers round these two great novelists a considerable group of good novelists, who more or less mirror their mid-Victorian mood. Wilkie Collins may be said to be in this way a lesser Dickens and Anthony Trollope a lesser Thackeray. Wilkie Collins is chiefly typical of his time in this respect: that while his moral and religious conceptions were as mechanical as his carefully constructed fictitious conspiracies, he nevertheless informed the latter with a sort of involuntary mysticism which dealt wholly with the darker side of the soul. For this was one of the most peculiar of the problems of the Victorian mind. The idea of the supernatural was perhaps at as low an ebb as it had ever been--certainly much lower than it is now. But in spite of this, and in spite of a certain ethical cheeriness that was almost *de rigueur*--the strange fact remains that the only sort of supernaturalism the Victorians allowed to their imaginations was a sad supernaturalism. They might have ghost stories, but not saints' stories. They could trifle with the curse or unpardoning prophecy of a witch, but not with the pardon of a priest. They seem to have held (I believe erroneously) that the supernatural was safest when it came from below. When we think (for example) of the uncountable riches of religious art, imagery, ritual and popular legend that has clustered round Christmas through all the Christian ages, it is a truly extraordinary thing to reflect that Dickens (wishing to have in *The Christmas Carol* a little happy supernaturalism by way of a change) actually had to make up a mythology for himself. Here was one of the rare cases where Dickens, in a real and human sense, did suffer from the lack of culture. For the rest, Wilkie Collins is these two elements: the mechanical and the mystical; both very good of their kind. He is one of the few novelists in whose case it is proper and literal to speak of his "plots." He was a plotter; he went about to slay Godfrey Ablewhite as coldly and craftily as the Indians did. But he also had a sound though sinister note of true magic; as in the repetition of the two white dresses in *The Woman in White*; or of the dreams with their double explanations in *Armada*. His ghosts do walk. They are alive; and walk as softly as Count Fosco, but as solidly. Finally, *The Moonstone* is probably the best detective tale in the world. Anthony Trollope, a clear and very capable realist, represents rather another side of the Victorian spirit of comfort; its leisureliness, its love of detail, especially of domestic detail; its love of following characters and kindred from book to book and from generation to generation. Dickens very seldom tried this latter experiment, and then (as in *Master Humphrey's Clock*) unsuccessfully; those magnesium blazes of his were too brilliant and glaring to be indefinitely prolonged. But Thackeray was full of it; and we often feel that the characters in *The Newcomes* or *Philip* might legitimately complain that their talk and tale are being perpetually interrupted and pestered by people out of other books. Within his narrower limits, Trollope was a more strict and masterly realist than Thackeray, and even those who would call his personages "types" would admit that they are as vivid as characters. It was a bustling but a quiet world that he described: politics before the coming of the Irish and the Socialists; the Church in the lull between the Oxford Movement and the modern High Anglican energy. And it is notable in the Victorian spirit once more that though his clergymen are all of them real men and many of them good men, it never really occurs to us to think of them as the priests of a religion. Charles Reade may be said to go along with these; and Disraeli and even Kingsley; not because these three very different persons had anything particular in common, but because they all fell short of the first rank in about the same degree. Charles Reade had a kind of cold coarseness about him, not morally but artistically, which keeps him out of the best literature as such: but he is of importance to the Victorian development in another way; because he has the harsher and more tragic note that has come later in the study of our social problems. He is the first of the angry realists. Kingsley's best books may be called boys' books. There is a real though a juvenile poetry in *Westward Ho!* and though that narrative, historically considered, is very much of a lie, it is a good, thundering honest lie. There are also genuinely eloquent things in *Hypatia*, and a certain electric atmosphere of sectarian excitement that Kingsley kept himself in, and did know how to convey. He said he wrote the book in his heart's blood. This is an exaggeration, but there is a truth in it; and one does feel that he may have relieved his feelings by writing it in red ink. As for Disraeli, his novels are able and interesting considered as everything except novels, and are an important contribution precisely because they are written by an alien who did not take our politics so seriously as Trollope did. They are important again as showing those later Victorian changes which men like Thackeray missed. Disraeli did do something towards revealing the dishonesty of our politics--even if he had done a good deal towards bringing it about. Between this group and the next there hovers a figure very hard to place; not higher in letters than these, yet not easy to class with them; I mean Bulwer Lytton. He was no greater than they were; yet somehow he seems to take up more space. He did not, in the ultimate reckoning, do anything in particular: but he was a figure; rather as Oscar Wilde was later a figure. You could not have the Victorian Age without him. And this was not due to wholly superficial things like his dandyism, his dark, sinister good looks and a great deal of the mere polished melodrama that he wrote. There was

something in his all-round interests; in the variety of things he tried; in his half-aristocratic swagger as poet and politician, that made him in some ways a real touchstone of the time. It is noticeable about him that he is always turning up everywhere and that he brings other people out, generally in a hostile spirit. His Byronic and almost Oriental ostentation was used by the young Thackeray as something on which to sharpen his new razor of Victorian common sense. His pose as a dilettante satirist inflamed the execrable temper of Tennyson, and led to those lively comparisons to a bandbox and a lion in curlpapers. He interposed the glove of warning and the tear of sensibility between us and the proper ending of *Great Expectations*. Of his own books, by far the best are the really charming comedies about *The Caxtons* and *Kenelm Chillingly*; none of his other works have a high literary importance now, with the possible exception of *A Strange Story*; but his *Coming Race* is historically interesting as foreshadowing those novels of the future which were afterwards such a weapon of the Socialists. Lastly, there was an element indefinable about Lytton, which often is in adventurers; which amounts to a suspicion that there was something in him after all. It rang out of him when he said to the hesitating Crimean Parliament: "Destroy your Government and save your army." With the next phase of Victorian fiction we enter a new world; the later, more revolutionary, more continental, freer but in some ways weaker world in which we live to-day. The subtle and sad change that was passing like twilight across the English brain at this time is very well expressed in the fact that men have come to mention the great name of Meredith in the same breath as Mr. Thomas Hardy. Both writers, doubtless, disagreed with the orthodox religion of the ordinary English village. Most of us have disagreed with that religion until we made the simple discovery that it does not exist. But in any age where ideas could be even feebly disentangled from each other, it would have been evident at once that Meredith and Hardy were, intellectually speaking, mortal enemies. They were much more opposed to each other than Newman was to Kingsley; or than Abelard was to St. Bernard. But then they collided in a sceptical age, which is like colliding in a London fog. There can never be any clear controversy in a sceptical age. Nevertheless both Hardy and Meredith did mean something; and they did mean diametrically opposite things. Meredith was perhaps the only man in the modern world who has almost had the high honour of rising out of the low estate of a Pantheist into the high estate of a Pagan. A Pagan is a person who can do what hardly any person for the last two thousand years could do: a person who can take Nature naturally. It is due to Meredith to say that no one outside a few of the great Greeks has ever taken Nature so naturally as he did. And it is also due to him to say that no one outside Colney Hatch ever took Nature so unnaturally as it was taken in what Mr. Hardy has had the blasphemy to call *Wessex Tales*. This division between the two points of view is vital; because the turn of the nineteenth century was a very sharp one; by it we have reached the rapids in which we find ourselves to-day. Meredith really is a Pantheist. You can express it by saying that God is the great All: you can express it much more intelligently by saying that Pan is the great god. But there is some sense in it, and the sense is this: that some people believe that this world is sufficiently good at bottom for us to trust ourselves to it without very much knowing why. It is the whole point in most of Meredith's tales that there is something behind us that often saves us when we understand neither it nor ourselves. He sometimes talked mere intellectualism about women: but that is because the most brilliant brains can get tired. Meredith's brain was quite tired when it wrote some of its most quoted and least interesting epigrams: like that about passing Seraglio Point, but not doubling Cape Turk. Those who can see Meredith's mind in that are with those who can see Dickens' mind in *Little Nell*. Both were chivalrous pronouncements on behalf of oppressed females: neither has any earthly meaning as ideas. But what Meredith did do for women was not to emancipate them (which means nothing) but to express them, which means a great deal. And he often expressed them right, even when he expressed himself wrong. Take, for instance, that phrase so often quoted: "Woman will be the last thing civilised by man." Intellectually it is something worse than false; it is the opposite of what he was always attempting to say. So far from admitting any equality in the sexes, it logically admits that a man may use against a woman any chains or whips he has been in the habit of using against a tiger or a bear. He stood as the special champion of female dignity: but I cannot remember any author, Eastern or Western, who has so calmly assumed that man is the master and woman merely the material, as Meredith really does in this phrase. Any one who knows a free woman (she is generally a married woman) will immediately be inclined to ask two simple and catastrophic questions, first: "Why should woman be civilised?" and, second: "Why, if she is to be civilised, should she be civilised by man?" In the mere intellectualism of the matter, Meredith seems to be talking the most brutal sex mastery: he, at any rate, has not doubled Cape Turk, nor even passed Seraglio Point. Now why is it that we all really feel that this Meredithian passage is not so insolently masculine as in mere logic it would seem? I think it is for this simple reason: that there is something about Meredith making us feel that it is not woman he disbelieves in, but civilisation. It is a dark undemonstrated feeling that Meredith would really be rather sorry if woman were civilised by man--or by anything else. When we have got that, we have got the real Pagan--the man that does believe in Pan. It is proper to put this philosophic matter first, before the æsthetic appreciation of Meredith, because with Meredith a sort of passing bell has rung and the Victorian orthodoxy is certainly no longer safe. Dickens and Carlyle, as we have said, rebelled against the orthodox

compromise: but Meredith has escaped from it. Cosmopolitanism, Socialism, Feminism are already in the air; and Queen Victoria has begun to look like Mrs. Grundy. But to escape from a city is one thing: to choose a road is another. The free-thinker who found himself outside the Victorian city, found himself also in the fork of two very different naturalistic paths. One of them went upwards through a tangled but living forest to lonely but healthy hills: the other went down to a swamp. Hardy went down to botanise in the swamp, while Meredith climbed towards the sun. Meredith became, at his best, a sort of daintily dressed Walt Whitman: Hardy became a sort of village atheist brooding and blaspheming over the village idiot. It is largely because the free-thinkers, as a school, have hardly made up their minds whether they want to be more optimist or more pessimist than Christianity that their small but sincere movement has failed. For the duel is deadly; and any agnostic who wishes to be anything more than a Nihilist must sympathise with one version of nature or the other. The God of Meredith is impersonal; but he is often more healthy and kindly than any of the persons. That of Thomas Hardy is almost made personal by the intense feeling that he is poisonous. Nature is always coming in to save Meredith's women; Nature is always coming in to betray and ruin Hardy's. It has been said that if God had not existed it would have been necessary to invent Him. But it is not often, as in Mr. Hardy's case, that it is necessary to invent Him in order to prove how unnecessary (and undesirable) He is. But Mr. Hardy is anthropomorphic out of sheer atheism. He personifies the universe in order to give it a piece of his mind. But the fight is unequal for the old philosophical reason: that the universe had already given Mr. Hardy a piece of its mind to fight with. One curious result of this divergence in the two types of sceptic is this: that when these two brilliant novelists break down or blow up or otherwise lose for a moment their artistic self-command, they are both equally wild, but wild in opposite directions. Meredith shows an extravagance in comedy which, if it were not so complicated, every one would call broad farce. But Mr. Hardy has the honour of inventing a new sort of game, which may be called the extravagance of depression. The placing of the weak lover and his new love in such a place that they actually see the black flag announcing that Tess has been hanged is utterly inexcusable in art and probability; it is a cruel practical joke. But it is a practical joke at which even its author cannot brighten up enough to laugh. But it is when we consider the great artistic power of these two writers, with all their eccentricities, that we see even more clearly that free-thought was, as it were, a fight between finger-posts. For it is the remarkable fact that it was the man who had the healthy and manly outlook who had the crabbed and perverse style; it was the man who had the crabbed and perverse outlook who had the healthy and manly style. The reader may well have complained of paradox when I observed above that Meredith, unlike most neo-Pagans, did in his way take Nature naturally. It may be suggested, in tones of some remonstrance, that things like "though pierced by the cruel acerb," or "thy fleetingness is bigger in the ghost," or "her gabbling grey she eyes askant," or "sheer film of the surface awag" are not taking Nature naturally. And this is true of Meredith's style, but it is not true of his spirit; nor even, apparently, of his serious opinions. In one of the poems I have quoted he actually says of those who live nearest to that Nature he was always praising-- "Have they but held her laws and nature dear, They mouth no sentence of inverted wit"; which certainly was what Meredith himself was doing most of the time. But a similar paradox of the combination of plain tastes with twisted phrases can also be seen in Browning. Something of the same can be seen in many of the cavalier poets. I do not understand it: it may be that the fertility of a cheerful mind crowds everything, so that the tree is entangled in its own branches; or it may be that the cheerful mind cares less whether it is understood or not; as a man is less articulate when he is humming than when he is calling for help. Certainly Meredith suffers from applying a complex method to men and things he does not mean to be complex; nay, honestly admires for being simple. The conversations between Diana and Redworth fail of their full contrast because Meredith can afford the twopence for Diana coloured, but cannot afford the penny for Redworth plain. Meredith's ideals were neither sceptical nor finicky: but they can be called insufficient. He had, perhaps, over and above his honest Pantheism two convictions profound enough to be called prejudices. He was probably of Welsh blood, certainly of Celtic sympathies, and he set himself more swiftly though more subtly than Ruskin or Swinburne to undermining the enormous complacency of John Bull. He also had a sincere hope in the strength of womanhood, and may be said, almost without hyperbole, to have begotten gigantic daughters. He may yet suffer for his chivalric interference as many champions do. I have little doubt that when St. George had killed the dragon he was heartily afraid of the princess. But certainly neither of these two vital enthusiasms touched the Victorian trouble. The disaster of the modern English is not that they are not Celtic, but that they are not English. The tragedy of the modern woman is not that she is not allowed to follow man, but that she follows him far too slavishly. This conscious and theorising Meredith did not get very near his problem and is certainly miles away from ours. But the other Meredith was a creator; which means a god. That is true of him which is true of so different a man as Dickens, that all one can say of him is that he is full of good things. A reader opening one of his books feels like a schoolboy opening a hamper which he knows to have somehow cost a hundred pounds. He may be more bewildered by it than by an ordinary hamper; but he gets the impression of a real richness of thought; and that is what one really gets from such riots of felicity as Evan Harrington or Harry Richmond. His philosophy may be barren, but he was not. And the

chief feeling among those that enjoy him is a mere wish that more people could enjoy him too. I end here upon Hardy and Meredith; because this parting of the ways to open optimism and open pessimism really was the end of the Victorian peace. There are many other men, very nearly as great, on whom I might delight to linger: on Shorthouse, for instance, who in one way goes with Mrs. Browning or Coventry Patmore. I mean that he has a wide culture, which is called by some a narrow religion. When we think what even the best novels about cavaliers have been (written by men like Scott or Stevenson) it is a wonderful thing that the author of *John Inglesant* could write a cavalier romance in which he forgot Cromwell but remembered Hobbes. But Shorthouse is outside the period in fiction in the same sort of way in which Francis Thompson is outside it in poetry. He did not accept the Victorian basis. He knew too much. There is one more matter that may best be considered here, though briefly: it illustrates the extreme difficulty of dealing with the Victorian English in a book like this, because of their eccentricity; not of opinions, but of character and artistic form. There are several great Victorians who will not fit into any of the obvious categories I employ; because they will not fit into anything, hardly into the world itself. Where Germany or Italy would relieve the monotony of mankind by paying serious respect to an artist, or a scholar, or a patriotic warrior, or a priest--it was always the instinct of the English to do it by pointing out a Character. Dr. Johnson has faded as a poet or a critic, but he survives as a Character. Cobbett is neglected (unfortunately) as a publicist and pamphleteer, but he is remembered as a Character. Now these people continued to crop up through the Victorian time; and each stands so much by himself that I shall end these pages with a profound suspicion that I have forgotten to mention a Character of gigantic dimensions. Perhaps the best example of such eccentrics is George Borrow; who sympathised with unsuccessful nomads like the gipsies while every one else sympathised with successful nomads like the Jews; who had a genius like the west wind for the awakening of wild and casual friendships and the drag and attraction of the roads. But whether George Borrow ought to go into the section devoted to philosophers, or the section devoted to novelists, or the section devoted to liars, nobody else has ever known, even if he did. But the strongest case of this Victorian power of being abruptly original in a corner can be found in two things: the literature meant merely for children and the literature meant merely for fun. It is true that these two very Victorian things often melted into each other (as was the way of Victorian things), but not sufficiently to make it safe to mass them together without distinction. Thus there was George Macdonald, a Scot of genius as genuine as Carlyle's; he could write fairy-tales that made all experience a fairy-tale. He could give the real sense that every one had the end of an elfin thread that must at last lead them into Paradise. It was a sort of optimist Calvinism. But such really significant fairy-tales were accidents of genius. Of the Victorian Age as a whole it is true to say that it did discover a new thing; a thing called Nonsense. It may be doubted whether this thing was really invented to please children. Rather it was invented by old people trying to prove their first childhood, and sometimes succeeding only in proving their second. But whatever else the thing was, it was English and it was individual. Lewis Carroll gave mathematics a holiday: he carried logic into the wild lands of illogicality. Edward Lear, a richer, more romantic and therefore more truly Victorian buffoon, improved the experiment. But the more we study it, the more we shall, I think, conclude that it reposed on something more real and profound in the Victorians than even their just and exquisite appreciation of children. It came from the deep Victorian sense of humour. It may appear, because I have used from time to time the only possible phrases for the case, that I mean the Victorian Englishman to appear as a blockhead, which means an unconscious buffoon. To all this there is a final answer: that he was also a conscious buffoon--and a successful one. He was a humorist; and one of the best humorists in Europe. That which Goethe had never taught the Germans, Byron did manage to teach the English--the duty of not taking him seriously. The strong and shrewd Victorian humour appears in every slash of the pencil of Charles Keene; in every undergraduate inspiration of Calverley or "Q." or J. K. S. They had largely forgotten both art and arms: but the gods had left them laughter. But the final proof that the Victorians were alive by this laughter, can be found in the fact they could manage and master for a moment even the cosmopolitan modern theatre. They could contrive to put "The Bab Ballads" on the stage. To turn a private name into a public epithet is a thing given to few: but the word "Gilbertian" will probably last longer than the name Gilbert. It meant a real Victorian talent; that of exploding unexpectedly and almost, as it seemed, unintentionally. Gilbert made good jokes by the thousand; but he never (in his best days) made the joke that could possibly have been expected of him. This is the last essential of the Victorian. Laugh at him as a limited man, a moralist, conventionalist, an opportunist, a formalist. But remember also that he was really a humorist; and may still be laughing at you.

CHAPTER III THE GREAT VICTORIAN POETS

What was really unsatisfactory in Victorian literature is something much easier to feel than to state. It was not so much a superiority in the men of other ages to the Victorian men. It was a superiority of Victorian men to themselves. The individual was unequal. Perhaps that is why the society became unequal: I cannot say. They were lame giants; the strongest of them walked on one leg a little shorter than the other. A great man in any age must be a common man, and also an uncommon man. Those that are only uncommon men are perverts and sowers of pestilence. But somehow the great Victorian man was more and less than this. He was at once a giant and a dwarf. When he has been sweeping the sky in circles infinitely great, he suddenly shrivels into something indescribably small. There is a moment when Carlyle turns suddenly from a high creative mystic to a common Calvinist. There are moments when George Eliot turns from a prophetess into a governess. There are also moments when Ruskin turns into a governess, without even the excuse of sex. But in all these cases the alteration comes as a thing quite abrupt and unreasonable. We do not feel this acute angle anywhere in Homer or in Virgil or in Chaucer or in Shakespeare or in Dryden; such things as they knew they knew. It is no disgrace to Homer that he had not discovered Britain; or to Virgil that he had not discovered America; or to Chaucer that he had not discovered the solar system; or to Dryden that he had not discovered the steam-engine. But we do most frequently feel, with the Victorians, that the very vastness of the number of things they know illustrates the abrupt abyss of the things they do not know. We feel, in a sort of way, that it is a disgrace to a man like Carlyle when he asks the Irish why they do not bestir themselves and re-forest their country: saying not a word about the soaking up of every sort of profit by the landlords which made that and every other Irish improvement impossible. We feel that it is a disgrace to a man like Ruskin when he says, with a solemn visage, that building in iron is ugly and unreal, but that the weightiest objection is that there is no mention of it in the Bible; we feel as if he had just said he could find no hair-brushes in Habakkuk. We feel that it is a disgrace to a man like Thackeray when he proposes that people should be forcibly prevented from being nuns, merely because he has no fixed intention of becoming a nun himself. We feel that it is a disgrace to a man like Tennyson, when he talks of the French revolutions, the huge crusades that had recreated the whole of his civilisation, as being "no graver than a schoolboy's barring out." We feel that it is a disgrace to a man like Browning to make spluttering and spiteful puns about the names Newman, Wiseman, and Manning. We feel that it is a disgrace to a man like Newman when he confesses that for some time he felt as if he couldn't come in to the Catholic Church, because of that dreadful Mr. Daniel O'Connell, who had the vulgarity to fight for his own country. We feel that it is a disgrace to a man like Dickens, when he makes a blind brute and savage out of a man like St. Dunstan; it sounds as if it were not Dickens talking but Dombey. We feel it is a disgrace to a man like Swinburne, when he has a Jingo fit and calls the Boer children in the concentration camps "Whelps of treacherous dams whom none save we have spared to starve and slay": we feel that Swinburne, for the first time, really has become an immoral and indecent writer. All this is a certain odd provincialism peculiar to the English in that great century: they were in a kind of pocket; they appealed to too narrow a public opinion; I am certain that no French or German men of the same genius made such remarks. Renan was the enemy of the Catholic Church; but who can imagine Renan writing of it as Kingsley or Dickens did? Taine was the enemy of the French Revolution; but who can imagine Taine talking about it as Tennyson or Newman talked? Even Matthew Arnold, though he saw this peril and prided himself on escaping it, did not altogether escape it. There must be (to use an Irishism) something shallow in the depths of any man who talks about the Zeitgeist as if it were a living thing. But this defect is very specially the key to the case of the two great Victorian poets, Tennyson and Browning; the two spirited or beautiful tunes, so to speak, to which the other events marched or danced. It was especially so of Tennyson, for a reason which raises some of the most real problems about his poetry. Tennyson, of course, owed a great deal to Virgil. There is no question of plagiarism here; a debt to Virgil is like a debt to Nature. But Tennyson was a provincial Virgil. In such passages as that about the schoolboy's barring out he might be called a suburban Virgil. I mean that he tried to have the universal balance of all the ideas at which the great Roman had aimed: but he hadn't got hold of all the ideas to balance. Hence his work was not a balance of truths, like the universe. It was a balance of whims; like the British Constitution. It is intensely typical of Tennyson's philosophical temper that he was almost the only Poet Laureate who was not ludicrous. It is not absurd to think of Tennyson as tuning his harp in praise of Queen Victoria: that is, it is not absurd in the same sense as Chaucer's harp hallowed by dedication to Richard II or Wordsworth's harp hallowed by dedication to George IV is absurd. Richard's court could not properly appreciate either Chaucer's daisies or his "devotion." George IV would not have gone pottering about Helvellyn in search of purity and the simple annals of the poor. But Tennyson did sincerely believe in the Victorian compromise; and sincerity is never undignified. He really did hold a great many of the same views as Queen Victoria, though he was gifted with a more fortunate literary style. If Dickens is Cobbett's democracy stirring in its grave, Tennyson is the exquisitely ornamental extinguisher on the flame of the first revolutionary poets. England has settled down; England has become Victorian. The compromise was interesting, it was national and for a long time it was successful: there is still a great deal to be said for it. But it was as freakish and unphilosophic, as arbitrary and untranslatable, as a

beggar's patched coat or a child's secret language. Now it is here that Browning had a certain odd advantage over Tennyson; which has, perhaps, somewhat exaggerated his intellectual superiority to him. Browning's eccentric style was more suitable to the poetry of a nation of eccentrics; of people for the time being removed far from the centre of intellectual interests. The hearty and pleasant task of expressing one's intense dislike of something one doesn't understand is much more poetically achieved by saying, in a general way "Grrr--you swine!" than it is by laboured lines such as "the red fool-fury of the Seine." We all feel that there is more of the man in Browning here; more of Dr. Johnson or Cobbett. Browning is the Englishman taking himself wilfully, following his nose like a bull-dog, going by his own likes and dislikes. We cannot help feeling that Tennyson is the Englishman taking himself seriously--an awful sight. One's memory flutters unhappily over a certain letter about the Papal Guards written by Sir Willoughby Patterne. It is here chiefly that Tennyson suffers by that very Virgilian loveliness and dignity of diction which he put to the service of such a small and anomalous national scheme. Virgil had the best news to tell as well as the best words to tell it in. His world might be sad; but it was the largest world one could live in before the coming of Christianity. If he told the Romans to spare the vanquished and to war down the mighty, at least he was more or less well informed about who were mighty and who were vanquished. But when Tennyson wrote verses like-- "Of freedom in her regal seat, Of England; not the schoolboy heat, The blind hysterics of the Celt" he quite literally did not know one word of what he was talking about; he did not know what Celts are, or what hysterics are, or what freedom was, or what regal was or even of what England was--in the living Europe of that time. His religious range was very much wider and wiser than his political; but here also he suffered from treating as true universality a thing that was only a sort of lukewarm local patriotism. Here also he suffered by the very splendour and perfection of his poetical powers. He was quite the opposite of the man who cannot express himself; the inarticulate singer who dies with all his music in him. He had a great deal to say; but he had much more power of expression than was wanted for anything he had to express. He could not think up to the height of his own towering style. For whatever else Tennyson was, he was a great poet; no mind that feels itself free, that is, above the ebb and flow of fashion, can feel anything but contempt for the later effort to discredit him in that respect. It is true that, like Browning and almost every other Victorian poet, he was really two poets. But it is just to him to insist that in his case (unlike Browning's) both the poets were good. The first is more or less like Stevenson in metre; it is a magical luck or skill in the mere choice of words. "Wet sands marbled with moon and cloud"--"Flits by the sea-blue bird of March"--"Leafless ribs and iron horns"--"When the long dun wolds are ribbed with snow"--in all these cases one word is the keystone of an arch which would fall into ruin without it. But there are other strong phrases that recall not Stevenson but rather their common master, Virgil--"Tears from the depths of some divine despair"--"There is fallen a splendid tear from the passion-flower at the gate"--"Was a great water; and the moon was full"--"God made Himself an awful rose of dawn." These do not depend on a word but on an idea: they might even be translated. It is also true, I think, that he was first and last a lyric poet. He was always best when he expressed himself shortly. In long poems he had an unfortunate habit of eventually saying very nearly the opposite of what he meant to say. I will take only two instances of what I mean. In the Idylls of the King, and in In Memoriam (his two sustained and ambitious efforts), particular phrases are always flashing out the whole fire of the truth; the truth that Tennyson meant. But owing to his English indolence, his English aristocratic irresponsibility, his English vagueness in thought, he always managed to make the main poem mean exactly what he did not mean. Thus, these two lines which simply say that "Lancelot was the first in tournament, But Arthur mightiest in the battle-field" do really express what he meant to express about Arthur being after all "the highest, yet most human too; not Lancelot, nor another." But as his hero is actually developed, we have exactly the opposite impression; that poor old Lancelot, with all his faults, was much more of a man than Arthur. He was a Victorian in the bad as well as the good sense; he could not keep priggishness out of long poems. Or again, take the case of In Memoriam. I will quote one verse (probably incorrectly) which has always seemed to me splendid, and which does express what the whole poem should express--but hardly does. "That we may lift from out the dust, A voice as unto him that hears A cry above the conquered years Of one that ever works, and trust." The poem should have been a cry above the conquered years. It might well have been that if the poet could have said sharply at the end of it, as a pure piece of dogma, "I've forgotten every feature of the man's face: I know God holds him alive." But under the influence of the mere leisurely length of the thing, the reader does rather receive the impression that the wound has been healed only by time; and that the victor hours can boast that this is the man that loved and lost, but all he was is overworn. This is not the truth; and Tennyson did not intend it for the truth. It is simply the result of the lack of something militant, dogmatic and structural in him: whereby he could not be trusted with the trail of a very long literary process without entangling himself like a kitten playing cat's-cradle. Browning, as above suggested, got on much better with eccentric and secluded England because he treated it as eccentric and secluded; a place where one could do what one liked. To a considerable extent he did do what he liked; arousing not a few complaints; and many doubts and conjectures as to why on earth he liked it. Many comparatively sympathetic persons pondered upon what pleasure it

could give any man to write Sordello or rhyme "end-knot" to "offend not." Nevertheless he was no anarchist and no mystagogue; and even where he was defective, his defect has commonly been stated wrongly. The two chief charges against him were a contempt for form unworthy of an artist, and a poor pride in obscurity. The obscurity is true, though not, I think, the pride in it; but the truth about this charge rather rises out of the truth about the other. The other charge is not true. Browning cared very much for form; he cared very much for style. You may not happen to like his style; but he did. To say that he had not enough mastery over form to express himself perfectly like Tennyson or Swinburne is like criticising the griffin of a mediæval gargoyle without even knowing that it is a griffin; treating it as an infantile and unsuccessful attempt at a classical angel. A poet indifferent to form ought to mean a poet who did not care what form he used as long as he expressed his thoughts. He might be a rather entertaining sort of poet; telling a smoking-room story in blank verse or writing a hunting-song in the Spenserian stanza; giving a realistic analysis of infanticide in a series of triolets; or proving the truth of Immortality in a long string of limericks. Browning certainly had no such indifference. Almost every poem of Browning, especially the shortest and most successful ones, was moulded or graven in some special style, generally grotesque, but invariably deliberate. In most cases whenever he wrote a new song he wrote a new kind of song. The new lyric is not only of a different metre, but of a different shape. No one, not even Browning, ever wrote a poem in the same style as that horrible one beginning "John, Master of the Temple of God," with its weird choruses and creepy prose directions. No one, not even Browning, ever wrote a poem in the same style as Pisgah-sights. No one, not even Browning, ever wrote a poem in the same style as Time's Revenges. No one, not even Browning, ever wrote a poem in the same style as Meeting at Night and Parting at Morning. No one, not even Browning, ever wrote a poem in the same style as The Flight of the Duchess, or in the same style as The Grammarian's Funeral, or in the same style as A Star, or in the same style as that astounding lyric which begins abruptly "Some people hang pictures up." These metres and manners were not accidental; they really do suit the sort of spiritual experiment Browning was making in each case. Browning, then, was not chaotic; he was deliberately grotesque. But there certainly was, over and above this grotesqueness, a perversity and irrationality about the man which led him to play the fool in the middle of his own poems; to leave off carving gargoyles and simply begin throwing stones. His curious complicated puns are an example of this: Hood had used the pun to make a sentence or a sentiment especially pointed and clear. In Browning the word with two meanings seems to mean rather less, if anything, than the word with one. It also applies to his trick of setting himself to cope with impossible rhymes. It may be fun, though it is not poetry, to try rhyming to ranunculus; but even the fun presupposes that you do rhyme to it; and I will affirm, and hold under persecution, that "Tommy-make-room-for-your-uncle-us" does not rhyme to it. The obscurity, to which he must in a large degree plead guilty, was, curiously enough, the result rather of the gay artist in him than the deep thinker. It is patience in the Browning students; in Browning it was only impatience. He wanted to say something comic and energetic and he wanted to say it quick. And, between his artistic skill in the fantastic and his temperamental turn for the abrupt, the idea sometimes flashed past unseen. But it is quite an error to suppose that these are the dark mines containing his treasure. The two or three great and true things he really had to say he generally managed to say quite simply. Thus he really did want to say that God had indeed made man and woman one flesh; that the sex relation was religious in this real sense that even in our sin and despair we take it for granted and expect a sort of virtue in it. The feelings of the bad husband about the good wife, for instance, are about as subtle and entangled as any matter on this earth; and Browning really had something to say about them. But he said it in some of the plainest and most unmistakable words in all literature; as lucid as a flash of lightning. "Pompilia, will you let them murder me?" Or again, he did really want to say that death and such moral terrors were best taken in a military spirit; he could not have said it more simply than: "I was ever a fighter; one fight more, the best and the last." He did really wish to say that human life was unworkable unless immortality were implied in it every other moment; he could not have said it more simply: "leave now to dogs and apes; Man has for ever." The obscurities were not merely superficial, but often covered quite superficial ideas. He was as likely as not to be most unintelligible of all in writing a compliment in a lady's album. I remember in my boyhood (when Browning kept us awake like coffee) a friend reading out the poem about the portrait to which I have already referred, reading it in that rapid dramatic way in which this poet must be read. And I was profoundly puzzled at the passage where it seemed to say that the cousin disparaged the picture, "while John scorns ale." I could not think what this sudden teetotalism on the part of John had to do with the affair, but I forgot to ask at the time and it was only years afterwards that, looking at the book, I found it was "John's corns ail," a very Browningsque way of saying he winced. Most of Browning's obscurity is of that sort--the mistakes are almost as quaint as misprints--and the Browning student, in that sense, is more a proof reader than a disciple. For the rest his real religion was of the most manly, even the most boyish sort. He is called an optimist; but the word suggests a calculated contentment which was not in the least one of his vices. What he really was was a romantic. He offered the cosmos as an adventure rather than a scheme. He did not explain evil, far less explain it away; he enjoyed defying it. He was a troubadour even in theology and metaphysics: like the Jongleurs de Dieu of St.

Francis. He may be said to have serenaded heaven with a guitar, and even, so to speak, tried to climb there with a rope ladder. Thus his most vivid things are the red-hot little love lyrics, or rather, little love dramas. He did one really original and admirable thing: he managed the real details of modern love affairs in verse, and love is the most realistic thing in the world. He substituted the street with the green blind for the faded garden of Watteau, and the "blue spirt of a lighted match" for the monotony of the evening star. Before leaving him it should be added that he was fitted to deepen the Victorian mind, but not to broaden it. With all his Italian sympathies and Italian residence, he was not the man to get Victorian England out of its provincial rut: on many things Kingsley himself was not so narrow. His celebrated wife was wider and wiser than he in this sense; for she was, however one-sidedly, involved in the emotions of central European politics. She defended Louis Napoleon and Victor Emmanuel; and intelligently, as one conscious of the case against them both. As to why it now seems simple to defend the first Italian King, but absurd to defend the last French Emperor--well, the reason is sad and simple. It is concerned with certain curious things called success and failure, and I ought to have considered it under the heading of The Book of Snobs. But Elizabeth Barrett, at least, was no snob: her political poems have rather an impatient air, as if they were written, and even published, rather prematurely--just before the fall of her idol. These old political poems of hers are too little read to-day; they are amongst the most sincere documents on the history of the times, and many modern blunders could be corrected by the reading of them. And Elizabeth Barrett had a strength really rare among women poets; the strength of the phrase. She excelled in her sex, in epigram, almost as much as Voltaire in his. Pointed phrases like: "Martyrs by the pang without the palm"--or "Incense to sweeten a crime and myrrh to embitter a curse," these expressions, which are witty after the old fashion of the conceit, came quite freshly and spontaneously to her quite modern mind. But the first fact is this, that these epigrams of hers were never so true as when they turned on one of the two or three pivots on which contemporary Europe was really turning. She is by far the most European of all the English poets of that age; all of them, even her own much greater husband, look local beside her. Tennyson and the rest are nowhere. Take any positive political fact, such as the final fall of Napoleon. Tennyson wrote these profoundly foolish lines-- "He thought to quell the stubborn hearts of oak Madman!" as if the defeat of an English regiment were a violation of the laws of Nature. Mrs. Browning knew no more facts about Napoleon, perhaps, than Tennyson did; but she knew the truth. Her epigram on Napoleon's fall is in one line "And kings crept out again to feel the sun." Talleyrand would have clapped his horrible old hands at that. Her instinct about the statesman and the soldier was very like Jane Austen's instinct for the gentleman and the man. It is not unnoticeable that as Miss Austen spent most of her life in a village, Miss Barrett spent most of her life on a sofa. The godlike power of guessing seems (for some reason I do not understand) to grow under such conditions. Unfortunately Mrs. Browning was like all the other Victorians in going a little lame, as I have roughly called it, having one leg shorter than the other. But her case was, in one sense, extreme. She exaggerated both ways. She was too strong and too weak, or (as a false sex philosophy would express it) too masculine and too feminine. I mean that she hit the centre of weakness with almost the same emphatic precision with which she hit the centre of strength. She could write finally of the factory wheels "grinding life down from its mark," a strong and strictly true observation. Unfortunately she could also write of Euripides "with his droppings of warm tears." She could write in A Drama of Exile, a really fine exposition, touching the later relation of Adam and the animals: unfortunately the tears were again turned on at the wrong moment at the main; and the stage direction commands a silence, only broken by the dropping of angel's tears. How much noise is made by angel's tears? Is it a sound of emptied buckets, or of garden hose, or of mountain cataracts? That is the sort of question which Elizabeth Barrett's extreme love of the extreme was always tempting people to ask. Yet the question, as asked, does her a heavy historical injustice; we remember all the lines in her work which were weak enough to be called "womanly," we forget the multitude of strong lines that are strong enough to be called "manly"; lines that Kingsley or Henley would have jumped for joy to print in proof of their manliness. She had one of the peculiar talents of true rhetoric, that of a powerful concentration. As to the critic who thinks her poetry owed anything to the great poet who was her husband, he can go and live in the same hotel with the man who can believe that George Eliot owed anything to the extravagant imagination of Mr. George Henry Lewes. So far from Browning inspiring or interfering, he did not in one sense interfere enough. Her real inferiority to him in literature is that he was consciously while she was unconsciously absurd. It is natural, in the matter of Victorian moral change, to take Swinburne as the next name here. He is the only poet who was also, in the European sense, on the spot; even if, in the sense of the Gilbertian song, the spot was barred. He also knew that something rather crucial was happening to Christendom; he thought it was getting unchristened. It is even a little amusing, indeed, that these two Pro-Italian poets almost conducted a political correspondence in rhyme. Mrs. Browning sternly reproached those who had ever doubted the good faith of the King of Sardinia, whom she acclaimed as being truly a king. Swinburne, lyrically alluding to her as "Sea-eagle of English feather," broadly hinted that the chief blunder of that wild fowl had been her support of an autocratic adventurer: "calling a crowned man royal, that was no more than a king." But it is not fair, even in this important connection, to judge Swinburne by Songs Before Sunrise. They

were songs before a sunrise that has never turned up. Their dogmatic assertions have for a long time past stared starkly at us as nonsense. As, for instance, the phrase "Glory to Man in the Highest, for man is the master of things"; after which there is evidently nothing to be said, except that it is not true. But even where Swinburne had his greater grip, as in that grave and partly just poem *_Before a Crucifix_*, Swinburne, the most Latin, the most learned, the most largely travelled of the Victorians, still knows far less of the facts than even Mrs. Browning. The whole of the poem, *_Before a Crucifix_*, breaks down by one mere mistake. It imagines that the French or Italian peasants who fell on their knees before the Crucifix did so because they were slaves. They fell on their knees because they were free men, probably owning their own farms. Swinburne could have found round about Putney plenty of slaves who had no crucifixes: but only crucifixions. When we come to ethics and philosophy, doubtless we find Swinburne in full revolt, not only against the temperate idealism of Tennyson, but against the genuine piety and moral enthusiasm of people like Mrs. Browning. But here again Swinburne is very English, nay, he is very Victorian, for his revolt is illogical. For the purposes of intelligent insurrection against priests and kings, Swinburne ought to have described the natural life of man, free and beautiful, and proved from this both the noxiousness and the needlessness of such chains. Unfortunately Swinburne rebelled against Nature first and then tried to rebel against religion for doing exactly the same thing that he had done. His songs of joy are not really immoral; but his songs of sorrow are. But when he merely hurls at the priest the assertion that flesh is grass and life is sorrow, he really lays himself open to the restrained answer, "So I have ventured, on various occasions, to remark." When he went forth, as it were, as the champion of pagan change and pleasure, he heard uplifted the grand choruses of his own *_Atalanta_*, in his rear, refusing hope. The splendid diction that blazes through the whole of that drama, that still dances exquisitely in the more lyrical *_Poems and Ballads_*, makes some marvellous appearances in *_Songs Before Sunrise_*, and then mainly falters and fades away, is, of course, the chief thing about Swinburne. The style is the man; and some will add that it does not, thus unsupported, amount to much of a man. But the style itself suffers some injustice from those who would speak thus. The views expressed are often quite foolish and often quite insincere; but the style itself is a manlier and more natural thing than is commonly made out. It is not in the least languorous or luxurious or merely musical and sensuous, as one would gather from both the eulogies and the satires, from the conscious and the unconscious imitations. On the contrary, it is a sort of fighting and profane parody of the Old Testament; and its lines are made of short English words like the short Roman swords. The first line of one of his finest poems, for instance, runs, "I have lived long enough to have seen one thing, that love hath an end." In that sentence only one small "e" gets outside the monosyllable. Through all his interminable tragedies, he was fondest of lines like-- "If ever I leave off to honour you God give me shame; I were the worst churl born." The dramas were far from being short and dramatic; but the words really were. Nor was his verse merely smooth; except his very bad verse, like "the lilies and languors of virtue, to the raptures and roses of vice," which both, in cheapness of form and foolishness of sentiment, may be called the worst couplet in the world's literature. In his real poetry (even in the same poem) his rhythm and rhyme are as original and ambitious as Browning; and the only difference between him and Browning is, not that he is smooth and without ridges, but that he always crests the ridge triumphantly and Browning often does not-- "On thy bosom though many a kiss be, There are none such as knew it of old. Was it Alciphron once or Arisbe, Male ringlets or feminine gold, That thy lips met with under the statue Whence a look shot out sharp after thieves From the eyes of the garden-god at you Across the fig-leaves." Look at the rhymes in that verse, and you will see they are as stiff a task as Browning's: only they are successful. That is the real strength of Swinburne--a style. It was a style that nobody could really imitate; and least of all Swinburne himself, though he made the attempt all through his later years. He was, if ever there was one, an inspired poet. I do not think it the highest sort of poet. And you never discover who is an inspired poet until the inspiration goes. With Swinburne we step into the circle of that later Victorian influence which was very vaguely called *Æsthetic*. Like all human things, but especially Victorian things, it was not only complex but confused. Things in it that were at one on the emotional side were flatly at war on the intellectual. In the section of the painters, it was the allies or pupils of Ruskin, pious, almost painfully exact, and copying mediæval details rather for their truth than their beauty. In the section of the poets it was pretty loose, Swinburne being the leader of the revels. But there was one great man who was in both sections, a painter and a poet, who may be said to bestride the chasm like a giant. It is in an odd and literal sense true that the name of Rossetti is important here, for the name implies the nationality. I have loosely called Carlyle and the Brontës the romance from the North; the nearest to a general definition of the *Æsthetic* movement is to call it the romance from the South. It is that warm wind that had never blown so strong since Chaucer, standing in his cold English April, had smelt the spring in Provence. The Englishman has always found it easier to get inspiration from the Italians than from the French; they call to each other across that unconquered castle of reason. Browning's *_Englishman in Italy_*, Browning's *_Italian in England_*, were both happier than either would have been in France. Rossetti was the Italian in England, as Browning was the Englishman in Italy; and the first broad fact about the artistic revolution Rossetti wrought is written when we have written his name. But if the South lets in warmth or

heat, it also lets in hardness. The more the orange tree is luxuriant in growth, the less it is loose in outline. And it is exactly where the sea is slightly warmer than marble that it looks slightly harder. This, I think, is the one universal power behind the Æsthetic and Pre-Raphaelite movements, which all agreed in two things at least: strictness in the line and strength, nay violence, in the colour. Rossetti was a remarkable man in more ways than one; he did not succeed in any art; if he had he would probably never have been heard of. It was his happy knack of half failing in both the arts that has made him a success. If he had been as good a poet as Tennyson, he would have been a poet who painted pictures. If he had been as good a painter as Burne-Jones, he would have been a painter who wrote poems. It is odd to note on the very threshold of the extreme art movement that this great artist largely succeeded by not defining his art. His poems were too pictorial. His pictures were too poetical. That is why they really conquered the cold satisfaction of the Victorians, because they did mean something, even if it was a small artistic thing. Rossetti was one with Ruskin, on the one hand, and Swinburne on the other, in reviving the decorative instinct of the Middle Ages. While Ruskin, in letters only, praised that decoration Rossetti and his friends repeated it. They almost made patterns of their poems. That frequent return of the refrain which was foolishly discussed by Professor Nordau was, in Rossetti's case, of such sadness as sometimes to amount to sameness. The criticism on him, from a mediæval point of view, is not that he insisted on a chorus, but that he could not insist on a jolly chorus. Many of his poems were truly mediæval, but they would have been even more mediæval if he could ever have written such a refrain as "Tally Ho!" or even "Tooral-ooral" instead of "Tall Troy's on fire." With Rossetti goes, of course, his sister, a real poet, though she also illustrated that Pre-Raphaelite's conflict of views that covered their coincidence of taste. Both used the angular outlines, the burning transparencies, the fixed but still unfathomable symbols of the great mediæval civilisation; but Rossetti used the religious imagery (on the whole) irreligiously, Christina Rossetti used it religiously but (on the whole) so to make it seem a narrower religion. One poet, or, to speak more strictly, one poem, belongs to the same general atmosphere and impulse as Swinburne; the free but languid atmosphere of later Victorian art. But this time the wind blew from hotter and heavier gardens than the gardens of Italy. Edward Fitzgerald, a cultured eccentric, a friend of Tennyson, produced what professed to be a translation of the Persian poet Omar, who wrote quatrains about wine and roses and things in general. Whether the Persian original, in its own Persian way, was greater or less than this version I must not discuss here, and could not discuss anywhere. But it is quite clear that Fitzgerald's work is much too good to be a good translation. It is as personal and creative a thing as ever was written; and the best expression of a bad mood, a mood that may, for all I know, be permanent in Persia, but was certainly at this time particularly fashionable in England. In the technical sense of literature it is one of the most remarkable achievements of that age; as poetical as Swinburne and far more perfect. In this verbal sense its most arresting quality is a combination of something haunting and harmonious that flows by like a river or a song, with something else that is compact and pregnant like a pithy saying picked out in rock by the chisel of some pagan philosopher. It is at once a tune that escapes and an inscription that remains. Thus, alone among the reckless and romantic verses that first rose in Coleridge or Keats, it preserves something also of the wit and civilisation of the eighteenth century. Lines like "a Muezzin from the tower of darkness cries," or "Their mouths are stopped with dust" are successful in the same sense as "Pinnacled dim in the intense inane" or "Through verdurous glooms and winding mossy ways." But-- "Indeed, indeed, repentance oft before I swore; but was I sober when I swore?" is equally successful in the same sense as-- "Damn with faint praise, assent with civil leer And without sneering teach the rest to sneer." It thus earned a right to be considered the complete expression of that scepticism and sensual sadness into which later Victorian literature was more and more falling away: a sort of bible of unbelief. For a cold fit had followed the hot fit of Swinburne, which was of a feverish sort: he had set out to break down without having, or even thinking he had, the rudiments of rebuilding in him; and he effected nothing national even in the way of destruction. The Tennysonianians still walked past him as primly as a young ladies' school--the Browningites still inked their eyebrows and minds in looking for the lost syntax of Browning; while Browning himself was away looking for God, rather in the spirit of a truant boy from their school looking for birds' nests. The nineteenth-century sceptics did not really shake the respectable world and alter it, as the eighteenth-century sceptics had done; but that was because the eighteenth-century sceptics were something more than sceptics, and believed in Greek tragedies, in Roman laws, in the Republic. The Swinburnian sceptics had nothing to fight for but a frame of mind; and when ordinary English people listened to it, they came to the conclusion that it was a frame of mind they would rather hear about than experience. But these later poets did, so to speak, spread their soul in all the empty spaces; weaker brethren, disappointed artists, unattached individuals, very young people, were sapped or swept away by these songs; which, so far as any particular sense in them goes, were almost songs without words. It is because there is something which is after all indescribably manly, intellectual, firm about Fitzgerald's way of phrasing the pessimism that he towers above the slope that was tumbling down to the decadents. But it is still pessimism, a thing unfit for a white man; a thing like opium, that may often be a poison and sometimes a medicine, but never a food for us, who are driven by an inner command not only to think but to live, not only to live but to grow, and not only to grow but to build. And,

indeed, we see the insufficiency of such sad extremes even in the next name among the major poets; we see the Swinburnian parody of mediævalism, the inverted Catholicism of the decadents, struggling to get back somehow on its feet. The æsthetic school had, not quite unjustly, the name of mere dilettanti. But it is fair to say that in the next of them, a workman and a tradesman, we already feel something of that return to real issues leading up to the real revolts that broke up Victorianism at last. In the mere art of words, indeed, William Morris carried much further than Swinburne or Rossetti the mere imitation of stiff mediæval ornament. The other mediævalists had their modern moments; which were (if they had only known it) much more mediæval than their mediæval moments. Swinburne could write-- "We shall see Buonaparte the bastard Kick heels with his throat in a rope." One has an uneasy feeling that William Morris would have written something like-- "And the kin of the ill king Bonaparte Hath a high gallows for all his part." Rossetti could, for once in a way, write poetry about a real woman and call her "Jenny." One has a disturbed suspicion that Morris would have called her "Jehanne." But all that seems at first more archaic and decorative about Morris really arose from the fact that he was more virile and real than either Swinburne or Rossetti. It arose from the fact that he really was, what he so often called himself, a craftsman. He had enough masculine strength to be tidy: that is, after the masculine manner, tidy about his own trade. If his poems were too like wallpapers, it was because he really could make wallpapers. He knew that lines of poetry ought to be in a row, as palings ought to be in a row; and he knew that neither palings nor poetry looks any the worse for being simple or even severe. In a sense Morris was all the more creative because he felt the hard limits of creation as he would have felt them if he were not working in words but in wood; and if he was unduly dominated by the mere conventions of the mediævals, it was largely because they were (whatever else they were) the very finest fraternity of free workmen the world is ever likely to see. The very things that were urged against Morris are in this sense part of his ethical importance; part of the more promising and wholesome turn he was half unconsciously giving to the movement of modern art. His hazier fellow-Socialists blamed him because he made money; but this was at least in some degree because he made other things to make money: it was part of the real and refreshing fact that at last an æsthete had appeared who could make something. If he was a capitalist, at least he was what later capitalists cannot or will not be--something higher than a capitalist, a tradesman. As compared with aristocrats like Swinburne or aliens like Rossetti, he was vitally English and vitally Victorian. He inherits some of that paradoxical glory which Napoleon gave reluctantly to a nation of shopkeepers. He was the last of that nation; he did not go out golfing: like that founder of the artistic shopman, Samuel Richardson, "he kept his shop, and his shop kept him." The importance of his Socialism can easily be exaggerated. Among other lesser points, he was not a Socialist; he was a sort of Dickensian anarchist. His instinct for titles was always exquisite. It is part of his instinct of decoration: for on a page the title always looks important and the printed mass of matter a mere dado under it. And no one had ever nobler titles than The Roots of the Mountains or The Wood at the End of the World. The reader feels he hardly need read the fairy-tale because the title is so suggestive. But, when all is said, he never chose a better title than that of his social Utopia, News from Nowhere. He wrote it while the last Victorians were already embarked on their bold task of fixing the future--of narrating to-day what has happened to-morrow. They named their books by cold titles suggesting straight corridors of marble--titles like Looking Backward. But Morris was an artist as well as an anarchist. News from Nowhere is an irresponsible title; and it is an irresponsible book. It does not describe the problem solved; it does not describe wealth either wielded by the State or divided equally among the citizens. It simply describes an undiscovered country where every one feels good-natured all day. That he could even dream so is his true dignity as a poet. He was the first of the Æsthetes to smell mediævalism as a smell of the morning; and not as a mere scent of decay. With him the poetry that had been peculiarly Victorian practically ends; and, on the whole, it is a happy ending. There are many other minor names of major importance; but for one reason or other they do not derive from the schools that had dominated this epoch as such. Thus Thompson, the author of The City of Dreadful Night, was a fine poet; but his pessimism combined with a close pugnacity does not follow any of the large but loose lines of the Swinburnian age. But he was a great person--he knew how to be democratic in the dark. Thus Coventry Patmore was a much greater person. He was bursting with ideas, like Browning--and truer ideas as a rule. He was as eccentric and florid and Elizabethan as Browning; and often in moods and metres that even Browning was never wild enough to think of. No one will ever forget the first time he read Patmore's hint that the cosmos is a thing that God made huge only "to make dirt cheap"; just as nobody will ever forget the sudden shout he uttered when he first heard Mrs. Todgers asked for the rough outline of a wooden leg. These things are not jokes, but discoveries. But the very fact that Patmore was, as it were, the Catholic Browning, keeps him out of the Victorian atmosphere as such. The Victorian English simply thought him an indecent sentimentalist, as they did all the hot and humble religious diarists of Italy or Spain. Something of the same fate followed the most powerful of that last Victorian group who were called "Minor Poets." They numbered many other fine artists: notably Mr. William Watson, who is truly Victorian in that he made a manly attempt to tread down the decadents and return to the right reason of Wordsworth-- "I have not paid the world The evil and the insolent courtesy Of offering it my

baseness as a gift." But none of them were able even to understand Francis Thompson; his sky-scraping humility, his mountains of mystical detail, his occasional and unashamed weakness, his sudden and sacred blasphemies. Perhaps the shortest definition of the Victorian Age is that he stood outside it.

CHAPTER IV THE BREAK-UP OF THE COMPROMISE

If it be curiously and carefully considered it will, I think, appear more and more true that the struggle between the old spiritual theory and the new material theory in England ended simply in a deadlock; and a deadlock that has endured. It is still impossible to say absolutely that England is a Christian country or a heathen country; almost exactly as it was impossible when Herbert Spencer began to write. Separate elements of both sorts are alive, and even increasingly alive. But neither the believer nor the unbeliever has the impudence to call himself the Englishman. Certainly the great Victorian rationalism has succeeded in doing a damage to religion. It has done what is perhaps the worst of all damages to religion. It has driven it entirely into the power of the religious people. Men like Newman, men like Coventry Patmore, men who would have been mystics in any case, were driven back upon being much more extravagantly religious than they would have been in a religious country. Men like Huxley, men like Kingsley, men like most Victorian men, were equally driven back on being irreligious; that is, on doubting things which men's normal imagination does not necessarily doubt. But certainly the most final and forcible fact is that this war ended like the battle of Sheriffmuir, as the poet says; they both did fight, and both did beat, and both did run away. They have left to their descendants a treaty that has become a dull torture. Men may believe in immortality, and none of the men know why. Men may not believe in miracles, and none of the men know why. The Christian Church had been just strong enough to check the conquest of her chief citadels. The rationalist movement had been just strong enough to conquer some of her outposts, as it seemed, for ever. Neither was strong enough to expel the other; and Victorian England was in a state which some call liberty and some call lockjaw. But the situation can be stated another way. There came a time, roughly somewhere about 1880, when the two great positive enthusiasms of Western Europe had for the time exhausted each other--Christianity and the French Revolution. About that time there used to be a sad and not unsympathetic jest going about to the effect that Queen Victoria might very well live longer than the Prince of Wales. Somewhat in the same way, though the republican impulse was hardly a hundred years old and the religious impulse nearly two thousand, yet as far as England was concerned, the old wave and the new seemed to be spent at the same time. On the one hand Darwin, especially through the strong journalistic genius of Huxley, had won a very wide spread though an exceedingly vague victory. I do not mean that Darwin's own doctrine was vague; his was merely one particular hypothesis about how animal variety might have arisen; and that particular hypothesis, though it will always be interesting, is now very much the reverse of secure. But it is only in the strictly scientific world and among strictly scientific men that Darwin's detailed suggestion has largely broken down. The general public impression that he had entirely proved his case (whatever it was) was early arrived at, and still remains. It was and is hazily associated with the negation of religion. But (and this is the important point) it was also associated with the negation of democracy. The same Mid-Victorian muddle-headedness that made people think that "evolution" meant that we need not admit the supremacy of God, also made them think that "survival" meant that we must admit the supremacy of men. Huxley had no hand in spreading these fallacies; he was a fair fighter; and he told his own followers, who spoke thus, most emphatically not to play the fool. He said most strongly that his or any theory of evolution left the old philosophical arguments for a creator, right or wrong, exactly where they were before. He also said most emphatically that any one who used the argument of Nature against the ideal of justice or an equal law, was as senseless as a gardener who should fight on the side of the ill weeds merely because they grew apace. I wish, indeed, that in such a rude summary as this, I had space to do justice to Huxley as a literary man and a moralist. He had a live taste and talent for the English tongue, which he devoted to the task of keeping Victorian rationalism rational. He did not succeed. As so often happens when a rather unhealthy doubt is in the atmosphere, the strongest words of their great captain could not keep the growing crowds of agnostics back from the most hopeless and inhuman extremes of destructive thought. Nonsense not yet quite dead about the folly of allowing the unfit to survive began to be more and more wildly whispered. Such helpless specimens of "advanced thought" are, of course, quite as inconsistent with Darwinism as they are with democracy or with any other intelligent proposition ever offered. But these unintelligent propositions were offered; and the ultimate result was this rather important one: that the harshness of Utilitarianism began to turn into downright tyranny. That beautiful faith in human nature and in freedom which had made delicate the dry air of John Stuart Mill; that robust, romantic sense of justice which had redeemed even the injustices of Macaulay--all that seemed slowly and sadly to be drying up. Under the shock of Darwinism all that was good in the Victorian rationalism shook and dissolved like

dust. All that was bad in it abode and clung like clay. The magnificent emancipation evaporated; the mean calculation remained. One could still calculate in clear statistical tables, how many men lived, how many men died. One must not ask how they lived; for that is politics. One must not ask how they died; for that is religion. And religion and politics were ruled out of all the Later Victorian debating clubs; even including the debating club at Westminster. What third thing they were discussing, which was neither religion nor politics, I do not know. I have tried the experiment of reading solidly through a vast number of their records and reviews and discussions; and still I do not know. The only third thing I can think of to balance religion and politics is art; and no one well acquainted with the debates at St. Stephen's will imagine that the art of extreme eloquence was the cause of the confusion. None will maintain that our political masters are removed from us by an infinite artistic superiority in the choice of words. The politicians know nothing of politics, which is their own affair: they know nothing of religion, which is certainly not their affair: it may legitimately be said that they have to do with nothing; they have reached that low and last level where a man knows as little about his own claim, as he does about his enemies'. In any case there can be no doubt about the effect of this particular situation on the problem of ethics and science. The duty of dragging truth out by the tail or the hind leg or any other corner one can possibly get hold of, a perfectly sound duty in itself, had somehow come into collision with the older and larger duty of knowing something about the organism and ends of a creature; or, in the everyday phrase, being able to make head or tail of it. This paradox pursued and tormented the Victorians. They could not or would not see that humanity repels or welcomes the railway-train, simply according to what people come by it. They could not see that one welcomes or smashes the telephone, according to what words one hears in it. They really seem to have felt that the train could be a substitute for its own passengers; or the telephone a substitute for its own voice. In any case it is clear that a change had begun to pass over scientific inquiry, of which we have seen the culmination in our own day. There had begun that easy automatic habit, of science as an oiled and smooth-running machine, that habit of treating things as obviously unquestionable, when, indeed, they are obviously questionable. This began with vaccination in the Early Victorian Age; it extended to the early licence of vivisection in its later age; it has found a sort of fitting foolscap, or crown of crime and folly, in the thing called Eugenics. In all three cases the point was not so much that the pioneers had not proved their case; it was rather that, by an unexpressed rule of respectability, they were not required to prove it. This rather abrupt twist of the rationalistic mind in the direction of arbitrary power, certainly weakened the Liberal movement from within. And meanwhile it was being weakened by heavy blows from without. There is a week that is the turn of the year; there was a year that was the turn of the century. About 1870 the force of the French Revolution faltered and fell: the year that was everywhere the death of Liberal ideas: the year when Paris fell: the year when Dickens died. While the new foes of freedom, the sceptics and scientists, were damaging democracy in ideas, the old foes of freedom, the emperors and the kings, were damaging her more heavily in arms. For a moment it almost seemed that the old Tory ring of iron, the Holy Alliance, had recombined against France. But there was just this difference: that the Holy Alliance was now not arguably, but almost avowedly, an Unholy Alliance. It was an alliance between those who still thought they could deny the dignity of man and those who had recently begun to have a bright hope of denying even the dignity of God. Eighteenth-century Prussia was Protestant and probably religious. Nineteenth-century Prussia was almost utterly atheist. Thus the old spirit of liberty felt itself shut up at both ends, that which was called progressive and that which was called reactionary: barricaded by Bismarck with blood and iron and by Darwin by blood and bones. The enormous depression which infects many excellent people born about this time, probably has this cause. It was a great calamity that the freedom of Wilkes and the faith of Dr. Johnson fought each other. But it was an even worse calamity that they practically killed each other. They killed each other almost simultaneously, like Herminius and Mamilius. Liberalism (in Newman's sense) really did strike Christianity through headpiece and through head; that is, it did daze and stun the ignorant and ill-prepared intellect of the English Christian. And Christianity did smite Liberalism through breastplate and through breast; that is, it did succeed, through arms and all sorts of awful accidents, in piercing more or less to the heart of the Utilitarian--and finding that he had none. Victorian Protestantism had not head enough for the business; Victorian Radicalism had not heart enough for the business. Down fell they dead together, exactly as Macaulay's Lay says, and still stood all who saw them fall almost until the hour at which I write. This coincident collapse of both religious and political idealism produced a curious cold air of emptiness and real subconscious agnosticism such as is extremely unusual in the history of mankind. It is what Mr. Wells, with his usual verbal delicacy and accuracy, spoke of as that ironical silence that follows a great controversy. It is what people less intelligent than Mr. Wells meant by calling themselves *_fin de siècle_*; though, of course, rationally speaking, there is no more reason for being sad towards the end of a hundred years than towards the end of five hundred fortnights. There was no arithmetical autumn, but there was a spiritual one. And it came from the fact suggested in the paragraphs above; the sense that man's two great inspirations had failed him together. The Christian religion was much more dead in the eighteenth century than it was in the nineteenth century. But the republican enthusiasm was also much more alive. If their scepticism was cold, and their faith even colder, their

practical politics were wildly idealistic; and if they doubted the kingdom of heaven, they were gloriously credulous about the chances of it coming on earth. In the same way the old pagan republican feeling was much more dead in the feudal darkness of the eleventh or twelfth centuries, than it was even a century later; but if creative politics were at their lowest, creative theology was almost at its highest point of energy. The modern world, in fact, had fallen between two stools. It had fallen between that austere old three-legged stool which was the tripod of the cold priestess of Apollo; and that other mystical and mediæval stool that may well be called the Stool of Repentance. It kept neither of the two values as intensely valuable. It could not believe in the bonds that bound men; but, then, neither could it believe in the men they bound. It was always restrained in its hatred of slavery by a half remembrance of its yet greater hatred of liberty. They were almost alone, I think, in thus carrying to its extreme the negative attitude already noted in Miss Arabella Allen. Anselm would have despised a civic crown, but he would not have despised a relic. Voltaire would have despised a relic; but he would not have despised a vote. We hardly find them both despised till we come to the age of Oscar Wilde. These years that followed on that double disillusionment were like one long afternoon in a rich house on a rainy day. It was not merely that everybody believed that nothing would happen; it was also that everybody believed that anything happening was even duller than nothing happening. It was in this stale atmosphere that a few flickers of the old Swinburnian flame survived; and were called Art. The great men of the older artistic movement did not live in this time; rather they lived through it. But this time did produce an interregnum of art that had a truth of its own; though that truth was near to being only a consistent lie. The movement of those called *Æsthetes* (as satirised in *Patience*) and the movement of those afterwards called *Decadents* (satirised in Mr. Street's delightful *Autobiography of a Boy*) had the same captain; or at any rate the same bandmaster. Oscar Wilde walked in front of the first procession wearing a sunflower, and in front of the second procession wearing a green carnation. With the *æsthetic* movement and its more serious elements, I deal elsewhere; but the second appearance of Wilde is also connected with real intellectual influences, largely negative, indeed, but subtle and influential. The mark in most of the arts of this time was a certain quality which those who like it would call "uniqueness of aspect," and those who do not like it "not quite coming off." I mean the thing meant something from one standpoint; but its mark was that the *smallest* change of standpoint made it unmeaning and unthinkable--a foolish joke. A beggar painted by Rembrandt is as solid as a statue, however roughly he is sketched in; the soul can walk all round him like a public monument. We see he would have other aspects; and that they would all be the aspects of a beggar. Even if one did not admit the extraordinary qualities in the painting, one would have to admit the ordinary qualities in the sitter. If it is not a masterpiece it is a man. But a nocturne by Whistler of mist on the Thames is either a masterpiece or it is nothing; it is either a nocturne or a nightmare of childish nonsense. Made in a certain mood, viewed through a certain temperament, conceived under certain conventions, it may be, it often is, an unreplaceable poem, a vision that may never be seen again. But the moment it ceases to be a splendid picture it ceases to be a picture at all. Or, again, if *Hamlet* is not a great tragedy it is an uncommonly good tale. The people and the posture of affairs would still be there even if one thought that Shakespeare's moral attitude was wrong. Just as one could imagine all the other sides of Rembrandt's beggar, so, with the mind's eye (Horatio), one can see all four sides of the castle of Elsinore. One might tell the tale from the point of view of Laërtes or Claudius or Polonius or the gravedigger; and it would still be a good tale and the same tale. But if we take a play like *Pelléas and Mélisande*, we shall find that unless we grasp the particular fairy thread of thought the poet rather hazily flings to us, we cannot grasp anything whatever. Except from one extreme poetic point of view, the thing is not a play; it is not a bad play, it is a mass of clotted nonsense. One whole act describes the lovers going to look for a ring in a distant cave when they both know they have dropped it down a well. Seen from some secret window on some special side of the soul's turret, this might convey a sense of faerie futility in our human life. But it is quite obvious that unless it called forth that one kind of sympathy, it would call forth nothing but laughter and rotten eggs. In the same play the husband chases his wife with a drawn sword, the wife remarking at intervals "I am not gay." Now there may really be an idea in this; the idea of human misfortune coming most cruelly upon the optimism of innocence; that the lonely human heart says, like a child at a party, "I am not enjoying myself as I thought I should." But it is plain that unless one thinks of this idea (and of this idea only) the expression is not in the least unsuccessful pathos; it is very broad and highly successful farce. Maeterlinck and the decadents, in short, may fairly boast of being subtle; but they must not mind if they are called narrow. This is the spirit of Wilde's work and of most of the literary work done in that time and fashion. It is, as Mr. Arthur Symons said, an attitude; but it is an attitude in the flat, not in the round; not a statue, but the cardboard king in a toy-theatre, which can only be looked at from the front. In Wilde's own poetry we have particularly a perpetually toppling possibility of the absurd; a sense of just falling too short or just going too far. "Plant lilies at my head" has something wrong about it; something silly that is not there in-- "And put a grey stone at my head" in the old ballad. But even where Wilde was right, he had a way of being right with this excessive strain on the reader's sympathy (and gravity) which was the mark of all these men with a "point of view." There is a very sound sonnet of his in which he begins by lamenting mere anarchy, as

hostile to the art and civilisation that were his only gods; but ends by saying-- "And yet These Christs that die upon the barricades God knows that I am with them--in some ways." Now that is really very true; that is the way a man of wide reading and worldly experience, but not ungenerous impulses, does feel about the mere fanatic, who is at once a nuisance to humanity and an honour to human nature. Yet who can read that last line without feeling that Wilde is poised on the edge of a precipice of bathos; that the phrase comes very near to being quite startlingly silly. It is as in the case of Maeterlinck, let the reader move his standpoint one inch nearer the popular standpoint, and there is nothing for the thing but harsh, hostile, unconquerable mirth. Somehow the image of Wilde lolling like an elegant leviathan on a sofa, and saying between the whiffs of a scented cigarette that martyrdom is martyrdom in some respects, has seized on and mastered all more delicate considerations in the mind. It is unwise in a poet to goad the sleeping lion of laughter. In less dexterous hands the decadent idea, what there was of it, went entirely to pieces, which nobody has troubled to pick up. Oddly enough (unless this be always the Nemesis of excess) it began to be insupportable in the very ways in which it claimed specially to be subtle and tactful; in the feeling for different art-forms, in the welding of subject and style, in the appropriateness of the epithet and the unity of the mood. Wilde himself wrote some things that were not immorality, but merely bad taste; not the bad taste of the conservative suburbs, which merely means anything violent or shocking, but real bad taste; as in a stern subject treated in a florid style; an over-dressed woman at a supper of old friends; or a bad joke that nobody had time to laugh at. This mixture of sensibility and coarseness in the man was very curious; and I for one cannot endure (for example) his sensual way of speaking of dead substances, satin or marble or velvet, as if he were stroking a lot of dogs and cats. But there was a sort of power--or at least weight--in his coarseness. His lapses were those proper to the one good thing he really was, an Irish swashbuckler--a fighter. Some of the Roman Emperors might have had the same luxuriousness and yet the same courage. But the later decadents were far worse, especially the decadent critics, the decadent illustrators--there were even decadent publishers. And they utterly lost the light and reason of their existence: they were masters of the clumsy and the incongruous. I will take only one example. Aubrey Beardsley may be admired as an artist or no; he does not enter into the scope of this book. But it is true that there is a certain brief mood, a certain narrow aspect of life, which he renders to the imagination rightly. It is mostly felt under white, deathly lights in Piccadilly, with the black hollow of heaven behind shiny hats or painted faces: a horrible impression that all mankind are masks. This being the thing Beardsley could express (and the only thing he could express), it is the solemn and awful fact that he was set down to illustrate Malory's *Morte d'Arthur*. There is no need to say more; taste, in the artist's sense, must have been utterly dead. They might as well have employed Burne-Jones to illustrate *Martin Chuzzlewit*. It would not have been more ludicrous than putting this portrayer of evil puppets, with their thin lines like wire and their small faces like perverted children's, to trace against the grand barbaric forests the sin and the sorrow of Lancelot. To return to the chief of the decadents, I will not speak of the end of the individual story: there was horror and there was expiation. And, as my conscience goes at least, no man should say one word that could weaken the horror--or the pardon. But there is one literary consequence of the thing which must be mentioned, because it bears us on to that much breezier movement which first began to break in upon all this ghastly idleness--I mean the Socialist Movement. I do not mean "*De Profundis*"; I do not think he had got to the real depths when he wrote that book. I mean the one real thing he ever wrote: *The Ballad of Reading Gaol*; in which we hear a cry for common justice and brotherhood very much deeper, more democratic and more true to the real trend of the populace to-day, than anything the Socialists ever uttered even in the boldest pages of Bernard Shaw. Before we pass on to the two expansive movements in which the Victorian Age really ended, the accident of a distinguished artist is available for estimating this somewhat cool and sad afternoon of the epoch at its purest; not in lounging pessimism or luxurious aberrations, but in earnest skill and a high devotion to letters. This change that had come, like the change from a golden sunset to a grey twilight, can be very adequately measured if we compare the insight and intricacy of Meredith with the insight and intricacy of Mr. Henry James. The characters of both are delicate and indisputable; but we must all have had a feeling that the characters in Meredith are gods, but that the characters in Henry James are ghosts. I do not mean that they are unreal: I believe in ghosts. So does Mr. Henry James; he has written some of his very finest literature about the little habits of these creatures. He is in the deep sense of a dishonoured word, a Spiritualist if ever there was one. But Meredith was a materialist as well. The difference is that a ghost is a disembodied spirit; while a god (to be worth worrying about) must be an embodied spirit. The presence of soul and substance together involves one of the two or three things which most of the Victorians did not understand--the thing called a sacrament. It is because he had a natural affinity for this mystical materialism that Meredith, in spite of his affectations, is a poet: and, in spite of his Victorian Agnosticism (or ignorance) is a pious Pagan and not a mere Pantheist. Mr. Henry James is at the other extreme. His thrill is not so much in symbol or mysterious emblem as in the absence of interventions and protections between mind and mind. It is not mystery: it is rather a sort of terror at knowing too much. He lives in glass houses; he is akin to Maeterlinck in a feeling of the nakedness of souls. None of the Meredithian things, wind or wine or sex or stark nonsense, ever gets

between Mr. James and his prey. But the thing is a deficiency as well as a talent: we cannot but admire the figures that walk about in his afternoon drawing-rooms; but we have a certain sense that they are figures that have no faces. For the rest, he is most widely known, or perhaps only most widely chaffed, because of a literary style that lends itself to parody and is a glorious feast for Mr. Max Beerbohm. It may be called The Hampered, or Obstacle Race Style, in which one continually trips over commas and relative clauses; and where the sense has to be perpetually qualified lest it should mean too much. But such satire, however friendly, is in some sense unfair to him; because it leaves out his sense of general artistic design, which is not only high, but bold. This appears, I think, most strongly in his short stories; in his long novels the reader (or at least one reader) does get rather tired of everybody treating everybody else in a manner which in real life would be an impossible intellectual strain. But in his short studies there is the unanswerable thing called real originality; especially in the very shape and point of the tale. It may sound odd to compare him to Mr. Rudyard Kipling; but he is like Kipling and also like Wells in this practical sense: that no one ever wrote a story at all like the *Mark of the Beast*; no one ever wrote a story at all like *A Kink in Space*; and in the same sense no one ever wrote a story like *The Great Good Place*. It is alone in order and species; and it is masterly. He struck his deepest note in that terrible story, *The Turn of the Screw*; and though there is in the heart of that horror a truth of repentance and religion, it is again notable of the Victorian writers that the only supernatural note they can strike assuredly is the tragic and almost the diabolic. Only Mr. Max Beerbohm has been able to imagine Mr. Henry James writing about Christmas. Now upon this interregnum, this cold and brilliant waiting-room which was Henry James at its highest and Wilde at its worst, there broke in two positive movements, largely honest though essentially unhistoric and profane, which were destined to crack up the old Victorian solidity past repair. The first was Bernard Shaw and the Socialists: the second was Rudyard Kipling and the Imperialists. I take the Socialists first not because they necessarily came so in order of time, but because they were less the note upon which the epoch actually ended. William Morris, of whom we have already spoken, may be said to introduce the Socialists, but rather in a social sense than a philosophical. He was their friend, and in a sort of political way, their father; but he was not their founder, for he would not have believed a word of what they ultimately came to say. Nor is this the conventional notion of the old man not keeping pace with the audacity of the young. Morris would have been disgusted not with the wildness, but the tameness of our tidy Fabians. He was not a Socialist, but he was a Revolutionist; he didn't know much more about what he was; but he knew that. In this way, being a full-blooded fellow, he rather repeats the genial sulkiness of Dickens. And if we take this fact about him first, we shall find it a key to the whole movement of this time. For the one dominating truth which overshadows everything else at this point is a political and economic one. The Industrial System, run by a small class of Capitalists on a theory of competitive contract, had been quite honestly established by the early Victorians and was one of the primary beliefs of Victorianism. The Industrial System, so run, had become another name for hell. By Morris's time and ever since, England has been divided into three classes: Knaves, Fools, and Revolutionists. History is full of forgotten controversies; and those who speak of Socialism now have nearly all forgotten that for some time it was an almost equal fight between Socialism and Anarchism for the leadership of the exodus from Capitalism. It is here that Herbert Spencer comes in logically, though not chronologically; also that much more interesting man, Auberon Herbert. Spencer has no special place as a man of letters; and a vastly exaggerated place as a philosopher. His real importance was that he was very nearly an Anarchist. The indefinable greatness there is about him after all, in spite of the silliest and smuggest limitations, is in a certain consistency and completeness from his own point of view. There is something mediæval, and therefore manful, about writing a book about everything in the world. Now this simplicity expressed itself in politics in carrying the Victorian worship of liberty to the most ridiculous lengths; almost to the length of voluntary taxes and voluntary insurance against murder. He tried, in short, to solve the problem of the State by eliminating the State from it. He was resisted in this by the powerful good sense of Huxley; but his books became sacred books for a rising generation of rather bewildered rebels, who thought we might perhaps get out of the mess if everybody did as he liked. Thus the Anarchists and Socialists fought a battle over the death-bed of Victorian Industrialism; in which the Socialists (that is, those who stood for increasing instead of diminishing the power of Government) won a complete victory and have almost exterminated their enemy. The Anarchist one meets here and there nowadays is a sad sight; he is disappointed with the future, as well as with the past. This victory of the Socialists was largely a literary victory; because it was effected and popularised not only by a wit, but by a sincere wit; and one who had the same sort of militant lucidity that Huxley had shown in the last generation and Voltaire in the last century. A young Irish journalist, impatient of the impoverished Protestantism and Liberalism to which he had been bred, came out as the champion of Socialism not as a matter of sentiment, but as a matter of common sense. The primary position of Bernard Shaw towards the Victorian Age may be roughly summarised thus: the typical Victorian said coolly: "Our system may not be a perfect system, but it works." Bernard Shaw replied, even more coolly: "It may be a perfect system, for all I know or care. But it does not work." He and a society called the Fabians, which once exercised considerable influence, followed this shrewd and sound strategic

hint to avoid mere emotional attack on the cruelty of Capitalism; and to concentrate on its clumsiness, its ludicrous incapacity to do its own work. This campaign succeeded, in the sense that while (in the educated world) it was the Socialist who looked the fool at the beginning of that campaign, it is the Anti-Socialist who looks the fool at the end of it. But while it won the educated classes it lost the populace for ever. It dried up those springs of blood and tears out of which all revolt must come if it is to be anything but bureaucratic readjustment. We began this book with the fires of the French Revolution still burning, but burning low. Bernard Shaw was honestly in revolt in his own way: but it was Bernard Shaw who trod out the last ember of the Great Revolution. Bernard Shaw proceeded to apply to many other things the same sort of hilarious realism which he thus successfully applied to the industrial problem. He also enjoyed giving people a piece of his mind; but a piece of his mind was a more appetising and less raw-looking object than a piece of Hardy's. There were many modes of revolt growing all around him; Shaw supported them--and supplanted them. Many were pitting the realism of war against the romance of war: they succeeded in making the fight dreary and repulsive, but the book dreary and repulsive too. Shaw, in *Arms and the Man*, did manage to make war funny as well as frightful. Many were questioning the right of revenge or punishment; but they wrote their books in such a way that the reader was ready to release all mankind if he might revenge himself on the author. Shaw, in *Captain Brassbound's Conversion*, really showed at its best the merry mercy of the pagan; that beautiful human nature that can neither rise to penance nor sink to revenge. Many had proved that even the most independent incomes drank blood out of the veins of the oppressed: but they wrote it in such a style that their readers knew more about depression than oppression. In *Widowers' Houses* Shaw very nearly (but not quite) succeeded in making a farce out of statistics. And the ultimate utility of his brilliant interruption can best be expressed in the very title of that play. When ages of essential European ethics have said "widows' houses," it suddenly occurs to him to say "but what about widowers' houses?" There is a sort of insane equity about it which was what Bernard Shaw had the power to give, and gave. Out of the same social ferment arose a man of equally unquestionable genius, Mr. H. G. Wells. His first importance was that he wrote great adventure stories in the new world the men of science had discovered. He walked on a round slippery world as boldly as Ulysses or Tom Jones had worked on a flat one. Cyrano de Bergerac or Baron Munchausen, or other typical men of science, had treated the moon as a mere flat silver mirror in which Man saw his own image--the Man in the Moon. Wells treated the moon as a globe, like our own; bringing forth monsters as moonish as we are earthy. The exquisitely penetrating political and social satire he afterwards wrote belongs to an age later than the Victorian. But because, even from the beginning, his whole trend was Socialist, it is right to place him here. While the old Victorian ideas were being disturbed by an increasing torture at home, they were also intoxicated by a new romance from abroad. It did not come from Italy with Rossetti and Browning, or from Persia with Fitzgerald: but it came from countries as remote, countries which were (as the simple phrase of that period ran) "painted red" on the map. It was an attempt to reform England through the newer nations; by the criticism of the forgotten colonies, rather than of the forgotten classes. Both Socialism and Imperialism were utterly alien to the Victorian idea. From the point of view of a Victorian aristocrat like Palmerston, Socialism would be the cheek of gutter snipes; Imperialism would be the intrusion of cads. But cads are not alone concerned. Broadly, the phase in which the Victorian epoch closed was what can only be called the Imperialist phase. Between that and us stands a very individual artist who must nevertheless be connected with that phase. As I said at the beginning, Macaulay (or, rather, the mind Macaulay shared with most of his powerful middle class) remains as a sort of pavement or flat foundation under all the Victorians. They discussed the dogmas rather than denied them. Now one of the dogmas of Macaulay was the dogma of progress. A fair statement of the truth in it is not really so hard. Investigation of anything naturally takes some little time. It takes some time to sort letters so as to find a letter: it takes some time to test a gas-bracket so as to find the leak; it takes some time to sift evidence so as to find the truth. Now the curse that fell on the later Victorians was this: that they began to value the time more than the truth. One felt so secretarial when sorting letters that one never found the letter; one felt so scientific in explaining gas that one never found the leak; and one felt so judicial, so impartial, in weighing evidence that one had to be bribed to come to any conclusion at all. This was the last note of the Victorians: procrastination was called progress. Now if we look for the worst fruits of this fallacy we shall find them in historical criticism. There is a curious habit of treating any one who comes before a strong movement as the "forerunner" of that movement. That is, he is treated as a sort of slave running in advance of a great army. Obviously, the analogy really arises from St. John the Baptist, for whom the phrase "forerunner" was rather peculiarly invented. Equally obviously, such a phrase only applies to an alleged or real divine event: otherwise the forerunner would be a founder. Unless Jesus had been the Baptist's God, He would simply have been his disciple. Nevertheless the fallacy of the "forerunner" has been largely used in literature. Thus men will call a universal satirist like Langland a "morning star of the Reformation," or some such rubbish; whereas the Reformation was not larger, but much smaller than Langland. It was simply the victory of one class of his foes, the greedy merchants, over another class of his foes, the lazy abbots. In real history this constantly occurs; that some small movement happens to favour one of the million things suggested by some

great man; whereupon the great man is turned into the running slave of the small movement. Thus certain sectarian movements borrowed the sensationalism without the sacramentalism of Wesley. Thus certain groups of decadents found it easier to imitate De Quincey's opium than his eloquence. Unless we grasp this plain common sense (that you or I are not responsible for what some ridiculous sect a hundred years hence may choose to do with what we say) the peculiar position of Stevenson in later Victorian letters cannot begin to be understood. For he was a very universal man; and talked some sense not only on every subject, but, so far as it is logically possible, in every sense. But the glaring deficiencies of the Victorian compromise had by that time begun to gape so wide that he was forced, by mere freedom of philosophy and fancy, to urge the neglected things. And yet this very urgency certainly brought on an opposite fever, which he would not have liked if he had lived to understand it. He liked Kipling, though with many healthy hesitations; but he would not have liked the triumph of Kipling; which was the success of the politician and the failure of the poet. Yet when we look back up the false perspective of time, Stevenson does seem in a sense to have prepared that imperial and downward path. I shall not talk here, any more than anywhere else in this book, about the "sedulous ape" business. No man ever wrote as well as Stevenson who cared only about writing. Yet there is a sense, though a misleading one, in which his original inspirations were artistic rather than purely philosophical. To put the point in that curt covenanting way which he himself could sometimes command, he thought it immoral to neglect romance. The whole of his real position was expressed in that phrase of one of his letters "our civilisation is a dingy ungentlemanly business: it drops so much out of a man." On the whole he concluded that what had been dropped out of the man was the boy. He pursued pirates as Defoe would have fled from them; and summed up his simplest emotions in that touching *cri de coeur* "shall we never shed blood?" He did for the penny dreadful what Coleridge had done for the penny ballad. He proved that, because it was really human, it could really rise as near to heaven as human nature could take it. If Thackeray is our youth, Stevenson is our boyhood: and though this is not the most artistic thing in him, it is the most important thing in the history of Victorian art. All the other fine things he did were, for curious reasons, remote from the current of his age. For instance, he had the good as well as the bad of coming from a Scotch Calvinist's house. No man in that age had so healthy an instinct for the actuality of positive evil. In *The Master of Ballantrae* he did prove with a pen of steel, that the Devil is a gentleman--but is none the less the Devil. It is also characteristic of him (and of the revolt from Victorian respectability in general) that his most blood-and-thunder sensational tale is also that which contains his most intimate and bitter truth. *Dr. Jekyll and Mr. Hyde* is a double triumph; it has the outside excitement that belongs to Conan Doyle with the inside excitement that belongs to Henry James. Alas, it is equally characteristic of the Victorian time that while nearly every Englishman has enjoyed the anecdote, hardly one Englishman has seen the joke--I mean the point. You will find twenty allusions to Jekyll and Hyde in a day's newspaper reading. You will also find that all such allusions suppose the two personalities to be equal, neither caring for the other. Or more roughly, they think the book means that man can be cloven into two creatures, good and evil. The whole stab of the story is that man *can't*: because while evil does not care for good, good must care for evil. Or, in other words, man cannot escape from God, because good is the God in man; and insists on omniscience. This point, which is good psychology and also good theology and also good art, has missed its main intention merely because it was also good story-telling. If the rather vague Victorian public did not appreciate the deep and even tragic ethics with which Stevenson was concerned, still less were they of a sort to appreciate the French finish and fastidiousness of his style; in which he seemed to pick the right word up on the point of his pen, like a man playing spillikins. But that style also had a quality that could be felt; it had a military edge to it, an *acies*; and there was a kind of swordsmanship about it. Thus all the circumstances led, not so much to the narrowing of Stevenson to the romance of the fighting spirit; but the narrowing of his influence to that romance. He had a great many other things to say; but this was what we were willing to hear: a reaction against the gross contempt for soldiering which had really given a certain Chinese deadness to the Victorians. Yet another circumstance thrust him down the same path; and in a manner not wholly fortunate. The fact that he was a sick man immeasurably increases the credit to his manhood in preaching a sane levity and pugnacious optimism. But it also forbade him full familiarity with the actualities of sport, war, or comradeship: and here and there his note is false in these matters, and reminds one (though very remotely) of the mere provincial bully that Henley sometimes sank to be. For Stevenson had at his elbow a friend, an invalid like himself, a man of courage and stoicism like himself; but a man in whom everything that Stevenson made delicate and rational became unbalanced and blind. The difference is, moreover, that Stevenson was quite right in claiming that he could treat his limitation as an accident; that his medicines "did not colour his life." His life was really coloured out of a shilling paint-box, like his toy-theatre: such high spirits as he had are the key to him: his sufferings are not the key to him. But Henley's sufferings are the key to Henley; much must be excused him, and there is much to be excused. The result was that while there was always a certain dainty equity about Stevenson's judgments, even when he was wrong, Henley seemed to think that on the right side the wronger you were the better. There was much that was feminine in him; and he is most understandable when surprised in those little solitary poems which speak of

emotions mellowed, of sunset and a quiet end. Henley hurled himself into the new fashion of praising Colonial adventure at the expense both of the Christian and the republican traditions; but the sentiment did not spread widely until the note was struck outside England in one of the conquered countries; and a writer of Anglo-Indian short stories showed the stamp of the thing called genius; that indefinable, dangerous and often temporary thing. For it is really impossible to criticise Rudyard Kipling as part of Victorian literature, because he is the end of such literature. He has many other powerful elements; an Indian element, which makes him exquisitely sympathetic with the Indian; a vague Jingo influence which makes him sympathetic with the man that crushes the Indian; a vague journalistic sympathy with the men that misrepresent everything that has happened to the Indian; but of the Victorian virtues, nothing. All that was right or wrong in Kipling was expressed in the final convulsion that he almost in person managed to achieve. The nearest that any honest man can come to the thing called "impartiality" is to confess that he is partial. I therefore confess that I think this last turn of the Victorian Age was an unfortunate turn; much on the other side can be said, and I hope will be said. But about the facts there can be no question. The Imperialism of Kipling was equally remote from the Victorian caution and the Victorian idealism: and our subject does quite seriously end here. The world was full of the trampling of totally new forces, gold was sighted from far in a sort of cynical romanticism: the guns opened across Africa; and the great queen died.

* * * * *

Of what will now be the future of so separate and almost secretive an adventure of the English, the present writer will not permit himself, even for an instant, to prophesy. The Victorian Age made one or two mistakes, but they were mistakes that were really useful; that is, mistakes that were really mistaken. They thought that commerce outside a country must extend peace: it has certainly often extended war. They thought that commerce inside a country must certainly promote prosperity; it has largely promoted poverty. But for them these were experiments; for us they ought to be lessons. If we continue the capitalist use of the populace--if we continue the capitalist use of external arms, it will lie heavy on the living. The dishonour will not be on the dead.

BIBLIOGRAPHICAL NOTE

After having surveyed the immense field presented in such a volume as Mr. George Mair's Modern English Literature in this series, or, more fully, in the Cambridge History of Modern Literature, the later volume of Chambers' English Literature, Mr. Gosse's History of Modern English Literature, or Henry Morley's English Literature in the Reign

of Victoria, the wise reader will choose some portion for closer study, and will go straight to the originals before he has any further traffic with critics or commentators, however able.

He will then need the aid of fuller biographies. Some Victorian Lives are already classic, or nearly so, among them Sir G. Trevelyan's Macaulay, Forster's Dickens, Mrs. Gaskell's Charlotte Brontë, Froude's Carlyle, and Sir E. T. Cook's Ruskin. With these may be ranged the great Dictionary of National Biography. The "English Men of

Letters" Series includes H. D. Traill's Coleridge, Ainger's Lamb, Trollope's Thackeray, Leslie Stephen's George Eliot, Herbert Paul's Matthew Arnold, Sir A. Lyall's Tennyson, G. K. Chesterton's Robert Browning, and A. C. Benson's Fitzgerald. At least two autobiographies must be named, those of Herbert Spencer and John Stuart Mill, and, as antidote to Newman's Apologia, the gay self-revelations of Borrow, and

Jefferies' Story of My Heart. Other considerable volumes are W. J. Cross's George Eliot, Lionel Johnson's Art of Thomas Hardy, Mr. W. M. Rossetti's Dante, G. Rossetti, Colvin's R. L. Stevenson, J. W. Mackail's William Morris, Holman Hunt's Pre-Raphaelite Brotherhood, Sir Leslie Stephen's The Utilitarians, Buxton Forman's Our Living Poets, Edward Thomas's Swinburne, Monypenny's Disraeli, Dawson's Victorian Novelists, and Stedman's Victorian Poets. The "Everyman" Short Biographical Dictionary of English Literature is useful for dates.

The latter half of the second volume of Mr. F. A. Mumby's Letters of Literary Men is devoted to the Victorian Age. There are fuller collections of the Letters of Leigh Hunt, Thackeray, Dickens, the Brownings, Fitzgerald, Charles Kingsley, Matthew Arnold, and more recently the Letters of George Meredith, edited by his son.

Among the important critical writers of the period, Matthew Arnold (Essays in Criticism, Study of Celtic Literature, etc.) stands easily first. Others are John, now Lord, Morley (Studies in Literature, etc.), Augustine

Birrell (*Obiter Dicta*, *Essays*), W. E. Henley (*Views and Reviews*), J. Addington Symonds (*Essays*), J. Churton Collins, Richard Garnett, Stopford A. Brooke, George E. B. Saintsbury (*History of Criticism*), R. H. Hutton (*Contemporary Thought*), J. M. Robertson (*Modern Humanists*, *Buckle*, etc.), Frederic Harrison (*The Choice of Books*, etc.), Andrew Lang, Walter Bagehot, Edmund Gosse, Prof. Dowden, Sir Walter Raleigh, and Sir A. T. Quiller Couch.

4. 20th Century: Reuben Post Halleck. *History of American Literature*

Reuben Post Halleck

History of American Literature

Preface

The wide use of the author's *History of English Literature*, the favor with which it has been received in all parts of the United States, and the number of earnest requests for a *History of American Literature* on the same plan, have led to the writing of this book. It has not appeared sooner because the author has followed his rule of making a careful first-hand study, not only of all the matter discussed, but also of a far greater amount, which, although it must be omitted from a condensed textbook, is, nevertheless, necessary as a background for judgment and selection. The following chapters describe the greatest achievements in American literature from the earliest times until the present. Many pupils fail to obtain a clear idea of great American authors and literary movements because textbook writers and teachers ignore the element of truth in the old adage, "The half is greater than the whole," and dwell too much on minor authors and details, which could reasonably be expected to interest only a specialist. In the following pages especial attention has been paid, not only to the individual work of great authors, but also to literary movements, ideals, and animating principles, and to the relation of all these to English literature. The author has further aimed to make this work both interesting and suggestive. He has endeavored to present the subject in a way that necessitates the comparison of authors and movements, and leads to stimulating thinking. He has tried to communicate enough of the spirit of our literature to make students eager for a first-hand acquaintance with it, to cause them to investigate for themselves this remarkable American record of spirituality, initiative, and democratic accomplishment. As a guide to such study, there have been placed at the end of each chapter *Suggested Readings* and still further hints, called *Questions and Suggestions*. In *A Glance Backward*, the author emphasizes in brief compass the most important truths that American literature teaches, truths that have resulted in raising the ideals of Americans and in arousing them to greater activity. Any one who makes an original study of American literature will not be a mere apologist for it. He will marvel at the greatness of the moral lesson, at the fidelity of the presentation of the thought which has molded this nation, and at the peculiar aptness which its great authors have displayed in ministering to the special needs and aspirations of Americans. He will realize that the youth who stops with the indispensable study of English literature is not prepared for American citizenship, because our literature is needed to present the ideals of American life. There may be greater literatures, but none of them can possibly take the place of ours for citizens of this democracy. The moral element, the most impressive quality in American literature, is continuous from the earliest colonial days until the present. Teachers should be careful not to obscure this quality. As the English scientist, John Tyndall, has shown in the case of Emerson, this moral stimulus is capable of adding immeasurably to the achievement of the young. The temptation to slight the colonial period should be resisted. It has too often been the fashion to ask, Why should the student not begin the study of American literature with Washington Irving, the first author read for pure pleasure? The answer is that the student would not then comprehend the stages of growth of the new world ideals, that he would not view our later literature through the proper atmosphere, and that he would lack certain elements necessary for a sympathetic comprehension of the subject. The seven years employed in the preparation of this work would have been insufficient, had not the author been assisted by his wife, to whom he is indebted not only for invaluable criticism but also for the direct authorship of some of the best matter in this book.

R. P. H.

HISTORY OF AMERICAN LITERATURE

CHAPTER I

COLONIAL LITERATURE

RELATION TO ENGLISH LITERATURE.--The literature produced in that part of America known as the United States did not begin as an independent literature. The early colonists were Englishmen who brought with them their

own language, books, and modes of thought. England had a world-famous literature before her sons established a permanent settlement across the Atlantic. Shakespeare had died four years before the Pilgrims landed at Plymouth. When an American goes to Paris he can neither read the books, nor converse with the citizens, if he knows no language but his own. Let him cross to London, and he will find that, although more than three hundred years have elapsed since the first colonists came to America, he immediately feels at home, so far as the language and literature are concerned. For nearly two hundred years after the first English settlements in America, the majority of the works read there were written by English authors. The hard struggle necessary to obtain a foothold in a wilderness is not favorable to the early development of a literature. Those who remained in England could not clear away the forest, till the soil, and conquer the Indians, but they could write the books and send them across the ocean. The early settlers were for the most part content to allow English authors to do this. For these reasons it would be surprising if early American literature could vie with that produced in England during the same period. When Americans began to write in larger numbers, there was at first close adherence to English models. For a while it seemed as if American literature would be only a feeble imitation of these models, but a change finally came, as will be shown in later chapters. It is to be hoped, however, that American writers of the future will never cease to learn from Chaucer, Spenser, Shakespeare, Milton, Bunyan, and Wordsworth. AMERICAN LITERATURE AN IMPORTANT STUDY.--We should not begin the study of American literature in an apologetic spirit. There should be no attempt to minimize the debt that America owes to English literature, nor to conceal the fact that American literature is young and has not had time to produce as many masterpieces as England gave to the world during a thousand years. However, it is now time also to record the fact that the literature of England gained something from America. Cultivated Englishmen to-day willingly admit that without a study of Cooper, Poe, and Hawthorne no one could give an adequate account of the landmarks of achievement in fiction, written in our common tongue. French critics have even gone so far as to canonize Poe. In a certain field he and Hawthorne occupy a unique place in the world's achievement. Again, men like Bret Harte and Mark Twain are not common in any literature. Foreigners have had American books translated into all the leading languages of the world. It is now more than one hundred years since Franklin, the great American philosopher of the practical, died, and yet several European nations reprint nearly every year some of his sayings, which continue to influence the masses. English critics, like John Addington Symonds, Robert Louis Stevenson, and Edward Dowden, have testified to the power of the democratic element in our literature and have given the dictum that it cannot be neglected. Some of the reasons why American literature developed along original lines and thus conveyed a message of its own to the world are to be found in the changed environment and the varying problems and ideals of American life. Even more important than the changed ways of earning a living and the difference in climate, animals, and scenery were the struggles leading to the Revolutionary War, the formation and guidance of the Republic, and the Civil War. All these combined to give individuality to American thought and literature. Taken as a whole, American literature has accomplished more than might reasonably have been expected. Its study is especially important for us, since the deeds associated with our birthplace must mean more to us than more remarkable achievements of men born under other skies. Our literature, even in its humble beginnings, contains a lesson that no American can afford to miss. Unless we know its ideals and moral aims and are swayed by them, we cannot keep our heritage. WHY VIRGINIA WAS COLONIZED.--In 1607 the first permanent English colony within the present limits of the United States was planted at Jamestown in Virginia. The colony was founded for commercial reasons by the London Company, an organization formed to secure profits from colonization. The colonists and the company that furnished their ship and outfit expected large profits from the gold mines and the precious stones which were believed to await discovery. Of course, the adventurers were also influenced by the honor and the romantic interest which they thought would result from a successful settlement. When the expedition sailed from England in December, 1606, Michael Drayton, an Elizabethan poet, wrote verses dedicated "To the Virginian Voyage." These stanzas show the reason for sending the colonizers to Virginia:--

"You brave heroic minds,
 Worthy your country's name,
 That honor still pursue,
 Whilst loit'ring hinds
 Lurk here at home with shame,
 Go and subdue.
 * * * * *
 And cheerfully at sea,
 Success you still entice,
 To get the pearl and gold;

And ours to hold
Virginia,
Earth's only paradise."

The majority of the early Virginian colonists were unfit for their task. Contemporary accounts tell of the "many unruly gallants, packed hither by their friends to escape ill destinies." Beggars, vagabonds, indentured servants, kidnapped girls, even convicts, were sent to Jamestown and became the ancestors of some of the "poor white trash" of the South. After the execution of Charles I. in 1649, and the setting up of the Puritan Commonwealth, many of the royalists, or Cavaliers, as they were called, came to Virginia to escape the obnoxious Puritan rule. They became the ancestors of Presidents and statesmen, and of many of the aristocratic families of the South. The ideals expressed by Captain John Smith, the leader and preserver of the Jamestown colony, are worthy to rank beside those of the colonizers of New England. Looking back at his achievement in Virginia, he wrote, "Then seeing we are not born for ourselves but each to help other ... Seeing honor is our lives' ambition ... and seeing by no means would we be abated of the dignities and glories of our predecessors; let us imitate their virtues to be worthily their successors."

WHY THE PURITANS COLONIZED NEW ENGLAND.--During the period from 1620 to 1640, large numbers of Englishmen migrated to that part of America now known as New England. These emigrants were not impelled by hope of wealth, or ease, or pleasure. They were called Puritans because they wished to purify the Church of England from what seemed to them great abuses; and the purpose of these men in emigrating to America was to lay the foundations of a state built upon their religious principles.

These people came for an intangible something--liberty of conscience, a fuller life of the spirit--which has never commanded a price on any stock exchange in the world. They looked beyond

"Things done that took the eye and had the price;
O'er which, from level stand,
The low world laid its hand,
Found straightway to its mind, could value in a trice."

These Puritans had been more than one century in the making. We hear of them in the time of Wycliffe (1324-1384). Their religion was a constant command to put the unseen above the seen, the eternal above the temporal, to satisfy the aspiration of the spirit. James I. (reign, 1603-1625) told them that he would harry them out of the kingdom unless they conformed to the rites of the Established Church. His son and successor Charles I. (reign, 1625-1649) called to his aid Archbishop Laud (1573-1645), a bigoted official of that church. Laud hunted the dissenting clergy like wild beasts, threw them into prison, whipped them in the pillory, branded them, slit their nostrils, and mutilated their ears. JOHN COTTON, pastor of the church of Boston, England, was told that if he had been guilty only of an infraction of certain of the Ten Commandments, he might have been pardoned, but since his crime was Puritanism, he must suffer. He had great trouble in escaping on a ship bound for the New England Boston. Professor Tyler says: "New England has perhaps never quite appreciated its great obligations to Archbishop Laud. It was his overmastering hate of nonconformity, it was the vigilance and vigor and consecrated cruelty with which he scoured his own diocese and afterward all England, and hunted down and hunted out the ministers who were committing the unpardonable sin of dissent, that conferred upon the principal colonies of New England their ablest and noblest men." It should be noted that the Puritan colonization of New England took place in a comparatively brief space of time, during the twenty years from 1620 to 1640. Until 1640 persecution drove the Puritans to New England in multitudes, but in that year they suddenly stopped coming. "During the one hundred and twenty-five years following that date, more persons, it is supposed, went back from the New to the Old England than came from the Old England to the New," says Professor Tyler. The year 1640 marks the assembling of the Long Parliament, which finally brought to the block both Archbishop Laud (1645) and King Charles I. (1649), and chose the great Puritan, Oliver Cromwell, to lead the Commonwealth. ELIZABETHAN TRAITS.--The leading men in the colonization of Virginia and New England were born in the reign of Queen Elizabeth (1558-1603), and they and their descendants showed on this side of the Atlantic those characteristics which made the Elizabethan age preeminent. In the first place, the Elizabethans possessed initiative. This power consists, first, in having ideas, and secondly, in passing from the ideas to the suggested action. Some people merely dream. The Elizabethans dreamed glorious dreams, which they translated into action. They defeated the Spanish Armada; they circumnavigated the globe; they made it possible for Shakespeare's pen to mold the thought and to influence the actions of the world. If we except those indentured servants and apprentices who came to America merely because others brought them, we shall find not only that the first colonists were born in an age distinguished for its initiative, but also that they came because they possessed this characteristic in a greater degree than those who remained behind. It was easier for the

majority to stay with their friends; hence England was not depopulated. The few came, those who had sufficient initiative to cross three thousand miles of unknown sea, who had the power to dream dreams of a new commonwealth, and the will to embody those dreams in action. In the second place, the Elizabethans were ingenious, that is, they were imaginative and resourceful. Impelled by the mighty forces of the Reformation and the Revival of Learning which the England of Elizabeth alone felt at one and the same time, the Elizabethans craved and obtained variety of experience, which kept the fountainhead of ingenuity filled. It is instructive to follow the lives of Elizabethans as different as Sir Philip Sidney, William Shakespeare, Sir Walter Raleigh, Captain John Smith, and John Winthrop, and to note the varied experiences of each. Yankee ingenuity had an Elizabethan ancestry. The hard conditions of the New World merely gave an opportunity to exercise to the utmost an ingenuity which the colonists brought with them. In the third place, the Elizabethans were unusually democratic; that is, the different classes mingled together in a marked degree, more than in modern England, more even than in the United States to-day. This intermingling was due in part to increased travel, to the desire born of the New Learning to live as varied and as complete a life as possible, and to the absence of overspecialization among individuals. This chance for varied experience with all sorts and conditions of men enabled Shakespeare to speak to all humanity. All England was represented in his plays. When the Rev. Thomas Hooker, born in the last half of Elizabeth's reign, was made pastor at Hartford, Connecticut, he suggested to his flock a democratic form of government much like that under which we now live. Let us remember that American life and literature owe their most interesting traits to these three Elizabethan qualities--initiative, ingenuity, and democracy. Let us not forget that the Cambridge University graduate, the cooper, cloth-maker, printer, and blacksmith had the initiative to set out for the New World, the ingenuity to deal with its varied exigencies, and the democratic spirit that enabled them to work side by side, no matter how diverse their former trades, modes of life, and social condition.

CAPTAIN JOHN SMITH, 1579-1631

The hero of the Jamestown colony, and its savior during the first two years, was Captain John Smith, born in Willoughby, Lincolnshire, in 1579, twenty-four years before the death of Elizabeth and thirty-seven before the death of Shakespeare. Smith was a man of Elizabethan stamp--active, ingenious, imaginative, craving new experiences. While a mere boy, he could not stand the tediousness of ordinary life, and so betook himself to the forest where he could hunt and play knight. In the first part of his young manhood he crossed the Channel, voyaged in the Mediterranean, fought the Turks, killing three of them in single combat, was taken prisoner and enslaved by the Tartars, killed his inhuman master, escaped into Russia, went thence through Europe to Africa, was in desperate naval battles, returned to England, sailing thence for Virginia, which he reached at the age of twenty-eight. He soon became president of the Jamestown colony and labored strenuously for its preservation. The first product of his pen in America was A True Relation of Virginia, written in 1608, the year in which John Milton was born. The last work written by Smith in America is entitled: A Map of Virginia, with a Description of the Country, the Commodities, People, Government, and Religion. His description of the Indians shows his capacity for quickly noting their traits:-- "They are inconstant in everything, but what fear constraineth them to keep. Crafty, timorous, quick of apprehension and very ingenious. Some are of disposition fearful, some bold, most cautious, all savage. Generally covetous of copper, beads, and such like trash. They are soon moved to anger, and so malicious that they seldom forget an injury: they seldom steal one from another, lest their conjurers should reveal it, and so they be pursued and punished. That they are thus feared is certain, but that any can reveal their offences by conjuration I am doubtful." Smith has often been accused of boasting, and some have said that he was guilty of great exaggeration or something worse, but it is certain that he repeatedly braved hardships, extreme dangers, and captivity among the Indians to provide food for the colony and to survey Virginia. After carefully editing Captain John Smith's Works in a volume of 983 pages, Professor Edwin Arber says: "For [our] own part, beginning with doubtfulness and wariness we have gradually come to the unhesitating conviction, not only of Smith's truthfulness, but also that, in regard to all personal matters, he systematically understates rather than exaggerates anything he did." Although by far the greater part of Smith's literary work was done after he returned to England, yet his two booklets written in America entitle him to a place in colonial literature. He had the Elizabethan love of achievement, and he records his admiration for those whose 'pens writ what their swords did.' He was not an artist with his pen, but our early colonial literature is the richer for his rough narrative and for the description of Virginia and the Indians. In one sense he gave the Indian to literature, and that is his greatest achievement in literary history. Who has not heard the story of his capture by the Indians, of his rescue from torture and death, by the beautiful Indian maiden, Pocahontas, of her risking her life to save him a second time from Indian treachery, of her bringing corn and preserving the colony from famine, of her visit to England in 1616, a few weeks after the death of Shakespeare, of her royal reception as a

princess, the daughter of an Indian king, of Smith's meeting her again in London, where their romantic story aroused the admiration of the court and the citizens for the brown-eyed princess? It would be difficult to say how many tales of Indian adventure this romantic story of Pocahontas has suggested. It has the honor of being the first of its kind written in the English tongue. Did Pocahontas actually rescue Captain Smith? In his account of his adventures, written in Virginia in 1608, he does not mention this rescue, but in his later writings he relates it as an actual occurrence. When Pocahontas visited London, this story was current, and there is no evidence that she denied it. Professor Arber says, "To deny the truth of the Pocahontas incident is to create more difficulties than are involved in its acceptance." But literature does not need to ask whether the story of Hamlet or of Pocahontas is true. If this unique story of American adventure is a product of Captain Smith's creative imagination, the literary critic must admit the captain's superior ability in producing a tale of such vitality. If the story is true, then our literature does well to remember whose pen made this truth one of the most persistent of our early romantic heritages. He is as well known for the story of Pocahontas as for all of his other achievements. The man who saved the Virginia colony and who first suggested a new field to the writer of American romance is rightly considered one of the most striking figures in our early history, even if he did return to England in less than three years and end his days there in 1631.

LITERARY ACTIVITY IN VIRGINIA COLONY

A POSSIBLE SUGGESTION FOR SHAKESPEARE'S TEMPEST.--WILLIAM STRACHEY, a contemporary of Shakespeare and secretary of the Virginian colony, wrote at Jamestown and sent to London in 1610 the manuscript of *A True Repertory of the Wrack and Redemption of Sir Thomas Gates, Kt., upon and from the Islands of the Bermudas*. This is a story of shipwreck on the Bermudas and of escape in small boats. The book is memorable for the description of a storm at sea, and it is possible that it may even have furnished suggestions to Shakespeare for *The Tempest*. If so, it is interesting to compare these with what they produced in Shakespeare's mind. Strachey tells how "the sea swelled above the clouds and gave battle unto heaven." He speaks of "an apparition of a little round light, like a faint star, trembling and streaming along with a sparkling blaze, half the height upon the main mast, and shooting sometimes from shroud to shroud." Ariel says to Prospero:--

"I boarded the king's ship; now on the beak,
Now in the waist, the deck, in every cabin,
I flam'd amazement: Sometimes I'd divide,
And burn in many places; on the topmast,
The yards, and bowsprit, would I flame distinctly,
Then meet and join."

Strachey voices the current belief that the Bermudas were harassed by tempests, devils, wicked spirits, and other fearful objects. Shakespeare has Ferdinand with fewer words intensify Strachey's picture:--

"Hell is empty,
And all the devils are here."

The possibility that incidents arising out of Virginian colonization may have turned Shakespeare's attention to "the still vex'd Bermoothes" and given him suggestions for one of his great plays lends added interest to Strachey's *True Repertory*. But, aside from Shakespeare, this has an interest of its own. It has the Anglo-Saxon touch in depicting the wrath of the sea, and it shows the character of the early American colonists who braved a wrath like this.

POETRY IN THE VIRGINIA COLONY.--GEORGE SANDYS (1577-1644), during his stay in the colony as its treasurer, translated ten books of Ovid's *Metamorphoses*, sometimes working by the light of a pine knot. This work is rescued from the class of mere translation by its literary art and imaginative interpretation, and it possesses for us an additional interest because of its nativity amid such surroundings. Two lines telling how Philemon

"Took down a fitch of bacon with a prung,
That long had in the smoky chimney hung,"

show that his environment aided him somewhat in the translation. He himself says of this version that it was "bred in the new world, whereof it cannot but participate, especially having wars and tumults to bring it to light, instead of the muses." He was read by both Dryden and Pope in their boyhood, and the form of their verse shows his influence.

The only original poem which merits our attention in the early Virginian colony was found soon after the Revolutionary War in a collection of manuscripts, known as the Burwell Papers. This poem is an elegy on the death of Nathaniel Bacon (1676), a young Virginian patriot and military hero, who resisted the despotic governor, Sir William Berkeley. It was popularly believed that Bacon's mysterious death was due to poison. An unknown friend wrote the elegy in defense of Bacon and his rebellion. These lines from that elegy show a strength unusual in colonial poetry:--

"Virginia's foes,
To whom, for secret crimes, just vengeance owes
Deserved plagues, dreading their just desert,
Corrupted death by Paracelsian art,
Him to destroy . . .
Our arms, though ne'er so strong,
Will want the aid of his commanding tongue,
Which conquered more than Caesar."

DESCRIPTIONS OF VIRGINIA.--ROBERT BEVERLY, clerk of the Council of Virginia, published in London in 1705 a History and Present State of Virginia. This is today a readable account of the colony and its people in the first part of the eighteenth century. This selection shows that in those early days Virginians were noted for what has come to be known as southern hospitality:--

"The inhabitants are very courteous to travellers, who need no other recommendation, but the being human creatures. A stranger has no more to do, but to inquire upon the road where any gentleman or good housekeeper lives, and there he may depend upon being received with hospitality. This good nature is so general among their people, that the gentry, when they go abroad, order their principal servant to entertain all visitors with everything the plantation affords. And the poor planters who have but one bed, will very often sit up, or lie upon a form or couch all night, to make room for a weary traveller to repose himself after his journey."

COLONEL WILLIAM BYRD (1674-1744), a wealthy Virginian, wrote a History of the Dividing Line run in the Year 1728. He was commissioned by the Virginian colony to run a line between it and North Carolina. This book is a record of personal experiences, and is as interesting as its title is forbidding. This selection describes the Dismal Swamp, through which the line ran:--

"Since the surveyors had entered the Dismal they had laid eyes on no living creature; neither bird nor beast, insect nor reptile came in view. Doubtless the eternal shade that broods over this mighty bog and hinders the sunbeams from blessing the ground, makes it an uncomfortable habitation for anything that has life. Not so much as a Zealand frog could endure so aguish a situation. It had one beauty, however, that delighted the eye, though at the expense of all the other senses: the moisture of the soil preserves a continual verdure, and makes every plant an evergreen, but at the same time the foul damps ascend without ceasing, corrupt the air, and render it unfit for respiration. Not even a turkey buzzard will venture to fly over it, no more than the Italian vultures will fly over the filthy lake Avernus or the birds in the Holy Land over the salt sea where Sodom and Gomorrah formerly stood.

"In these sad circumstances the kindest thing we could do for our

suffering friends was to give them a place in the Litany. Our chaplain for his part did his office and rubbed us up with a seasonable sermon. This was quite a new thing to our brethren of North Carolina, who live in a climate where no clergyman can breathe, any more than spiders in Ireland."

These two selections show that American literature, even before the Revolution, came to be something more than an imitation of English literature. They are the product of our soil, and no critic could say that they might as well have been written in London as in Virginia. They also show how much eighteenth-century prose had improved in form. Even in England, modern prose may almost be said to begin with John Dryden, who died at the beginning of the eighteenth century. In addition to improvement in form, we may note the appearance of a new quality--humor. Our earliest writers have few traces of humor because colonization was a serious life and death affair to them.

DIFFERENT LINES OF DEVELOPMENT OF VIRGINIA AND NEW ENGLAND.--As we now go back more than a hundred years to the founding of the Plymouth colony in 1620, we may note that Virginia and New England developed along different lines. We shall find more dwellers in towns, more democracy and mingling of all classes, more popular education, and more literature in New England. The ruling classes of Virginia were mostly descendants of the Cavaliers who had sympathized with monarchy, while the Puritans had fought the Stuart kings and had approved a Commonwealth. In Virginia a wealthy class of landed gentry came to be an increasing power in the political history of the country. The ancestors of George Washington and many others who did inestimable service to the nation were among this class. It was long the fashion for this aristocracy to send their children to England to be educated, while the Puritans trained theirs at home.

New England started a printing press, and was printing books by 1640. In 1671 Sir William Berkeley, governor of Virginia, wrote, "I thank God there are no free schools, nor printing, and I hope we shall not have these hundred years; for learning has brought disobedience and heresy and sects into the world, and printing has developed them."

Producers of literature need the stimulus of town life. The South was chiefly agricultural. The plantations were large, and the people lived in far greater isolation than in New England, where not only the town, but more especially the church, developed a close social unit. One other reason served to make it difficult for a poet of the plowman type, like Robert Burns, or for an author from the general working class, like Benjamin Franklin, to arise in the South. Labor was thought degrading, and the laborer did not find the same chance as at the North to learn from close association with the intelligent class. The reason for this is given by Colonel William Byrd, from whom we have quoted in the preceding section. He wrote in 1736 of the leading men of the South:-- "They import so many negroes hither, that I fear this Colony will some time or other be confirmed by the name of New Guinea. I am sensible of many bad consequences of multiplying these Ethiopians amongst us. They blow up the pride and ruin the industry of our white people, who seeing a rank of poor creatures below them, detest work, for fear it should make them look like slaves."

WILLIAM BRADFORD, 1590-1657

William Bradford was born in 1590 in the Pilgrim district of England, in the Yorkshire village of Austerfield, two miles north of Scrooby. While a child, he attended the religious meetings of the Puritans. At the age of eighteen he gave up a good position in the post service of England, and crossed to Holland to escape religious persecution. His History of Plymouth Plantation is not a record of the Puritans as a whole, but only of that branch known as the Pilgrims, who left England for Holland in 1607 and 1608, and who, after remaining there for nearly twelve years, had the initiative to be the first of their band to come to the New World, and to settle at Plymouth in 1620. For more than thirty years he was governor of the Plymouth colony, and he managed its affairs with the discretion of a Washington and the zeal of a Cromwell. His History tells the story of the Pilgrim Fathers from the time of the formation of their two congregations in England, until 1647. [Illustration: FACSIMILE OF FIRST PARAGRAPH OF BRADFORD'S "HISTORY OF PLYMOUTH PLANTATION"] In 1897 the United States for the first time came into possession of the manuscript of this famous History of Plymouth Plantation, which had in some mysterious manner been taken from Boston in colonial times and had found its way into the library of the Lord Bishop of London. Few of the English seem to have read it. Even its custodian miscalled it The Log of the Mayflower, although after the ship finally cleared from England, only five incidents of the voyage are briefly mentioned: the death of a young seaman who cursed the Pilgrims on the voyage and made sport of their misery; the

cracking of one of the main beams of the ship; the washing overboard in a storm of a good young man who was providentially saved; the death of a servant; and the sight of Cape Cod. On petition, the Lord Bishop of London generously gave this manuscript of 270 pages to the Commonwealth of Massachusetts. In a speech at the time of its formal reception, Senator Hoar eloquently summed up the subject matter of the volume as follows:-- "I do not think many Americans will gaze upon it without a little trembling of the lips and a little gathering of mist in the eyes, as they think of the story of suffering, of sorrow, of peril, of exile, of death, and of lofty triumph which that book tells,--which the hand of the great leader and founder of America has traced on those pages. There is nothing like it in human annals since the story of Bethlehem. These Englishmen and English women going out from their homes in beautiful Lincoln and York, wife separated from husband and mother from child in that hurried embarkation for Holland, pursued to the beach by English horsemen; the thirteen years of exile; the life at Amsterdam, 'in alley foul and lane obscure'; the dwelling at Leyden; the embarkation at Delfthaven; the farewell of Robinson; the terrible voyage across the Atlantic; the compact in the harbor; the landing on the rock; the dreadful first winter; the death roll of more than half the number; the days of suffering and of famine; the wakeful night, listening for the yell of wild beast and the war whoop of the savage; the building of the State on those sure foundations which no wave or tempest has ever shaken; the breaking of the new light; the dawning of the new day; the beginning of the new life; the enjoyment of peace with liberty,--of all these things this is the original record by the hand of our beloved father and founder." In addition to giving matter of unique historical importance, Bradford entertains his readers with an account of Squanto, the Pilgrims' tame Indian, of Miles Standish capturing the "lord of misrule" at Merrymount, and of the failure of an experiment in tilling the soil in common. Bradford says that there was immediate improvement when each family received the full returns from working its own individual plot of ground. He thus philosophizes about this social experiment of the Pilgrims:-- "The experience that was had in this common course and condition, tried sundry years, and that amongst godly and sober men, may well evince the vanity of that conceit of Plato's and other ancients, applauded by some of later times;---that the taking away of property and bringing in community into a common wealth would make them happy and flourishing.... Let none object this is men's corruption, and nothing to the course itself. I answer, seeing all men have this corruption in them, God in his wisdom saw another course fitter for them." America need not be ashamed of either the form or the subject matter of her early colonial prose in comparison with that produced in England at the same time.

JOHN WINTHROP, 1588-1649

On March 29, 1630, John Winthrop made the first entry in his Journal on board the ship Arbella, before she left the Isle of Wight for Massachusetts Bay. This Journal was to continue until a few months before his death in 1649, and was in after times to receive the dignified name of History of New England, although it might more properly still be called his Journal, as its latest editor does indeed style it. John Winthrop was born in the County of Suffolk, England, in 1588, the year of the defeat of the Spanish Armada. He was a wealthy, well-educated Puritan, the owner of broad estates. As he paced the deck of the Arbella, the night before he sailed for Massachusetts, he knew that he was leaving comfort, home, friends, position, all for liberty of conscience. Few men have ever voluntarily abandoned more than Winthrop, or clung more tenaciously to their ideals.

After a voyage lasting more than two months, he settled with a large number of Puritans on the site of modern Boston. For the principal part of the time from his arrival in 1630 until his death in 1649, he served as governor of the Massachusetts Bay Colony. Not many civil leaders of any age have shown more sagacity, patriotism, and tireless devotion to duty than John Winthrop.

His Journal is a record of contemporaneous events from 1630 to 1648. The early part of this work might with some justice have been called the Log of the Arbella.

TRANSLITERATION OF FACSIMILE OF WINTHROP'S "JOURNAL"

"ANNO DOMINI 1630, MARCH 29, MONDAY.
"EASTER MONDAY.

"Riding at the Cowes, near the Isle of Wight, in the Arbella, a ship of 350 tons, whereof Capt. Peter Milborne was master, being manned with 52 seamen, and 28 pieces of ordnance, (the wind coming to the N. by W. the evening before,) in the morning there came aboard us Mr. Cradock, the late governor, and the masters of his 2 ships, Capt. John Lowe, master of the Ambrose, and Mr. Nicholas Hurlston, master of the Jewel, and Mr. Thomas Beecher, master of the Talbot." The entry for Monday, April 12, 1630, is:-- "The wind more large to the N. a stiff gale, with fair weather. In the afternoon less wind, and our people began to grow well again. Our children and others, that were sick and lay groaning in the cabins, we fetched out, and having stretched a rope from the steerage to the main-mast, we made them stand, some of one side and some of the other, and sway it up and down till they were warm, and by this means they soon grew well and merry." The following entry for June 5, 1644, reflects an interesting side light on the government of Harvard, our first American college:-- "Two of our ministers' sons, being students in the college, robbed two dwelling houses in the night of some fifteen pounds. Being found out, they were ordered by the governors of the college to be there whipped, which was performed by the president himself--yet they were about twenty years of age; and after they were brought into the court and ordered to twofold satisfaction, or to serve so long for it. We had yet no particular punishment for burglary." Another entry for 1644 tells of one William Franklin, condemned for causing the death of his apprentice:-- "The case was this. He had taken to apprentice one Nathaniel Sewell, one of those children sent over the last year for the country; the boy had the scurvy and was withal very noisome, and otherwise ill disposed. His master used him with continual rigour and unmerciful correction, and exposed him many times to much cold and wet in the winter season, and used divers acts of rigour towards him, as hanging him in the chimney, etc., and the boy being very poor and weak, he tied him upon an horse and so brought him (sometimes sitting and sometimes hanging down) to Boston, being five miles off, to the magistrates, and by the way the boy calling much for water, would give him none, though he came close by it, so as the boy was near dead when he came to Boston, and died within a few hours after." Winthrop relates how Franklin appealed the case when he was found guilty, and how the Puritans inflicted the death penalty on him after searching the Bible for a rule on which to base their decision. The most noticeable qualities of this terrible story are its simplicity, its repression, its lack of striving after effect. Winthrop, Bradford, and Bunyan had learned from the 1611 version of the Bible to be content to present any situation as simply as possible and to rely on the facts themselves to secure the effect. Winthrop's finest piece of prose, Concerning Liberty, appears in an entry for the year 1645. He defines liberty as the power "to do that which is good, just, and honest. This liberty you are to stand for, with the hazard, not only of your goods, but of your lives, if need be." Winthrop saw clearly what many since his day have failed to see, that a government conducted by the people could not endure, if liberty meant more than this. Winthrop's Journal records almost anything which seemed important to the colonists. Thus, he tells about storms, fires, peculiar deaths of animals, crimes, trials, Indians, labor troubles, arrival of ships, trading expeditions, troubles with England about the charter, politics, church matters, events that would point a moral, like the selfish refusal of the authorities to loan a quantity of gunpowder to the Plymouth colony and the subsequent destruction of that same powder by an explosion, or the drowning of a child in the well while the parents were visiting on Sunday. In short, this Journal gives valuable information about the civil, religious, and domestic life of the early days of the Massachusetts Bay Colony. The art of modern prose writing was known neither in England nor in America in Winthrop's time. The wonder is that he told the story of this colony in such good form and that he still holds the interest of the reader so well.

THE RELIGIOUS IDEAL

William Bradford and John Winthrop were governors of two religious commonwealths. We must not forget that the Puritans came to America to secure a higher form of spiritual life. In the reign of Elizabeth, it was thought that the Revival of Learning would cure all ills and unlock the gates of happiness. This hope had met with disappointment. Then Puritanism came, and ushered in a new era of spiritual aspiration for something better, nobler, and more satisfying than mere intellectual attainments or wealth or earthly power had been able to secure. The Puritans chose the Bible as the guidebook to their Promised Land. The long sermons to which they listened were chiefly biblical expositions. The Puritans considered the saving of the soul the most important matter, and they neglected whatever form of culture did not directly tend toward that result. They thought that entertaining reading and other forms of amusement were contrivances of the devil to turn the soul's attention away from the Bible. Even beauty and art were considered handmaids of the Evil One. The Bible was read, reread, and constantly studied, and it took the place of secular poetry and prose. The New England Puritan believed in the theology of John Calvin, who died in 1564. His creed, known as Calvinism, emphasized the importance of the individual, of life's continuous moral struggle, which would land each soul in heaven or hell for all eternity. In the New England Primer, the children were taught the first article of belief, as they learned the letter A:--

"In Adam's fall,
We sinned all."

Calvinism stressed the doctrine of foreordination, that certain ones, "the elect," had been foreordained to be saved. THOMAS SHEPHARD (1605-1649), one of the great Puritan clergy, fixed the mathematical ratio of the damned to the elect as "a thousand to one." On the physical side, scientists have pointed out a close correspondence between Calvin's creed and the theory of evolution, which emphasizes the desperate struggle resulting from the survival of the fittest. The "fittest" are the "elect"; those who perish in the contest, the "damned." In the evolutionary struggle, only the few survive, while untold numbers of the unfit, no matter whether seeds of plants, eggs of fish, human beings, or any other form of life, go to the wall. In spite of the apparent contradiction between free will and foreordination, each individual felt himself fully responsible for the saving of his soul. A firm belief in this tremendous responsibility made each one rise the stronger to meet the other responsibilities of life. Civil responsibility seemed easier to one reared in this school. The initiative bequeathed by Elizabethan times was increased by the Puritans' religion. Although there were probably as many university men in proportion to the population in early colonial Massachusetts as in England, the strength and direction of their religious ideals helped to turn their energy into activities outside the field of pure literature. In course of time, however, Nathaniel Hawthorne appeared to give lasting literary expression to this life. THE NEW ENGLAND CLERGY.--The clergy occupied a leading place in both the civil and religious life of New England. They were men of energy and ability, who could lead their congregations to Holland or to the wilds of New England. For the purpose in hand the world has never seen superior leaders. Many of them were graduates of Cambridge University, England. Their great authority was based on character, education, and natural ability. A contemporary historian said of John Cotton, who came as pastor from the old to the new Boston in 1633, that whatever he "delivered in the pulpit was soon put into an order of court ... or set up as a practice in the church." The sermons, from two to four hours long, took the place of magazines, newspapers, and modern musical and theatrical entertainments. The church members were accustomed to hard thinking and they enjoyed it as a mental exercise. Their minds had not been rendered flabby by such a diet of miscellaneous trash or sensational matter as confronts modern readers. Many of the congregation went with notebooks to record the different heads and the most striking thoughts in the sermon, such, for instance, as the following on the dangers of idleness:-- "Whilst the stream keeps running, it keeps clear; but let it stand still, it breeds frogs and toads and all manner of filth. So while you keep going, you keep clear." The sermons were often doctrinal, metaphysical, and extremely dry, but it is a mistake to conclude that the clergy did not speak on topics of current interest. Winthrop in his Journal for 1639 relates how the Rev. John Cotton discussed whether a certain shopkeeper, who had been arraigned before the court for extortion, for having taken "in some small things, above two for one," was guilty of sin and should be excommunicated from the church, or only publicly admonished. Cotton prescribed admonition and he laid down a code of ethics for the guidance of sellers. With the exception of Roger Williams (1604?-1683), who had the modern point of view in insisting on complete "soul liberty," on the right of every man to think as he pleased on matters of religion, the Puritan clergy were not tolerant of other forms of worship. They said that they came to New England in order to worship God as they pleased. They never made the slightest pretense of establishing a commonwealth where another could worship as he pleased, because they feared that such a privilege might lead to a return of the persecution from which they had fled. If those came who thought differently about religion, they were told that there was sufficient room elsewhere, in Rhode Island, for instance, whither Roger Williams went after he was banished from Salem. The history of the Puritan clergy would have been more pleasing had they been more tolerant, less narrow, more modern, like Roger Williams. Yet perhaps it is best not to complain overmuch of the strange and somewhat repellent architecture of the bridge which bore us over the stream dividing the desert of royal and ecclesiastical tyranny from the Promised Land of our Republic. Let us not forget that the clergy insisted on popular education; that wherever there was a clergyman, there was almost certain to be a school, even if he had to teach it himself, and that the clergy generally spoke and acted as if they would rather be "free among the dead than slaves among the living."

POETRY

The trend of Puritan theology and the hard conditions of life did not encourage the production of poetry. The Puritans even wondered if singing in church was not an exercise which turned the mind from God. The Rev. John Cotton investigated the question carefully under four main heads and six subheads, and he cited scriptural authority to show that Paul and Silas (Acts, xvi., 25) had sung a Psalm in the prison. Cotton therefore concluded that the Psalms might be sung in church. [Illustration: FACSIMILE OF TITLE-PAGE TO "BAY PSALM BOOK"] BAY PSALM BOOK.--"The divines in the country" joined to translate "into English metre" the whole book of Psalms

from the original Hebrew, and they probably made the worst metrical translation in existence. In their preface to this work, known as the Bay Psalm Book (1640), the first book of verse printed in the British American colonies, they explained that they did not strive for a more poetic translation because "God's altar needs not our polishings." The following verses from Psalm cxxxvii. are a sample of the so-called metrical translation which the Puritans sang:--

"1. The rivers on of Babilon
there-when wee did sit downe:
yea even then wee mourned, when
wee remembered Sion.

"2. Our Harps wee did it hang amid,
upon the willow tree.

"3. Because there they that us away
led in captivitee,
Requir'd of us a song, & thus
askt mirth: us waste who laid,
sing us among a Sion's song,
unto us then they said."

MICHAEL WIGGLESWORTH (1631-1705).--This Harvard graduate and Puritan preacher published in 1662 a poem setting forth some of the tenets of Calvinistic theology. This poem, entitled The Day of Doom, or a Poetical Description of the Great and Last Judgment, had the largest circulation of any colonial poem. The following lines represent a throng of infants at the left hand of the final Judge, pleading against the sentence of infant damnation:--

"Not we, but he ate of the tree,
whose fruit was interdicted;
Yet on us all of his sad fall
the punishment's inflicted.
How could we sin that had not been,
or how is his sin our,
Without consent, which to prevent
we never had the pow'r?"

Wigglesworth represents the Almighty as replying:--

"You sinners are, and such a share
as sinners may expect;
Such you shall have, for I do save
none but mine own Elect.
Yet to compare your sin with their
who liv'd a longer time,
I do confess yours is much less,
though every sin's a crime.

"A crime it is, therefore in bliss
you may not hope to dwell;
But unto you I shall allow
the easiest room in Hell."

When we read verse like this, we realize how fortunate the Puritanism of Old England was to have one great poet schooled in the love of both morality and beauty. John Milton's poetry shows not only his sublimity and high ideals, but also his admiration for beauty, music, and art. Wigglesworth's verse is inferior to much of the ballad doggerel, but it has a swing and a directness fitted to catch the popular ear and to lodge in the memory. While some of his work seems humorous to us, it would not have made that impression on the early Puritans. At the same time, we must not rely on verse like this for our understanding of their outlook on life and death. Beside Wigglesworth's lines

we should place the epitaph, "Reserved for a Glorious Resurrection," composed by the great orthodox Puritan clergyman, Cotton Mather (p. 46), for his own infant, which died unbaptized when four days old. It is well to remember that both the Puritans and their clergy had a quiet way of believing that God had reserved to himself the final interpretation of his own word.

ANNE BRADSTREET (1612-1672).--Colonial New England's best poet, or "The Tenth Muse," as she was called by her friends, was a daughter of the Puritan governor, Thomas Dudley, and became the wife of another Puritan governor, Simon Bradstreet, with whom she came to New England in 1630. Although she was born before the death of Shakespeare, she seems never to have studied the works of that great dramatist. Her models were what Milton called the "fantastics," a school of poets who mistook for manifestations of poetic power, far-fetched and strained metaphors, oddities of expression, remote comparisons, conceits, and strange groupings of thought. She had especially studied Sylvester's paraphrase of *The Divine Weeks and Works* of the French poet Du Bartas, and probably also the works of poets like George Herbert (1593-1633), of the English fantastic school. This paraphrase of Du Bartas was published in a folio of 1215 pages, a few years before Mrs. Bradstreet came to America. This book shows the taste which prevailed in England in the latter part of the first third of the seventeenth century, before Milton came into the ascendancy. The fantastic comparison between the "Spirit Eternal," brooding upon chaos, and a hen, is shown in these lines from Du Bartas:--

"Or as a Hen that fain would hatch a brood
(Some of her own, some of adoptive blood)
Sits close thereon, and with her lively heat,
Of yellow-white balls, doth live birds beget:
Even in such sort seemed the Spirit Eternal
To brood upon this Gulf with care paternal."

A contemporary critic thought that he was giving her early work high praise when he called her "a right Du Bartas girl." One of her early poems is *The Four Elements*, where Fire, Air, Earth, and Water

"... did contest
Which was the strongest, noblest, and the best,
Who was of greatest use and mightiest force."

Such a debate could never be decided, but the subject was well suited to the fantastic school of poets because it afforded an opportunity for much ingenuity of argument and for far-fetched comparisons, which led nowhere.

Late in life, in her poem, *Contemplations*, she wrote some genuine poetry, little marred by imitation of the fantastic school. Spenser seems to have become her master in later years. No one without genuine poetic ability could have written such lines as:--

"I heard the merry grasshopper then sing,
The black-clad cricket bear a second part,
They kept one tune, and played on the same string,
Seeming to glory in their little art."

These lines show both poetic ease and power:--

"The mariner that on smooth waves doth glide
Sings merrily, and steers his bark with ease,
As if he had command of wind and tide,
And now become great master of the seas."

The comparative excellence of her work in such an atmosphere and amid the domestic cares incident to rearing eight children is remarkable.

NATHANIEL WARD, 1578?-1652

[Illustration: FACSIMILE OF TITLE PAGE TO WARD'S
"SIMPLE COBBLER OF AGAWAM"]

In 1647 Nathaniel Ward, who had been educated for the law, but who afterward became a clergyman, published a strange work known as *The Simple Cobbler of Agawam, in America* "willing," as the sub-title continues, "to help mend his native country, lamentably tattered, both in the upper leather and sole, with all the honest stitches he can take." He had been assistant pastor at Agawam (Ipswich) until ill health caused him to resign. He then busied himself in compiling a code of laws and in other writing before he returned to England in 1647. The following two sentences from his

unique book show two points of the religious faith of the Puritans: (1) the belief in a personal devil always actively seeking the destruction of mankind, and (2) the assumption that the vitals of the "elect" are safe from the mortal sting of sin.

"Satan is now in his passions, he feels his passion approaching, he loves to fish in roiled waters. Though that dragon cannot sting the vitals of the elect mortally, yet that Beelzebub can fly-blow their intellectuals miserably."

He is often a bitter satirist, a sort of colonial Carlyle, as this attack on woman shows:--

"I honor the woman that can honor herself with her attire; a good text always deserves a fair margent; I am not much offended if I see a trim far trimmer than she that wears it. In a word, whatever Christianity or civility will allow, I can afford with London measure: but when I hear a nugiperous gentledame inquire what dress the Queen is in this week: what the nudiustertian fashion of the Court; I mean the very newest; with egg to be in it in all haste, whatever it be; I look at her as the very gizzard of a trifle, the product of a quarter of a cipher, the epitome of nothing, fitter to be kicked, if she were of a kickable substance, than either honored or humored."

He does not hesitate to coin a word. The preceding short selection introduces us to "nugiperous" and "nudiustertian." Next, he calls the women's tailor-made gowns "the very pettitoes of infirmity, the giblets of perquisquilian toys."

The spirit of a reformer always sees work to be done, and Ward emphasized three remedies for mid-seventeenth-century ills: (1) Stop toleration of departure from religious truth; (2) banish the frivolities of women and men; and (3) bring the civil war in England to a just end. In proportion to the population, his *Simple Cobbler*, designed to mend human ways, was probably as widely read as Carlyle's *Sartor Resartus* in later days.

In criticism, Ward deserves to be remembered for these two lines:--

"Poetry's a gift wherein but few excel;
He doth very ill that doth not passing well."

SAMUEL SEWALL, 1652-1730

There was born in 1652 at Bishopstoke, Hampshire, England, a boy who sailed for New England when he was nine years old, and who became our greatest colonial diarist. This was Samuel Sewall, who graduated from Harvard in 1671 and finally became chief justice of Massachusetts.

[Illustration: SAMUEL SEWALL]

His *Diary* runs with some breaks from 1673 to 1729, the year before his death. Good diaries are scarce in any literature. Those who keep them seldom commit to writing many of the most interesting events and secrets of their

lives. This failing makes the majority of diaries and memoirs very dry, but this fault cannot be found with Samuel Sewall. His Diary will more and more prove a mine of wealth to the future writers of our literature, to our dramatists, novelists, poets, as well as to our historians. The early chronicles and stories on which Shakespeare founded many of his plays were no more serviceable to him than this Diary may prove to a coming American writer with a genius like Hawthorne's.

In Sewall's Diary we at once feel that we are close to life. The following entry brings us face to face with the children in a Puritan household:--

"Nov. 6, 1692. Joseph threw a knop of brass and hit his sister Betty on the forehead so as to make it bleed and swell; upon which, and for his playing at Prayer-time, and eating when Return Thanks, I whipped him pretty smartly. When I first went in (called by his Grandmother) he sought to shadow and hide himself from me behind the head of the cradle: which gave me the sorrowful remembrance of Adam's carriage."

Sewall was one of the seven judges who sentenced nineteen persons to be put to death for witchcraft at Salem. After this terrible delusion had passed, he had the manliness to rise in church before all the members, and after acknowledging "the blame and shame of his decision," call for "prayers that God who has an unlimited authority would pardon that sin."

Sewall's Diary is best known for its faithful chronicle of his courtship of Mrs. Catharine Winthrop. Both had been married twice before, and both had grown children. He was sixty-nine and she fifty-six. No record of any other Puritan courtship so unique as this has been given to the world. He began his formal courtship of Mrs. Winthrop, October 1, 1720. His Diary contains records of each visit, of what they said to each other, of the Sermons, cake, and gingerbread that he gave her, of the healths that he drank to her, the lump of sugar that she gave him, of how they "went into the best room, and clos'd the shutters."

"Nov. 2. Gave her about 1/2 pound of sugar almonds, cost 3 shillings per [pound]. Carried them on Monday. She seem'd pleas'd with them, ask'd what they cost. Spake of giving her a hundred pounds per annum if I died before her. Ask'd her what sum she would give me, if she should die first?"

"Monday, Nov. 7. I went to Mad. Winthrop; found her rocking her little Katy in the cradle. I excused my coming so late (near eight). She set me an arm'd chair and cushion; and so the cradle was between her arm'd chair and mine. Gave her the remnant of my almonds. She did not eat of them as before.... The fire was come to one short brand besides the block, which brand was set up in end; at last it fell to pieces and no recruit was made.... Took leave of her.... Her dress was not so clean as sometime it had been. Jehovah jireh!"

Acute men have written essays to account for the aristocratic Mrs. Winthrop's refusal of Chief-Justice Sewall. Some have said that it was due to his aversion to slavery and to his refusal to allow her to keep her slaves. This episode is only a small part of a rich storehouse. The greater part of the Diary contains only the raw materials of literature, yet some of it is real literature, and it ranks among the great diaries of the world.

COTTON MATHER, 1663-1728

[Illustration: COTTON MATHER]

LIFE AND PERSONALITY.--Cotton Mather, grandson of the Rev. John Cotton (p. 14), and the most distinguished of the old type of Puritan clergymen, was born in Boston and died in his native city, without ever having traveled a hundred miles from it. He entered Harvard at the age of eleven, and took the bachelor's degree at fifteen. His life

shows such an overemphasis of certain Puritan traits as almost to presage the coming decline of clerical influence. He says that at the age of only seven or eight he not only composed forms of prayer for his schoolmates, but also obliged them to pray, although some of them cuffed him for his pains. At fourteen he began a series of fasts to crucify the flesh, increase his holiness, and bring him nearer to God.

He endeavored never to waste a minute. In his study, where he often worked sixteen hours a day, he had in large letters the sign, "BE SHORT," to greet the eyes of visitors. The amount of writing which he did almost baffles belief. His published works, numbering about four hundred, include sermons, essays, and books. During all of his adult life, he also preached in the North Church of Boston.

He was a religious "fantastic" (p. 40), that is, he made far-fetched applications of religious truth. A tall man suggested to him high attainments in Christianity; washing his hands, the desirability of a clean heart.

Although Cotton Mather became the most famous clergyman of colonial New England, he was disappointed in two of his life's ambitions. He failed to become president of Harvard and to bring New England back in religious matters to the first halcyon days of the colony. On the contrary, he lived to see Puritan theocracy suffer a great decline. His fantastic and strained application of religious truth, his overemphasis of many things, and especially his conduct in zealously aiding and abetting the Salem witchcraft murders, were no mean factors in causing that decline.

His intentions were certainly good. He was an apostle of altruism, and he tried to improve each opportunity for doing good in everyday life. He trained his children to do acts of kindness for other children. His *Essays to Do Good* were a powerful influence on the life of Benjamin Franklin. Cotton Mather would not have lived in vain if he had done nothing else except to help mold Franklin for the service of his country; but this is only one of Mather's achievements. We must next pass to his great work in literature. *THE MAGNALIA*.--This "prose epic of New England Puritanism," the most famous of Mather's many works, is a large folio volume entitled *Magnalia Christi Americana: or the Ecclesiastical History of New England*. It was published in London in 1702, two years after Dryden's death. The book is a remarkable compound of whatever seemed to the author most striking in early New England history. His point of view was of course religious. The work contains a rich store of biography of the early clergy, magistrates, and governors, of the lives of eleven of the clerical graduates of Harvard, of the faith, discipline, and government of the New England churches, of remarkable manifestations of the divine providence, and of the "Way of the Lord" among the churches and the Indians. We may to-day turn to the *Magnalia* for vivid accounts of early New England life. Mather has a way of selecting and expressing facts in such a way as to cause them to lodge in the memory. These two facts about John Cotton give us a vivid impression of the influence of the early clergy:--

"The keeper of the inn where he did use to lodge, when he came to Derby, would profanely say to his companions, that he wished Mr. Cotton were gone out of his house, for he was not able to swear while that man was under his roof..."

"The Sabbath he began the evening before, for which keeping of the Sabbath from evening to evening he wrote arguments before his coming to New England; and I suppose 'twas from his reason and practice that the Christians of New England have generally done so too."

We read that the daily vocation of Thomas Shepard, the first pastor at Cambridge, Massachusetts, was, to quote Mather's noble phrase, "*A Trembling Walk with God*." He speaks of the choleric disposition of Thomas Hooker, the great Hartford clergyman, and says it was "useful unto him," because "he had ordinarily as much government of his choler as a man has of a mastiff dog in a chain; he 'could let out his dog, and pull in his dog, as he pleased.'" Some of Mather's prose causes modern readers to wonder if he was not a humorist. He says that a fire in the college buildings in some mysterious way influenced the President of Harvard to shorten one of his long prayers, and gravely adds, "that if the devotions had held three minutes longer, the Colledge had been irrecoverably laid in ashes." One does not feel sure that Mather saw the humor in this demonstration of practical religion. It is also doubtful whether he is intentionally humorous in his most fantastic prose, such, for instance, as his likening the Rev. Mr. Partridge to the bird of that name, who, because he "had no defence neither of beak nor claw," took "a flight

over the ocean" to escape his ecclesiastical hunters, and finally "took wing to become a bird of paradise, along with the winged seraphim of heaven."

Such fantastic conceits, which for a period blighted the literature of the leading European nations, had their last great exponent in Cotton Mather. Minor writers still indulge in these conceits, and find willing readers among the uneducated, the tired, and those who are bored when they are required to do more than skim the surface of things. John Seccomb, a Harvard graduate of 1728, the year in which Mather died, then gained fame from such lines as:--

"A furrowed brow,
Where corn might grow,"

but the best prose and poetry have for a long time won their readers for other qualities. Even the taste of the next generation showed a change, for Cotton Mather's son, Samuel, noted as a blemish his father's "straining for far-fetched and dear-bought hints." Cotton Mather's most repellent habit to modern readers is his overloading his pages with quotations in foreign languages, especially in Latin. He thus makes a pedantic display of his wide reading.

He is not always accurate in his presentation of historical or biographical matter, but in spite of all that can be said against the *Magnalia*, it is a vigorous presentation of much that we should not willingly let die. In fact, when we read the early history of New England, we are frequently getting from the *Magnalia* many things in changed form without ever suspecting the source.

JONATHAN EDWARDS, 1703-1758

LIFE AND WRITINGS.--Jonathan Edwards, who ranks among the world's greatest theologians and metaphysicians, was born in 1703 in East Windsor, Connecticut. Like Cotton Mather, Edwards was precocious, entering Yale before he was thirteen. The year previous to his going to college, he wrote a paper on spiders, showing careful scientific observation and argument. This paper has been called "one of the rarest specimens of precocious scientific genius on record." At fourteen, he read Locke's *Essay on the Human Understanding*, receiving from it, he says, higher pleasure "than the most greedy miser finds when gathering up handfuls of silver and gold from some newly discovered treasure." Before he was seventeen, he had graduated from Yale, and he had become a tutor there before he was twenty-one.

Like Dante, he had a Beatrice. Thinking of her, he wrote this prose hymn of a maiden's love for the Divine Power:--

"They say there is a young lady in New Haven who is beloved of that great Being who made and rules the world, and there are certain seasons in which this great Being, in some way or other invisible, comes to her and fills her mind with exceeding sweet delight, and that she hardly cares for anything except to meditate on Him, that she expects after a while to be received up where He is, to be raised up out of the world and caught up into heaven, being assured that He loves her too well to let her remain at a distance from Him always. She will sometimes go about from place to place singing sweetly, and seems to be always full of joy and pleasure, and no one knows for what. She loves to be alone, walking in the fields and groves, and seems to have some one invisible always conversing with her"

[Illustration: MEMORIAL TABLET TO JONATHAN EDWARDS
(First Church, Northampton, Mass)]

Jonathan Edwards thus places before us Sarah Pierrepont, a New England Puritan maiden. To note the similarity of thought between the Old Puritan England and the New, let us turn to the maiden in Milton's *Comus*:--

"A thousand liveried angels lackey her,
Driving far off each thing of sin and guilt,
And in clear dream and solemn vision,
Tell her of things that no gross ear can hear,

Till oft converse with heav'nly habitants
Begin to cast a beam on th'outward shape,
The unpolluted temple of the mind,
And turns it by degrees to the soul's essence,
Till all be made immortal."

Unlike Dante, Edwards married his Beatrice at the age of seventeen. In 1727, the year of his marriage, he became pastor of the church in Northampton, Massachusetts. With the aid of his wife, he inaugurated the greatest religious revival of the century, known as the "Great Awakening," which spread to other colonial churches, crossed the ocean, and stimulated Wesley to call sinners to repentance.

Early in life, Edwards formed a series of resolutions, three of which are:--

"To live with all my might, while I do live."

"Never to do anything, which, if I should see in another, I should count a just occasion to despise him for, or to think any way the more meanly of him."

"Never, henceforward, till I die, to act as if I were any way my own, but entirely and altogether God's."

He earnestly tried to keep these resolutions until the end. After a successful pastorate of twenty-three years at Northampton, the church dismissed him for no fault of his own.

Like Dante, he was driven into exile, and he went from Northampton to the frontier town of Stockbridge, where he remained for seven years as a missionary to the Indians. His wife and daughters did their utmost to add to the family income, and some contributions were sent him from Scotland, but he was so poor that he wrote his books on the backs of letters and on the blank margins cut from newspapers. His fame was not swallowed up in the wilderness. Princeton College called him to its presidency in 1757. He died in that office in 1758, after less than three months' service in his new position. His wife was still in Stockbridge when he passed away. "Tell her," he said to his daughter, "that the uncommon union which has so long subsisted between us has been of such a nature as I trust is spiritual, and therefore will continue forever." In September of the same year she came to lie beside him in the graveyard at Princeton.

In 1900, the church that had dismissed him one hundred and fifty years before placed on its walls a bronze tablet in his memory, with the noble inscription from Malachi ii., 6.

As a writer, Jonathan Edwards won fame in three fields. He is (1) America's greatest metaphysician, (2) her greatest theologian, and (3) a unique poetic interpreter of the universe as a manifestation of the divine love. His best known metaphysical work is The Freedom of the Will (1754). The central point of this work is that the will is determined by the strongest motive, that it is "repugnant to reason that one act of the will should come into existence without a cause." He boldly says that God is free to do only what is right. Edwards emphasizes the higher freedom, gained through repeated acts of the right kind, until both the inclination and the power to do wrong disappear.

As a theologian, America has not yet produced his superior. His Treatise concerning the Religious Affections, his account of the Great Awakening, called Faithful Narrative of the Surprising Work of God, and Thoughts on the Revival, as well as his more distinctly technical theological works, show his ability in this field. Unfortunately, he did not rise superior to the Puritan custom of preaching about hell fire. He delivered on that subject a sermon which causes modern readers to shudder; but this, although the most often quoted, is the least typical of the man and his writings. Those in search of really typical statements of his theology will find them in such specimens as, "God and real existence is the same. God is and there is nothing else." He was a theological idealist, believing that all the varied phenomena of the universe are "constantly proceeding from God, as light from the sun." Such statements suggest Shelley's lines, which tell how

"... the one Spirit's plastic stress
Sweeps through the dull dense world compelling there
All new successions to the forms they wear."

Dr. Allen, Edwards's biographer and critic, and a careful student of his unpublished, as well as of his published, writings, says, "He was at his best and greatest, most original and creative, when he described the divine love." Such passages as the following, and also the one quoted on page 51, show this quality:--

"When we behold the fragrant rose and lily, we see His love and purity.
So the green trees and fields and singing of birds are the emanations of
His infinite joy and benignity. The easiness and naturalness of trees and
vines are shadows of His beauty and loveliness."

His favorite text was, "I am the Rose of Sharon and the Lily of the
valleys," and his favorite words were "sweet and bright."

ENGLISH LITERATURE OF THE PERIOD

The great English writers between the colonization of Jamestown in 1607 and the outbreak of the French and Indian War in 1754 are: (1) JOHN MILTON (1608-1674), the great poetic spokesman of Puritan England, whose Comus is addressed to those, who:--

"... by due steps aspire
To lay their just hands on that golden key
That opes the palace of eternity,"

whose Sonnets breathe a purposeful prayer to live this life as ever in his great Taskmaster's eye, and whose Paradise Lost is the colossal epic of the loss of Eden through sin; (2) JOHN BUNYAN (1628-1688), whose Pilgrim's Progress addressed itself in simple, earnest English to each individual human being, telling him what he must do to escape the City of Destruction and to reach the City of All Delight; (3) JOHN DRYDEN (1631-1700), a master in the field of satiric and didactic verse and one of the pioneers in the field of modern prose criticism; (4) ALEXANDER POPE (1688-1744), another poet of the satiric and didactic school, who exalted form above matter, and wrote polished couplets which have been models for so many inferior poets; (5) the essayists, RICHARD STEELE (1672-1729) and JOSEPH ADDISON (1672-1719), the latter being especially noted for the easy, flowing prose of his papers in the Spectator; (6) JONATHAN SWIFT (1667-1745), a master of prose satire, whose Gulliver's Travels has not lost its fascination; (7) DANIEL DEFOE (1661?-1731) whose Robinson Crusoe continues to increase in popularity; (8) SAMUEL RICHARDSON (1689-1761), and HENRY FIELDING (1707-1754), the two great mid-eighteenth-century novelists.

The colonial literature of this period was influenced only in a very minor degree by the work of these men, for a generation usually passed before the influence of contemporary English authors appeared in American literature. In the next chapter, we shall see evidences of the influence of Pope. Benjamin Franklin will tell us how Bunyan and Addison were his teachers, and the early fiction will show its indebtedness to the work of Samuel Richardson.

LEADING HISTORICAL FACTS

Virginia and Massachusetts produced the most of our colonial literature. There were, however, thirteen colonies stretched along the seaboard from Georgia (1733), the last to be founded, to Canada. Although these colonies were established under different grants or charters, and although some had more liberty and suffered less from the interference of England than others, it is nevertheless true that every colony was a school for a self-governing democracy. No colonies elsewhere in the world had the same amount of liberty. This period was a necessary preparation for the coming republic. We must not suppose that there was complete liberty in those days. Such a state has not been reached even in the twentieth century. The early government of Virginia was largely aristocratic; that of Massachusetts, theocratic. Virginia persecuted the Puritans. The early settlers of Massachusetts drove out Roger

Williams and hanged Quakers. New York persecuted those who did not join the Church of England. The central truth, however, is that these thirteen colonies were making the greatest of all world experiments in democracy and liberty. The important colony of New Netherland (New York) was settled by the Dutch early in the seventeenth century. They established an aristocracy with great landed estates along the Hudson. The student of literature is specially interested in this colony because Washington Irving (p. 112) has invested it with a halo of romance. He shows us the sturdy Knickerbockers, the Van Cortlands, the Van Dycks, the Van Wycks, and other chivalrous Dutch burghers, sitting in perfect silence, puffing their pipes, and thinking of nothing for hours together in those "days of simplicity and sunshine." For literary reasons it is well that this was not made an English colony until the Duke of York took possession of it in 1664. At the beginning of the eighteenth century, the colonists in the middle and northern part of the country divided their energies almost equally between trade and agriculture. At the South, agriculture was the chief occupation and tobacco and rice were the two leading staples. These were produced principally by the labor of negro slaves. There were also many indentured servants at the South, where the dividing lines between the different classes were most strongly marked. Up to 1700 the history of each colony is practically that of a separate unit. Almost all the colonies had trouble with Indians and royal governors. Pirates, rapacious politicians, religious matters, or witchcraft were sometimes sources of disturbance. All knew the hard labor and the privations involved in subduing the wilderness and making permanent settlements in a new land. History tells of the abandonment of many other colonies and of the subjugation of many other races, but no difficulty and no foe daunted this Anglo-Saxon stock. In 1700 the population of New England was estimated at about one hundred and ten thousand. In 1754, the beginning of the French and Indian War, Connecticut alone had that number, while all New England probably had at this time nearly four hundred thousand. The middle colonies began the eighteenth century with about fifty-nine thousand and grew by the middle of the century to about three hundred and fifty-five thousand. During the same period, the southern group increased from about ninety thousand to six hundred thousand. By 1750 the thirteen colonies probably had a total population of nearly fourteen hundred thousand. Since no census was taken until 1790, these figures are only approximately correct. Such development serves to show the trend of coming events. This remarkable increase in population soon caused numbers to go farther west. This movement resulted in collision with the French, who were at this time holding the central part of the country, from the Gulf into Canada. One other result followed. The colonies began to seem valuable to England because they furnished a market for English manufactures and a carrying trade for English ships. The previous comparative insignificance of the colonies and the trouble in England had served to protect them, but their trade had now assumed a proportion that made the mother country realize what a valuable commercial asset she would have if she regulated the colonies in her own interest.

SUMMARY

In this chapter we have traced the history of American colonial literature from the foundation of the Jamestown Colony until 1754. Before 1607 Chaucer, Spenser, and Shakespeare had written, and before 1620 the King James version of the Bible had been produced. England had, therefore, a wonderful literature before her colonies came to America. They were the heirs of all that the English race had previously accomplished; and they brought to these shores an Elizabethan initiative, ingenuity, and democratic spirit. The Virginia colony was founded, as colonies usually are, for a commercial reason. The Virginians and the other southern colonists lived more by agriculture, were more widely scattered, had fewer schools, more slaves, and less town life than the New Englanders. Under the influence of a commanding clergy, common schools, and the stimulus of town life, the New England colony produced more literature. The chief early writers of Virginia are: (1) Captain John Smith, who described the country and the Indians, and gave to literature the story of Pocahontas, thereby disclosing a new world to the imagination of writers; (2) William Strachey, who outranks contemporary colonial writers in describing the wrath of the sea, and who may even have furnished a suggestion to Shakespeare for The Tempest; (3) two poets, (a) George Sandys, who translated part of Ovid, and (b) the unknown author of the elegy on Nathaniel Bacon; and (4) Robert Beverly and William Byrd, who gave interesting descriptions of early Virginia. The chief colonial writers of New England are: (1) William Bradford, whose History of Plymouth Plantation tells the story of the first Pilgrim colony; (2) John Winthrop, who wrote in his Journal the early history of the Massachusetts Bay Colony; (3) the poets, including (a) the translators of the Bay Psalm Book, the first volume of so-called verse printed in the British American colonies, (b) Wigglesworth, whose Day of Doom, was a poetic exposition of Calvinistic theology, (c) Anne Bradstreet, who wrote a small amount of genuine poetry, after she had passed from the influence of the "fantastic" school of poets; (4) Nathaniel Ward, the author of The Simple Cobbler of Agawam, an attempt to mend human ways; (5) Samuel Sewall, New England's greatest colonial diarist; (6) Cotton Mather, the most famous clerical writer, whose Magnalia is a compound of early colonial history and biography, sometimes written in a

"fantastic" style; (7) Jonathan Edwards, America's greatest metaphysician and theologian, who maintained that the action of the human will is determined by the strongest motive, that the substance of this universe is nothing but "the divine Idea," communicated to human consciousness, and who could invest spiritual truth with the beauty of the Rose of Sharon and the Lily of the valleys. The New England colonist came to America because of religious feeling. His religion was to him a matter of eternal life or eternal death. From the modern point of view, this religion may seem too inflexibly stern, too little illumined by the spirit of love, too much darkened by the shadow of eternal punishment, but unless that religion had communicated something of its own dominating inflexibility to the colonist, he would never have braved the ocean, the wilderness, the Indians; he would never have flung the gauntlet down to tyranny at Lexington and Concord. The greatest lesson taught by colonial literature, by men like Bradford, Winthrop, Edwards, and the New England clergy in general, is moral heroism, the determination to follow the shining path of the Eternal over the wave and through the forest to a new temple of human liberty. Their aspiration, endeavor, suffering, accomplishment, should strengthen our faith in the worth of those spiritual realities which are not quoted in the markets of the world, but which alone possess imperishable value.

Narratives of Early Virginia, edited by Tyler.

Bradford's History of Plymouth Plantation. New edition, edited by Davis. (Scribner, 1908.)

Winthrop's Journal ("History of New England"). New edition, edited by Hosmer, 2 vols., (Scribner, 1908.)

Chamberlain's Samuel Sewall and the World He Lived in.

Lodge's "A Puritan Pepys" (Sewall) in Studies in History.

Campbell's Anne Bradstreet and her Time.

Twichell's John Winthrop.

Walker's Thomas Hooker.

Wendell's Life of Cotton Mather.

Allen's Life of Jonathan Edwards.

Gardiner's Jonathan Edwards, a Retrospect.

SUGGESTED READINGS

The following volumes of selections from American Literature will be referred to either by the last name of the author, or, if there are more authors than one, by the initials of the last names:--

Cairns's Selections from Early American Writers, 1607-1800. (Macmillan.)

Trent and Wells's Colonial Prose and Poetry, 3 vols., 1607-1775. (Crowell.)

Stedman and Hutchinson's A Library of American Literature, 1608-1890, 11 vols. (Benjamin.)

Carpenter's American Prose Selections. (Macmillan.)

Trent's Southern Writers: Selections in Prose and Verse. (Macmillan.)

At least one of the selections indicated for each author should be read.

JOHN SMITH.--The Beginnings of Jamestown (from A True Relation of Virginia, 1608); The Religious Observances of the Indians (from A Map of Virginia, published in 1612), Cairns, pp. 2-4, 10-14; The Romance of Pocahontas (from The General History of Virginia, 1624), S. & H., Vol.

I., pp. 10-17; T. & W., Vol. I., pp. 12-22.

WILLIAM STRACHEY.--Read the selection from A True Repertory of the Wrack and Redemption of Sir Thomas Gates, in Cairns, 19-26.

POETRY IN THE VIRGINIA COLONY.--For George Sandys, see pp. 51-58 in Vol. I. of Tyler's A History of American Literature during the Colonial Time.

For the elegy on the death of Nathaniel Bacon, see Tyler, Vol. I., 78, 79; Cairns, 185-188; T. & W., II., 166-169; S. & H., I., 456-458; Trent, 12-14.

DESCRIPTIONS OF VIRGINIA.--The best selection from Beverly's History and Present State of Virginia may be found in T. & W., II., 354-360. See also Trent, 16-18; S. & H., II., 270-272.

For selections from Byrd's History of the Dividing Line, see Cairns, passim, 259-272; Trent, 19-22; T. & W., III., 23-32; S. & H., II., 302-305.

WILLIAM BRADFORD.--The Voyage of the Mayflower, Cairns, 31-35; Early Difficulties of the Pilgrim Fathers, T. & W., I., 42-45; The Communal System Abandoned, T. & W., I., 46-49; The Landing of the Pilgrims and their Settlement at Plymouth, S. & H., I., 124-130.

JOHN WINTHROP.--Twenty-five entries from his Journal or History of New England are given in Cairns, 44-48, and fourteen in T. & W., I., 99-105.

His famous speech on Liberty may be found in T. & W., I., 106-116; in S. & H., I., 302-303; and in Cairns, 50-53.

EARLY NEW ENGLAND VERSE.--The selection in the text (p. 38) from the Bay Psalm Book is sufficient.

For Wigglesworth's Day of Doom, see Cairns, 166-177; T. & W., II., 54-60; S. & H., passim, II., 3-16.

Anne Bradstreet's best poem, Contemplations, may be found in Cairns, 154-162; T. & W., I., 280-283; S. & H., I., 314, 315.

WARD'S SIMPLE COBBLER OF AGAWAM.--His view of religious toleration is given in Cairns, 113-118, and T. & W., I., 253-259. For the satiric essay on women's fashions, see Cairns, 119-124; T. & W., I., 260-266; S. & H. I., 276-280.

SAMUEL SEWALL.--Cairns, 240-243, gives from the Diary the events of a month. Notes on the Witchcraft Persecution and his prayer of repentance for "the blame and shame of it" may be found in T. & W., II., 294-296. The record of his courtship of Madam Winthrop is given in Cairns, 245-249; T. & W., II., 304-319; and S. & H., II., 192-200. For his early anti-slavery tract, see T. & W., II., 320-326; S. & H., II., 189-192.

COTTON MATHER.--His fantastic life of Mr. Ralph Partridge from the Magnalia is given in Cairns, 228, 229. The interesting story of the New England argonaut, Sir William Phips, may be found in T. & W., II., 257-266, and in S. & H., II., 143-149. One of his best biographies is that of Thomas Hooker, S. & H., II., 149-156.

JONATHAN EDWARDS.--For a specimen of an almost poetic exposition of the divine love, read the selection in Cairns, 280, 281; T. & W., III., 148, 149; S. & H., II., 374; and Carpenter, 16, 17, beginning, "I am the Rose of Sharon and the Lily of the valleys." Selections from his Freedom of the Will are given in Cairns. 291-294; T. & W., III., 185-187; and S. & H., II., 404-407 (the best).

5. 20th Century: William Dean Howells. *American Literary Centers*

William Dean Howells

Literature and Life -American Literary Centers

American Literary Centres

One of the facts which we Americans have a difficulty in making clear to a rather inattentive world outside is that, while we have apparently a literature of our own, we have no literary centre. We have so much literature that from time to time it seems even to us we must have a literary centre. We say to ourselves, with a good deal of logic, Where there is so much smoke there must be some fire, or at least a fireplace. But it is just here that, misled by tradition, and even by history, we deceive ourselves. Really, we have no fireplace for such fire as we have kindled; or, if any one is disposed to deny this, then I say, we have a dozen fireplaces; which is quite as bad, so far as the notion of a literary centre is concerned, if it is not worse. I once proved this fact to my own satisfaction in some papers which I wrote several years ago; but it appears, from a question which has lately come to me from England, that I did not carry conviction quite so far as that island; and I still have my work all before me, if I understand the London friend who wishes "a comparative view of the centres of literary production" among us; "how and why they change; how they stand at present; and what is the relation, for instance, of Boston to other such centres."

I.

Here, if I cut my coat according to my cloth, I should have a garment which this whole volume would hardly stuff out with its form; and I have a fancy that if I begin by answering, as I have sometimes rather too succinctly done, that we have no more a single literary centre than Italy or than Germany has (or had before their unification), I shall not be taken at my word. I shall be right, all the same, and if I am told that in those countries there is now a tendency to such a centre, I can only say that there is none in this, and that, so far as I can see, we get further every day from having such a centre. The fault, if it is a fault, grows upon us, for the whole present tendency of American life is centrifugal, and just so far as literature is the language of our life, it shares this tendency. I do not attempt to say how it will be when, in order to spread ourselves over the earth, and convincingly to preach the blessings of our deeply incorporated civilization by the mouths of our eight-inch guns, the mind of the nation shall be politically centred at some capital; that is the function of prophecy, and I am only writing literary history, on a very small scale, with a somewhat crushing sense of limits. Once, twice, thrice there was apparently an American literary centre: at Philadelphia, from the time Franklin went to live there until the death of Charles Brockden Brown, our first romancer; then at New York, during the period which may be roughly described as that of Irving, Poe, Willis, and Bryant; then at Boston, for the thirty or forty years illumined by the presence of Longfellow, Lowell, Whittier, Hawthorne, Emerson, Holmes, Prescott, Parkman, and many lesser lights. These are all still great publishing centres. If it were not that the house with the largest list of American authors was still at Boston, I should say New York was now the chief publishing centre; but in the sense that London and Paris, or even Madrid and Petersburg, are literary centres, with a controlling influence throughout England and France, Spain and Russia, neither New York nor Boston is now our literary centre, whatever they may once have been. Not to take Philadelphia too seriously, I may note that when New York seemed our literary centre Irving alone among those who gave it lustre was a New-Yorker, and he mainly lived abroad; Bryant, who was a New Englander, was alone constant to the city of his adoption; Willis, a Bostonian, and Poe, a Marylander, went and came as their poverty or their prosperity compelled or invited; neither dwelt here unbrokenly, and Poe did not even die here, though he often came near starving. One cannot then strictly speak of any early American literary centre except Boston, and Boston, strictly speaking, was the New England literary centre. However, we had really no use for an American literary centre before the Civil War, for it was only after the Civil War that we really began to have an American literature. Up to that time we had a Colonial literature, a Knickerbocker literature, and a New England literature. But as soon as the country began to feel its life in every limb with the coming of peace, it began to speak in the varying accents of all the different sections--North, East, South, West, and Farthest West; but not before that time.

II.

Perhaps the first note of this national concord, or discord, was sounded from California, in the voices of Mr. Bret Harte, of Mark Twain, of Mr. Charles Warren Stoddard (I am sorry for those who do not know his beautiful Idyls of the South Seas), and others of the remarkable group of poets and humorists whom these names must stand for. The San Francisco school briefly flourished from 1867 till 1872 or so, and while it endured it made San Francisco the

first national literary centre we ever had, for its writers were of every American origin except Californian. After the Pacific Slope, the great Middle West found utterance in the dialect verse of Mr. John Hay, and after that began the exploitation of all the local parlances, which has sometimes seemed to stop, and then has begun again. It went on in the South in the fables of Mr. Joel Chandler Harris's Uncle Remus, and in the fiction of Miss Murfree, who so long masqueraded as Charles Egbert Craddock. Louisiana found expression in the Creole stories of Mr. G. W. Cable, Indiana in the Hoosier poems of Mr. James Whitcomb Riley, and central New York in the novels of Mr. Harold Frederic; but nowhere was the new impulse so firmly and finely directed as in New England, where Miss Sarah Orne Jewett's studies of country life antedated Miss Mary Wilkins's work. To be sure, the portrayal of Yankee character began before either of these artists was known; Lowell's Bigelow Papers first reflected it; Mrs. Stowe's Old Town Stories caught it again and again; Mrs. Harriet Prescott Spofford, in her unromantic moods, was of an excellent fidelity to it; and Mrs. Rose Terry Cooke was even truer to the New England of Connecticut. With the later group Mrs. Lily Chase Wyman has pictured Rhode Island work-life with truth pitiless to the beholder, and full of that tender humanity for the material which characterizes Russian fiction. Mr. James Lane Allen has let in the light upon Kentucky; the Red Men and White of the great plains have found their interpreter in Mr. Owen Wister, a young Philadelphian witness of their dramatic conditions and characteristics; Mr. Hamlin Garland had already expressed the sad circumstances of the rural Northwest in his pathetic idyls, colored from the experience of one who had been part of what he saw. Later came Mr. Henry B. Fuller, and gave us what was hardest and most sordid, as well as something of what was most touching and most amusing, in the burly-burly of Chicago.

III.

A survey of this sort imparts no just sense of the facts, and I own that I am impatient of merely naming authors and books that each tempt me to an expansion far beyond the limits of this essay; for, if I may be so personal, I have watched the growth of our literature in Americanism with intense sympathy. In my poor way I have always liked the truth, and in times past I am afraid that I have helped to make it odious to those who believed beauty was something different; but I hope that I shall not now be doing our decentralized literature a disservice by saying that its chief value is its honesty, its fidelity to our decentralized life. Sometimes I wish this were a little more constant; but upon the whole I have no reason to complain; and I think that as a very interested spectator of New York I have reason to be content with the veracity with which some phases of it have been rendered. The lightning--or the flash-light, to speak more accurately--has been rather late in striking this ungainly metropolis, but it has already got in its work with notable effect at some points. This began, I believe, with the local dramas of Mr. Edward Harrigan, a species of farces, or sketches of character, loosely hung together, with little sequence or relevancy, upon the thread of a plot which would keep the stage for two or three hours. It was very rough magic, as a whole, but in parts it was exquisite, and it held the mirror up towards politics on their social and political side, and gave us East-Side types--Irish, German, negro, and Italian--which were instantly recognizable and deliciously satisfying. I never could understand why Mr. Harrigan did not go further, but perhaps he had gone far enough; and, at any rate, he left the field open for others. The next to appear noticeably in it was Mr. Stephen Crane, whose Red Badge of Courage wronged the finer art which he showed in such New York studies as Maggie: A Girl of the Streets, and George's Mother. He has been followed by Abraham Cahan, a Russian Hebrew, who has done portraits of his race and nation with uncommon power. They are the very Russian Hebrews of Hester Street translated from their native Yiddish into English, which the author mastered after coming here in his early manhood. He brought to his work the artistic qualities of both the Slav and the Jew, and in his 'Jekl: A Story of the Ghetto', he gave proof of talent which his more recent book of sketches--'The Imported Bride groom'--confirms. He sees his people humorously, and he is as unsparing of their sordidness as he is compassionate of their hard circumstance and the somewhat frowsy pathos of their lives. He is a Socialist, but his fiction is wholly without "tendentiousness." A good many years ago--ten or twelve, at least--Mr. Harry Harland had shown us some politer New York Jews, with a romantic coloring, though with genuine feeling for the novelty and picturesqueness of his material; but I do not think of any one who has adequately dealt with our Gentile society. Mr. James has treated it historically in Washington Square, and more modernly in some passages of The Bostonians, as well as in some of his shorter stories; Mr. Edgar Fawcett has dealt with it intelligently and authoritatively in a novel or two; and Mr. Brander Matthews has sketched it, in this aspect, and that with his Gallic cleverness, neatness, and point. In the novel, 'His Father's Son', he in fact faces it squarely and renders certain forms of it with masterly skill. He has done something more distinctive still in 'The Action and the Word', one of the best American stories I know. But except for these writers, our literature has hardly taken to New York society.

IV.

It is an even thing: New York society has not taken to our literature. New York publishes it, criticises it, and circulates it, but I doubt if New York society much reads it or cares for it, and New York is therefore by no means the literary centre that Boston once was, though a large number of our literary men live in or about New York. Boston, in my time at least, had distinctly a literary atmosphere, which more or less pervaded society; but New York has distinctly nothing of the kind, in any pervasive sense. It is a vast mart, and literature is one of the things marketed here; but our good society cares no more for it than for some other products bought and sold here; it does not care nearly so much for books as for horses or for stocks, and I suppose it is not unlike the good society of any other metropolis in this. To the general, here, journalism is a far more appreciable thing than literature, and has greater recognition, for some very good reasons; but in Boston literature had vastly more honor, and even more popular recognition, than journalism. There journalism desired to be literary, and here literature has to try hard not to be journalistic. If New York is a literary centre on the business side, as London is, Boston was a literary centre, as Weimar was, and as Edinburgh was. It felt literature, as those capitals felt it, and if it did not love it quite so much as might seem, it always respected it. To be quite clear in what I wish to say of the present relation of Boston to our other literary centres, I must repeat that we have now no such literary centre as Boston was. Boston itself has perhaps outgrown the literary consciousness which formerly distinguished it from all our other large towns. In a place of nearly a million people (I count in the outlying places) newspapers must be more than books; and that alone says everything. Mr. Aldrich once noticed that whenever an author died in Boston, the New-Yorkers thought they had a literary centre; and it is by some such means that the primacy has passed from Boston, even if it has not passed to New York. But still there is enough literature left in the body at Boston to keep her first among equals in some things, if not easily first in all. Mr. Aldrich himself lives in Boston, and he is, with Mr. Stedman, the foremost of our poets. At Cambridge live Colonel T. W. Higginson, an essayist in a certain sort without rival among us; and Mr. William James, the most interesting and the most literary of psychologists, whose repute is European as well as American. Mr. Charles Eliot Norton alone survives of the earlier Cambridge group--Longfellow, Lowell, Richard Henry Dana, Louis Agassiz, Francis J. Child, and Henry James, the father of the novelist and the psychologist. To Boston Mr. James Ford Rhodes, the latest of our abler historians, has gone from Ohio; and there Mr. Henry Cabot Lodge, the Massachusetts Senator, whose work in literature is making itself more and more known, was born and belongs, politically, socially, and intellectually. Mrs. Julia Ward Howe, a poet of wide fame in an elder generation, lives there; Mr. T. B. Aldrich lives there; and thereabouts live Mrs. Elizabeth Stuart Phelps Ward and Mrs. Harriet Prescott Spofford, the first of a fame beyond the last, who was known to us so long before her. Then at Boston, or near Boston, live those artists supreme in the kind of short story which we have carried so far: Miss Jewett, Miss Wilkins, Miss Alice Brown, Mrs. Chase-Wyman, and Miss Gertrude Smith, who comes from Kansas, and writes of the prairie farm-life, though she leaves Mr. E. W. Howe (of 'The Story of a Country Town' and presently of the Atchison Daily Globe) to constitute, with the humorous poet Ironquill, a frontier literary centre at Topeka. Of Boston, too, though she is of western Pennsylvania origin, is Mrs. Margaret Deland, one of our most successful novelists. Miss Wilkins has married out of Massachusetts into New Jersey, and is the neighbor of Mr. H. M. Alden at Metuchen. All these are more or less embodied and represented in the Atlantic Monthly, still the most literary, and in many things still the first of our magazines. Finally, after the chief publishing house in New York, the greatest American publishing house is in Boston, with by far the largest list of the best American books. Recently several firms of younger vigor and valor have recruited the wasted ranks of the Boston publishers, and are especially to be noted for the number of rather nice new poets they give to the light.

V.

Dealing with the question geographically, in the right American way, we descend to Hartford obliquely by way of Springfield, Massachusetts, where, in a little city of fifty thousand, a newspaper of metropolitan influence and of distinctly literary tone is published. At Hartford while Charles Dudley Warner lived, there was an indisputable literary centre; Mark Twain lives there no longer, and now we can scarcely count Hartford among our literary centres, though it is a publishing centre of much activity in subscription books. At New Haven, Yale University has latterly attracted Mr. William H. Bishop, whose novels I always liked for the best reasons, and has long held Professor J. T. Lounsbury, who is, since Professor Child's death at Cambridge, our best Chaucer scholar. Mr. Donald G. Mitchell, once endeared to the whole fickle American public by his Reveries of a Bachelor and his Dream Life, dwells on the borders of the pleasant town, which is also the home of Mr. J. W. De Forest, the earliest real American novelist, and for certain gifts in seeing and telling our life also one of the greatest. As to New York (where the imagination may arrive daily from New Haven, either by a Sound boat or by eight or ten of the swiftest express trains in the world), I confess I am more and more puzzled. Here abide the poets, Mr. R. H. Stoddard, Mr. E. C. Stedman, Mr. R. W. Gilder, and many whom an envious etcetera must hide from view; the fictionists, Mr. R. H.

Davis, Mrs. Kate Douglas Wiggin, Mr. Brander Matthews, Mr. Frank Hopkinson Smith, Mr. Abraham Cahan, Mr. Frank Norris, and Mr. James Lane Allen, who has left Kentucky to join the large Southern contingent, which includes Mrs. Burton Harrison and Mrs. McEnery Stuart; the historians, Professor William M. Sloane and Dr. Eggleston (reformed from a novelist); the literary and religious and economic essayists, Mr. Hamilton W. Mabie, Mr. H. M. Alden, Mr. J. J. Chapman, and Mr. E. L. Godkin, with critics, dramatists, satirists, magazinists, and journalists of literary stamp in number to convince the wavering reason against itself that here beyond all question is the great literary centre of these States. There is an Authors' Club, which alone includes a hundred and fifty authors, and, if you come to editors, there is simply no end. Magazines are published here and circulated hence throughout the land by millions; and books by the ton are the daily output of our publishers, who are the largest in the country. If these things do not mean a great literary centre, it would be hard to say what does; and I am not going to try for a reason against such facts. It is not quality that is wanting, but perhaps it is the quantity of the quality; there is leaven, but not for so large a lump. It may be that New York is going to be our literary centre, as London is the literary centre of England, by gathering into itself all our writing talent, but it has by no means done this yet. What we can say is that more authors come here from the West and South than go elsewhere; but they often stay at home, and I fancy very wisely. Mr. Joel Chandler Harris stays at Atlanta, in Georgia; Mr. James Whitcomb Riley stays at Indianapolis; Mr. Maurice Thompson spent his whole literary life, and General Lew. Wallace still lives at Crawfordsville, Indiana; Mr. Madison Cawein stays at Louisville, Kentucky; Miss Murfree stays at St. Louis, Missouri; Francis R. Stockton spent the greater part of the year at his place in West Virginia, and came only for the winter months to New York; Mr. Edward Bellamy, until his failing health exiled him to the Far West, remained at Chicopee, Massachusetts; and I cannot think of one of these writers whom it would have advantaged in any literary wise to dwell in New York. He would not have found greater incentive than at home; and in society he would not have found that literary tone which all society had, or wished to have, in Boston when Boston was a great town and not yet a big town. In fact, I doubt if anywhere in the world there was ever so much taste and feeling for literature as there was in that Boston. At Edinburgh (as I imagine it) there was a large and distinguished literary class, and at Weimar there was a cultivated court circle; but in Boston there was not only such a group of authors as we shall hardly see here again for hundreds of years, but there was such regard for them and their calling, not only in good society, but among the extremely well-read people of the whole intelligent city, as hardly another community has shown. New York, I am quite sure, never was such a centre, and I see no signs that it ever will be. It does not influence the literature of the whole country as Boston once did through writers whom all the young writers wished to resemble; it does not give the law, and it does not inspire the love that literary Boston inspired. There is no ideal that it represents. A glance at the map of the Union will show how very widely our smaller literary centres are scattered; and perhaps it will be useful in following me to other more populous literary centres. Dropping southward from New York, now, we find ourselves in a literary centre of importance at Philadelphia, since that is the home of Mr. J. B. McMasters, the historian of the American people; of Mr. Owen Wister, whose fresh and vigorous work I have mentioned; and of Dr. Weir Mitchell, a novelist of power long known to the better public, and now recognized by the larger in the immense success of his historical romance, Hugh Wynne. If I skip Baltimore, I may ignore a literary centre of great promise, but while I do not forget the excellent work of Johns Hopkins University in training men for the solid literature of the future, no Baltimore names to conjure with occur to me at the moment; and we must really get on to Washington. This, till he became ambassador at the Court of St. James, was the home of Mr. John Hay, a poet whose biography of Lincoln must rank him with the historians, and whose public service as Secretary of State classes him high among statesmen. He blotted out one literary centre at Cleveland, Ohio, when he removed to Washington, and Mr. Thomas Nelson Page another at Richmond, Virginia, when he came to the national capital. Mr. Paul Dunbar, the first negro poet to divine and utter his race, carried with him the literary centre of Dayton, Ohio, when he came to be an employee in the Congressional Library; and Mr. Charles Warren Stoddard, in settling at Washington as Professor of Literature in the Catholic University, brought somewhat indirectly away with him the last traces of the old literary centre at San Francisco. A more recent literary centre in the Californian metropolis went to pieces when Mr. Gelett Burgess came to New York and silenced the 'Lark', a bird of as new and rare a note as ever made itself heard in this air; but since he has returned to California, there is hope that the literary centre may form itself there again. I do not know whether Mrs. Charlotte Perkins Stetson wrecked a literary centre in leaving Los Angeles or not. I am sure only that she has enriched the literary centre of New York by the addition of a talent in sociological satire which would be extraordinary even if it were not altogether unrivalled among us. Could one say too much of the literary centre at Chicago? I fancy, yes; or too much, at least, for the taste of the notable people who constitute it. In Mr. Henry B. Fuller we have reason to hope, from what he has already done, an American novelist of such greatness that he may well leave being the great American novelist to any one who likes taking that role. Mr. Hamlin Garland is another writer of genuine and original gift who centres at Chicago; and Mrs. Mary Catherwood has made her name well known in romantic fiction. Miss Edith Wyatt is a talent, newly known, of

the finest quality in minor fiction; Mr. Robert Herrick, Mr. Will Payne in their novels, and Mr. George Ade and Mr. Peter Dump in their satires form with those named a group not to be matched elsewhere in the country. It would be hard to match among our critical journals the 'Dial' of Chicago; and with a fair amount of publishing in a sort of books often as good within as they are uncommonly pretty without, Chicago has a claim to rank with our first literary centres. It is certainly to be reckoned not so very far below London, which, with Mr. Henry James, Mr. Harry Harland, and Mr. Bret Harte, seems to me an American literary centre worthy to be named with contemporary Boston. Which is our chief literary centre, however, I am not, after all, ready to say. When I remember Mr. G. W. Cable, at Northampton, Massachusetts, I am shaken in all my preoccupations; when I think of Mark Twain, it seems to me that our greatest literary centre is just now at Riverdale- on-the-Hudson.

American Literature in Exile

A recently lecturing Englishman is reported to have noted the unenviable primacy of the United States among countries where the struggle for material prosperity has been disastrous to the pursuit of literature. He said, or is said to have said (one cannot be too careful in attributing to a public man the thoughts that may be really due to an imaginative frame in the reporter), that among us, "the old race of writers of distinction, such as Longfellow, Bryant, Holmes, and Washington Irving, have (sic) died out, and the Americans who are most prominent in cultivated European opinion in art or literature, like Sargent, Henry James, or Marion Crawford, live habitually out of America, and draw their inspiration from England, France, and Italy."

I.

If this were true, I confess that I am so indifferent to what many Americans glory in that it would not distress me, or wound me in the sort of self-love which calls itself patriotism. If it would at all help to put an end to that struggle for material prosperity which has eventuated with us in so many millionaires and so many tramps, I should be glad to believe that it was driving our literary men out of the country. This would be a tremendous object-lesson, and might be a warning to the millionaires and the tramps. But I am afraid it would not have this effect, for neither our very rich nor our very poor care at all for the state of polite learning among us; though for the matter of that, I believe that economic conditions have little to do with it; and that if a general mediocrity of fortune prevailed and there were no haste to be rich and to get poor, the state of polite learning would not be considerably affected. As matters stand, I think we may reasonably ask whether the Americans "most prominent in cultivated European opinion," the Americans who "live habitually out of America," are not less exiles than advance agents of the expansion now advertising itself to the world. They may be the vanguard of the great army of adventurers destined to overrun the earth from these shores, and exploit all foreign countries to our advantage. They probably themselves do not know it, but in the act of "drawing their inspiration" from alien scenes, or taking their own where they find it, are not they simply transporting to Europe "the struggle for material prosperity," which Sir Lepel supposes to be fatal to them here? There is a question, however, which comes before this, and that is the question whether they have quitted us in such numbers as justly to alarm our patriotism. Qualitatively, in the authors named and in the late Mr. Bret Harte, Mr. Harry Harland, and the late Mr. Harold Frederic, as well as in Mark Twain, once temporarily resident abroad, the defection is very great; but quantitatively it is not such as to leave us without a fair measure of home-keeping authorship. Our destitution is not nearly so great now in the absence of Mr. James and Mr. Crawford as it was in the times before the "struggle for material prosperity" when Washington Irving went and lived in England and on the European continent well-nigh half his life. Sir Lepel Griffin--or Sir Lepel Griffin's reporter--seems to forget the fact of Irving's long absenteeism when he classes him with "the old race" of eminent American authors who stayed at home. But really none of those he names were so constant to our air as he seems--or his reporter seems --to think. Longfellow sojourned three or four years in Germany, Spain, and Italy; Holmes spent as great time in Paris; Bryant was a frequent traveller, and each of them "drew his inspiration" now and then from alien sources. Lowell was many years in Italy, Spain, and England; Motley spent more than half his life abroad; Hawthorne was away from us nearly a decade.

II.

If I seem to be proving too much in one way, I do not feel that I am proving too much in another. My facts go to show that the literary spirit is the true world-citizen, and is at home everywhere. If any good American were distressed by the absenteeism of our authors, I should first advise him that American literature was not derived from the folklore of the red Indians, but was, as I have said once before, a condition of English literature, and was independent even of our independence. Then I should entreat him to consider the case of foreign authors who had found it more comfortable or more profitable to live out of their respective countries than in them. I should allege for his consolation the case of Byron, Shelley, and Leigh Hunt, and more latterly that of the Brownings and Walter Savage Landor, who preferred an Italian to an English sojourn; and yet more recently that of Mr. Rudyard Kipling, who voluntarily lived several years in Vermont, and has "drawn his inspiration" in notable instances from the life of these States. It will serve him also to consider that the two greatest Norwegian authors, Bjornsen and Ibsen, have both lived long in France and Italy. Heinrich Heine loved to live in Paris much better than in Dusseldorf, or even in Hamburg; and Tourguenief himself, who said that any man's country could get on without him, but no man could get on without his country, managed to dispense with his own in the French capital, and died there after he was quite

free to go back to St. Petersburg. In the last century Rousseau lived in France rather than Switzerland; Voltaire at least tried to live in Prussia, and was obliged to a long exile elsewhere; Goldoni left fame and friends in Venice for the favor of princes in Paris. Literary absenteeism, it seems to me, is not peculiarly an American vice or an American virtue. It is an expression and a proof of the modern sense which enlarges one's country to the bounds of civilization. I cannot think it justly a reproach in the eyes of the world, and if any American feels it a grievance, I suggest that he do what he can to have embodied in the platform of his party a plank affirming the right of American authors to a public provision that will enable them to live as agreeably at home as they can abroad on the same money. In the mean time, their absenteeism is not a consequence of "the struggle for material prosperity," not a high disdain of the strife which goes on not less in Europe than in America, and must, of course, go on everywhere as long as competitive conditions endure, but is the result of chances and preferences which mean nothing nationally calamitous or discreditable.

6. 20th Century: Murry, J. Middleton. *Aspects of Literature*

Preface

Two of these essays, 'The Function of Criticism' and 'The Religion of Rousseau,' were contributed to the Times Literary Supplement; that on 'The Poetry of Edward Thomas' in the Nation; all the rest save one have appeared in the Athenæum. The essays are arranged in the order in which they were written, with two exceptions. The second part of the essay on Tchekov has been placed with the first for convenience, although in order of thought it should follow the essay, 'The Cry in the Wilderness.' More important, I have placed 'The Function of Criticism' first although it was written last, because it treats of the broad problem of literary criticism, suggests a standard of values implicit elsewhere in the book, and thus to some degree affords an introduction to the remaining essays. But the degree is not great, as the critical reader will quickly discover for himself. I ask him not to indulge the temptation of convicting me out of my own mouth. I am aware that my practice is often inconsistent with my professions; and I ask the reader to remember that the professions were made after the practice and to a considerable extent as the result of it. The practice came first, and if I could reasonably expect so much of the reader I would ask him to read 'The Function of Criticism' once more when he has reached the end of the book. I make no apology for not having rewritten the essays. As a critic I enjoy nothing more than to trace the development of a writer's attitude through its various phases; I could do no less than afford my readers the opportunity of a similar enjoyment in my own case. They may be assured that none of the essays have suffered any substantial alteration, even where, for instance in the case of the incidental and (I am now persuaded) quite inadequate estimate of Chaucer in 'The Nostalgia of Mr Masfield,' my view has since completely changed. Here and there I have recast expressions which, though not sufficiently conveying my meaning, had been passed in the haste of journalistic production. But I have nowhere tried to adjust earlier to later points of view. I am aware that these points of view are often difficult to reconcile; that, for instance, 'aesthetic' in the essay on Tchekov has a much narrower meaning than it bears in 'The Function of Criticism'; that the essay on 'The Religion of Rousseau' is criticism of a kind which I deprecate as insufficient in the essay, 'The Cry in the Wilderness,' because it lacks that reference to life as a whole which I have come to regard as essential to criticism; and that in this latter essay I use the word 'moral' (for instance in the phrase 'The values of literature are in the last resort moral') in a sense which is never exactly defined. The key to most of these discrepancies will, I hope, be found in the introductory essay on 'The Function of Criticism.'

May, 1920.

The Function of Criticism

It is curious and interesting to find our younger men of letters actively concerned with the present condition of literary criticism. This is a novel preoccupation for them and one which is, we believe, symptomatic of a general hesitancy and expectation. In the world of letters everything is a little up in the air, volatile and uncrystallised. It is a world of rejections and velleities; in spite of outward similarities, a strangely different world from that of half a dozen years ago. Then one had a tolerable certainty that the new star, if the new star was to appear, would burst upon our vision in the shape of a novel. To-day we feel it might be anything. The cloud no bigger than a man's hand might even be, like Trigoris in 'The Sea-gull,' like a piano; it has no predetermined form. This sense of incalculability, which has been aroused by the prodigious literary efflorescence of late years, reacts upon its cause; and the reaction tends by many different paths to express itself finally in the ventilation of problems that hinge about criticism. There is a general feeling that the growth of the young plant has been too luxuriant; a desire to have it vigorously pruned by a capable gardener, in order that its strength may be gathered together to produce a more perfect fruit. There is also a sense that if the *lusus naturæ*, the writer of genius, were to appear, there ought to be a person or an organisation capable of recognising him, however unexpected his scent or the shape of his leaves. Both these tasks fall upon criticism. The younger generation looks round a little apprehensively to see if there is a gardener whom it can trust, and decides, perhaps a little prematurely, that there is none. There is reviewing but no criticism, says one icy voice that we have learned to respect. There are pontiffs and potential pontiffs, but no critics, says another disrespectful young man. Oh, for some more Scotch Reviewers to settle the hash of our English bards, sighs a third. And the London Mercury, after whetting our appetite by announcing that it proposed to restore the standards of authoritative criticism, still leaves us a little in the dark as to what these standards are. Mr T.S. Eliot deals more kindly, if more frigidly, with us in the Monthly Chapbook. There are, he says, three kinds of criticism--the historical, the philosophic, and the purely literary. 'Every form of genuine criticism is directed towards creation. The historical or philosophic critic of poetry is criticising poetry in order to create a history or a philosophy; the poetic critic is criticising poetry in order to create poetry.' These separate and distinct kinds, he considers, are but rarely found to-day, even in a fragmentary form; where they do exist, they are almost invariably mingled in an

inextricable confusion. Whether we agree or not with the general condemnation of reviewing implicit in this survey of the situation, or with the division of criticism itself, we have every reason to be grateful to Mr Eliot for disentangling the problem for us. The question of criticism has become rather like Glaucus the sea-god, encrusted with shells and hung with weed till his lineaments are hardly discernible. We have at least clear sight of him now, and we are able to decide whether we will accept Mr Eliot's description of him. Let us see. We have no difficulty in agreeing that historical criticism of literature is a kind apart. The historical critic approaches literature as the manifestation of an evolutionary process in which all the phases are of equal value. Essentially, he has no concern with the greater or less literary excellence of the objects whose history he traces--their existence is alone sufficient for him; a bad book is as important as a good one, and much more important than a good one if it exercised, as bad books have a way of doing, a real influence on the course of literature. In practice, it is true, the historical critic generally fails of this ideal of unimpassioned objectivity. He either begins by making judgments of value for himself, or accepts those judgments which have been endorsed by tradition. He fastens upon a number of outstanding figures and more or less deliberately represents the process as from culmination to culmination; but in spite of this arbitrary foreshortening he is primarily concerned, in each one of the phases which he distinguishes, with that which is common to every member of the group of writers which it includes. The individuality, the quintessence, of a writer lies completely outside his view. We may accept the isolation of the historical critic then, at least in theory, and conceive of him as a fragment of a social historian, as the author of a chapter in the history of the human spirit. But can we isolate the philosophic critic in the same way? And what exactly is a philosophic critic? Is he a critic with a philosophical scheme in which art and literature have their places, a critic who therefore approaches literature with a definite conception of it as one among many parallel manifestations of the human spirit, and with a system of values derived from his metaphysical scheme? Hegel and Croce are philosophical critics in this sense, and Aristotle is not, as far as we can judge from the Poetics, wherein he considers the literary work of Greece as an isolated phenomenon, and examines it in and for itself. But for the moment, and with the uneasy sense that we have not thoroughly laid the ghost of philosophic criticism, we will assume that we have isolated him, and pass to the consideration of the pure literary critic, if indeed we can find him. What does he do? How shall we recognise him? Mr Eliot puts before us Coleridge and Aristotle and Dryden as literary critics par excellence arranged in an ascending scale of purity. The concatenation is curious, for these were men possessed of very different interests and faculties of mind; and it would occur to few to place Dryden, as a critic, at their head. The living centre of Aristotle's criticism is a conception of art as a means to a good life. As an activity, poetry 'is more philosophic than history,' a nearer approach to the universal truth in appearances; and as a more active influence, drama refines our spiritual being by a purgation of pity and terror. Indeed, it would not be an exaggeration to say that the very pith and marrow of Aristotle's literary criticism is a system of moral values derived from his contemplation of life. It was necessary that this relation should exist, because for Aristotle literature was, essentially, an imitation of life though we must remember to understand imitation according to our final sense of the theme which is the golden, persistent thread throughout the Poetics. The imitation of life in literature was for Aristotle, the creative revelation of the ideal actively at work in human life. The tragic hero failed because his composition was less than ideal; but he could only be a tragic hero if the ideal was implicit in him and he visibly approximated to it. It is this constant reference to the ideal which makes of 'imitation' a truly creative principle and the one which, properly understood, is the most permanently valid and pregnant of all; it is also one which has been constantly misunderstood. Its importance is, nevertheless, so central that adequate recognition of it might conceivably be taken as the distinguishing mark of all fruitful criticism. To his sympathetic understanding of this principle Coleridge owed a great debt. It is true that his efforts to refine upon it were not only unsuccessful, but a trifle ludicrous; his effort to graft the vague transcendentalism of Germany on to the rigour and clarity of Aristotle was, from the outset, unfortunately conceived. But the root of the matter was there, and in Coleridge's fertile mind the Aristotelian theory of imitation flowered into a magnificent conception of the validity and process of the poetic imagination. And partly because the foundation was truly Aristotelian, partly because Coleridge had known what it was to be a great poet, the reference to life pervades the whole of what is permanently valuable in Coleridge's criticism. In him, too, there is a strict and mutually fertilising relation between the moral and the æsthetic values. This is the firm ground beneath his feet when he--too seldom--proceeds to the free exercise of his exquisite æsthetic discrimination. In Dryden, however, there was no such organic interpenetration. Dryden, too, had a fine sensibility, though less exquisite, by far, than that of Coleridge; but his theoretical system was not merely alien to him--it was in itself false and mistaken. *Corruptio optimi pessima*. He took over from France the sterilised and lifeless Aristotelianism which has been the plague of criticism for centuries; he used it no worse than his French exemplars, but he used it very little better than they. It was in his hands, as in theirs, a dead mechanical framework of rules about the unities. Dryden, we can see in his critical writing, was constantly chafed by it. He behaves like a fine horse with a bearing rein: he is continually tossing his head after a minute or two of 'good manners and action,' and saying, 'Shakespeare was the best of them,

anyhow'; 'Chaucer beats Ovid to a standstill.' It is a gesture with which all decent people sympathise and when it is made in language so supple as Dryden's prose it has a lasting charm. Dryden's heart was in the right place, and he was not afraid of showing it; but that does not make him a critic, much less a critic to be set as a superior in the company of Aristotle and Coleridge. Our search for the pure literary critic is likely to be arduous. We have seen that there is a sense in which Dryden is a purer literary critic than either Coleridge or Aristotle; but we have also seen that it is precisely by reason of the 'pureness' in him that he is to be relegated into a rank inferior to theirs. It looks as though we might have to pronounce that the true literary critic is the philosophic critic. Yet the pronouncement must not be prematurely made; for there is a real and vital difference between those for whom we have accepted the designation of philosophic critics, Hegel or Croce, and Aristotle or Coleridge. Yet three of these (and it might be wise to include Coleridge as a fourth) were professional philosophers. It is evidently not the philosophy as such that makes the difference. The difference depends, we believe, upon the nature of the philosophy. The secret lies in Aristotle. The true literary critic must have a humanistic philosophy. His inquiries must be modulated, subject to an intimate, organic governance, by an ideal of the good life. He is not the mere investigator of facts; existence is never for him synonymous with value, and it is of the utmost importance that he should never be deluded into believing that it is. He will not accept from Hegel the thesis that all the events of human history, all man's spiritual activities, are equally authentic manifestations of Spirit; he will not even recognise the existence of Spirit. He may accept from Croce the thesis that art is the expression of intuitions, but he will not be extravagantly grateful, because his duty as a critic is to distinguish between intuitions and to decide that one is more significant than another. A philosophy of art that lends him no aid in this and affords no indication why the expression of one intuition should be preferred to the expression of another is of little value to him. He will incline to say that Hegel and Croce are the scientists of art rather than its philosophers. Here, then, is the opposition: between the philosophy that borrows its values from science and the philosophy which shares its values with art. We may put it with more cogency and truth: the opposition lies between a philosophy without values and a philosophy based upon them. For values are human, anthropocentric. Shut them out once and you shut them out for ever. You do not get them back, as some believe, by declaring that such and such a thing is true. Nothing is precious because it is true save to a mind which has, consciously or unconsciously, decided that it is good to know the truth. And the making of that single decision is a most momentous judgment of value. If the scientist appeals to it, as indeed he invariably does, he too is at bottom, though he may deny it, a humanist. He would do better to confess it, and to confess that he too is in search of the good life. Then he might become aware that to search for the good life is in fact impossible, unless he has an ideal of it before his mind's eye. An ideal of the good life, if it is to have the internal coherence and the organic force of a true ideal, must inevitably be æsthetic. There is no other power than our æsthetic intuition by which we can imagine or conceive it; we can express it only in æsthetic terms. We say, for instance, the good life is that in which man has achieved a harmony of the diverse elements in his soul. For the good life, we know instinctively, is one of our human absolutes. It is not good with reference to any end outside itself. A man does not live the good life because he is a good citizen; but he is a good citizen because he lives the good life. And here we touch the secret of the most magnificently human of all books that has ever been written--Plato's Republic. In the Republic the good life and the life of the good citizen are identified; but the citizenship is not of an earthly but of an ideal city, whose proportions, like the duties of its citizens, are determined by the æsthetic intuition. Plato's philosophy is æsthetic through and through, and because it is æsthetic it is the most human, the most permanently pregnant of all philosophies. Much labour has been spent on the examination of the identity which Plato established between the good and the beautiful. It is labour lost, for that identity is axiomatic, absolute, irreducible. The Greeks knew by instinct that it is so, and in their common speech the word for a gentleman was the kalos kagathos, the beautiful-good. This is why we have to go back to the Greeks for the principles of art and criticism, and why only those critics who have returned to bathe themselves in the life-giving source have made enduring contributions to criticism. They alone are--let us not say philosophic critics but--critics indeed. Their approach to life and their approach to art are the same; to them, and to them alone, life and art are one. The interpenetration is complete; the standards by which life and art are judged the same. If we may use a metaphor, in the Greek view art is the consciousness of life. Poetry is more philosophic and more highly serious than history, just as the mind of a man is more significant than his outward gestures. To make those gestures significant the art of the actor must be called into play. So to make the outward event of history significant the poet's art is needed. Therefore a criticism which is based on the Greek view is impelled to assign to art a place, the place of sovereignty in its scheme of values. That Plato himself did not do this was due to his having misunderstood the nature of that process of 'imitation' in which art consists; but only the superficial readers of Plato--and a good many readers deserve no better name--will conclude from the fact that he rejected art that his attitude was not fundamentally æsthetic. Not only is the Republic itself one of the greatest 'imitations,' one of the most subtle and profound works of art ever created, but it would also be true to say that Plato cleared the way for a true conception of art. In reality he rejected not art, but false art; and it only remained for Aristotle to discern the

nature of the relation between artistic 'imitation' and the ideal for the Platonic system to be complete and four-square, a perpetual inspiration and an everlasting foundation for art and the criticism of art. Art, then, is the revelation of the ideal in human life. As the ideal is active and organic so must art itself be. The ideal is never achieved, therefore the process of revealing it is creative in the truest sense of the word. More than that, only by virtue of the artist in him can man appreciate or imagine the ideal at all. To discern it is essentially the work of divination or intuition. The artist divines the end at which human life is aiming; he makes men who are his characters completely expressive of themselves, which no actual man ever has been. If he works on a smaller canvas he aims to make himself completely expressive of himself. That, also, is the aim of the greater artist who expresses himself through the medium of a world of characters of his own creation. He needs that machinery, if a coarse and non-organic metaphor may be tolerated, for the explication of his own intuitions of the ideal, which are so various that the attempt to express them through the persona of himself would inevitably end in confusion. That is why the great poetic genius is never purely lyrical, and why the greatest lyrics are as often as not the work of poets who are only seldom lyrical. Moreover, every act of intuition or divination of the ideal in act in the world of men must be set, implicitly or explicitly, in relation to the absolute ideal. In subordinating its particular intuitions to the absolute ideal art is, therefore, merely asserting its own sovereign autonomy. True criticism is itself an organic part of the whole activity of art; it is the exercise of sovereignty by art upon itself, and not the imposition of an alien. To use our previous metaphor, as art is the consciousness of life, criticism is the consciousness of art. The essential activity of true criticism is the harmonious control of art by art. This is at the root of a confusion in the thought of Mr. Eliot, who, in his just anxiety to assert the full autonomy of art, pronounces that the true critic of poetry is the poet and has to smuggle the anomalous Aristotle in on the hardly convincing ground that 'he wrote well about everything,' and has, moreover, to elevate Dryden to a purple which he is quite unfitted to wear. No, what distinguishes the true critic of poetry is a truly æsthetic philosophy. In the present state of society it is extremely probable that only the poet or the artist will possess this, for art and poetry were never more profoundly divorced from the ordinary life of society than they are at the present day. But the poet who would be a critic has to make his æsthetic philosophy conscious to himself; to him as a poet it may be unconscious. This necessary change from unconsciousness to consciousness is by no means easy, and we should do well to insist upon its difficulty, for quite as much nonsense is talked about poetry by poets and by artists about art as by the profane about either. Moreover, it is important to remember that in proportion as society approaches the ideal--there is no continual progress towards the ideal; at present society is as far removed from it as it has ever been--the chance of the philosopher, of the scientist even, becoming a true critic of art grows greater. When the æsthetic basis of all humane activity is familiarly recognised, the values of the philosopher, the scientist, and the artist become consciously the same, and therefore interchangeable. Still, the ideal society is sufficiently remote for us to disregard it, and we shall say that the principle of art for art's sake contains an element of truth when it is opposed to those who would inflict upon art the values of science, of metaphysics, or of a morality of mere convention. We shall also say that the principle of art for art's sake needs to be understood and interpreted very differently. Its implications are tremendous. Art is autonomous, and to be pursued for its own sake, precisely because it comprehends the whole of human life; because it has reference to a more perfectly human morality than other activity of man; because, in so far as it is truly art, it is indicative of a more comprehensive and unchallengeable harmony in the spirit of man. It does not demand impossibilities, that man should be at one with the universe or in tune with the infinite; but it does envisage the highest of all attainable ideals, that man should be at one with himself, obedient to his own most musical law. Thus art reveals to us the principle of its own governance. The function of criticism is to apply it. Obviously it can be applied only by him who has achieved, if not the actual æsthetic ideal in life, at least a vision and a sense of it. He alone will know that the principle he has to elucidate and apply is living, organic. It is indeed the very principle of artistic creation itself. Therefore he will approach what claims to be a work of art first as a thing in itself, and seek with it the most intimate and immediate contact in order that he may decide whether it too is organic and living. He will be untiring in his effort to refine his power of discrimination by the frequentation of the finest work of the past, so that he may be sure of himself when he decides, as he must, whether the object before him is the expression of an æsthetic intuition at all. At the best he is likely to find that it is mixed and various; that fragments of æsthetic vision jostle with unsubordinated intellectual judgments. But, in regarding the work of art as a thing in itself, he will never forget the hierarchy of comprehension, that the active ideal of art is indeed to see life steadily and see it whole, and that only he has a claim to the title of a great artist whose work manifests an incessant growth from a merely personal immediacy to a coherent and all-comprehending attitude to life. The great artist's work is in all its parts a revelation of the ideal as a principle of activity in human life. As the apprehension of the ideal is more or less perfect, the artist's comprehension will be greater or less. The critic has not merely the right, but the duty, to judge between Homer and Shakespeare, between Dante and Milton, between Cezanne and Michelangelo, Beethoven and Mozart. If the foundations of his criticism are truly æsthetic, he is compelled to believe and to show that among would-be artists some are true artists and some

are not, and that among true artists some are greater than others. That what has generally passed under the name of æsthetic criticism assumes as an axiom that every true work of art is unique and incomparable is merely the paradox which betrays the unworthiness of such criticism to bear the name it has arrogated to itself. The function of true criticism is to establish a definite hierarchy among the great artists of the past, as well as to test the production of the present; by the combination of these activities it asserts the organic unity of all art. It cannot honestly be said that our present criticism is adequate to either task.

[APRIL, 1920.

The Religion of Rousseau

These are times when men have need of the great solitaries; for each man now in his moment is a prey to the conviction that the world and his deepest aspirations are incommensurable. He is shaken by a presentiment that the lovely bodies of men are being spent and flaming human minds put out in a conflict for something which never can be won in the clash of material arms, and he is distraught by a vision of humanity as a child pitifully wandering in a dark wood where the wind faintly echoes the strange word 'Peace.' Therefore he too wanders pitifully like that child, seeking peace, and men are become the symbols of mankind. The tragic paradox of human life which slumbers in the soul in years of peace is awakened again. When we would be solitary and cannot, we are made sensible of the depth and validity of the impulse which moved the solitaries of the past. The paradox is apparent now on every hand. It appears in the death of the author of *La Formation Religieuse* de J.J. Rousseau.[1] One of the most distinguished of the younger generation of French scholar-critics, M. Masson met a soldier's death before the book to which he had devoted ten years of his life was published. He had prepared it for the press in the leisure hours of the trenches. There he had communed with the unquiet spirit of the man who once thrilled the heart of Europe by stammering forgotten secrets, and whispered to an age flushed and confident with material triumphs that the battle had been won in vain. Rousseau, rightly understood is no consoling companion for a soldier. What if after all, the true end of man be those hours of plenary beatitude he spent lying at the bottom of the boat on the Lake of Bienné? What if the old truth is valid still, that man is born free but is everywhere in chains? Let us hope that the dead author was not too keenly conscious of the paradox which claimed him for sacrifice. His death would have been bitter. [Footnote 1: *La Formation Religieuse* de Jean-Jacques Rousseau. Par Pierre Maurice Masson. (Paris: Hachette. Three volumes.)] >From his book we can hardly hazard a judgment. His method would speak against it. Jean-Jacques, as he himself knew only too well, is one of the last great men to be catechised historically, for he was inadequate to the life which is composed of the facts of which histories are made. He had no historical sense; and of a man who has no historical sense no real history can be written. Chronology was meaningless to him because he could recognise no sovereignty of time over himself. With him ends were beginnings. In the third Dialogue he tell us--and it is nothing less than the sober truth told by a man who knew himself well--that his works must be read backwards, beginning with the last, by those who would understand him. Indeed, his function was, in a deeper sense than is imagined by those who take the parable called the *Contrat Social* for a solemn treatise of political philosophy, to give the lie to history. In himself he pitted the eternal against the temporal and grew younger with years. He might be known as the man of the second childhood par excellence. To the eye of history the effort of his soul was an effort backwards, because the vision of history is focused only for a perspective of progress. On his after-dinner journey to Diderot at Vincennes, Jean-Jacques saw, with the suddenness of intuition, that that progress, amongst those convinced and cogent prophets he had lived so long was for him an unsubstantial word. He beheld the soul of man *sub specie æternitatis*. In his vision history and institutions dissolved away. His second childhood had begun. On such a man the historical method can have no grip. There is, as the French say, no *engrenage*. It points to a certain lack of the subtler kind of understanding to attempt to apply the method; more truly, perhaps, to an unessential interest, which has of late years been imported into French criticism from Germany. The Sorbonne has not, we know, gone unscathed by the disease of documentation for documentation's sake. M. Masson's three volumes leave us with the sense that their author had learnt a method and in his zeal to apply it had lost sight of the momentous question whether Jean-Jacques was a person to whom it might be applied with a prospect of discovery. No one who read Rousseau with a mind free of ulterior motives could have any doubt on the matter. Jean-Jacques is categorical on the point. The Savoyard Vicar was speaking for Jean-Jacques to posterity when he began his profession of faith with the words:-- 'Je ne veux argumenter avec vous, ni même de tenter vous convaincre; il me

suffit de vous exposer ce que je pense dans la simplicité de mon coeur. Consultez le vôtre pendant mon discours; c'est tout ce que je vous demande.' To the extent, therefore, that M. Masson did not respond to this appeal and filled his volumes with information concerning the books Jean-Jacques might have read and a hundred other interesting but only partly relevant things, he did the citizen of Geneva a wrong. The ulterior motive is there, and the faint taste of a thesis in the most modern manner. But the method is saved by the perception which, though it sometimes lacks the perfect keenness of complete understanding, is exquisite enough to suggest the answer to the questions it does not satisfy. Though the environment is lavish the man is not lost. It is but common piety to seek to understand Jean-Jacques in the way in which he pleaded so hard to be understood. Yet it is now over forty years since a voice of authority told England how it was to regard him. Lord Morley was magisterial and severe, and England obeyed. One feels almost that Jean-Jacques himself would have obeyed if he had been alive. He would have trembled at the stern sentence that his deism was 'a rag of metaphysics floating in a sunshine of sentimentalism,' and he would have whispered that he would try to be good; but, when he heard his Dialogues described as the outpourings of a man with persecution mania, he might have rebelled and muttered silently an *Eppur si muove*. We see now that it was a mistake to stand him in the social dock, and that precisely those Dialogues which the then Mr Morley so powerfully dismissed contain his plea that the tribunal has no jurisdiction. To his contention that he wrote his books to ease his own soul it might be replied that their publication was a social act which had vast social consequences. But Jean-Jacques might well retort that the fact that his contemporaries and the generation which followed read and judged him in the letter and not in the spirit is no reason why we, at nearly two centuries remove, should do the same. A great man may justly claim our deference, if Jean-Jacques asks that his last work shall be read first we are bound, even if we consider it only a quixotic humour, to indulge it. But to those who read the neglected Dialogues it will appear a humour no longer. Here is a man who at the end of his days is filled to overflowing with bitterness at the thought that he has been misread and misunderstood. He says to himself: Either he is at bottom of the same nature as other men or he is different. If he is of the same nature, then there must be a malignant plot at work. He has revealed his heart with labour and good faith; not to hear him his fellow-men must have stopped their ears. If he is of another kind than his fellows, then--but he cannot bear the thought. Indeed it is a thought that no man can bear. They are blind because they will not see. He has not asked them to believe that what he says is true; he asks only that they shall believe that he is sincere, sincere in what he says, sincere, above all, when he implores that they should listen to the undertone. He has been 'the painter of nature and the historian of the human heart.' His critics might have paused to consider why Jean-Jacques, certainly not niggard of self-praise in the Dialogues, should have claimed no more for himself than this. He might have claimed, with what in their eyes at least must be good right, to have been pre-eminent in his century as a political philosopher, a novelist, and a theorist of education. Yet to himself he is no more than 'the painter of nature and the historian of the human heart.' Those who would make him more make him less, because they make him other than he declares himself to be. His whole life has been an attempt to be himself and nothing else besides; and all his works have been nothing more and nothing less than his attempt to make his own nature plain to men. Now at the end of his life he has to swallow the bitterness of failure. He has been acclaimed the genius of his age; kings have delighted to honour him, but they have honoured another man. They have not known the true Jean-Jacques. They have taken his parables for literal truth, and he knows why.

'Des êtres si singulièrement constitués doivent nécessairement s'exprimer autrement que les hommes ordinaires. Il est impossible qu'avec des âmes si différemment modifiés ils ne portent pas dans l'expression de leurs sentiments et de leurs idées l'empreinte de ces modifications. Si cette empreinte échappe à ceux qui n'ont aucune notion de cette manière d'être, elle ne peut échapper à ceux qui la connoissent, et qui en sont affectés eux-mêmes. C'est une signe caractéristique auquel les initiés se reconnoissent entre eux; et ce qui donne un grand prix à ce signe, c'est qu'il ne peut se contrefaire, que jamais il n'agit qu'au niveau de sa source, et que, quand il ne part pas du coeur de ceux qui l'imitent, il n'arrive pas non plus aux coeurs faits pour le distinguer; mais sitôt qu'il y parvient, on ne sauroit s'y méprendre; il est vrai dès qu'il est senti.'

At the end of his days he felt that the great labour of his life which had been to express an intuitive certainty in words which would carry intellectual conviction, had been in vain, and his last words are: 'It is true so soon as it is felt.' Three pages would tell as much of the essential truth of his 'religious formation' as three volumes. At Les

Charmettes with Mme de Warens, as a boy and as a young man, he had known peace of soul. In Paris, amid the intellectual exaltation and enthusiasms of the Encyclopædists, the memory of his lost peace haunted him like an uneasy conscience. His boyish unquestioning faith disappeared beneath the destructive criticism of the great pioneers of enlightenment and progress. Yet when all had been destroyed the hunger in his heart was still unsatisfied. Underneath his passionate admiration for Diderot smouldered a spark of resentment that he was not understood. They had torn down the fabric of expression into which he had poured the emotion of his immediate certainty as a boy; sometimes with an uplifted, sometimes with a sinking heart he surveyed the ruins. But the certainty that he had once been certain, the memory and the desire of the past peace--this they could not destroy. They could hardly even weaken this element within him, for they did not know that it existed, they were unable to conceive that it could exist. Jean-Jacques himself could give them no clue to its existence; he had no words, and he was still under the spell of the intellectual dogma of his age that words must express definite things. In common with his age he had lost the secret of the infinite persuasion of poetry. So the consciousness that he was different from those who surrounded him, and from those he admired as his masters, took hold of him. He was afraid of his own otherness, as all men are afraid when the first knowledge of their own essential loneliness begins to trouble their depths. The pathos of his struggle to kill the seed of this devastating knowledge is apparent in his declared desire to become 'a polished gentleman.' In the note which he added to his memoir for M. Dupin in 1749 he confesses to this ideal. If only he could become 'one of them,' indistinguishable without and within, he might be delivered from that disquieting sense of tongue-tied queerness in a normal world. If he cheated himself at all, the deception was brief. The poignant memory of Les Charmettes whispered to him that there was a state of grace in which the hard things were made clear. But he had not yet the courage of his destiny. His consciousness of his separation from his fellows had still to harden into a consciousness of superiority before that courage would come. On the road to Vincennes on an October evening in 1749--M. Masson has fixed the date for us--he read in a news-sheet the question of the Dijon Academy: 'Si le rétablissement des arts et des sciences a contribué à épurer les moeurs?' The scales dropped from his eyes and the weight was removed from his tongue. There is no mystery about this 'revelation.' For the first time the question had been put in terms which struck him squarely in the heart. Jean-Jacques made his reply with the stammering honesty of a man of genius wandering in age of talent. The First Discourse seems to many rhetorical and extravagant. In after days it appeared so to Rousseau himself, and he claimed no more for it than that he had tried to tell the truth. Before he learned that he had won the Dijon prize and that his work had taken Paris by storm, he was surely a prey to terrors lest his Vincennes vision of the non-existence of progress should have been mere madness. The success reassured him. 'Cette faveur du public, nullement brigué, et pour un auteur inconnu, me donna la première assurance véritable de mon talent.' He was, in fact, not 'queer,' but right; and he had seemed to be queer precisely because he was right. Now he had the courage. 'Je suis grossier,' he wrote in the preface to *Narcisse*, 'maussade, impoli par principes; je me fous de tous vous autres gens de cour; je suis un barbare.' There is a touch of exaggeration and bravado in it all. He was still something of the child hallooing in the dark to give himself heart. He clutched hold of material symbols of the freedom he had won, round wig, black stockings, and a living gained by copying music at so much a line. But he did not break with his friends; the 'bear' suffered himself to be made a lion. He had still a foot in either camp, for though he had the conviction that he was right, he was still fumbling for his words. The memoirs of Madame d'Epinau tell us how in 1754, at dinner at Mlle Quinault's, impotent to reply to the polite atheistical persiflage of the company, he broke out: 'Et moi, messieurs, je crois en Dieu. Je sors si vous dites un mot de plus.' That was not what he meant; neither was the First Discourse what he meant. He had still to find his language, and to find his language he had to find his peace. He was like a twig whirled about in an eddy of a stream. Suddenly the stream bore him to Geneva, where he returned to the church which he had left at Confignon. That, too, was not what he meant. When he returned from Geneva, Madame d'Epinau had built him the Ermitage. In the *Rêveries*, which are mellow with the golden calm of his discovered peace, he tells how, having reached the climacteric which he had set at forty years, he went apart into the solitude of the Ermitage to inquire into the configuration of his own soul, and to fix once for all his opinions and his principles. In the exquisite third *Rêverie* two phrases occur continually. His purpose was 'to find firm ground'--'prendre une assiette,'--and his means to this discovery was 'spiritual honesty'--'bonne foi.' Rousseau's deep concern was to elucidate the anatomy of his own soul, but, since he was sincere, he regarded it as a type of the soul of man. Looking into himself, he saw that, in spite of all his follies, his weaknesses, his faintings by the way, his blasphemies against the spirit, he was good. Therefore he declared: Man is born good. Looking into himself he saw that he was free to work out his own salvation, and to find that solid foundation of peace which he so fervently desired. Therefore he declared: Man is born free. To the whisper of les Charmettes that there was a condition of grace had been added the sterner voice of remorse for his abandoned children, telling him that he had fallen from his high estate.

J'ai fui en vain; partout j'ai retrouvé la Loi.

Il faut céder enfin! ô porte, il faut admettre

L'hôte; coeur frémissant, il faut subir le maître,
Quelqu'un qui soit en moi plus moi-même que moi.'

The noble verse of M. Claudel contains the final secret of Jean-Jacques. He found in himself something more than himself. Therefore he declared: There is a God. But he sought to work out a logical foundation for these pinnacles of truth. He must translate these luminous convictions of his soul into arguments and conclusions. He could not, even to himself, admit that they were only intuitions; and in the *Contrat Social* he turned the reason to the service of a certainty not her own. This unremitting endeavour to express an intuitive certainty in intellectual terms lies at the root of the many superficial contradictions in his work, and of the deeper contradiction which forms, as it were, the inward rhythm of his three great books. He seems to surge upwards on a passionate wave of revolutionary ideas, only to sink back into the calm of conservative or quietist conclusions. M. Masson has certainly observed it well.

'Le premier Discours anathématise les sciences et les arts, et ne voit le salut que dans les académies; le Discours sur l'Inégalité paraît détruire tout autorité, et recommande pourtant "l'obéissance scrupuleuse aux lois et aux hommes qui en sont les auteurs": la Nouvelle Héloïse prêche d'abord l'émancipation sentimentale, et proclame la suprématie des droits de la passion, mais elle aboutit à exalter la fidélité conjugale, à consolider les grands devoirs familiaux et sociaux. Le Vicaire Savoyard nous réserve la même surprise.'

To the revolutionaries of his age he was a renegade and a reactionary; to the Conservatives, a subversive charlatan. Yet he was in truth only a man stricken by the demon of 'la bonne foi,' and, like many men devoured by the passion of spiritual honesty, in his secret heart he believed in his similitude to Christ. 'Je ne puis pas souffrir les tièdes,' he wrote to Madame Latour in 1762, 'quiconque ne se passionne pas pour moi n'est pas digne de moi.' There is no mistaking the accent, and it sounds more plainly still in the *Dialogues*. He, too, was persecuted for righteousness' sake, because he, too, proclaimed that the kingdom of heaven was within men. And what, indeed, have material things to do with the purification and the peace of the soul? World-shattering arguments and world-preserving conclusions--this is the inevitable paradox which attends the attempt to record truth seen by the eye of the soul in the language of the market-place. The eloquence and the inspiration may descend upon the man so that he writes believing that all men will understand. He wakes in the morning and he is afraid, not of his own words whose deeper truth he does not doubt, but of the incapacity of mankind to understand him. They will read in the letter what was written in the spirit; their eyes will see the words, but their ears will be stopped to the music. The mystique as Péguy would have said, will be degraded into politique. To guard himself against this unhallowed destiny, at the last Rousseau turns with decision and in the language of his day rewrites the hard saying, that the things which are Cæsar's shall be rendered unto Cæsar. In the light of this necessary truth all the contradictions which have been discovered in Rousseau's work fade away. That famous confusion concerning 'the natural man,' whom he presents to us now as a historic fact, now as an ideal, took its rise, not in the mind of Jean-Jacques, but in the minds of his critics. The *Contrat Social* is a parable of the soul of man, like the *Republic* of Plato. The truth of the human soul is its implicit perfection; to that reality material history is irrelevant, because the anatomy of the soul is eternal. And as for the nature of this truth, 'it is true so soon as it is felt.' When the Savoyard Vicar, after accepting all the destructive criticism of religious dogma, turned to the Gospel story with the immortal 'Ce n'est pas ainsi qu'on invente,' he was only anticipating what Jean-Jacques was to say of himself before his death, that there was a sign in his work which could not be imitated, and which acted only at the level of its source. We may call Jean-Jacques religious because we have no other word; but the word would be more truly applied to the reverence felt towards such a man than to his own emotion. He was driven to speak of God by the habit of his childhood and the deficiency of a language shaped by the intellect and not by the soul. But his deity was one whom neither the Catholic nor the Reformed Church could accept, for He was truly a God who does not dwell in temples made with hands. The respect he owed to God, said the Vicar, was such that he could affirm nothing of Him. And, again, still more profoundly, he said, 'He is to our souls what our soul is to our body.' That is the mystical utterance of a man who was no mystic, but of one who found his full communion in the beatific *dolce far niente* of the Lake of Bienna. Jean-Jacques was set apart from his generation, because, like Malvolio, he thought highly of the soul and in nowise approved the conclusions of his fellows; and he was fortunate to the last, in spite of what some are pleased to call his madness (which was indeed only his flaming and uncomprehending indignation at the persecution inevitably meted out by those who have only a

half truth to one who has the whole), because he enjoyed the certainty that his high appraisal of the soul was justified.

[MARCH, 1918.

The Poetry of Edward Thomas

We believe that when we are old and we turn back to look among the ruins with which our memory will be strewn for the evidence of life which disaster could not kill, we shall find it in the poems of Edward Thomas.[2] They will appear like the faint, indelible writing of a palimpsest over which in our hours of exaltation and bitterness more resonant, yet less enduring, words were inscribed; or they will be like a phial discovered in the ashes of what was once a mighty city. There will be the triumphal arch standing proudly; the very tombs of the dead will seem to share its monumental magnificence. Yet we will turn from them all, from the victory and sorrow alike, to this faintly gleaming bubble of glass that will hold captive the phantasm of a fragrance of the soul. By it some dumb and doubtful knowledge will be evoked to tremble on the edge of our minds. We shall reach back, under its spell, beyond the larger impulses of a resolution and a resignation which will have become a part of history, to something less solid and more permanent over which they passed and which they could not disturb. [Footnote 2: Last Poems. By Edward Thomas. (Selwyn & Blount.)] Our consciousness will have its record. The tradition of England in battle has its testimony; our less traditional despairs will be compassed about by a crowd of witnesses. But it might so nearly have been in vain that we should seek an echo of that which smiled at the conclusions of our consciousness. The subtler faiths might so easily have fled through our harsh fingers. When the sound of the bugles died, having crowned reveillé with the equal challenge of the last post, how easily we might have been persuaded that there was a silence, if there had not been one whose voice rose only so little above that of the winds and trees and the life of undertone we share with them as to make us first doubt the silence and then lend an ear to the incessant pulses of which it is composed. The infinite and infinitesimal vague happinesses and immaterial alarms, terrors and beauties scared by the sound of speech, memories and forgettings that the touch of memory itself crumbles into dust--this very texture of the life of the soul might have been a gray background over which tumultuous existence passed unheeding had not Edward Thomas so painfully sought the angle from which it appears, to the eye of eternity, as the enduring warp of the more gorgeous woof. The emphasis sinks; the stresses droop away. To exacter knowledge less charted and less conquerable certainties succeed; truths that somehow we cannot make into truths, and that have therefore some strange mastery over us; laws of our common substance which we cannot make human but only humanise; loyalties we do not recognise and dare not disregard; beauties which deny communion with our beautiful, and yet compel our souls. So the sedge-warbler's
'Song that lacks all words, all melody,
All sweetness almost, was dearer then to me
Than sweetest voice that sings in tune sweet words.'

Not that the unheard melodies were sweeter than the heard to this dead poet. We should be less confident of his quality if he had not been, both in his knowledge and his hesitations, the child of his age. Because he was this, the melodies were heard; but they were not sweet. They made the soul sensible of attachments deeper than the conscious mind's ideals, whether of beauty or goodness. Not to something above but to something beyond are we chained, for all that we forget our fetters, or by some queer trick of self-hallucination turn them into golden crowns. But perhaps the finer task of our humanity is to turn our eyes calmly into 'the dark backward and abysm' not of time, but of the eternal present on whose pinnacle we stand.

'I have mislaid the key. I sniff the spray
And think of nothing; I see and hear nothing;
Yet seem, too, to be listening, lying in wait
For what I should, yet never can, remember.
No garden appears, no path, no child beside,
Neither father nor mother, nor any playmate;
Only an avenue, dark, nameless without end.'

So, it seems, a hundred years have found us out. We come no longer trailing clouds of glory. We are that which we are, less and more than our strong ancestors; less, in that our heritage does not descend from on high, more, in that we know ourselves for less. Yet our chosen spirit is not wholly secure in his courage. He longs not merely to know in what undifferentiated oneness his roots are fixed, but to discover it beautiful. Not even yet is it sufficient to have a premonition of the truth; the truth must wear a familiar colour.

'This heart, some fraction of me, happily
Floats through the window even now to a tree
Down in the misting, dim-lit, quiet vale,
Not like a peewit that returns to wail
For something it has lost, but like a dove
That slants unswerving to its home and love.
There I find my rest, and through the dark air
Flies what yet lives in me. Beauty is there.'

Beauty, yes, perhaps; but beautiful by virtue of its coincidence with the truth, as there is beauty in those lines securer and stronger far than the melody of their cadence, because they tell of a loyalty of man's being which, being once made sensible of it, he cannot gainsay. Whence we all come, whither we must all make our journey, there is home indeed. But necessity, not remembered delights, draws us thither. That which we must obey is our father if we will; but let us not delude ourselves into the expectation of kindness and the fatted calf, any more than we dare believe that the love which moves the sun and the other stars has in it any charity. We may be, we are, the children of the universe; but we have 'neither father nor mother nor any playmate.' And Edward Thomas knew this. The knowledge should be the common property of the poetry of our time, marking it off from what went before and from what will come after. We believe that it will be found to be so; and that the presence of this knowledge, and the quality which this knowledge imparts, makes Edward Thomas more than one among his contemporaries. He is their chief. He challenges other regions in the hinterland of our souls. Yet how shall we describe the narrowness of the line which divides his province from theirs, or the only half-conscious subtlety of the gesture with which he beckons us aside from trodden and familiar paths? The difference, the sense of departure, is perhaps most apparent in this, that he knows his beauty is not beautiful, and his home no home at all.

'This is my grief. That land,
My home, I have never seen.
No traveller tells of it,
However far he has been.

'And could I discover it
I fear my happiness there,
Or my pain, might be dreams of return
To the things that were.'

Great poetry stands in this, that it expresses man's allegiance to his destiny. In every age the great poet triumphs in all that he knows of necessity; thus he is the world made vocal. Other generations of men may know more, but their increased knowledge will not diminish from the magnificence of the music which he has made for the spheres. The known truth alters from age to age; but the thrill of the recognition of the truth stands fast for all our human eternity. Year by year the universe grows vaster, and man, by virtue of the growing brightness of his little lamp, sees himself more and more as a child born in the midst of a dark forest, and finds himself less able to claim the obeisance of the all. Yet if he would be a poet, and not a harper of threadbare tunes, he must at each step in the downward passing from his sovereignty, recognise what is and celebrate it as what must be. Thus he regains, by another path, the supremacy which he has forsaken. Edward Thomas's poetry has the virtue of this recognition. It may be said that his universe was not vaster but smaller than the universe of the past, for its bounds were largely those of his own self. It is, even in material fact, but half true. None more closely than he regarded the living things of earth in all their quarters. 'After Rain' is, for instance, a very catalogue of the texture of nature's visible garment, freshly put on, down to the little ash-leaves

'... thinly spread
In the road, like little black fish, inlaid

As if they played.'

But it is true that these objects of vision were but the occasion of the more profound discoveries within the region of his own soul. There he discovered vastness and illimitable vistas; found himself to be an eddy in the universal flux, driven whence and whither he knew not, conscious of perpetual instability, the meeting place of mighty impacts of which only the farthest ripple agitates the steady moonbeam of the waking mind. In a sense he did no more than to state what he found, sometimes in the more familiar language of beauties lost, mourned for lost, and irrecoverable.

'The simple lack
Of her is more to me
Than other's presence,
Whether life splendid be
Or utter black.

'I have not seen,
I have no news of her;
I can tell only
She is not here, but there
She might have been.

'She is to be kissed
Only perhaps by me;
She may be seeking
Me and no other; she
May not exist.'

That search lies nearer to the norm of poetry. We might register its wistfulness, praise the appealing nakedness of its diction and pass on. If that were indeed the culmination of Edward Thomas's poetical quest, he would stand securely enough with others of his time. But he reaches further. In the verses on his 'home,' which we have already quoted, he passes beyond these limits. He has still more to tell of the experience of the soul fronting its own infinity:--

'So memory made
Parting to-day a double pain:
First because it was parting; next
Because the ill it ended vexed
And mocked me from the past again.
Not as what had been remedied
Had I gone on,--not that, ah no!
But as itself no longer woe.'

There speaks a deep desire born only of deep knowledge. Only those who have been struck to the heart by a sudden awareness of the incessant not-being which is all we hold of being, know the longing to arrest the movement even at the price of the perpetuation of their pain. So it was that the moments which seemed to come to him free from the infirmity of becoming haunted and held him most.

'Often I had gone this way before,
But now it seemed I never could be
And never had been anywhere else.'

To cheat the course of time, which is only the name with which we strive to cheat the flux of things, and to anchor the soul to something that was not instantly engulfed--

'In the undefined
Abyss of what can never be again.'

Sometimes he looked within himself for the monition which men have felt as the voice of the eternal memory; sometimes, like Keats, but with none of the intoxication of Keats's sense of a sharing in victory, he grasped at the recurrence of natural things, 'the pure thrush word,' repeated every spring, the law of wheeling rooks, or to the wind 'that was old when the gods were young,' as in this profoundly typical sensing of 'A New House.'

'All was foretold me; naught
Could I foresee;
But I learned how the wind would sound
After these things should be.'

But he could not rest even there. There was, indeed, no anchorage in the enduring to be found by one so keenly aware of the flux within the soul itself. The most powerful, the most austere imagined poem in this book is that entitled 'The Other,' which, apart from its intrinsic appeal, shows that Edward Thomas had something at least of the power to create the myth which is the poet's essential means of triangulating the unknown of his emotion. Had he lived to perfect himself in the use of this instrument, he might have been a great poet indeed. 'The Other' tells of his pursuit of himself, and how he overtook his soul.

'And now I dare not follow after
Too close. I try to keep in sight,
Dreading his frown and worse his laughter,
I steal out of the wood to light;
I see the swift shoot from the rafter
By the window: ere I alight
I wait and hear the starlings wheeze
And nibble like ducks: I wait his flight.
He goes: I follow: no release
Until he ceases. Then I also shall cease.'

No; not a great poet, will be the final sentence, when the palimpsest is read with the calm and undivided attention that is its due, but one who had many (and among them the chief) of the qualities of a great poet. Edward Thomas was like a musician who noted down themes that summon up forgotten expectations. Whether the genius to work them out to the limits of their scope and implication was in him we do not know. The life of literature was a hard master to him; and perhaps the opportunity he would eagerly have grasped was denied him by circumstance. But, if his compositions do not, his themes will never fail--of so much we are sure--to awaken unsuspected echoes even in unsuspecting minds.

[JANUARY 1919.

Mr Yeats's Swan Song

In the preface to *The Wild Swans at Coole*,^[3] Mr W.B. Yeats speaks of 'the phantasmagoria through which alone I can express my convictions about the world.' The challenge could hardly be more direct. At the threshold we are confronted with a legend upon the door-post which gives us the essential plan of all that we shall find in the house if we enter in. There are, it is true, a few things capable of common use, verses written in the seeming-strong vernacular of literary Dublin, as it were a hospitable bench placed outside the door. They are indeed inside the house, but by accident or for temporary shelter. They do not, as the phrase goes, belong to the scheme, for they are direct transcriptions of the common reality, whether found in the sensible world or the emotion of the mind. They are, from Mr Yeats's angle of vision (as indeed from our own), essentially *vers d'occasion*. The poet's high and passionate argument must be sought elsewhere, and precisely in his expression of his convictions about the world. And here, on the poet's word and the evidence of our search, we shall find phantasmagoria, ghostly symbols of a truth which cannot be otherwise conveyed, at least by Mr Yeats. To this, in itself, we make no demur. The poet, if he is a true poet, is driven to approach the highest reality he can apprehend. He cannot transcribe it simply because he

does not possess the necessary apparatus of knowledge, and because if he did possess it his passion would flag. It is not often that Spinoza can disengage himself to write as he does at the beginning of the third book of the Ethics, nor could Lucretius often kindle so great a fire in his soul as that which made his material incandescent in *Aeneadum genatrix*. Therefore the poet turns to myth as a foundation upon which he can explicate his imagination. He may take his myth from legend or familiar history, or he may create one for himself anew, but the function it fulfils is always the same. It supplies the elements with which he can build the structure of his parable, upon which he can make it elaborate enough to convey the multitudinous reactions of his soul to the world. But between myths and phantasmagoria there is a great gulf. The structural possibilities of the myth depend upon its intelligibility. The child knows upon what drama, played in what world, the curtain will rise when he hears the trumpet-note: 'Of man's first disobedience....' And, even when the poet turns from legend and history to create his own myth, he must make one whose validity is visible, if he is not to be condemned to the sterility of a coterie. The lawless and fantastic shapes of his own imagination need, even for their own perfect embodiment, the discipline of the common perception. The phantoms of the individual brain, left to their own waywardness, lose all solidity and become like primary forms of life, instead of the penultimate forms they should be. For the poet himself must move securely among his visions; they must be not less certain and steadfast than men are. To anchor them he needs intelligible myth. Nothing less than a supremely great genius can save him if he ventures into the vast without a landmark visible to other eyes than his own. Blake had a supremely great genius and was saved in part. The masculine vigour of his passion gave stability to the figures of his imagination. They are heroes because they are made to speak like heroes. Even in Blake's most recondite work there is always the moment when the clouds are parted and we recognise the austere and awful countenances of gods. The phantasmagoria of the dreamer have been mastered by the sheer creative will of the poet. Like Jacob, he wrestled until the going down of the sun with his angel and would not let him go. The effort which such momentary victories demand is almost superhuman; yet to possess the power to exert it is the sole condition upon which a poet may plunge into the world of phantasms. Mr Yeats has too little of the power to vindicate himself from the charge of idle dreaming. He knows the problem; perhaps he has also known the struggle. But the very terms in which he suggests it to us subtly convey a sense of impotence:--

Hands, do what you're bid;
Bring the balloon of the mind
That bellies and drags in the wind
Into its narrow shed.

The languor and ineffectuality of the image tell us clearly how the poet has failed in his larger task; its exactness, its precise expression of an ineffectuality made conscious and condoned, bears equal witness to the poet's minor probity. He remains an artist by determination, even though he returns downcast and defeated from the great quest of poetry. We were inclined at first, seeing those four lines enthroned in majestic isolation on a page, to find in them evidence of an untoward conceit. Subsequently they have seemed to reveal a splendid honesty. Although it has little mysterious and haunting beauty, *The Wild Swans at Coole* is indeed a swan song. It is eloquent of final defeat; the following of a lonely path has ended in the poet's sinking exhausted in a wilderness of gray. Not even the regret is passionate; it is pitiful.

'I am worn out with dreams,
A weather-worn, marble triton
Among the streams;
And all day long I look
Upon this lady's beauty
As though I had found in book
A pictured beauty,
Pleased to have filled the eyes
Or the discerning ears,
Delighted to be but wise,
For men improve with the years;
And yet, and yet
Is this my dream, or the truth?
O would that we had met
When I had my burning youth;
But I grow old among dreams,

A weather-worn, marble triton
Among the streams.'

It is pitiful because, even now in spite of all his honesty the poet mistakes the cause of his sorrow. He is worn out not with dreams, but with the vain effort to master them and submit them to his own creative energy. He has not subdued them nor built a new world from them; he has merely followed them like will-o'-the-wisps away from the world he knew. Now, possessing neither world, he sits by the edge of a barren road that vanishes into a no-man's land, where is no future, and whence there is no way back to the past.

'My country is Kiltartan Cross,
My countrymen Kiltartan's poor;
No likely end could bring them loss
Or leave them happier than before.'

It may be that Mr Yeats has succumbed to the malady of a nation. We do not know whether such things are possible; we must consider him only in and for himself. From this angle we can regard him only as a poet whose creative vigour has failed him when he had to make the highest demands upon it. His sojourn in the world of the imagination, far from enriching his vision, has made it infinitely tenuous. Of this impoverishment, as of all else that has overtaken him, he is agonisedly aware.

'I would find by the edge of that water
The collar-bone of a hare,
Worn thin by the lapping of the water,
And pierce it through with a gimlet, and stare
At the old bitter world where they marry in churches,
And laugh over the untroubled water
At all who marry in churches,
Through the white thin bone of a hare.'

Nothing there remains of the old bitter world which for all its bitterness is a full world also; but nothing remains of the sweet world of imagination. Mr Yeats has made the tragic mistake of thinking that to contemplate it was sufficient. Had he been a great poet he would have made it his own, by forcing it into the fetters of speech. By re-creating it, he would have made it permanent; he would have built landmarks to guide him always back to where the effort of his last discovery had ended. But now there remains nothing but a handful of the symbols with which he was content:--

'A Sphinx with woman breast and lion paw,
A Buddha, hand at rest,
Hand lifted up that blest;
And right between these two a girl at play.'

These are no more than the dry bones in the valley of Ezekiel, and, alas! there is no prophetic fervour to make them live.

Whether Mr Yeats, by some grim fatality, mistook his phantasmagoria for the product of the creative imagination, or whether (as we prefer to believe) he made an effort to discipline them to his poetic purpose and failed, we cannot certainly say. Of this, however, we are certain, that somehow, somewhere, there has been disaster. He is empty, now. He has the apparatus of enchantment, but no potency in his soul. He is forced to fall back upon the artistic honesty which has never forsaken him. That it is an insufficient reserve let this passage show:--

'For those that love the world serve it in action,
Grow rich, popular, and full of influence,
And should they paint or write still it is action:
The struggle of the fly in marmalade.
The rhetorician would deceive his neighbours,
The sentimentalist himself; while art

Is but a vision of reality....'

Mr Yeats is neither rhetorician nor sentimentalist. He is by structure and impulse an artist. But structure and impulse are not enough. Passionate apprehension must be added to them. Because this is lacking in Mr Yeats those lines, concerned though they are with things he holds most dear, are prose and not poetry.

[APRIL, 1919.

The Wisdom of Anatole France

How few are the wise writers who remain to us? They are so few that it seems, at moments, that wisdom, like justice of old, is withdrawing from the world, and that when their fullness of years is accomplished, as, alas! it soon must be, the wise men who will leave us will have been the last of their kind. It is true that something akin to wisdom, or rather a quality whose outward resemblance to wisdom can deceive all but the elect, will emerge from the ruins of war; but true wisdom is not created out of the catastrophic shock of disillusionment. An unexpected disaster is always held to be in some sort undeserved. Yet the impulse to rail at destiny, be it never so human, is not wise. Wisdom is not bitter; at worst it is bitter-sweet, and bitter-sweet is the most subtle and lingering savour of all.

Let us not say in our haste, that without wisdom we are lost. Wisdom is, after all, but one attitude to life among many. It happens to be the one which will stand the hardest wear, because it is prepared for all ill-usage. But hard wear is not the only purpose which an attitude may serve. We may demand of an attitude that it should enable us to exact the utmost from ourselves. To refuse to accommodate oneself to the angularities of life or to make provision beforehand for its catastrophes is, indeed, folly; but it may be a divine folly. It is, at all events, a folly to which poets incline. But poets are not wise; indeed, the poetry of true wisdom is a creation which can, at the best, be but dimly imagined. Perhaps, of them all, Lucretius had the largest inkling of what such poetry might be; but he disqualified himself by an aptitude for ecstasy, which made his poetry superb and his wisdom of no account. To acquiesce is wise; to be ecstatic in acquiescence is not to have acquiesced at all. It is to have identified oneself with an imagined power against whose manifestations, in those moments when no ecstasy remains, one rebels. It is a megalomania, a sublime self-deception, a heroic attempt to project the soul on to the side of destiny, and to believe ourselves the masters of those very powers which have overwhelmed us.

Whether the present generation will produce great poetry, we do not know. We are tolerably certain that it will not produce wise men. It is too conscious of defeat and too embittered to be wise. Some may seek that ecstasy of seeming acquiescence of which we have spoken; others, who do not endeavour to escape the pain by plunging the barb deeper, may try to shake the dust of life from off their feet. Neither will be wise. But precisely because they are not wise, they will seek the company of wise men. Their own attitude will not wear. The ecstasy will fail, the will to renunciation falter; the gray reality which permits no one to escape it altogether will filter like a mist into the vision and the cell. Then they will turn to the wise men. They will find comfort in the smile to which they could not frame their own lips, and discover in it more sympathy than they could hope for.

Among the wise men whom they will surely most frequent will be Anatole France. His company is constant; his attitude durable. There is no undertone of anguish in his work like that which gives such poignant and haunting beauty to Tchekhov. He has never suffered himself to be so involved in life as to be maimed by it. But the price he has paid for his safety has been a renunciation of experience. Only by being involved in life, perhaps only by being maimed by it, could he have gained that bitterness of knowledge which is the enemy of wisdom. Not that Anatole France made a deliberate renunciation: no man of his humanity would of his own will turn aside. It was instinct which guided him into a sequestered path, which ran equably by the side of the road of alternate exaltation and catastrophe which other men of equal genius must travel. Therefore he has seen men as it were in profile against the sky, but never face to face. Their runnings, their stumblings and their gesticulations are a tumultuous portion of the landscape rather than symbols of an intimate and personal possibility. They lend a baroque enchantment to the scene.

So it is that in all the characters of Anatole France's work which are not closely modelled upon his own idiosyncrasy there is something of the marionette. They are not the less charming for that; nor do they lack a certain logic, but it is not the logic of personality. They are embodied comments upon life, but they do not live. And there is for Anatole France, while he creates them, and for us, while we read about them, no reason why they should live. For living, in the accepted sense, is an activity impossible without indulging many illusions; and fervently to sympathise with characters engaged in the activity demands that their author should participate in the illusions. He, too, must be surprised at the disaster which he himself has proved inevitable. It is not enough that he should pity them; he must share in their effort, and be discomfited at their discomfiture. Such exercises of the soul are impossible to a real acquiescence, which cannot even permit itself the inspiration of the final illusion that the wreck of human hopes, being ordained, is beautiful. The man who acquiesces is condemned to stand apart and contemplate a puppet-show with which he can never really sympathise.

'De toutes les définitions de l'homme la plus mauvaise me paraît celle qui en fait un animal raisonnable. Je ne me vante pas excessivement en me donnant pour doué de plus de raison que la plupart de ceux de mes semblables que j'ai vus de près ou dont j'ai connu l'histoire. La raison habite rarement les âmes communes, et bien plus rarement encore les grands esprits.... J'appelle raisonnable celui qui accorde sa raison particulière avec la raison universelle, de manière à n'être jamais trop surpris de ce qui arrive et à s'y accommoder tant bien que mal; j'appelle raisonnable celui qui, observant le désordre de la nature et la folie humaine, ne s'obstine point à y voir de l'ordre et de la sagesse; j'appelle raisonnable enfin celui qui ne s'efforce pas de l'être.'

The chasm between living and being wise (which is to be raisonnable) is manifest. The condition of living is to be perpetually surprised, incessantly indignant or exultant, at what happens. To bridge the chasm there is for the wise man only one way. He must cast back in his memory to the time when he, too, was surprised and indignant. No man is, after all, born wise, though he may be born with an instinct for wisdom. Thus Anatole France touches us most nearly when he describes his childhood. The innocent, wayward, positive, romantic little Pierre Nozière[4] is a human being to a degree to which no other figures in the master's comedy of unreason are. And it is evident that Anatole France himself finds him by far the most attractive of them all. He can almost persuade himself, at moments, that he still is the child he was, as in the exquisite story of how, when he had been to a truly royal chocolate shop, he attempted to reproduce its splendours in play. At one point his invention and his memory failed him, and he turned to his mother to ask: 'Est-ce celui qui vend ou celui qui achète qui donne de l'argent?'

'Je ne devais jamais connaître le prix de l'argent. Tel j'étais à trois ans ou trois ans et demi dans le cabinet tapissé de boutons de roses, tel je restai jusqu'à la vieillesse, qui m'est légère, comme elle l'est à toutes les âmes exemptes d'avarice et d'orgueil. Non, maman, je n'ai jamais connu le prix de l'argent. Je ne le connais pas encore, ou plutôt je le connais trop bien.'

[Footnote 4: Le Petit Pierre. Par Anatole France. (Paris: Calmann-Lévy.)]

To know a thing too well is by worlds removed from not to know it at all, and Anatole France does not elsewhere similarly attempt to indulge the illusion of unbroken innocence. He who refused to put a mark of interrogation after 'What is God,' in defiance of his mother, because he knew, now has to restrain himself from putting one after everything he writes or thinks. 'Ma pauvre mère, si elle vivait, me dirait peut-être que maintenant j'en mets trop.' Yes, Anatole France is wise, and far removed from childish follies. And, perhaps, it is precisely because of his wisdom that he can so exactly discern the enchantment of his childhood. So few men grow up. The majority remain hobbledehoys throughout life; all the disabilities and none of the unique capacities of childhood remain. There are a few who, in spite of all experience, retain both; they are the poets and the grands esprits. There are fewer still who learn utterly to renounce childish things; and they are the wise men.

'Je suis une autre personne que l'enfant dont je parle. Nous n'avons plus en commun, lui et moi, un atome de substance ni de pensée. Maintenant qu'il m'est devenu tout à fait étranger, je puis en sa compagnie me distraire de la mienne. Je l'aime, moi qui ne m'aime ni ne me haïs. Il m'est doux de vivre en pensée les jours qu'il vivait et je souffre de respirer l'air du temps où nous sommes.'

Not otherwise is it with us and Anatole France. We may have little in common with his thought--the community we often imagine comes of self-deception--but it is sweet for us to inhabit his mind for a while. His touch is potent to soothe our fitful fevers.

[APRIL, 1919.

Gerard Manley Hopkins

Modern poetry, like the modern consciousness of which it is the epitome, seems to stand irresolute at a crossways with no signpost. It is hardly conscious of its own indecision, which it manages to conceal from itself by insisting that it is lyrical, whereas it is merely impressionist. The value of impressions depends upon the quality of the mind which receives and renders them, and to be lyrical demands at least as firm a temper of the mind, as definite and unflinching a general direction, as to be epic. Roughly speaking, the present poetical fashion may, with a few conspicuous exceptions, be described as poetry without tears. The poet may assume a hundred personalities in as many poems, or manifest a hundred influences, or he may work a single sham personality threadbare or render piecemeal an undigested influence. What he may not do, or do only at the risk of being unfashionable, is to attempt what we may call, for the lack of a better word, the logical progression of an oeuvre. One has no sense of the rhythm of an achievement. There is an output of scraps, which are scraps, not because they are small, but because one scrap stands in no organic relation to another in the poet's work. Instead of lending each other strength, they betray each other's weakness. Yet the organic progression for which we look, generally in vain, is not peculiar to poetic genius of the highest rank. If it were, we might be accused of mere querulousness. The rhythm of personality is hard, indeed, to achieve. The simple mind and the single outlook are now too rare to be considered as near possibilities, while the task of tempering a mind to a comprehensive adequacy to modern experience is not an easy one. The desire to escape and the desire to be lost in life were probably never so intimately associated as they are now; and it is a little preposterous to ask a moth fluttering round a candle-flame to see life steadily and see it whole. We happen to have been born into an age without perspective; hence our idolatry for the one living poet and prose writer who has it and comes, or appears to come, from another age. But another rhythm is possible. No doubt it would be mistaken to consider this rhythm as in fact wholly divorced from the rhythm of personality; it probably demands at least a minimum of personal coherence in its possessor. For critical purposes, however, they are distinct. This second and subsidiary rhythm is that of technical progression. The single pursuit of even the most subordinate artistic intention gives unity, significance, mass to a poet's work. When Verlaine declares 'de la musique avant toute chose,' we know where we are. And we know this not in the obvious sense of expecting his verse to be predominantly musical; but in the more important sense of desiring to take a man seriously who declares for anything 'avant toute chose.' It is the 'avant toute chose' that matters, not as a profession of faith--we do not greatly like professions of faith--but as the guarantee of the universal in the particular, of the dianoa in the episode. It is the 'avant toute chose' that we chiefly miss in modern poetry and modern society and in their quaint concatenations. It is the 'avant toute chose' that leads us to respect both Mr Hardy and Mr Bridges, though we give all our affection to one of them. It is the 'avant toute chose' that compels us to admire the poems of Gerard Manley Hopkins[5]; it is the 'avant toute chose' in his work, which, as we believe, would have condemned him to obscurity to-day, if he had not (after many years) had Mr Bridges, who was his friend, to stand sponsor and the Oxford University Press to stand the racket. Apparently Mr Bridges himself is something of our opinion, for his introductory sonnet ends on a disdainful note:--

'Go forth: amidst our chaffinch flock display
Thy plumage of far wonder and heavenward flight!'

[Footnote 5: Poems of Gerard Manley Hopkins. Edited with notes by Robert Bridges. (Oxford: University Press.)]

It is from a sonnet written by Hopkins to Mr Bridges that we take the most concise expression of his artistic intention, for the poet's explanatory preface is not merely technical, but is written in a technical language peculiar to himself. Moreover, its scope is small; the sonnet tells us more in two lines than the preface in four pages.

'O then if in my lagging lines you miss
The roll, the rise, the carol, the creation....'

There is his 'avant toute chose.' Perhaps it seems very like 'de la musique.' But it tells us more about Hopkins's music than Verlaine's line told us about his. This music is of a particular kind, not the 'sanglots du violon,' but pre-eminently the music of song, the music most proper to lyrical verse. If one were to seek in English the lyrical poem to which Hopkins's definition could be most fittingly applied, one would find Shelley's 'Skylark.' A technical progression onwards from the 'Skylark' is accordingly the main line of Hopkins's poetical evolution. There are other, stranger threads interwoven; but this is the chief. Swinburne, rightly enough if the intention of true song is considered, appears hardly to have existed for Hopkins, though he was his contemporary. There is an element of Keats in his epithets, a half-echo in 'whorled ear' and 'lark-charmèd'; there is an aspiration after Milton's architectonic in the construction of the later sonnets and the most lucid of the fragments, 'Epithalamion.' But the central point of departure is the 'Skylark.' The 'May Magnificat' is evidence of Hopkins's achievement in the direct line:--

'Ask of her, the mighty mother:
Her reply puts this other
Question: What is Spring?--
Growth in everything--

Flesh and fleece, fur and feather,
Grass and greenworld all together;
Star-eyed strawberry-breasted
Throstle above her nested
Cluster of bugle-blue eggs thin
Forms and warms the life within....

... When drop-of-blood-and-foam-dapple
Bloom lights the orchard-apple,
And thicket and thorp are merry
With silver-surfèd cherry,

And azuring-over graybell makes
Wood banks and brakes wash wet like lakes,
And magic cuckoo-call
Caps, clears, and clinches all....'

That is the primary element manifested in one of its simplest, most recognisable, and some may feel most beautiful forms. But a melody so simple, though it is perhaps the swiftest of which the English language is capable without the obscurity which comes of the drowning of sense in sound, did not satisfy Hopkins. He aimed at complex internal harmonies, at a counterpoint of rhythm; for this more complex element he coined an expressive word of his own:--

'But as air, melody, is what strikes me most of all in music and
design in painting, so design, pattern, or what I am in the habit of
calling inscape is what I above all aim at in poetry.'

Here, then, in so many words, is Hopkins's 'avant toute chose' at a higher level of elaboration. 'Inscape' is still, in spite of the apparent differentiation, musical; but a quality of formalism seems to have entered with the specific designation. With formalism comes rigidity; and in this case the rigidity is bound to overwhelm the sense.

For the relative constant in the composition of poetry is the law of language which admits only a certain amount of adaptation. Musical design must be subordinate to it, and the poet should be aware that even in speaking of musical design he is indulging a metaphor. Hopkins admitted this, if we may judge by his practice, only towards the end of his life. There is no escape by sound from the meaning of the posthumous sonnets, though we may hesitate to pronounce whether this directness was due to a modification of his poetical principles or to the urgency of the content of the sonnets, which, concerned with a matter of life and death, would permit no obscuring of their sense for musical reasons.

'I wake and feel the fell of dark, not day.
What hours, O what black hours we have spent
This night! what sights you, heart, saw; ways you went!
And more must in yet longer light's delay.
With witness I speak this. But where I say
Hours I mean years, mean life. And my lament
Is cries countless, cries like dead letters sent
To dearest him that lives, alas! away.'

There is compression, but not beyond immediate comprehension; music, but a music of overtones; rhythm, but a rhythm which explicates meaning and makes it more intense.

Between the 'May Magnificat' and these sonnets is the bulk of Hopkins's poetical work and his peculiar achievement. Perhaps it could be regarded as a phase in his evolution towards the 'more balanced and Miltonic style' which he hoped for, and of which the posthumous sonnets are precursors; but the attempt to see him from this angle would be perverse. Hopkins was not the man to feel, save on exceptional occasions, that urgency of content of which we have spoken. The communication of thought was seldom the dominant impulse of his creative moment, and it is curious how simple his thought often proves to be when the obscurity of his language has been penetrated. Musical elaboration is the chief characteristic of his work, and for this reason what seem to be the strangest of his experiments are his most essential achievement. So, for instance, 'The Golden Echo':--

'Spare!
There is one, yes, I have one (Hush there!);
Only not within seeing of sun,
Not within the singeing of the strong sun,
Tall sun's tingeing, or treacherous the tainting of the earth's air,
Somewhere else where there is, ah, well, where! one,
One. Yes, I can tell such a key, I do know such a place,
Where, whatever's prized and passes of us, everything that's fresh and
fast flying of us, seems to us sweet of us and
swiftly away with, done away with, undone,
Undone, done with, soon done with, and yet clearly and dangerously sweet
Of us, the wimpled-water-dimpled, not-by-morning-matchèd face,
The flower of beauty, fleece of beauty, too too apt to, ah! to fleet,
Never fleets more, fastened with the tenderest truth
To its own best being and its loveliness of youth....'

Than this, Hopkins truly wrote, 'I never did anything more musical.' By his own verdict and his own standards it is therefore the finest thing that Hopkins did. Yet even here, where the general beauty is undoubted, is not the music too obvious? Is it not always on the point of degenerating into a jingle--as much an exhibition of the limitations of a poetical theory as of its capabilities? The tyranny of the 'avant toute chose' upon a mind in which the other things were not stubborn and self-assertive is apparent. Hopkins's mind was irresolute concerning the quality of his own poetical ideal. A coarse and clumsy assonance seldom spread its snare in vain. Exquisite openings are involved in disaster:

-- 'When will you ever, Peace, wild wood dove, shy wings shut,
Your round me roaming end, and under be my boughs?
When, when, Peace, will you, Peace? I'll not play hypocrite

To own my heart: I yield you do come sometimes; but
That piecemeal peace is poor peace. What pure peace....'

And the more wonderful opening of 'Windhover' likewise sinks, far less disastrously, but still perceptibly:--

'I caught this morning morning's minion, kingdom of daylight's dauphin,
 dapple-dawn-drawn Falcon, in his riding
Of the rolling level underneath him steady air, and striding
High there, how he rung upon the rein of a wimpling wing
In his ecstasy! then off, off forth on swing,
As a skate's heel sweeps smooth on a bow-bend: the hurl and the gliding
Rebuffed the big wind. My heart in hiding
Stirred for a bird,--the achieve of, the mastery of the thing!'

We have no doubt that 'stirred for a bird' was an added excellence to the poet's ear; to our sense it is a serious blemish on lines which have 'the roll, the rise, the carol, the creation.'

There is no good reason why we should give characteristic specimens of the poet's obscurity, since our aim is to induce people to read him. The obscurities will slowly vanish and something of the intention appear; and they will find in him many of the strange beauties won by men who push on to the borderlands of their science; they will speculate whether the failure of his whole achievement was due to the starvation of experience which his vocation imposed upon him, or to a fundamental vice in his poetical endeavour. For ourselves we believe that the former was the true cause. His 'avant toute chose' whirling dizzily in a spiritual vacuum, met with no salutary resistance to modify, inform, and strengthen it. Hopkins told the truth of himself--the reason why he must remain a poets' poet:--

I want the one rapture of an inspiration.
O then if in my lagging lines you miss
The roll, the rise, the carol, the creation,
My winter world, that scarcely yields that bliss
Now, yields you, with some sighs, our explanation.'

[JUNE, 1919.

The Problem of Keats

It is a subject for congratulation that a second edition of Sir Sidney Colvin's life of Keats[6] has been called for by the public: first, because it is a good, a very good book, and secondly, because all evidence of a general curiosity concerning a poet so great and so greatly to be loved must be counted for righteousness. The impassioned and intimate sympathy which is felt--as we may at least conclude--by a portion of the present generation for Keats is a motion of the consciousness which stands in a right and natural order. Keats is with us; and it argues much for a generous elasticity in Sir Sidney Colvin's mind, which we have neither the right nor the custom to expect in an older generation, that he should have had more than a sidelong vision of at least one aspect of the community between his poet-hero and a younger race which has had the destiny to produce far more heroes than poets. Commenting upon the inability of the late Mr Courthope to appreciate Keats, Sir Sidney writes:--

'He supposed that Keats was indifferent to history or politics. But of history he was in fact an assiduous reader, and the secret of his indifference to politics, so far as it existed, was that those of his own time had to men of his years and way of thinking been a disillusion,--that the saving of the world from the grip of one great overshadowing tyranny had but ended in reinstating a number of ancient and minor tyrannies less interesting but not less tyrannical. To that which lies behind and above politics and history to the general destinies, aspirations, and tribulations of the race, he was, as we have seen, not indifferent but only tragically and acutely sensitive.'

[Footnote 6: John Keats: His Life and Poetry, His Friends, Critics, and After-fame. By Sidney Colvin. Second edition. (Macmillan.)]

We believe that both the positive and the negative of that vindication might be exemplified among chosen spirits to-day, living or untimely dead; but we desire, not to enlist Sir Sidney in a cause, but only to make apparent the reason why, in spite of minor dissents and inevitable differences of estimation, our sympathy with him is enduring. It may be that we have chosen to identify ourselves so closely with Keats that we feel to Sir Sidney the attachment that is reserved for the staunch friend of a friend who is dead; but we do not believe that this is so. We are rather attached by the sense of a loyalty that exists in and for itself; more intimate repercussions may follow, but they can follow only when the critical honesty, the determination to let Keats be valid as Keats, whatever it might cost (and we can see that it sometimes costs Sir Sidney not a little), has impressed itself upon us.

It is rather by this than by Sir Sidney's particular contributions to our knowledge of the poet that we judge his book. This assured, we accept his patient exposition of the theme of 'Endymion' with a friendly interest that would certainly not be given to one with a lesser claim upon us; and in this spirit we can also find a welcome for the minute investigation of the pictorial and plastic material of Keats's imagination. Under auspices less benign we might have found the former mistaken and the latter irrelevant; but it so happens that when Sir Sidney shows us over the garden every goose is a swan. Like travellers who at the end of a long day's journey among an inhospitable peasantry are, against their expectation received in a kindly farm, and find themselves talking glibly to their host of matters which are unimportant and unknown to them--the price of land, and the points of a pedigree bull--so we follow with an intense and intelligent absorption a subtle argument in 'Endymion' in which at no moment we really believe. On the contrary, we are convinced (when we are free from our author's friendly spell) that Keats wrote 'Endymion' at all adventure. The words of the cancelled preface: 'Before I began I had no inward feel of being able to finish; and as I proceeded my steps were all uncertain,' were, we are sure, quite literally true, and if anything an under-statement of his lack of argument and plan. Not that we believe that Keats was incapable of or averse to 'fundamental brain-work'--he had an understanding more robust, firmer in its hold of reality, more closely cast upon experience, than any one of his great contemporaries, Wordsworth not excepted--but at that phase in his evolution he was simply not concerned with understanding. 'Endymion' is not a record or sublimation of experience; it is itself an experience. It was the liberation of a verbal inhibition, and the magic word of freedom was Beauty. The story of Endymion was to Keats a road to the unknown, in her course along which his imagination might 'paw up against the sky.' A refusal to admit that Keats built 'Endymion' upon any structure of argument, however obscure--even Sir Sidney would acknowledge that the argument he discovers is very obscure--is so far from being a derogation from his genius that it is in our opinion necessary to a full appreciation of his idiosyncrasy. It is customary to regard the Odes as the pinnacle of his achievement and to trace a poetical progression to that point and a subsequent decline: we are shown the evidence of this decline in the revised Induction to 'Hyperion.' As far as an absolute poetical perfection is concerned there can be no serious objection to the view. But the case of Keats is eminently one to be considered in itself as well as objectively. There is no danger that Keats's poetry will not be appreciated; the danger is that Keats may not be understood. And precisely this moment is opportune for understanding him. As Mr T.S. Eliot has lately pointed out, the development of English poetry since the early nineteenth century was largely based on the achievement of two poets of genius, Keats and Shelley, who never reached maturity. They were made gods; and rightly, had not poets themselves bowed down to them. That was ridiculous; there is something even pitiful in the spectacle of Rossetti and Morris finding the culmination of poetry, the one in 'The Eve of St Agnes,' the other in 'La Belle Dame sans Merci.' And this indiscriminating submission of a century to the influence of hypostatized phases in the development of a poet of sanity and genius is perhaps the chief of the causes of the half-conscious, and for the most part far less discriminating, spirit of revolt which is at work in modern poetry. A sense is abroad that the tradition has somehow been snapped, that what has been accepted as the tradition unquestioningly for a hundred years is only a *cul de sac*. Somewhere there has been a substitution. In the resulting chaos the twittering of bats is taken for poetry, and the critically minded have the grim amusement of watching verse-writers gain eminence by imitating Coventry Patmore! The bolder spirits declare that there never was such a thing as a tradition, that it is no use learning, because there is nothing to learn. But they are a little nervous for all their boldness, and they prefer to hunt in packs, of which the only condition of membership is that no one should ask what it is. At such a juncture, if indeed not at all times, it is of no less importance to understand Keats than to appreciate his poetry. The culmination of the achievement of the Keats to be understood is not the Odes, perfect as they are, nor the tales--a heresy even for objective criticism--nor 'Hyperion'; but precisely that revised Induction to 'Hyperion' which on the other argument is held to indicate how the poet's powers had been ravaged by disease and the pangs of unsatisfied love. On the technical side alone the Induction is of extraordinary interest. Keats's natural and proper revulsion from the Miltonic

style, the deliberate art of which he had handled like an almost master, is evident but incomplete; he is hampered by the knowledge that the virus is in his blood. The creative effort of the Induction was infinitely greater than is immediately apparent. Keats is engaged in a war on two fronts: he is struggling against the Miltonic manner, and struggling also to deal with an unfamiliar content. The whole direction of his poetic purpose had shifted since he wrote 'Hyperion.' 'Hyperion,' though far finer as art, had been produced by an impulse substantially the same as 'Endymion'; it was an exercise in a manner. Keats desired to prove to himself, and perhaps a little at that moment to prove to the world, that he was capable of Miltonic discipline and grandeur. It was, most strictly, necessary for him to be inwardly certain of this. He had drunk, as deeply as any of his contemporaries, of the tradition; he needed to know that he had assimilated what he had drunk, that he could employ a conscious art as naturally as the most deliberate artist of the past, and, most of all, that he would begin, when he did begin, at the point where his forerunners left off, and not at a point behind them. These necessities were not present in this form to Keats's mind when he began 'Hyperion'; most probably he began merely with the idea of holding his own with Milton, and with a delight in an apt and congenial theme. Keats was not a poet of definite and deliberate plans, which indeed are incident to a certain tenuity of soul; his decisions were taken not by the intellect, but by the being. He dropped 'Hyperion' because it was inadequate to the whole of him. He was weary of its deliberate art because it interposed a veil between him and that which he needed to express; it was an imposition upon himself.

'I have given up "Hyperion"--there were too many Miltonic inversions in it--Miltonic verse cannot be written but in an artful, or rather artist's, humour. I wish to give myself up to other sensations. English ought to be kept up. It may be interesting to you to pick out some lines from "Hyperion" and a mark + to the false beauty proceeding from art and one || to the true voice of feeling....'--(Letter to J.H. Reynolds, Sept. 22, 1819.)

That outwardly negative reaction is packed with positive implications. 'English ought to be kept up' meant, on Keats's lips, a very great deal. But there is other and more definite authority for the positive direction in which he was turning. To his brother George he wrote, at the same time:--

'I have but lately stood on my guard against Milton. Life to him would be death to me. Miltonic verse cannot be written, but is the verse of art. I wish to devote myself to another verse alone.'

More definite still is the letter of November 17, 1819, to his friend and publisher, John Taylor:--

'I have come to a determination not to publish anything I have now ready written; but for all that to publish a poem before long and that I hope to make a fine one. As the marvellous is the most enticing and the surest guarantee of harmonious numbers I have been endeavouring to persuade myself to untether fancy and to let her manage for herself. I and myself cannot agree about this at all. Wonders are no wonders to me. I am more at home amongst Men and Women. I would rather read Chaucer than Ariosto. The little dramatic skill I may as yet have, however badly it might show in a Drama, would, I think, be sufficient for a Poem. I wish to diffuse the colouring of St Agnes Eve throughout a poem in which Character and Sentiment would be the figures to such drapery. Two or three such poems if God should spare me, written in the course of the next six years would be a famous gradus ad Parnassum altissimum. I mean they would nerve me up to the writing of a few fine plays--my greatest ambition--when I do feel ambitious....'

No letter could be saner, nor more indicative of calm resolve. Yet the precise determination is that nothing that went to make the 1820 volume should be published, neither Odes, nor Tales, nor 'Hyperion.' This is that mood of Keats which Sir Sidney Colvin, in his comment upon a passage in the revised Induction, calls one of 'fierce injustice to his own achievements and their value.' But a poet, if he is a real one, judges his own achievements not by those of his

contemporaries, but by the standard of his own intention. The evidence that Keats's mind had passed beyond the stage at which it could be satisfied by the poems of the 1820 volume is overwhelming. His letters to George of April, 1819, show that he was naturally evolving towards an attitude, a philosophy, more profound and comprehensive than could be expressed adequately in such records of momentary aspiration and emotion as the Odes; though the keen and sudden poignancy that had invaded them belongs to the new Keats. They mark the transition to the new poetry which he vaguely discerned. The problem was to find the method. The letters we have quoted to show his reaction from the Miltonic influence display the more narrowly 'artistic' aspect of the same evolution. A technique more responsive to the felt reality of experience must be found--'English ought to be kept up'--the apparatus of Romantic story must be abandoned--'Wonders are no wonders to me'--yet the Romantic colour must be kept to restore to a realistic psychology the vividness and richly various quality that are too often lost by analysis. We do not believe that we have in any respect forced the interpretation of the letters; the terminology of that age needs to be translated to be understood. 'Men and Women ... Characters and Sentiments' are called, for better or worse, 'psychology' nowadays. And our translation has this merit, that some of our ultra-moderns will listen to the word 'psychology,' where they would be bat-blind to 'Characters' and stone-deaf to 'Sentiments.' Modern poetry is still faced with the same problem; but very few of its adepts have reached so far as to be able to formulate it even with the precision of Keats's scattered allusions. Keats himself was struck down at the moment when he was striving (against disease and against a devouring, hopeless love-passion) to face it squarely. The revised Induction reveals him in the effort to shape the traditional (and perhaps still necessary) apparatus of myth to an instrument of his attitude. The meaning of the Induction is not difficult to discover; but current criticism has the habit of regarding it dubiously. Therefore we may be forgiven for attempting, with the brevity imposed upon us, to make its elements clear. The first eighteen lines, which Sir Sidney Colvin on objective grounds regrets are, we think, vital.

'Fanatics have their dreams, wherewith they weave
A paradise for a sect; the savage, too,
From forth the loftiest fashion of his sleep
Guesses at heaven; pity these have not
Trac'd upon vellum or wild Indian leaf
The shadows of melodious utterance,
But bare of laurel they live, dream, and die;
For poesy alone can tell her dreams,--
With the fine spell of words alone can save
Imagination from the sable chain
And dumb enchantment. Who alive can say,
'Thou art no poet--mays't not tell thy dreams'?
Since every man whose soul is not a clod
Hath visions and would speak, if he had loved,
And been well-nurtured in his mother-tongue.
Whether the dream now purposed to rehearse
Be poet's or fanatic's will be known
When this warm scribe, my hand, is in the grave.'

We may admit that the form of these lines is unfortunate; but we cannot wish them away. They bear most closely upon the innermost argument of the poem as Keats endeavoured to reshape it. All men, says Keats, have their visions of reality; but the poet alone can express his, and the poet himself may at the last prove to have been a fanatic, one who has imagined 'a paradise for a sect' instead of a heaven for all humanity.

This discovery marks the point of crisis in Keats's development. He is no longer content to be the singer; his poetry must be adequate to all experience. No wonder then that the whole of the new Induction centres about this thought. He describes his effort to fight against an invading death and to reach the altar in the mighty dream palace. As his foot touches the altar-step life returns, and the prophetic voice of the veiled goddess reveals to him that he has been saved by his power 'to die and live again before Thy fated hour.'

"None can usurp this height," return'd that shade.
"But those to whom the miseries of the world
Are misery and will not let them rest.
All else who find a haven in the world

Where they may thoughtless sleep away their days,
If by a chance into this fane they come,
Rot on the pavement where thou rottedst half."

Because he has been mindful of the pain in the world, the poet has been saved. But the true lovers of humanity,--

'Who love their fellows even to the death,
Who feel the giant agony of the world,'

are greater than the poets; 'they are no dreamers weak.'

'They come not here, they have no thought to come,
And thou art here for thou are less than they.'

It is a higher thing to mitigate the pain of the world than to brood upon the problem of it. And not only the lover of mankind, but man the animal is pre-eminent above the poet-dreamer. His joy is joy; his pain, pain. 'Only the dreamer venoms all his days.' Yet the poet has his reward; it is given to him to partake of the vision of the veiled Goddess--memory, Moneta, Mnemosyne, the spirit of the eternal reality made visible.

'Then saw I a wan face
Not pined by human sorrows, but bright-blanch'd
By an immortal sickness which kills not;
It works a constant change, which happy death
Can put no end to; deathwards progressing
To no death was that visage; it had past
The lily and the snow; and beyond these
I must not think now, though I saw that face.
But for her eyes I should have fled away;
They held me back with a benignant light
Soft, mitigated by divinest lids
Half-closed, and visionless entire they seemed
Of all external things; they saw me not,
But in blank splendour beam'd like the mild moon
Who comforts those she sees not, who knows not
What eyes are upward cast....'

This vision of Moneta is the culminating point of Keats's evolution. It stands at the summit, not of his poetry, but of his achievement regarded as obedient to its own inward law. Moneta was to him the discovered spirit of reality; her vision was the vision of necessity itself. In her, joy and pain, life and death compassion and indifference, vision and blindness are one; she is the eternal abode of contraries, the Idea if you will, not hypostatized but immanent. Before this reality the poet is impotent as his fellows; he is above them by his knowledge of it, but below them by the weakness which that knowledge brings. He, too, is the prey of contraries, the mirror of his deity, struck to the heart of his victory, enduring the intolerable pain of triumph. Here, not unfittingly, in his struggle with a conception too big to express, came the end of Keats the poet. None have passed beyond him; few have been so far. Of the poetry that might have been constructed on the basis of an apprehension so profound we can form only a conjecture, each after his own image: we do not know the method of the 'other verse' of which Keats had a glimpse; we only know the quality with which it would have been saturated, the calm and various light of united contraries. We fear that Sir Sidney Colvin will not agree with our view. The angles of observation are different. The angle at which we have placed ourselves is not wholly advantageous--from it Sir Sidney's book could not have been written--but it has this advantage, that from it we can read his book with a heightened interest. As we look out from it, some things are increased and some diminished with the change of perspective; and among those which are increased is our gratitude to Sir Sidney. In the clear mirror of his sympathy and sanity nothing is obscured. We are shown the Keats who wrote the perfect poems that will last with the English language, and in the few places where Sir Sidney falls short of the spirit of complete acceptance, we discern behind the words of rebuke and regret only the idealisation of a love which we are proud to share.

[JULY, 1919.

Thoughts on Tchehov

We do not know if the stories collected in this volume [7] stand together in the Russian edition of Tchehov's works, or if the selection is due to Mrs Constance Garnett. It is also possible that the juxtaposition is fortuitous. But the stories are united by a similarity of material. Whereas in the former volumes of this admirable series Tchehov is shown as preoccupied chiefly with the life of the intelligentsia, here he finds his subjects in priests and peasants, or (in the story Uprooted) in the half-educated.

[Footnote 7: The Bishop; and Other Stories. By Anton Tchehov.
Translated by Constance Garnett. (Chatto & Windus.)]

Such a distinction is, indeed, irrelevant. As Tchehov presents them to our minds, the life of the country and the life of the town produce the same final impression, arouse in us an awareness of an identical quality; and thus, the distinction, by its very irrelevance, points us the more quickly to what is essential in Tchehov. It is that his attitude, to which he persuades us, is complete, not partial. His comprehension radiates from a steady centre, and is not capriciously kindled by a thousand accidental contacts. In other words, Tchehov is not what he is so often assumed to be, an impressionist. Consciously or unconsciously he had taken the step--the veritable salto mortale--by which the great literary artist moves out of the ranks of the minor writers. He had slowly shifted his angle of vision until he could discern a unity in multiplicity. Unity of this rare kind cannot be imposed as, for instance, Zola attempted to impose it. It is an emanation from life which can be distinguished only by the most sensitive contemplation.

The problem is to define this unity in the case of each great writer in whom it appears. To apprehend it is not so difficult. The mere sense of unity is so singular and compelling that it leaves room for few hesitations. The majority of writers, however excellent in their peculiar virtues, are not concerned with it: at one moment they represent, at another they may philosophise, but the two activities have no organic connection, and their work, if it displays any evolution at all, displays it only in the minor accidents of the craft, such as style in the narrower and technical sense, or the obvious economy of construction. There is no danger of mistaking these for great writers. Nor, in the more peculiar case of writers who attempt to impose the illusion of unity, is the danger serious. The apparatus is always visible; they cannot afford to do without the paraphernalia of argument which supplies the place of what is lacking in their presentation. The obvious instance of this legerdemain is Zola; a less obvious, and therefore more interesting example is Balzac. To attempt the more difficult problem. What is most peculiar to Tchehov's unity is that it is far more nakedly æsthetic than that of most of the great writers before him. Other writers of a rank equal to his--and there are not so very many--have felt the need to shift their angle of vision until they could perceive an all-embracing unity; but they were not satisfied with this. They felt, and obeyed, the further need of taking an attitude towards the unity they saw. They approved or disapproved, accepted or rejected it. It would be perhaps more accurate to say that they gave or refused their endorsement. They appealed to some other element than their own sense of beauty for the final verdict on their discovery; they asked whether it was just or good. The distinguishing mark of Tchehov is that he is satisfied with the unity he discovers. Its uniqueness is sufficient for him. It does not occur to him to demand that it should be otherwise or better. The act of comprehension is accompanied by an instantaneous act of acceptance. He is like a man who contemplates a perfect work of art; but the work of creation has been his, and has consisted in the gradual adjustment of his vision until he could see the frustration of human destinies and the arbitrary infliction of pain as processes no less inevitable, natural, and beautiful than the flowering of a plant. Not that Tchehov is a greater artist than any of his great predecessors; he is merely more wholly an artist, which is a very different thing. There is in him less admixture of preoccupations that are not purely æsthetic, and probably for this reason he has less creative vigour than any other artist of equal rank. It seems as though artists, like cattle and fruit trees, need a good deal of crossing with substantial foreign elements, in order to be very vigorous and very fruitful. Tchehov has the virtues and the shortcomings of the pure case. I do not wish to be understood as saying that Tchehov is a manifestation of *l'art pour l'art*, because in any commonly accepted sense of that phrase, he is not. Still, he might be considered as an exemplification of what the phrase might be made to mean. But instead of being diverted into a barren dispute over terminologies, one may endeavour to bring into prominence an aspect of Tchehov which has an immediate interest--his modernity. Again, the word is awkward. It suggests that he is

fashionable, or up to date. Tchehov is, in fact, a good many phases in advance of all that is habitually described as modern in the art of literature. The artistic problem which he faced and solved is one that is, at most, partially present to the consciousness of the modern writer--to reconcile the greatest possible diversity of content with the greatest possible unity of æsthetic impression. Diversity of content we are beginning to find in profusion--Miss May Sinclair's latest experiment shows how this need is beginning to trouble a writer with a settled manner and a fixed reputation--but how rarely do we see even a glimmering recognition of the necessity of a unified æsthetic impression! The modern method is to assume that all that is, or has been, present to consciousness is ipso facto unified æsthetically. The result of such an assumption is an obvious disintegration both of language and artistic effort, a mere retrogression from the classical method. The classical method consisted, essentially, in achieving æsthetic unity by a process of rigorous exclusion of all that was not germane to an arbitrary (because non-æsthetic) argument. This argument was let down like a string into the saturated solution of the consciousness until a unified crystalline structure congregated about it. Of all great artists of the past Shakespeare is the richest in his departures from this method. How much deliberate artistic purpose there was in his employment of songs and madmen and fools (an employment fundamentally different from that made by his contemporaries) is a subject far too big for a parenthesis. But he, too, is at bottom a classic artist. The modern problem--it has not yet been sufficiently solved for us to speak of a modern method--arises from a sense that the classical method produces over-simplification. It does not permit of a sufficient sense of multiplicity. One can think of a dozen semi-treatments of the problem from Balzac to Dostoevsky, but they were all on the old lines. They might be called Shakespearean modifications of the classical method. Tchehov, we believe, attempted a treatment radically new. To make use again of our former image in his maturer writing, he chose a different string to let down into the saturated solution of consciousness. In a sense he began at the other end. He had decided on the quality of æsthetic impression he wished to produce, not by an arbitrary decision, but by one which followed naturally from the contemplative unity of life which he had achieved. The essential quality he discerned and desired to represent was his argument, his string. Everything that heightened and completed this quality accumulated about it, quite independently of whether it would have been repelled by the old criterion of plot and argument. There is a magnificent example of his method in the longest story in this volume, 'The Steppe.' The quality is dominant throughout, and by some strange compulsion it makes heterogeneous things one; it is reinforced by the incident. Tiny events--the peasant who eats minnows alive, the Jewish inn-keeper's brother who burned his six thousand roubles--take on a character of portent, except that the word is too harsh for so delicate a distortion of normal vision; rather it is a sense of incalculability that haunts us. The emphases have all been slightly shifted, but shifted according to a valid scheme. It is not while we are reading, but afterwards that we wonder how so much significance could attach to a little boy's questions in a remote village shop:--

"How much are these cakes?"

"Two for a farthing."

'Yegorushka took out of his pocket the cake given him the day before by the Jewess and asked him:--

"And how much do you charge for cakes like this?"

'The shopman took the cake in his hands, looked at it from all sides, and raised one eyebrow.

"Like that?" he asked.

'Then he raised the other eyebrow, thought a minute, and answered:--

"Two for three farthings...."

It is foolish to quote it. It is like a golden pebble from the bed of a stream. The stream that flows over Tchehov's innumerable pebbles, infinitely diverse and heterogeneous, is the stream of a deliberately sublimated quality. The figure is inexact, as figures are. Not every pebble could be thus transmuted. But how they are chosen, what is the real nature of the relation which unites them, as we feel it does, is a secret which modern English writers need to explore. Till they have explored and mastered it Tchehov will remain a master in advance of them.

[AUGUST, 1919.

* * * * *

The case of Tchegov is one to be investigated again and again because he is the only great modern artist in prose. Tolstoy was living throughout Tchegov's life, as Hardy has lived throughout our own, and these are great among the greatest. But they are not modern. It is an essential part of their greatness that they could not be; they have a simplicity and scope that manifestly belongs to all time rather than to this. Tchegov looked towards Tolstoy as we to Hardy. He saw in him a Colossus, one whose achievement was of another and a greater kind than his own.

'I am afraid of Tolstoy's death. If he were to die there would be a big empty place in my life. To begin with, because I have never loved any man as much as him.... Secondly, while Tolstoy is in literature it is easy and pleasant to be a literary man; even recognising that one has done nothing and never will do anything is not so dreadful, since Tolstoy will do enough for all. His work is the justification of the enthusiasms and expectations built upon literature. Thirdly, Tolstoy takes a firm stand; he has an immense authority, and so long as he is alive, bad tastes in literature, vulgarity of every kind, insolent and lachrymose, all the bristling, exasperated vanities will be in the far background, in the shade....'--(January, 1900.)

Tchegov was aware of the gulf that separated him from the great men before him, and he knew that it yawned so deep that it could not be crossed. He belonged to a new generation, and he alone perhaps was fully conscious of it. 'We are lemonade,' he wrote in 1892.

'Tell me honestly who of my contemporaries--that is, men between thirty and forty-five--have given the world one single drop of alcohol?... Science and technical knowledge are passing through a great period now, but for our sort it is a flabby, stale, dull time.... The causes of this are not to be found in our stupidity, our lack of talent, or our insolence, but in a disease which for the artist is worse than syphilis or sexual exhaustion. We lack "something," that is true, and that means that, lift the robe of our muse, and you will find within an empty void. Let me remind you that the writers who we say are for all time or are simply good, and who intoxicate us, have one common and very important characteristic: they are going towards something and are summoning you towards it, too, and you feel, not with your mind but with your whole being, that they have some object, just like the ghost of Hamlet's father, who did not come and disturb the imagination for nothing.... And we? We! We paint life as it is, but beyond that--nothing at all.... Flog us and we can do more! We have neither immediate nor remote aims, and in our soul there is a great empty space. We have no politics, we do not believe in revolution, we have no God, we are not afraid of ghosts, and I personally am not afraid even of death and blindness. One who wants nothing, hopes for nothing, and fears nothing cannot be an artist....

'... You think I am clever. Yes, I am at least so far clever as not to conceal from myself my disease and not to deceive myself, and not to cover up my own emptiness with other people's rags, such as the ideas of the 'sixties and so on.'

That was written in 1892. When we remember all the strange literary effort gathered round about that year in the West--Symbolism, the Yellow Book, Art for Art's sake--and the limbo into which it has been thrust by now, we may

realise how great a precursor and, in his own despite, a leader, Anton Tchekhov was. When Western literature was plunging with enthusiasm into one cul de sac after another, incapable of diagnosing its own disease, Tchekhov in Russia, unknown to the West, had achieved a clear vision and a sense of perspective. To-day we begin to feel how intimately Tchekhov belongs to us; to-morrow we may feel how infinitely he is still in advance of us. A genius will always be in advance of a talent, and in so far as we are concerned with the genius of Tchekhov we must accept the inevitable. We must analyse and seek to understand it; we must, above all, make up our minds that since Tchekhov has written and his writings have been made accessible to us, a vast amount of our modern literary production is simply unpardonable. Writers who would be modern and ignore Tchekhov's achievement are, however much they may persuade themselves that they are devoted artists, merely engaged in satisfying their vanity or in the exercise of a profession like any other; for Tchekhov is a standard by which modern literary effort must be measured, and the writer of prose or poetry who is not sufficiently single-minded to apply the standard to himself is of no particular account. Though Tchekhov's genius is, strictly speaking, inimitable, it deserves a much exacter study than it has yet received. The publication of this volume of his letters[8] hardly affords the occasion for that; but it does afford an opportunity for the examination of some of the chief constituents of his perfect art. These touch us nearly because--we insist again--the supreme interest of Tchekhov is that he is the only great modern artist in prose. He belongs, as we have said, to us. If he is great, then he is great not least in virtue of qualities which we may aspire to possess; if he is an ideal, he is an ideal to which we can refer ourselves. He had been saturated in all the disillusionments which we regard as peculiarly our own, and every quality which is distinctive of the epoch of consciousness in which we are living now is reflected in him--and yet, miracle of miracles, he was a great artist. He did not rub his cheeks to produce a spurious colour of health; he did not profess beliefs which he could not maintain; he did not seek a reputation for universal wisdom, nor indulge himself in self-gratifying dreams of a millennium which he alone had the ability to control. He was and wanted to be nothing in particular, and yet, as we read these letters of his, we feel gradually form within ourselves the conviction that he was a hero--more than that, the hero of our time.

[Footnote 8: Letters of Anton Tchekhov. Translated by Constance Garnett (Chatto & Windus).]

It is significant that, in reading Tchekhov's letters, we do not consider him under the aspect of an artist. We are inevitably fascinated by his character as a man, one who, by efforts which we have most frequently to divine for ourselves from his reticences, worked on the infinitely complex material of the modern mind and soul, and made it in himself a definite, positive, and most lovable thing. He did not throw in his hand in face of his manifold bewilderments; he did not fly for refuge to institutions in which he did not believe; he risked everything, in Russia, by having no particular faith in revolution and saying so. In every conjuncture of his life that we can trace in his letters he behaved squarely by himself and, since he is our great exemplar, by us. He refused to march under any political banner—a thing, let it be remembered, of almost inconceivable courage in his country; he submitted to savagely hostile attacks for his political indifference; yet he spent more of his life and energy in doing active good to his neighbour than all the high-souled professors of liberalism and social reform. He undertook an almost superhuman journey to Sahalin in 1890 to investigate the condition of the prisoners there; in 1892 he spent the best part of a year as a doctor devising preventive measures against the cholera in the country district where he lived, and, although he had no time for the writing on which his living depended, he refused the government pay in order to preserve his own independence of action; in another year he was the leading spirit in organizing practical measures of famine relief about Nizhni-Novgorod. From his childhood to his death, moreover, he was the sole support of his family. Measured by the standards of Christian morality, Tchekhov was wholly a saint. His self-devotion was boundless.

Yet we know he was speaking nothing less than the truth of himself when he wrote: 'It is essential to be indifferent.' Tchekhov was indifferent; but his indifference, as a mere catalogue of his secret philanthropies will show, was of a curious kind. He made of it, as it were, an axiomatic basis of his own self-discipline. Since life is what it is and men are what they are, he seems to have argued, everything depends upon the individual. The stars are hostile, but love is kind, and love is within the compass of any man if he will work to attain it. In one of his earliest letters he defines true culture for the benefit of his brother Nikolay, who lacked it. Cultivated persons, he said, respect human personality; they have sympathy not for beggars and cats only; they respect the property of others, and therefore pay their debts; they are sincere and dread lying like fire; they do not disparage themselves to arouse compassion; they have no shallow vanity; if they have a talent they respect it; they develop the æsthetic feeling in themselves ... they seek as far as possible to restrain and ennoble the sexual instinct. The letter from which these chief points are taken is tremulous with sympathy and wit. Tchekhov was twenty-six when he wrote it. He concludes with the words: 'What

is needed is constant work day and night, constant reading, study, will. Every hour is precious for it.' In that letter are given all the elements of Tchehov the man. He set himself to achieve a new humanity, and he achieved it. The indifference upon which Tchehov's humanity was built was not therefore a moral indifference; it was, in the main, the recognition and acceptance of the fact that life itself is indifferent. To that he held fast to the end. But the conclusion which he drew from it was not that it made no particular difference what any one did, but that the attitude and character of the individual were all-important. There was, indeed, no panacea, political or religious, for the ills of humanity; but there could be a mitigation in men's souls. But the new asceticism must not be negative. It must not cast away the goods of civilisation because civilisation is largely a sham.

'Alas! I shall never be a Tolstoyan. In women I love beauty above all things, and in the history of mankind, culture expressed in carpets, carriages with springs, and keenness of wit. Ach! To make haste and become an old man and sit at a big table!'

Not that there is a trace of the hedonist in Tchehov, who voluntarily endured every imaginable hardship if he thought he could be of service to his fellow-men, but, as he wrote elsewhere, 'we are concerned with pluses alone.' Since life is what it is, its amenities are doubly precious. Only they must be amenities without humbug.

'Pharisaism, stupidity, and despotism reign not in bourgeois houses and prisons alone. I see them in science, in literature, in the younger generation.... That is why I have no preference either for gendarmes, or for butchers, or for scientists, or for writers, or for the younger generation. I regard trade marks and labels as a superstition. My holy of holies is the human body, health, intelligence, talent inspiration, love, and the most absolute freedom--freedom from violence and lying, whatever forms they make take. This is the programme I would follow if I were a great artist.'

What 'the most absolute freedom' meant to Tchehov his whole life is witness. It was a liberty of a purely moral kind, a liberty, that is, achieved at the cost of a great effort in self-discipline and self-refinement. In one letter he says he is going to write a story about the son of a serf--Tchehov was the son of a serf--who 'squeezed the slave out of himself.' Whether the story was ever written we do not know, but the process is one to which Tchehov applied himself all his life long. He waged a war of extermination against the lie in the soul in himself, and by necessary implication in others also. He was, thus, in all things a humanist. He faced the universe, but he did not deny his own soul. There could be for him no antagonism between science and literature, or science and humanity. They were all pluses; it was men who quarrelled among themselves. If men would only develop a little more loving-kindness, things would be better. The first duty of the artist was to be a decent man.

'Solidarity among young writers is impossible and unnecessary.... We cannot feel and think in the same way, our aims are different, or we have no aims whatever, we know each other little or not at all, and so there is nothing on to which this solidarity could be securely hooked.... And is there any need for it? No, in order to help a colleague, to respect his personality and work, to refrain from gossiping about him, envying him, telling him lies and being hypocritical, one does not need so much to be a young writer as simply a man.... Let us be ordinary people, let us treat everybody alike, and then we shall not need any artificially worked-up solidarity.'

It seems a simple discipline, this moral and intellectual honesty of Tchehov's, yet in these days of conceit and coterie his letters strike us as more than strange. One predominant impression remains: it is that of Tchehov's candour of soul. Somehow he has achieved with open eyes the mystery of pureness of heart; and in that, though we dare not analyse it further, lies the secret of his greatness as a writer and of his present importance to ourselves.

[MARCH, 1920.

American Poetry

We are not yet immune from the weakness of looking into the back pages to see what the other men have said; and on this occasion we received a salutary shock from the critic of the Detroit News, who informs us that Mr Aiken, 'despite the fact that he is one of the youngest and the newest, having made his debut less than four years ago, ... demonstrates ... that he is eminently capable of taking a solo part with Edgar Lee Masters, Amy Lowell, James Oppenheim, Vachel Lindsay, and Edwin Arlington Robinson.' The shock is two-fold. In a single sentence we are in danger of being convicted of ignorance, and, where we can claim a little knowledge, we plead guilty; we know nothing of either Mr Oppenheim or Mr Robinson. This very ignorance makes us cautious where we have a little knowledge. We know something of Mr Lindsay, something of Mr Masters, and a good deal of Miss Lowell, who has long been a familiar figure in our anthologies of revolt; and we cannot understand on what principle they are assembled together. Miss Lowell is, we are persuaded, a negligible poet, with a tenuous and commonplace impulse to write which she teases out into stupid 'originalities.' Of the other two gentlemen we have seen nothing which convinces us that they are poets, but also nothing which convinces us that they may not be. Moreover, we can understand how Mr Aiken might be classed with them. All three have in common what we may call creative energy. They are all facile, all obviously eager to say something, though it is not at all obvious what they desire to say, all with an instinctive conviction that whatever it is it cannot be said in the old ways. Not one of them produces the certainty that this conviction is really justified or that he has tested it; not one has written lines which have the doom 'thus and not otherwise' engraved upon their substance; not one has proved that he is capable of addressing himself to the central problem of poetry, no matter what technique be employed--how to achieve a concentrated unity of æsthetic impression. They are all diffuse; they seem to be content to lead a hundred indecisive attacks upon reality at once rather than to persevere and carry a single one to a final issue; they are all multiple, careless, and slipshod--and they are all interesting. They are extremely interesting. For one thing, they have all achieved what is, from whatever angle one looks at it, a very remarkable success. Very few people, initiate or profane, can have opened Mr Lindsay's 'Congo' or Mr Masters's 'Spoon River Anthology' or Mr Aiken's 'Jig of Forslin' without being impelled to read on to the end. That does not very often happen with readers of a book which professes to be poetry save in the case of the thronging admirers of Miss Ella Wheeler Wilcox, and their similars. There is, however, another case more exactly in point, namely, that of Mr Kipling. With Mr Kipling our three American poets have much in common, though the community must not be unduly pressed. Their most obvious similarity is the prominence into which they throw the novel interest in their verse. They are, or at moments they seem to be, primarily tellers of stories. We will not dogmatise and say that the attempt is illegitimate; we prefer to insist that to tell a story in poetry and keep it poetry is a herculean task. It would indeed be doubly rash to dogmatise, for our three poets desire to tell very different stories, and we are by no means sure that the emotional subtleties which Mr Aiken in particular aims at capturing are capable of being exactly expressed in prose. Since Mr Aiken is the corpus vile before us we will henceforward confine ourselves to him, though we premise that in spite of his very sufficient originality he is characteristic of what is most worth attention in modern American poetry. Proceeding then, we find another point of contact between him and Mr Kipling, more important perhaps than the former, and certainly more dangerous. Both find it apparently impossible to stem the uprush of rhetoric. Perhaps they do not try to; but we will be charitable--after all, there is enough good in either of them to justify charity--and assume that the willingness of the spirit gives way to the weakness of the flesh. Of course we all know about Mr Kipling's rhetoric; it is a kind of emanation of the spatial immensities with which he deals--Empires, the Seven Seas, from Dublin to Diarbekir. Mr Aiken has taken quite another province for his own; he is an introspective psychologist. But like Mr Kipling he prefers big business. His inward eye roves over immensities at least as vast as Mr Kipling's outward. In 'The Charnel Rose and Other Poems' this appetite for the illimitable inane of introspection seems to have gained upon him. There is much writing of this kind:--

'Dusk, withdrawing to a single lamplight
At the end of an infinite street--
He saw his ghost walk down that street for ever,
And heard the eternal rhythm of his feet.
And if he should reach at last that final gutter,
To-day, or to-morrow,

Or, maybe, after the death of himself and time;
And stand at the ultimate curbstone by the stars,
Above dead matches, and smears of paper, and slime;
Would the secret of his desire
Blossom out of the dark with a burst of fire?
Or would he hear the eternal arc-lamps sputter,
Only that; and see old shadows crawl;
And find the stars were street lamps after all?

Music, quivering to a point of silence,
Drew his heart down over the edge of the world....'

It is dangerous for a poet to conjure up infinities unless he has made adequate preparation for keeping them in control when they appear. We are afraid that Mr Aiken is almost a slave of the spirits he has evoked. Dostoevsky's devil wore a shabby frock-coat, and was probably managing-clerk to a solicitor at twenty-five shillings a week. Mr Aiken's incubus is, unfortunately, devoid of definition; he is protean and unsatisfactory.

'I am confused in webs and knots of scarlet
Spun from the darkness;
Or shuttled from the mouths of thirsty spiders.

Madness for red! I devour the leaves of autumn.
I tire of the green of the world.
I am myself a mouth for blood....'

Perhaps we do wrong to ask ourselves whether this and similar things mean, exactly, anything? Mr Aiken warns us that his intention has been to use the idea--'the impulse which sends us from one dream or ideal to another, always disillusioned, always creating for adoration some new and subtler fiction'--'as a theme upon which one might wilfully build a kind of absolute music.' But having given us so much instruction, he should have given more; he should have told us in what province of music he has been working. Are we to look for a music of verbal melody, or for a musical elaboration of an intellectual theme? We infer, partly from the assurance that 'the analogy to a musical symphony is close,' more from the absence of verbal melody, that we are to expect the elaboration of a theme. In that case the fact that we have a more definite grasp of the theme in the programme-introduction than anywhere in the poem itself points to failure. In the poem 'stars rush up and whirl and set,' 'skeletons whizz before and whistle behind,' 'sands bubble and roses shoot soft fire,' and we wonder what all the commotion is about. When there is a lull in the pandemonium we have a glimpse, not of eternity, but precisely of 1890:--

'And he saw red roses drop apart,
Each to disclose a charnel heart....

We are far from saying that Mr Aiken's poetry is merely a chemical compound of the 'nineties, Freud and introspective Imperialism; but we do think it is liable to resolve at the most inopportune moments into those elements, and that such moments occur with distressing frequency in the poem called 'The Charnel Rose.' 'Senlin' resists disruption longer. But the same elements are there. They are better but not sufficiently fused. The rhetoric forbids, for there is no cohesion in rhetoric. We have the sense that Mr Aiken felt himself inadequate to his own idea, and that he tried to drown the voice of his own doubt by a violent clashing of the cymbals where a quiet recitative was what the theme demanded and his art could not ensure.

'Death himself in the rain ... death himself ...
Death in the savage sunlight ... skeletal death ...
I hear the clack of his feet,
Clearly on stones, softly in dust,
Speeding among the trees with whistling breath,
Whirling the leaves, tossing his hands from waves ...
Listen! the immortal footsteps beat and beat!...'

We are persuaded that Mr Aiken did not mean to say that; he wanted to say something much subtler. But to find exactly what he wanted might have taken him many months. He could not wait. Up rushed the rhetoric; bang went the cymbals: another page, another book. And we, who have seen great promise in his gifts, are left to collect some inadequate fragments where his original design is not wholly lost amid the poor expedients of the moment. For Mr Aiken never pauses to discriminate. He feels that he needs rhyme; but any rhyme will do:--

'Has no one, in a great autumnal forest,
When the wind bares the trees with mournful tone,
Heard the sad horn of Senlin slowly blown?'

So he descends to a poetaster's padding. He does not stop to consider whether his rhyme interferes with the necessary rhythm of his verse; or, if he does, he is in too much of a hurry to care, for the interference occurs again and again. And these disturbances and deviations, rhetoric and the sacrifice of rhythm to shoddy rhyme, appear more often than the thematic outline itself emerges. In short, Mr Aiken is, at present, a poet whom we have to take on trust. We never feel that he meant exactly what he puts before us, and, on the whole, the evidence that he meant something better, finer, more irrevocably itself, is pretty strong. We catch in his hurried verses at the swiftly passing premonition of a frisson hitherto unknown to us in poetry, and as we recognise it, we recognise also the great distance he has to travel along the road of art, and the great labour that he must perform before he becomes something more than a brilliant feuilletonist in verse. It is hardly for us to prophesy whether he will devote the labour. His fluency tells us of his energy, but tells us nothing of its quality. We can only express our hope that he will, and our conviction that if he were to do so his great pains, and our lesser ones would be well required.

[SEPTEMBER, 1919.

Ronsard

Ronsard is rangé now; but he has not been in that position for so very long, a considerably shorter time for instance, than any one of the Elizabethans (excepting Shakespeare) with us. Sainte-Beuve was very tentative about him until the sixties, when his dubious, half-patronising air made way for a safe enthusiasm. And, even now, it can hardly be said that French critical opinion about him has crystallised; the late George Wyndham's essay shows a more convinced and better documented appreciation than any that we have read in French, based as it is on the instinctive sympathy which one landed gentleman who dabbles in the arts feels towards another who devotes himself to them--an admiration which does not exclude familiarity.

Indeed, it is precisely because Ronsard lends himself so superbly as an amateur to treatment by the amateur, that any attempt to approach him more closely seems to be tinged with rancour or ingratitude. There is something churlish in the determination to be most on one's guard against the engaging graces of the amateur, a sense that one is behaving like the hero of a Gissing novel; but the choice is not large. One must regard Ronsard either as a charming country gentleman, or as a great historical figure in the development of French poetry, or as a poet; and the third aspect has a chance of being the most important.

Ronsard is pre-eminently the poet of a simple mind. There is nothing mysterious about him or his poetry; there is not even a perceptible thread of development in either. They are equable, constant imperturbable, like the bag of a much invited gun, or the innings of a safe batsman. The accomplishment is akin to an animal endowment. The nerves, instead of being, if only for a moment, tense and agitated, are steady to a degree that can produce an exasperation in a less well-appointed spectator. He will never let himself down, or give himself away, one feels, until the admiration of an apparent sure restraint passes into the conviction that there is nothing to restrain. All Ronsard the poet is in his poetry, and indeed on the surface of it.

Poetry was not therefore, as one is tempted to think sometimes, for Ronsard a game. There was plenty of game in it; l'art de bien pétarquiser was all he claimed for himself. But the game would have wearied any one who was not

aware that he could be completely satisfied and expressed by it. Ronsard was never weary. However much one may tire of him, the fatigue never is infected by the nausea which is produced by some of the mechanical sonnet sequences of his contemporaries. No one reading Ronsard ever felt the tedium of mere nullity. It would be hard to find in the whole of M. van Bever's exhaustive edition of 'Les Amours'[9] a single piece which has not its sufficient charge of gusto. When you are tired, it is because you have had enough of that particular kind of man and mind; you know him too well, and can reckon too closely the chances of a shock of surprise.

[Footnote 9: Les Amours. Par Pierre de Ronsard. Texte établi par Ad. van Bever. Two volumes. (Paris: Crès.)]

With the more obvious, and in their way delightful, surprises Ronsard is generous. He can hold the attention longer than any poet of an equal tenuity of matter. Chiefly for two reasons, of which one is hardly capable of further analysis. It is the obvious reality of his own delight in 'Petrarchising.' He is perpetually in love with making; he disports himself with a childlike enthusiasm in his art. There are moments when he seems hardly to have passed beyond the stage of naïve wonder that words exist and are manipulable.

'Dous fut le trait, qu'Amour hors de sa trousse
Pour me tuer, me tira doucement,
Quand je fus pris au dous commencement
D'une douceur si doucètement douce....'

Ronsard is here a boy playing knucklebones with language; and some of his characteristic excellences are little more than a development of this aptitude, with its more striking incongruities abated. A modern ear can be intoxicated by the charming jingle of

'Petite Nimfe folastre,
Nimfette que j'idolastre....'

One does not pause to think how incredibly naive it is compared with Villon, who had not a fraction of Ronsard's scholarship, or even with Clement Marot; naive both in thought and art. As for the stature of the artist, we are back with Charles of Orleans. It would be idle to speculate what exactly Villon would have made of the atomic theory had he read Lucretius; but we are certain that he would have done something very different from Ronsard's

'Les petits cors, culbutant de travers,
Parmi leur cheute en biais vagabonde,
Heurtés ensemble ont composé le monde,
S'entr'acrochant d'acrochemens divers....'

For this is not grown-up; the cut to simplicity has been too short. So many of Ronsard's verses flow over the mind, without disturbing it; fall charmingly on the ear, and leave no echoes. But for the moment we share his enjoyment.

The second cause of his continued power of attraction is doubtless allied to the first; it is a naïveté of a particular kind, which differs from the profound ingenuousness of which we have spoken by the fact that it is employed deliberately. Conscious simplicity is art, and if it is successful art of no mean order, Ronsard's method of admitting us, as it were, to his conversation with himself is definitely his own. His interruptions of a verse with 'Hà' or 'Hé'; his 'Mon Dieu, que j'aime!' or 'Hé, que ne suis-je puce?' (the difference between Ronsard's flea and Donne's would be worth examination) have in them an element of irresistible bonhomie. We feel that he is making us his confidant. He does not have to tear agonies out of himself, so that what he confides has no chance of making explicit any secrets of our own. There is nothing dangerous about him; we know that he is as safe as we are. We are in conversation, not communion. But how effective and engaging it is!

'Vous ne le voulez pas? Eh bien, je suis contant ...'

'Hé, Dieu du ciel, je n'eusse pas pensé
Qu'un seul départ eust causé tant de peine!...'

or the still more casual

'Un joïeus deplaisir qui douteus l'épointelle,
Quoi l'épointelle! ainçois le genne et le martelle ...'

Of this device of style our own Elizabethans were to make more profitable use than Ronsard. At their best they packed an intensity of dramatic significance into conversational language, of which Ronsard had no inkling; and even a strict contemporary of his, like Wyatt, could touch cords more intimate by the same means. But, on the other hand, Ronsard never fails of his own effect, which is not to convince us emotionally, but to compel us to listen. His unexpected address to himself or to us is a new ornament for us to admire, not a new method for him to express a new thing; and the suggestion of new rhythms that might thus be attained is never fully worked out.

'Mais tu ne seras plus? Et puis?... quand la paleur
Qui blemist nôtre corps sans chaleur ne lumière
Nous perd le sentiment?...

The amplex of that reverberance is almost isolated.

Ronsard's resources are indeed few. But he needed few. His simple mind was at ease in machinery of commonplaces, and he makes the pleasant impression of one to whom commonplaces are real. He felt them all over again. One imagines him reading the classics--the Iliad in three days, or his beloved companion 'sous le bois amoureux,' Tibullus--with an unflinching delight in all the concatenations of phrase which are foisted on to unripe youth nowadays in the pages of a Gradus. One might almost say that he saw his loves at second-hand, through alien eyes, were it not that he faced them with some directness as physical beings, and that the artificiality implied in the criticism is incongruous with the honesty of such a natural man. But apart from a few particulars that would find a place in a census paper one would be hard put to it to distinguish Cassandre from Héléne. What charming things Ronsard has to say of either might be said of any charming woman--'le mignard embonpoint de ce sein,'--

'Petit nombril, que mon penser adore,
Non pas mon oeil, qui n'eut oncques ce bien ...'

And though he assures Héléne that she has turned him from his grave early style, 'qui pour chanter si bas n'est point ordonné,' the difference is too hard to detect; one is forced to conclude that it is precisely the difference between a court lady and an inn-keeper's daughter. As far as art is concerned the most definite and distinctive thing that Ronsard had to say of any of his ladies is said of one to whom he put forward none of his usually engrossing pretensions. It was the complexion of Marguerite of Navarre of which he wrote:--

'De vif cinabre estoit faicte sa joue,
Pareille au teint d'un rougissant oeillet,
Ou d'une fraize, alors que dans de laict
Dessus le hault de la cresse se joue.'

That is, whether it belonged to Marguerite or not, a divine complexion. It is the kind of thing that cannot be said about two ladies; the image is too precise to be interchangeable. This may be a reason why it was applied to a lady hors concours for Ronsard.

But we need, in fact, seek no reason other than the circumscription of Ronsard's poetical gifts. They reduce to only two--the gift of convinced commonplace, and the gift of simple melody. His commonplace is genuine commonplace, quite distinct from the tense and pregnant condensation of a lifetime of impassioned experience in Dante or Shakespeare; things that would occur to a bookish country gentleman in after-dinner conversation, the sentiments that such a rare and amiable person would underscore in his Horace. (From a not unimportant angle Ronsard is a minor Horace.) These things are the warp of his poetry; they range from the familiar 'Le temps s'en va' to the masterly straightforwardness of

'plus heurus celui qui la fera
Et femme et mère, en lieu d'une pucelle.'

His melody, likewise, is genuine melody; it is irrepressible. It led him to belie his own professed seriousness. He could not stop his sonnets from rippling even when he pretended to passionate argument. Life came easily to him; he was never weary of it, at the most he acknowledged that he was 'saoûl de la vie.' It is not surprising, therefore, that his remonstrances as the tortured lover have a trick of opening to a delightful tune:--

'Rens-moi mon coeur, rens-moi mon coeur pillarde....'

In another form this melody more closely recalls Thomas Campion:--

'Seule je l'ai veue, aussi je meurs pour elle....'

But to compare Ronsard's sonnet with 'Follow your saint' is to see how infinitely more subtle a master of lyrical music was the Elizabethan than the great French lyricist of the Renaissance. From first to last Ronsard was an amateur.

[SEPTEMBER, 1919.

Samuel Butler

The appearance of a new impression of *The Way of all Flesh*[10] in Mr Fifield's edition of Samuel Butler's works gives us an occasion to consider more calmly the merits and the failings of that entertaining story. Like all unique works of authors who stand, even to the most obvious apprehension, aside from the general path, it has been overwhelmed with superlatives. The case is familiar enough and the explanation is simple and brutal. It is hardly worth while to give it. The truth is that although there is no inherent reason why the isolated novel of an author who devotes himself to other forms should not be 'one of the great novels of the world,' the probabilities tell heavily against it. On the other hand, an isolated novel makes a good stick to beat the age. It is fairly certain to have something sufficiently unique about it to be useful for the purpose. Even its blemishes have a knack of being sui generis. To elevate it is, therefore, bound to imply the diminution of its contemporaries.

[Footnote 10: *The Way of all Flesh*. By Samuel Butler, 11th impression of 2nd edition. (Fifield.)]

Yet, apart from the general argument, there are particular reasons why the praise of *The Way of all Flesh* should be circumspect. Samuel Butler knew extraordinarily well what he was about. His novel was written intermittently between 1872 and 1884 when he abandoned it. In the twenty remaining years of his life he did nothing to it, and we have Mr Streatfeild's word for it that 'he professed himself dissatisfied with it as a whole, and always intended to rewrite, or at any rate, to revise it.' We could have deduced as much from his refusal to publish the book. The certainty of commercial failure never deterred Butler from publication; he was in the happy situation of being able to publish at his own expense a book of whose merit he was himself satisfied. His only reason for abandoning *The Way of all Flesh* was his own dissatisfaction with it. His instruction that it should be published in its present form after his death proves nothing against his own estimate. Butler knew, at least as well as we, that the good things in his book were legion. He did not wish the world or his own reputation to lose the benefit of them. But there are differences between a novel which contains innumerable good things and a great novel. The most important is that a great novel does not contain innumerable good things. You may not pick out the plums, because the pudding falls to pieces if you do. In *The Way of all Flesh*, however, a compère is always present whose business it is to say good things. His perpetual flow of asides is pleasant because the asides are piquant and, in their way, to the point. Butler's mind, being a good mind, had a predilection for the object, and his detestation of the rotunder platitudes of a Greek chorus, if nothing else, had taught him that a corner-man should have something to say on the subject in hand. His arguments are designed to assist his narrative; moreover, they are sympathetic to the modern mind. An enlightened hedonism is about all that is left to us, and Butler's hatred of humbug is, though a little more placid, like our own. We share his ethical likes and dislikes. As an audience we are ready to laugh at his asides, and, on the first night at least, to laugh at them even when they interrupt the play. But our liking for the theses cannot alter the fact that *The*

Way of all Flesh is a roman à thèses. Not that there is anything wrong with the roman à thèses, if the theses emerge from the narrative without its having to be obviously doctored. Nor does it matter very much that a compère should be present all the while, provided that he does not take upon himself to replace the demonstration the narrative must afford, by arguments outside it. But what happens in *The Way of all Flesh*? We may leave aside the minor thesis of heredity, for it emerges, gently enough, from the story; besides, we are not quite sure what it is. We have no doubt, on the other hand, about the major thesis; it is blazoned on the title page, with its sub-malicious quotation from St Paul to the Romans. 'We know that all things work together for good to them that love God.' The necessary gloss on this text is given in Chapter LXVIII, where Ernest, after his arrest, is thus described:--

'He had nothing more to lose; money, friends, character, all were gone for a very long time, if not for ever; but there was something else also that had taken its flight along with these. I mean the fear of that which man could do unto him. *Cantabit vacuus*. Who could hurt him more than he had been hurt already? Let him but be able to earn his bread, and he knew of nothing which he dared not venture if it would make the world a happier place for those who were young and lovable. Herein he found so much comfort that he almost wished he had lost his reputation even more completely--for he saw that it was like a man's life which may be found of them that lose it and lost of them that would find it. He should not have had the courage to give up all for Christ's sake, but now Christ had mercifully taken all, and lo! it seemed as though all were found.

'As the days went slowly by he came to see that Christianity and the denial of Christianity after all met as much as any other extremes do; it was a fight about names--not about things; practically the Church of Rome, the Church of England, and the freethinker have the same ideal standard and meet in the gentleman; for he is the most perfect saint who is the most perfect gentleman....'

With this help the text and the thesis can be translated: 'All experience does a gentleman good.' It is the kind of thing we should like very much to believe; as an article of faith it was held with passion and vehemence by Dostoevsky, though the connotation of the word 'gentleman' was for him very different from the connotation it had for Butler. (Butler's gentleman, it should be said in passing, was very much the ideal of a period, and not at all *quod semper, quod ubique*; a very Victorian anti-Victorianism.) Dostoevsky worked his thesis out with a ruthless devotion to realistic probability. He emptied the cornucopia of misery upon his heroes and drove them to suicide one after another; and then had the audacity to challenge the world to say that they were not better, more human, and more lovable for the disaster in which they were inevitably overwhelmed. And, though it is hard to say 'Yes' to his challenge, it is harder still to say 'No.' In the case of Ernest Pontifex, however, we do not care to respond to the challenge at all. The experiment is faked and proves nothing. It is mere humbug to declare that a man has been thrown into the waters of life to sink or swim, when there is an anxious but cool-headed friend on the bank with a £70,000 life-belt to throw after him the moment his head goes under. That is neither danger nor experience. Even if Ernest Pontifex knew nothing of the future awaiting him (as we are assured he did not) it makes no difference. We know he cannot sink; he is a lay figure with a pneumatic body. Whether he became a lay figure for Butler also we cannot say; we can merely register the fact that the book breaks down after Ernest's misadventure with Miss Maitland, a deplorably unsubstantial episode to be the crisis of a piece of writing so firm in texture and solid in values as the preceding chapters. Ernest as a man has an intense non-existence. After all, as far as the positive side of *The Way of all Flesh* is concerned, Butler's eggs are all in one basket. If the adult Ernest does not materialise, the book hangs in empty air. Whatever it may be instead it is not a great novel, nor even a good one. So much established, we may begin to collect the good things. Christina is the best of them. She is, by any standard, a remarkable creation. Butler was 'all round' Christina. Both by analysis and synthesis she is wholly his. He can produce her in either way. She lives as flesh and blood and has not a little of our affection; she is also constructed by definition, 'If it were not too awful a thing to say of anybody, she meant well'--the whole phrase gives exactly Christina's stature. Alethea Pontifex is really a bluff; but the bluff succeeds, largely because, having experience of Christina, we dare not call it. Mrs Jupp is triumphantly complete; there are even moments when she seems as great as Mrs Quickly. The novels that contain three such women (or two if we reckon the uncertain Alethea, who is really

only a vehicle for Butler's very best sayings, as cancelled by the non-existent Ellen) can be counted, we suppose, on our ten fingers. Of the men, Theobald is well worked out (in both senses of the word). But we know little of what went on inside him. We can fill out Christina with her inimitable day-dreams; Theobald remains something of a skeleton, whereas we have no difficulty at all with Dr Skinner, of Roughborough. We have a sense of him in retirement steadily filling the shelves with volumes of Skinner, and we know how it was done. When he reappears we assume the continuity of his existence without demur. The glimpse of George Pontifex is also satisfying; after the christening party we know him for a solid reality. Pryer was half-created when his name was chosen. Butler did the rest in a single paragraph which contains a perfect delineation of 'the Oxford manner' twenty years before it had become a disease known to ordinary diagnosis. The curious may find this towards the beginning of Chapter LI. But Ernest, upon whom so much depends, is a phantom--a dream-child waiting the incarnation which Butler refused him for twenty years. Was it laziness, was it a felt incapacity? We do not know; but in the case of a novelist it is our duty to believe the worst. The particularity of our attitude to Butler appears in the fact that we are disappointed, not with him, but with Ernest. We are even angry with that young man. If it had not been for him, we believe, *The Way of all Flesh* might have appeared in 1882; it might have short-circuited Robert Elsmere.

[JUNE, 1919.

* * * * *

We approach the biography of an author whom we respect, and therefore have thought about, with contradictory feelings. We are excited at the thought of finding our conclusions reinforced, and apprehensive less the compact and definite figure which our imaginations have gradually shaped should become vague and incoherent and dull. It is a pity to purchase enlightenment at the cost of definition; and it is more important that we should have a clear notion of the final shape of a man in whom we are interested than an exact record of his phases. The essential quality of great artists is incommensurable with biography; they seem to be unconsciously engaged in a perpetual evasion of the event. All that piety can do for them is beside the mark. Their wilful spirit is fled before the last stone of the mausoleum can be got in place, and as it flies it jogs the elbow of the cup-bearer and his libation is spilt idly upon the ground. Although it would be too much and too ungrateful to say that the monumental piety of Mr Festing Jones has been similarly turned to derision--after all, Butler was not a great man--we feel that something analogous has happened. This laborious building is a great deal too large for him to dwell in. He had made himself a cosy habitation in the Note-Books, with the fire in the right place and fairly impervious to the direct draughts of criticism. In a two-volume memoir[11] he shivers perceptibly, and at moments he looks faintly ridiculous more than faintly pathetic.

[Footnote 11: Samuel Butler, author of 'Erewhon' (1835-1902): a Memoir. By Henry Festing Jones. 2 vols. (Macmillan.)]

And if it be said that a biography should make no difference to our estimate of the man who lives and has his being in his published works, we reply that it shifts the emphasis. An amusingly wrong-headed book about Homer is a peccadillo; ten years of life lavished upon it is something a good deal more serious. And even *The Way of all Flesh*, which as an experimental novel is a very considerable achievement, becomes something different when we have to regard it as a laborious and infinitely careful record of experienced fact. Further still, even the edge of the perfected inconsequence of certain of the 'Notes' is somewhat dulled when we see the trick of it being exercised. The origin of the amusing remark on Blake, who 'was no good because he learnt Italian at over 60 in order to read Dante, and we know Dante was no good because he was so fond of Virgil, and Virgil was no good because Tennyson ran him--well, Tennyson goes without saying,' is to be found in 'No, I don't like Lamb. You see, Canon Ainger writes about him, and Canon Ainger goes to tea with my aunts.' Repeated, it becomes merely a clever way of being stupid, as we should be if we were tempted to say we couldn't bear Handel, because Butler was mad on him, and Butler was no good because he was run by Mr Jones, and, well, Mr Jones goes without saying. Nevertheless, though Butler lives with much discomfort and some danger in Mr Jones's tabernacle, he does continue to live. What his head loses by the inquisition of a biography his heart gains, though we wonder whether Butler himself would have smiled upon the exchange. Butler loses almost the last vestige of a title to be considered a creative artist when the incredible fact is revealed that the letters of Theobald and Christina in *The Way of all Flesh* are merely reproduced from those which his father and mother sent him. Nor was Butler, even as a copyist, always adequate to his originals. The brilliantly witty letters of Miss Savage, by which the first volume is made precious, seem to us to indicate a real woman upon whom something more substantial might have been modelled than the delightful but evanescent picture of Alethea

Pontifex. Here, at least, is a picture of Miss Savage and Butler together which, to our sense, gives some common element in both which escaped the expression of the author of *The Way of all Flesh*:--

'I like the cherry-eating scene, too [Miss Savage wrote after reading the MS. of *Alps and Sanctuaries*], because it reminded me of your eating cherries when I first knew you. One day when I was going to the gallery, a very hot day I remember, I met you on the shady side of Berners Street, eating cherries out of a basket. Like your Italian friends, you were perfectly silent with content, and you handed the basket to me as I was passing, without saying a word. I pulled out a handful and went on my way rejoicing, without saying a word either. I had not before perceived you to be different from any one else. I was like Peter Bell and the primrose with the yellow brim. As I went away to France a day or two after that and did not see you again for months, the recollection of you as you were eating cherries in Berners Street abode with me and pleased me greatly.'

Again, we feel that the unsubstantial Towneley of the novel should have been more like flesh and blood when we learn that he too was drawn from the life, and from a life which was intimately connected with Butler's. Here, most evidently, the heart gains what the head loses, for the story of Butler's long-suffering generosity to Charles Paine Pauli is almost beyond belief and comprehension. Butler had met Pauli, who was two years his junior, in New Zealand, and had conceived a passionate admiration for him. Learning that he desired to read for the bar, Butler, who had made an unexpected success of his sheep-farming, offered to lend him £100 to get to England and £200 a year until he was called. Very shortly after they both arrived in England, Pauli separated from Butler, refusing even to let him know his address, and thenceforward paid him one brief visit every day. He continued, however, to draw his allowance regularly until his death all through the period when, owing to the failure of Butler's investments, £200 seems to have been a good deal more than one-half Butler's income. At Pauli's death in 1897 Butler discovered what he must surely at moments have suspected, that Pauli had been making between £500 and £800 at the bar, and had left about £9000--not to Butler. Butler wrote an account of the affair after Pauli's death which is strangely self-revealing:--

'... Everything that he had was good, and he was such a fine handsome fellow, with such an attractive manner that to me he seemed everything I should like myself to be, but knew very well that I was not....

'I had felt from the very beginning that my intimacy with Pauli was only superficial, and I also perceived more and more that I bored him.... He liked society and I hated it. Moreover, he was at times very irritable and would find continual fault with me; often, I have no doubt, justly, but often, as it seemed to me, unreasonably. Devoted to him as I continued to be for many years, those years were very unhappy as well as very happy ones.

'I set down a great deal to his ill-health, no doubt truly; a great deal more, I was sure, was my own fault--and I am so still; I excused much on the score of his poverty and his dependence on myself--for his father and mother, when it came to the point, could do nothing for him; I was his host and was bound to forbear on that ground if on no other. I always hoped that, as time went on, and he saw how absolutely devoted to him I was, and what unbounded confidence I had in him, and how I forgave him over and over again for treatment which I would not have stood for a moment from any one else--I always hoped that he would soften and deal as frankly and unreservedly with me as I with him; but, though for some fifteen years I hoped this, in the end I gave it up, and settled down into a

resolve from which I never departed--to do all I could for him, to avoid friction of every kind, and to make the best of things for him and myself that circumstances would allow.'

In love such as this there is a feminine tenderness and devotion which positively illuminates what otherwise appears to be a streak of perversity in Butler; and the illumination becomes still more certain when we read Butler's letters to the young Swiss, Hans Faesch, to whom *Out into the Night* was written. Faesch had departed for Singapore.

'The sooner we all of us,' wrote Butler, 'as men of sense and sober reason, get through the very acute, poignant sorrow which we now feel, the better for us all. There is no fear of any of us forgetting when the acute stage is passed. I should be ashamed of myself for having felt as keenly and spoken with as little reserve as I have if it were any one but you; but I feel no shame at any length to which grief can take me when it is about you. I can call to mind no word which ever passed between us three which had been better unspoken: no syllable of irritation or unkindness; nothing but goodness and kindness ever came out of you, and such as our best was we gave it to you as you gave yours to us. Who may not well be plunged up to the lips in sorrow at parting from one of whom he can say this in all soberness and truth? I feel as though I had lost an only son with no hope of another....'

The love is almost pathetically lavish. Letters like these reveal to us a man so avid of affection that he must of necessity erect every barrier and defence to avoid a mortal wound. His sensibility was *rentrée*, probably as a consequence of his appalling childhood; and the indication helps us to understand not only the inordinate suspiciousness with which he behaved to Darwin, but the extent to which irony was his favoured weapon. The most threatening danger for such a man is to take the professions of the world at their face value; he can inoculate himself only by irony. The more extreme his case, the more devouring the hunger to love and be loved, the more extreme the irony, and in Butler it reached the absolute maximum, which is to interpret the professions of the world as their exact opposite. As a reviewer of the *Note-Books* in *The Athenæum* recently said, Butler's method was to stand propositions on their heads. He universalised his method; he applied it not merely to scientific propositions of fact, but, even more ruthlessly, to the converse of daily life. He divided up the world into a vast majority who meant the opposite of what they said, and an infinitesimal minority who were sincere. The truth that the vast majority are borderland cases escaped him, largely because he was compelled by his isolation to regard all his honest beliefs as proven certainties. That a man could like and admire him and yet regard him as in many things mistaken and wrong-headed was strictly incomprehensible to him, and from this angle the curious relations which existed between him and Dr Richard Garnett of the British Museum are of uncommon interest. They afford a strange example of mutual mystification. Thus at least one-half the world, not of life only (which does not greatly matter, for one can live as happily with half the world as with the whole) but of thought, was closed to him. Most of the poetry, the music, and the art of the world was humbug to him, and it was only by insisting that Homer and Shakespeare were exactly like himself that he managed to except them from his natural aversion. So, in the last resort, he humbugged himself quite as vehemently as he imagined the majority of men were engaged in humbugging him. If his standard of truth was higher than that of the many, it was lower than that of the few. There is a kingdom where the crass division into sheep and goats is merely clumsy and inopportune. In the slow meanderings of this *Memoir* we too often catch a glimpse of Butler measuring giants with the impertinent foot-rule of his common sense. One does not like him the less for it, but it is, in spite of all the disconcerting jokes with which it may be covered, a futile and ridiculous occupation. Persistently there emerges from the record the impression of something childish, whether in petulance or gaminerie, a crudeness as well as a shrewdness of judgment and ideal. Where Butler thought himself complete, he was insufficient; and where he thought himself insufficient, he was complete. To himself he appeared a hobbledehoy by the side of Pauli; to us he appears a hobbledehoy by the side of Miss Savage.

[OCTOBER, 1919.

The Poetry of Mr Hardy

One meets fairly often with the critical opinion that Mr Hardy's poetry is incidental. It is admitted on all sides that his poetry has curious merits of its own, but it is held to be completely subordinate to his novels, and those who maintain that it must be considered as having equal standing with his prose, are not seldom treated as guilty of paradox and preciousness. We are inclined to wonder, as we review the situation, whether those of the contrary persuasion are not allowing themselves to be impressed primarily by mere bulk, and arguing that a man's chief work must necessarily be what he has done most of; and we feel that some such supposition is necessary to explain what appears to us as a visible reluctance to allow Mr Hardy's poetry a clean impact upon the critical consciousness. It is true that we have ranged against us critics of distinction, such as Mr Lascelles Abercrombie and Mr Robert Lynd, and that it may savour of impertinence to suggest that the case could have been unconsciously pre-judged in their minds when they addressed themselves to Mr Hardy's poetry. Nevertheless, we find some significance in the fact that both these critics are of such an age that when they came to years of discretion the Wessex Novels were in existence as a corpus. There, before their eyes, was a monument of literary work having a unity unlike that of any contemporary author. The poems became public only after they had laid the foundations of their judgment. For them Mr Hardy's work was done. Whatever he might subsequently produce was an interesting, but to their criticism an otiose appendix to his prose achievement. It happens therefore that to a somewhat younger critic the perspective may be different. By the accident of years it would appear to him that Mr Hardy's poetry was no less a corpus than his prose. They would be extended equally and at the same moment before his eyes; he would embark upon voyages of discovery into both at roughly the same time; and he might find, in total innocence of preciousness and paradox, that the poetry would yield up to him a quality of perfume not less essential than any that he could extract from the prose. This is, as we see it, the case with ourselves. We discover all that our elders discover in Mr Hardy's novels; we see more than they in his poetry. To our mind it exists superbly in its own right; it is not lifted into significance upon the glorious substructure of the novels. They also are complete in themselves. We recognise the relation between the achievements, and discern that they are the work of a single mind; but they are separate works, having separate and unique excellences. The one is only approximately explicable in terms of the other. We incline, therefore, to attach a signal importance to what has always seemed to us the most important sentence in *Who's Who?*--namely, that in which Mr Hardy confesses that in 1868 he was compelled--that is his own word--to give up writing poetry for prose. For Mr Hardy's poetic gift is not a late and freakish flowering. In the volume into which has been gathered all his poetical work with the exception of 'The Dynasts,'[12] are pieces bearing the date 1866 which display an astonishing mastery, not merely of technique but of the essential content of great poetry. Nor are such pieces exceptional. Granted that Mr Hardy has retained only the finest of his early poetry, still there are a dozen poems of 1866-7 which belong either entirely or in part to the category of major poetry. Take, for instance, 'Neutral Tones':--

'We stood by a pond that winter day,
And the sun was white, as though chidden of God,
And a few leaves lay on the starving sod;
--They had fallen from an ash, and were gray.

'Your eyes on me were as eyes that rove
Over tedious riddles long ago;
And some winds played between us to and fro
On which lost the more by our love.

'The smile on your mouth was the deadest thing
Alive enough to have strength to die;
And a grin of bitterness swept thereby
Like an ominous bird a-wing....

'Since then keen lessons that love deceives
And wrings with wrong, have shaped to me
Your face, and the God-curst sun, and a tree
And a pond edged with grayish leaves.'

[Footnote 12: Collected. Poems of Thomas Hardy. Vol. I.
(Macmillan.)]

That was written in 1867. The date of *Desperate Remedies*, Mr Hardy's first novel, was 1871. *Desperate Remedies* may have been written some years before. It makes no difference to the astonishing contrast between the immaturity of the novel and the maturity of the poem. It is surely impossible in the face of such a juxtaposition then to deny that Mr Hardy's poetry exists in its own individual right, and not as a curious simulacrum of his prose.

These early poems have other points of deep interest, of which one of the chief is in a sense technical. One can trace a quite definite influence of Shakespeare's sonnets in his language and imagery. The four sonnets, 'She to Him' (1866), are full of echoes, as:--

'Numb as a vane that cankers on its point
True to the wind that kissed ere canker came.'

or this from another sonnet of the same year:--

'As common chests encasing wares of price
Are borne with tenderness through halls of state.'

Yet no one reading the sonnets of these years can fail to mark the impress of an individual personality. The effect is, at times, curious and impressive in the extreme. We almost feel that Mr Hardy is bringing some physical compulsion to bear on Shakespeare and forcing him to say something that he does not want to say. Of course, it is merely a curious tweak of the fancy; but there comes to us in such lines as the following an insistent vision of two youths of an age the one masterful, the other indulgent, and carrying out his companion's firm suggestion:--

'Remembering mine the loss is, not the blame
That Sportsman Time rears but his brood to kill,
Knowing me in my soul the very same--
One who would die to spare you touch of ill!--
Will you not grant to old affection's claim
The hand of friendship down Life's sunless hill?'

But, fancies aside, the effect of these early poems is twofold. Their attitude is definite:--

'Crass Casualty obstructs the sun and rain
And dicing time for gladness calls a moan ...
These purblind Doomsters had as readily thrown
Blisses about my pilgrimage as pain.'

and the technique has the mark of mastery, a complete economy of statement which produces the conviction that the words are saying only what poet ordained they should say, neither less nor more.

The early years were followed by the long period of the novels, in which, we are prepared to admit, poetry was actually if not in intention incidental. It is the grim truth that poetry cannot be written in between times; and, though we have hardly any dates on which to rely, we are willing to believe that few of Mr Hardy's characteristic poems were written between the appearance of *Desperate Remedies* and his farewell to the activity of novel-writing with *The Well-Beloved* (1897). But the few dates which we have tell us that 'Thoughts of Phena,' the beautiful poem beginning:--

'Not a line of her writing have I,
Not a thread of her hair....'

which reaches forward to the love poems of 1912-13, was written in 1890.

Whether the development of Mr Hardy's poetry was concealed or visible during the period of the novels, development there was into a maturity so overwhelming that by its touchstone the poetical work of his famous contemporaries appears singularly jejune and false. But, though by the accident of social conditions--for that Mr Hardy waited till 1898 to publish his first volume of poems is more a social than an artistic fact--it is impossible to follow out the phases of his poetical progress in the detail we would desire, it is impossible not to recognise that the mature poet, Mr Hardy, is of the same poetical substance as the young poet of the 'sixties. The attitude is unchanged; the modifications of the theme of 'crass casualty' leave its central asseveration unchanged. There are restatements, enlargements of perspective, a slow and forceful expansion of the personal into the universal, but the truth once recognised is never suffered for a moment to be hidden or mollified. Only a superficial logic would point, for instance, to his

'Wonder if Man's consciousness
Was a mistake of God's,'

as a denial of 'casualty.' To envisage an accepted truth from a new angle, to turn it over and over again in the mind in the hope of finding some aspect which might accord with a large and general view is the inevitable movement of any mind that is alive and not dead. To say that Mr Hardy has finally discovered unity may be paradoxical; but it is true. The harmony of the artist is not as the harmony of the preacher or the philosopher. Neither would grant, neither would understand the profound acquiescence that lies behind 'Adonais' or the 'Ode to the Grecian Urn.' Such acquiescence has no moral quality, as morality is even now understood, nor any logical compulsion. It does not stifle anger nor deny anguish; it turns no smiling face upon unsmiling things; it is not puffed up with the resonance of futile heroics. It accepts the things that are as the necessary basis of artistic creation. This unity which comes of the instinctive refusal in the great poet to deny experience, and subdues the self into the whole as part of that which is not denied, is to be found in every corner of Mr Hardy's mature poetry. It gives, as it alone can really give, to personal emotion what is called the impersonality of great poetry. We feel it as a sense of background, a conviction that a given poem is not the record, but the culmination of an experience, and that the experience of which it is the culmination is far larger and more profound than the one which it seems to record. At the basis of great poetry lies an all-embracing realism, an adequacy to all experience, a refusal of the merely personal in exultation or dismay. Take the contrast between Rupert Brooke's deservedly famous lines: 'There is some corner of a foreign field ...' and Mr Hardy's 'Drummer Hodge':--

'Yet portion of that unknown plain
Will Hodge for ever be;
His homely Northern heart and brain
Grow to some Southern tree,
And strange-eyed constellations reign
His stars eternally.'

We know which is the truer. Which is the more beautiful? Is it not Mr Hardy? And which (strange question) is the more consoling, the more satisfying, the more acceptable? Is it not Mr Hardy? There is sorrow, but it is the sorrow of the spheres. And this, not the apparent anger and dismay of a self's discomfiture, is the quality of greatness in Mr Hardy's poetry. The Mr Hardy of the love poems of 1912-13 is not a man giving way to memory in poetry; he is a great poet uttering the cry of the universe. A vast range of acknowledged experience returns to weight each syllable; it is the quality of life that is vocal, gathered into a moment of time with a vista of years:--

'Ignorant of what there is flitting here to see,
The waked birds preen and the seals flop lazily,
Soon you will have, Dear, to vanish from me,
For the stars close their shutters and the
Dawn whitens hazily.
Trust me, I mind not, though Life lours
The bringing me here; nay, bring me here again!
I am just the same as when
Our days were a joy and our paths through flowers.'

[NOVEMBER, 1919.

We have read these poems of Thomas Hardy, read them not once, but many times. Many of them have already become part of our being; their indelible impress has given shape to dumb and striving elements in our soul; they have set free and purged mute, heart-devouring regrets. And yet, though this is so, the reading of them in a single volume, the submission to their movement with a like unbroken motion of the mind, gathers their greatness, their poignancy and passion, into one stream, submerging us and leaving us patient and purified. There have been many poets among us in the last fifty years, poets of sure talent, and it may be even of genius, but no other of them has this compulsive power. The secret is not hard to find. Not one of them is adequate to what we know and have suffered. We have in our own hearts a new touchstone of poetic greatness. We have learned too much to be wholly responsive to less than an adamant honesty of soul and a complete acknowledgment of experience. 'Give us the whole,' we cry, 'give us the truth.' Unless we can catch the undertone of this acknowledgment, a poet's voice is in our ears hardly more than sounding brass or a tinkling cymbal. Therefore we turn--some by instinct and some by deliberate choice--to the greatest; therefore we deliberately set Mr Hardy among these. What they have, he has, and has in their degree--a plenary vision of life. He is the master of the fundamental theme; it enters into, echoes in, modulates and modifies all his particular emotions, and the individual poems of which they are the substance. Each work of his is a fragment of a whole--not a detached and arbitrarily severed fragment, but a unity which implies, calls for and in a profound sense creates a vaster and completely comprehensive whole. His reaction to an episode has behind and within it a reaction to the universe. An overwhelming endorsement descends upon his words: he traces them as with a pencil, and straightway they are graven in stone. Thus his short poems have a weight and validity which sets them apart in kind from even the very finest work of his contemporaries. These may be perfect in and for themselves; but a short poem by Mr Hardy is often perfect in a higher sense. As the lines of a diagram may be produced in imagination to contain within themselves all space, one of Mr Hardy's most characteristic poems may expand and embrace all human experience. In it we may hear the sombre, ruthless rhythm of life itself--the dominant theme that gives individuation to the ripple of fragmentary joys and sorrows. Take 'The Broken Appointment':--

'You did not come,
And marching Time drew on, and wore me numb.--
Yet less for loss of your dear presence there
Than that I thus found lacking in your make
That high compassion which can overbear
Reluctance for pure lovingkindness' sake
Grieved I, when, as the hope-hour stroked its sum,
You did not come.

'You love not me,
And love alone can lend you loyalty
--I know and knew it. But, unto the store
Of human deeds divine in all but name,
Was it not worth a little hour or more
To add yet this: Once you, a woman, came
To soothe a time-torn man; even though it be
You love not me?'

On such a seeming fragment of personal experience lies the visible endorsement of the universe. The hopes not of a lover but of humanity are crushed beneath its rhythm. The ruthlessness of the event is intensified in the motion of the poem till one can hear the even pad of destiny, and a moment comes when to a sense made eager by the strain of intense attention it seems to have been written by the destiny it records.

What is the secret of poetic power like this? We do not look for it in technique, though the technique of this poem is masterly. But the technique of 'as the hope-hour stroked its sum' is of such a kind that we know as we read that it proceeds from a sheer compulsive force. For a moment it startles; a moment more and the echo of those very words is reverberant with accumulated purpose. They are pitiless as the poem; the sign of an ultimate obedience is upon them. Whence came the power that compelled it? Can the source be defined or indicated? We believe it can be indicated, though not defined. We can show where to look for the mystery, that in spite of our regard remains a mystery still. We are persuaded that almost on the instant that it was felt the original emotion of the poem was endorsed. Perhaps it came to the poet as the pain of a particular and personal experience; but in a little or a long while--creative time is not measured by days or years--it became, for him, a part of the texture of the general life. It

became a manifestation of life, almost, nay wholly, in the sacramental sense, a veritable epiphany. The manifold and inexhaustible quality of life was focused into a single revelation. A critic's words do not lend themselves to the necessary precision. We should need to write with exactly the same power as Mr Hardy when he wrote 'the hope-hour stroked its sum,' to make our meaning likewise inevitable. The word 'revelation' is fertile in false suggestion; the creative act of power which we seek to elucidate is an act of plenary apprehension, by which one manifestation, one form of life, one experience is seen in its rigorous relation to all other and to all possible manifestations, forms, and experiences. It is, we believe, the act which Mr Hardy himself has tried to formulate in the phrase which is the title of one of his books of poems--Moments of Vision. Only those who do not read Mr Hardy could make the mistake of supposing that on his lips such a phrase had a mystical implication. Between belief and logic lies a third kingdom, which the mystics and the philosophers alike are too eager to forget--the kingdom of art, no less the residence of truth than the two other realms, and to some, perhaps, more authentic even than they. Therefore when we expand the word 'vision' in the phrase to 'aesthetic vision' we mean, not the perception of beauty, at least in the ordinary sense of that ill-used word, but the apprehension of truth, the recognition of a complete system of valid relations incapable of logical statement. Such are the acts of unique apprehension which Mr Hardy, we believe, implied by his title. In a 'moment of vision' the poet recognises in a single separate incident of life, life's essential quality. The uniqueness of the whole, the infinite multiplicity and variety of its elements, are manifested and apprehended in a part. Since we are here at work on the confines of intelligible statement, it is better, even at the cost of brutalising a poem, to choose an example from the book that bears the mysterious name. The verses that follow come from 'Near Lanivet, 1872.' We choose them as an example of Mr Hardy's method at less than its best, at a point at which the scaffolding of his process is just visible.

'There was a stunted hand-post just on the crest.
Only a few feet high:
She was tired, and we stopped in the twilight-time for her rest,
At the crossways close thereby.

'She leant back, being so weary, against its stem,
And laid her arms on its own,
Each open palm stretched out to each end of them,
Her sad face sideways thrown.

'Her white-clothed form at this dim-lit cease of day
Made her look as one crucified
In my gaze at her from the midst of the dusty way,
And hurriedly "Don't," I cried.

'I do not think she heard. Loosing thence she said,
As she stepped forth ready to go,
"I am rested now.--Something strange came into my head;
I wish I had not leant so!'"...

'And we dragged on and on, while we seemed to see
In the running of Time's far glass
Her crucified, as she had wondered if she might be
Some day.--Alas, alas!'

Superstition and symbolism, some may say; but they mistakenly invert the order of the creative process. The poet's act of apprehension is wholly different from the lover's fear; and of this apprehension the chance-shaped crucifix is the symbol and not the cause. The concentration of life's vicissitude upon that white-clothed form was first recognised by a sovereign act of aesthetic understanding or intuition; the seeming crucifix supplied a scaffolding for its expression; it afforded a clue to the method of transposition into words which might convey the truth thus apprehended; it suggested an equivalence. The distinction may appear to be hair-drawn, but we believe that it is vital to the theory of poetry as a whole, and to an understanding of Mr Hardy's poetry in particular. Indeed, in it must be sought the meaning of another of his titles, 'Satires of Circumstance,' where the particular circumstance is neither typical nor fortuitous, but a symbol necessary to communicate to others the sense of a quality in life more largely and variously apprehended by the poet. At the risk of appearing fantastic we will endeavour still further to elucidate

our meaning. The poetic process is, we believe, twofold. The one part, the discovery of the symbol, the establishment of an equivalence, is what we may call poetic method. It is concerned with the transposition and communication of emotion, no matter what the emotion may be, for to poetic method the emotional material is, strictly, indifferent. The other part is an esthetic apprehension of significance, the recognition of the all in the one. This is a specifically poetic act, or rather the supreme poetic act. Yet it may be absent from poetry. For there is no necessary connection between poetic apprehension and poetic method.

Poetic method frequently exists without poetic apprehension; and there is no reason to suppose that the reverse is not also true, for the recognition of greatness in poetry is probably not the peculiar privilege of great poets. We have here, at least a principle of division between major and minor poetry.

Mr Hardy is a major poet; and we are impelled to seek further and ask what it is that enables such a poet to perform this sovereign act of apprehension and to recognise the quality of the all in the quality of the one. We believe that the answer is simple. The great poet knows what he is looking for. Once more we speak too precisely, and so falsely, being compelled to use the language of the kingdom of logic to describe what is being done in the kingdom of art. The poet, we say, knows the quality for which he seeks; but this knowledge is rather a condition than a possession of soul. It is a state of responsiveness rather than a knowledge of that to which he will respond. But it is knowledge inasmuch as the choice of that to which he will respond is determined by the condition of his soul. On the purity of that condition depends his greatness as a poet, and that purity in its turn depends upon his denying no element of his profound experience. If he denies or forgets, the synthesis--again the word is a metaphor--which must establish itself within him is fragmentary and false. The new event can wake but partial echoes in his soul or none at all; it can neither be received into, nor can it create a complete relation, and so it passes incommensurable from limbo into forgetfulness. Mr Hardy stands high above all other modern poets by the deliberate purity of his responsiveness. The contagion of the world's slow stain has not touched him; from the first he held aloof from the general conspiracy to forget in which not only those who are professional optimists take a part. Therefore his simplest words have a vehemence and strangeness of their own:--

'It will have been:
Nor God nor Demon can undo the done,
Unseen the seen
Make muted music be as unbegun
Though things terrene
Groan in their bondage till oblivion supervene.'

What neither God nor Demon can do, men are incessantly at work to accomplish. Life itself rewards them for their assiduity, for she scatters her roses chiefly on the paths of those who forget her thorns. But the great poet remembers both rose and thorn; and it is beyond his power to remember them otherwise than together. It was fitting, then, and to some senses inevitable, that Mr Hardy should have crowned his work as a poet in his old age by a series of love poems that are unique for power and passion in even the English language. This late and wonderful flowering has no tinge of miracle; it has sprung straight from the main stem of Mr Hardy's poetic growth. Into 'Veteris Vestigia Flammæ' is distilled the quintessence of the power that created the Wessex Novels and 'The Dynasts'; all that Mr Hardy has to tell us of life, the whole of the truth that he has apprehended, is in these poems, and no poet since poetry began has apprehended or told us more. *Sunt lacrimæ rerum.*

POSTSCRIPT

Three months after this essay was written the first volume of the long awaited definitive edition of Mr Hardy's works (the Mellstock Edition) appeared. It was with no common thrill that we read in the precious pages of introduction the following words confirming the theory upon which the first part of the essay is largely based.

'Turning now to my verse--to myself the more individual part of my literary fruitage--I would say that, unlike some of the fiction, nothing interfered with the writer's freedom in respect of its form

or content. Several of the poems--indeed many--were produced before novel-writing had been thought of as a pursuit; but few saw the light till all the novels had been published....

'The few volumes filled by the verse cover a producing period of some eighteen years first and last, while the seventeen or more volumes of novels represent correspondingly about four-and-twenty years. One is reminded by this disproportion in time and result how much more concise and quintessential expression becomes when given in rhythmic form than when shaped in the language of prose.'

Present Condition of English Poetry

Shall we, or shall we not, be serious? To be serious nowadays is to be ill-mannered, and what, murmurs the cynic, does it matter? We have our opinion; we know that there is a good deal of good poetry in the Georgian book, a little in Wheels.[13] We know that there is much bad poetry in the Georgian book, and less in Wheels. We know that there is one poem in Wheels beside the intense and sombre imagination of which even the good poetry of the Georgian book pales for a moment. We think we know more than this. What does it matter? Pick out the good things, and let the rest go.

[Footnote 13: Georgian Poetry, 1918-1919. Edited by E.M. (The Poetry Bookshop.)

Wheels. Fourth Cycle. (Oxford: B.H. Blackwell.)]

And yet, somehow, this question of modern English poetry has become important for us, as important as the war, important in the same way as the war. We can even analogise. Georgian Poetry is like the Coalition Government; Wheels is like the Radical opposition. Out of the one there issues an indefinable odour of complacent sanctity, an unctuous redolence of union sacrée; out of the other, some acidulation of perversity. In the coalition poets we find the larger number of good men, and the larger number of bad ones; in the opposition poets we find no bad ones with the coalition badness, no good ones with the coalition goodness, but in a single case a touch of the apocalyptic, intransigent, passionate honesty that is the mark of the martyr of art or life. On both sides we have the corporate and the individual flavour; on both sides we have those individuals-by-courtesy whose flavour is almost wholly corporate; on both sides the corporate flavour is one that we find intensely disagreeable. In the coalition we find it noxious, in the opposition no worse than irritating. No doubt this is because we recognise a tendency to take the coalition seriously, while the opposition is held to be ridiculous. But both the coalition and the opposition--we use both terms in their corporate sense--are unmistakably the product of the present age. In that sense they are truly representative and complementary each to the other; they are a fair sample of the goodness and badness of the literary epoch in which we live; they are still more remarkable as an index of the complete confusion of aesthetic values that prevails to-day. The corporate flavour of the coalition is a false simplicity. Of the nineteen poets who compose it there are certain individuals whom we except absolutely from this condemnation, Mr de la Mare, Mr Davies, and Mr Lawrence; there are others who are more or less exempt from it, Mr Abercrombie, Mr Sassoon, Mrs Shove, and Mr Nichols; and among the rest there are varying degrees of saturation. This false simplicity can be quite subtle. It is compounded of worship of trees and birds and contemporary poets in about equal proportions; it is sicklied over at times with a quite perceptible varnish of modernity, and at other times with what looks to be technical skill, but generally proves to be a fairly clumsy reminiscence of somebody else's technical skill. The negative qualities of this simplese are, however, the most obvious; the poems imbued with it are devoid of any emotional significance whatever. If they have an idea it leaves you with the queer feeling that it is not an idea at all, that it has been defaced, worn smooth by the rippling of innumerable minds. Then, spread in a luminous haze over these compounded elements, is a fundamental right-mindedness; you feel, somehow, that they might have been very wicked, and yet they are very good. There is nothing disturbing about them; ils peuvent être mis dans toutes les mains; they are kind, generous, even noble. They sympathise with animate and inanimate nature. They have shining foreheads with big bumps of benevolence, like Flora Casby's father, and one inclines to believe that their eyes must be frequently filmed with an honest tear, if only because their vision is blurred. They are fond of lists of names

which never suggest things; they are sparing of similes. If they use them they are careful to see they are not too definite, for a definite simile makes havoc of their constructions, by applying to them a certain test of reality. But it is impossible to be serious about them. The more stupid of them supply the matter for a good laugh; the more clever the stuff of a more recondite amazement. What is one to do when Mr Monro apostrophises the force of Gravity in such words as these?—

'By leave of you man places stone on stone;
He scatters seed: you are at once the prop
Among the long roots of his fragile crop
You manufacture for him, and insure
House, harvest, implement, and furniture,
And hold them all secure.'

We are not surprised to learn further that

'I rest my body on your grass,
And let my brain repose in you.'

All that remains to be said is that Mr Monro is fond of dogs ('Can you smell the rose?' he says to Dog: 'ah, no!') and inclined to fish—both of which are Georgian inclinations.

Then there is Mr Drinkwater with the enthusiasm of the just man for moonlit apples--'moon-washed apples of wonder'--and the righteous man's sense of robust rhythm in this chorus from 'Lincoln':--

'You who know the tenderness
Of old men at eve-tide,
Coming from the hedgerows,
Coming from the plough,
And the wandering caress
Of winds upon the woodside,
When the crying yaffle goes
Underneath the bough.'

Mr Drinkwater, though he cannot write good doggerel, is a very good man. In this poem he refers to the Sermon on the Mount as 'the words of light >From the mountain-way.'

Mr Squire, who is an infinitely more able writer, would make an excellent subject for a critical investigation into false simplicity. He would repay a very close analysis, for he may deceive the elect in the same way as, we suppose, he deceives himself. His poem 'Rivers' seems to us a very curious example of the faux bon. Not only is the idea derivative, but the rhythmical treatment also. Here is Mr de la Mare:--

'Sweet is the music of Arabia
In my heart, when out of dreams
I still in the thin clear murk of dawn
Descry her gliding streams;
Hear her strange lutes on the green banks
Ring loud with the grief and delight
Of the dim-silked, dark-haired musicians
In the brooding silence of night.
They haunt me--her lutes and her forests;
No beauty on earth I see
But shadowed with that dream recalls
Her loveliness to me:
Still eyes look coldly upon me,
Cold voices whisper and say--
"He is crazed with the spell of far Arabia,

They have stolen his wits away."

And here is a verse from Mr Squire:--

'For whatever stream I stand by,
And whatever river I dream of,
There is something still in the back of my mind
From very far away;
There is something I saw and see not,
A country full of rivers
That stirs in my heart and speaks to me
More sure, more dear than they.

'And always I ask and wonder
(Though often I do not know it)
Why does this water not smell like water?...'

To leave the question of reminiscence aside, how the delicate vision of Mr de la Mare has been coarsened, how commonplace his exquisite technique has become in the hands of even a first-rate ability! It remains to be added that Mr Squire is an amateur of nature,--

'And skimming, fork-tailed in the evening air,
When man first was were not the martens there?'--

and a lover of dogs.

Mr Shanks, Mr W.J. Turner, and Mr Freeman belong to the same order. They have considerable technical accomplishment of the straightforward kind--and no emotional content. One can find examples of the disastrous simile in them all. They are all in their degree pseudo-naïves. Mr Turner wonders in this way:--

'It is strange that a little mud
Should echo with sounds, syllables, and letters,
Should rise up and call a mountain Popocatapetl,
And a green-leafed wood Oleander.'

Of course Mr Turner does not really wonder; those four lines are proof positive of that. But what matters is not so much the intrinsic value of the gift as the kindly thought which prompted the giver. Mr Shanks's speciality is beauty. He also is an amateur of nature. He bids us: 'Hear the loud night-jar spin his pleasant note.' Of course, Mr Shanks cannot have heard a real night-jar. His description is proof of that. But again, it was a kindly thought. Mr Freeman is, like Mr Squire, a more interesting case, deserving detailed analysis. For the moment we can only recommend a comparison of his first and second poems in this book with 'Sabrina Fair' and 'Love in a Valley' respectively.

It is only when we are confronted with the strange blend of technical skill and an emotional void that we begin to hunt for reminiscences. Reminiscences are no danger to the real poet. He is the splendid borrower who lends a new significance to that which he takes. He incorporates his borrowing in the new thing which he creates; it has its being there and there alone. One can see the process in the one fine poem in Wheels, Mr Wilfred Owen's 'Strange Meeting':--

'It seemed that out of the battle I escaped
Down some profound dull tunnel, long since scooped
Through granites which Titanic wars had groined.
Yet also there encumbered sleepers groaned,
Too fast in thought or death to be bestirred.
Then, as I probed them, one sprang up, and stared
With piteous recognition in fixed eyes,
Lifting distressful hands as if to bless.

And by his smile, I knew that sullen hall.
With a thousand fears that vision's face was grained;
Yet no blood reached there from the upper ground,
And no guns thumped, or down the flues made moan.
"Strange, friend," I said, "Here is no cause to mourn."
"None," said the other, "save the undone years,
The hopelessness. Whatever hope is yours,
Was my life also..."

The poem which begins with these lines is, we believe, the finest in these two books, both in intention and achievement. Yet no one can mistake its source. It comes, almost bodily, from the revised Induction to 'Hyperion.' The sombre imagination, the sombre rhythm is that of the dying Keats; the creative impulse is that of Keats.

'None can usurp this height, return'd that shade,
But those to whom the miseries of the world
Are misery, and will not let them rest.'

That is true, word by word, and line by line, of Wilfred Owen's 'Strange Meeting.' It touches great poetry by more than the fringe; even in its technique there is the hand of the master to be. Those monosyllabic assonances are the discovery of genius. We are persuaded that this poem by a boy like his great forerunner, who had the certainty of death in his heart, is the most magnificent expression of the emotional significance of the war that has yet been achieved by English poetry. By including it in his book, the editor of *Wheels* has done a great service to English letters.

Extravagant words, it may be thought. We appeal to the documents. Read *Georgian Poetry* and read 'Strange Meeting.' Compare Wilfred Owen's poem with the very finest things in the *Georgian* book--Mr Davies's 'Lovely Dames,' or Mr de la Mare's 'The Tryst,' or 'Fare Well,' or the twenty opening lines of Mr Abercrombie's disappointing poem. You will not find those beautiful poems less beautiful than they are; but you will find in 'Strange Meeting' an awe, an immensity, an adequacy to that which has been most profound in the experience of a generation. You will, finally, have the standard that has been lost, and the losing of which makes the confusion of a book like *Georgian Poetry* possible, restored to you. You will remember three forgotten things--that poetry is rooted in emotion, and that it grows by the mastery of emotion, and that its significance finally depends upon the quality and comprehensiveness of the emotion. You will recognise that the tricks of the trade have never been and never will be discovered by which ability can conjure emptiness into meaning.

It seems hardly worth while to return to *Wheels*. Once the argument has been pitched on the plane of 'Strange Meeting,' the rest of the contents of the book become irrelevant. But for the sake of symmetry we will characterise the corporate flavour of the opposition as false sophistication. There are the same contemporary reminiscences. Compare Mr Osbert Sitwell's *English Gothic* with Mr T.S. Eliot's *Sweeney*; and you will detect a simple mind persuading itself that it has to deal with the emotions of a complex one. The spectacle is almost as amusing as that of the similar process in the *Georgian* book. Nevertheless, in general, the affected sophistication here is, as we have said, merely irritating; while the affected simplicity of the coalition is positively noxious. Miss Edith Sitwell's deliberate painted toys are a great deal better than painted canvas trees and fields, masquerading as real ones. In the poems of Miss Iris Tree a perplexed emotion manages to make its way through a chaotic technique. She represents the solid impulse which lies behind the opposition in general. This impulse she describes, though she is very, very far from making poetry of it, in these not uninteresting verses:--

'But since we are mere children of this age,
And must in curious ways discover salvation
I will not quit my muddled generation,
But ever plead for Beauty in this rage.

'Although I know that Nature's bounty yields
Unto simplicity a beautiful content,
Only when battle breaks me and my strength is spent
Will I give back my body to the fields.'

There is the opposition. Against the righteous man, the mauvais sujet. We sympathise with the mauvais sujet. If he is persistent and laborious enough, he may achieve poetry. But he must travel alone. In order to be loyal to your age you must make up your mind what your age is. To be muddled yourself is not loyalty, but treachery, even to a muddled generation.

[DECEMBER, 1919.

The Nostalgia of Mr Masfield

Mr Masfield is gradually finding his way to his self-appointed end, which is the glorification of England in narrative verse. Reynard the Fox marks we believe, the end of a stage in his progress to this goal. He has reached a point at which his mannerisms have been so subdued that they no longer sensibly impede the movement of his verse, a point at which we may begin to speak (though not too loud) of mastery. We feel that he now approaches what he desires to do with some certainty of doing it, so that we in our turn can approach some other questions with some hope of answering them. The questions are various; but they radiate from and enter again into the old question whether what he is doing, and beginning to do well, is worth while doing, or rather whether it will have been worth while doing fifty years hence. For we have no doubt at all in our mind that, in comparison with the bulk of contemporary poetry, such work as Reynard the Fox is valuable. We may use the old rough distinction and ask first whether Reynard the Fox is durable in virtue of its substance, and second, whether it is durable in virtue of its form. The glorification of England! There are some who would give their souls to be able to glorify her as she has been glorified, by Shakespeare, by Milton, by Wordsworth, and by Hardy. For an Englishman there is no richer inspiration, no finer theme; to have one's speech and thought saturated by the fragrance of this lovely and pleasant land was once the birthright of English poets and novelists. But something has crept between us and it, dividing. Instead of an instinctive love, there is a conscious desire of England; instead of slow saturation, a desperate plunge into its mystery. The fragrance does not come at its own sweet will; we clutch at it. It does not enfold and pervade our most arduous speculations; no involuntary sweetness comes flooding in upon our confrontation of human destinies. Hardy is the last of that great line. If we long for sweetness--as we do long for it, and with how poignant a pain!--we must seek it out, like men who rush dusty and irritable from the babble and fever of the town. The rhythm of the earth never enters into their gait; they are like spies among the birds and flowers, like collectors of antique furniture in the haunts of peace. The Georgians snatch at nature; they are never part of it. And there is some element of this desperation in Mr Masfield. We feel in him an anxiety to load every rift with ore of this particular kind, a deliberate intention to emphasise that which is most English in the English country-side. How shall we say it? It is not that he makes a parade of arcane knowledge. The word 'parade' does injustice to his indubitable integrity. But we seem to detect behind his superfluity of technical, and at times archaic phrase, an unconscious desire to convince himself that he is saturated in essential Englishness, and we incline to think that even his choice of an actual subject was less inevitable than self-imposed. He would isolate the quality he would capture, have it more wholly within his grasp; yet, in some subtle way, it finally eludes him. The intention is in excess, and in the manner of its execution everything is (though often very subtly) in excess also. The music of English place-names, for instance is too insistent; no one into whom they had entered with the English air itself would use them with so manifest an admiration. Perhaps a comparison may bring definition nearer. The first part of Mr Masfield's poem, which describes the meet and the assembled persons one by one, recalls, not merely by the general cast of the subject, but by many actual turns of phrase, Chaucer's Prologue. Mr Masfield's parson has more than one point of resemblance to Chaucer's Monk:--

'An out-ryder, that loved venerye;
A manly man to ben an abbot able....'

But it would take too long to quote both pictures. We may choose for our juxtaposition the Prioress and one of Mr Masfield's young ladies:--

'Behind them rode her daughter Belle,
A strange, shy, lovely girl, whose face
Was sweet with thought and proud with race,

And bright with joy at riding there.
She was as good as blowing air,
But shy and difficult to know.
The kittens in the barley-mow,
The setter's toothless puppies sprawling,
The blackbird in the apple calling,
All knew her spirit more than we.
So delicate these maidens be
In loving lovely helpless things.'

And here is the Prioress:--

'But for to speken of hir conscience,
She was so charitable and so pitous,
She wolde weepe if that she sawe a mous
Caught in a trappe, if it were ded or bledde.
Of smalle houndes had she, that she fed
With rosted flesh, or milk, or wastel bread,
But sore wepte she if oon of hem were ded
Or if men smote it with a yerde smerte:
And all was conscience and tendere herte.'
Ful semely hir wympel pynched was;
His nose tretys; hir eyen greye as glas;
Hir mouth full small, and thereto soft and red,
But sikerly she hadde a fair forhed.'

There is in the Chaucer a naturalness, a lack of emphasis, a confidence that the object will not fail to make its own impression, beside which Mr Masefield's demonstration and underlining seem almost malsain. How far outside the true picture now appears that 'blackbird in the apple calling,' and how tainted by the desperate bergerie of the Georgian era!

It is, we admit, a portentous experiment to make, to set Mr Masefield's prologue beside Chaucer's. But not only is it a tribute to Mr Masefield that he brought us to reading Chaucer over again, but the comparison is at bottom just. Chaucer is not what we understand by a great poet; he has none of the imaginative comprehension and little of the music that belong to one: but he has perdurable qualities. He is at home with his speech and at home with his world; by his side Mr Masefield seems nervous and uncertain about both. He belongs, in fact, to a race (or a generation) of poets who have come to feel a necessity of overloading every rift with ore. The question is whether such a man can hope to express the glory and the fragrance of the English country-side.

Can there be an element of permanence in a poem of which the ultimate impulse is a *nostalgie de la boue* that betrays itself in line after line, a nostalgia so conscious of separation that it cannot trust that any associations will be evoked by an unemphasised appeal? Mr Masefield, in his fervour to grasp at that which for all his love is still alien to him, seems almost to shovel English mud into his pages; he cannot (and rightly cannot) persuade himself that the scent of the mud will be there otherwise. For the same reason he must make his heroes like himself. Here, for example, is the first whip, Tom Dansey:--

'His pleasure lay in hounds and horses;
He loved the Seven Springs water-courses,
Those flashing brooks (in good sound grass,
Where scent would hang like breath on glass).
He loved the English country-side;
The wine-leaved bramble in the ride,
The lichen on the apple-trees,
The poultry ranging on the lees,
The farms, the moist earth-smelling cover,
His wife's green grave at Mitcheldover,

Where snowdrops pushed at the first thaw.
Under his hide his heart was raw
With joy and pity of these things...'

That 'raw heart' marks the outsider, the victim of nostalgia. Apart from the fact that it is a manifest artistic blemish to impute it to the first whip of a pack of foxhounds, the language is such that it would be a mistake to impute it to anybody; and with that we come to the question of Mr Masefield's style in general.

As if to prove how rough indeed was the provisionally accepted distinction between substance and form, we have for a long while already been discussing Mr Masefield's style under a specific aspect. But the particular overstrain we have been examining is part of Mr Masefield's general condition. Overstrain is permanent with him. If we do not find it in his actual language (and, as we have said, he is ridding himself of the worst of his exaggerations) we are sure to find it in the very vitals of his artistic effort. He is seeking always to be that which he is not, to lash himself into the illusion of a certainty which he knows he can never wholly possess.

'From the Gallows Hill to the Kineton Copse
There were ten ploughed fields, like ten full-stops,
All wet red clay, where a horse's foot
Would be swathed, feet thick, like an ash-tree root.
The fox raced on, on the headlands firm,
Where his swift feet scared the coupling worm;
The rooks rose raving to curse him raw,
He snarled a sneer at their swoop and caw.
Then on, then on, down a half-ploughed field
Where a ship-like plough drove glitter-keeled,
With a bay horse near and a white horse leading,
And a man saying "Zook," and the red earth bleeding.'

The rasp of exacerbation is not to be mistaken. It comes, we believe, from a consciousness of anæmia, a frenetic reaction towards what used, some years ago, to be called 'blood and guts.'

And here, perhaps, we have the secret of Mr Masefield and of our sympathy with him. His work, for all its surface robustness and right-thinking (which has at least the advantage that it will secure for this 'epic of fox-hunting' a place in the library of every country house), is as deeply debilitated by reaction as any of our time. Its colour is hectic; its tempo feverish. He has sought the healing virtue where he believed it undefiled, in that miraculous English country whose magic (as Mr Masefield so well knows) is in Shakespeare, and whose strong rhythm is in Hardy. But the virtue eludes all conscious inquisition. The man who seeks it feverishly sees riot where there is peace. And may it not be, in the long run, that Mr Masefield would have done better not to delude himself into an identification he cannot feel, but rather to face his own disquiet where alone the artist can master it, in his consciousness? We will not presume to answer, mindful that Mr Masefield may not recognise himself in our mirror, but we will content ourselves with recording our conviction that in spite of the almost heroic effort that has gone to its composition Reynard the Fox lacks all the qualities essential to durability.

[JANUARY, 1920.

The Lost Legions

One day, we believe, a great book will be written, informed by the breath which moves the Spirits of Pity in Mr Hardy's Dynasts. It will be a delicate, yet undeviating record of the spiritual awareness of the generation that perished in the war. It will be a work of genius, for the essence that must be captured within it is volatile beyond belief, almost beyond imagination. We know of its existence by signs hardly more material than a dream-memory of beating wings or an instinctive, yet all but inexplicable refusal of that which has been offered us in its stead. The

autobiographer-novelists have been legion, yet we turn from them all with a slow shake of the head. 'No, it was not that. Had we lost only that we could have forgotten. It was not that.' No, it was the spirit that troubled, as in dream, the waters of the pool, some influence which trembled between silence and a sound, a precarious confidence, an unavowed quest, a wisdom that came not of years or experience, a dissatisfaction, a doubt, a devotion, some strange presentiment, it may have been, of the bitter years in store, in memory an ineffable, irrevocable beauty, a visible seal on the forehead of a generation.

'When the lamp is shattered.
The light in the dust lies dead--
When the cloud is scattered
The rainbow's glory is shed.
When the lute is broken,
Sweet tones are remembered not...'

Yet out of a thousand fragments this memory must be created anew in a form that will outlast the years, for it was precious. It was something that would vindicate an epoch against the sickening adulation of the hero-makers and against the charge of spiritual sterility; a light in whose gleam the bewildering non-achievements of the present age, the art which seems not even to desire to be art, the faith which seems not to desire to be faith, have substance and meaning. It was shot through and through by an impulse of paradox, an unconscious straining after the impossible, gathered into two or three tremulous years which passed too swiftly to achieve their own expression. Now, what remains of youth is cynical, is successful, publicly exploits itself. It was not cynical then. Elements of the influence that was are remembered only if they lasted long enough to receive a name. There was Unanimism. The name is remembered; perhaps the books are read. But it will not be found in the books. They are childish, just as the English novels which endeavoured to portray the soul of the generation were coarse and conceited. Behind all the conscious manifestations of cleverness and complexity lay a fundamental candour of which only a flickering gleam can now be recaptured. It glints on a page of M. Romain's Europe; the memory of it haunts Wilfred Owen's poems; it touches Keeling's letters; it hovers over these letters of Charles Sorley.[14] From a hundred strange lurking-places it must be gathered by pious and sensitive fingers and withdrawn from under the very edge of the scythe-blade of time, for if it wander longer without a habitation it will be lost for ever.

[Footnote 14: The Letters of Charles Sorley. (Cambridge University Press.)]

Charles Sorley was the youngest fringe of the strange unity that included him and men by ten years his senior. He had not, as they had, plunged with fantastic hopes and unspoken fears into the world. He had not learned the slogans of the day. But, seeing that the slogans were only a disguise for the undefined desires which inspired them he lost little and gained much thereby. The years at Oxford in which he would have taken a temporary sameness, a sameness in the long run protective and strengthening, were spared him. In his letters we have him unspoiled, as the sentimentalists would say--not yet with the distraction of protective colouring.

One who knew him better than the mere reader of his letters can pretend to know him declares that, in spite of his poems, which are among the most remarkable of those of the boy-poets killed in the war, Sorley would not have been a man of letters. The evidence of the letters themselves is heavy against the view; they insist upon being regarded as the letters of a potential writer. But a passionate interest in literature is not the inevitable prelude to a life as a writer, and although it is impossible to consider any thread in Sorley's letters as of importance comparable to that which joins the enthronement and dethronement of his literary idols, we shall regard it as the record of a movement of soul which might as easily find expression (as did Keeling's) in other than literary activities. It takes more than literary men to make a generation, after all.

And Sorley was typical above all in this, that, passionate and penetrating as was his devotion to literature, he never looked upon it as a thing existing in and for itself. It was, to him and his kind, the satisfaction of an impulse other and more complex than the æsthetic. Art was a means and not an end to him, and it is perhaps the apprehension of this that has led one who endeavoured in vain to reconcile Sorley to Pater into rash prognostication. Sorley would never have been an artist in Pater's way; he belonged to his own generation, to which l'art pour l'art had ceased to have meaning. There had come a pause, a throbbing silence, from which art might have emerged, may even now after the appointed time arise, with strange validities undreamed of or forgotten.

Let us not prophesy; let us be content with the recognition that Sorley's generation was too keenly, perhaps too disastrously aware of destinies, of

'the beating of the wings of Love
Shut out from his creation,'

to seek the comfort of the ivory tower.

Sorley first appears before us radiant with the white-heat of a schoolboy enthusiasm for Masfield. Masfield is--how we remember the feeling!--the poet who has lived; his naked reality tears through 'the lace of putrid sentimentalism (educing the effeminate in man) which rots like Tennyson and Swinburne have taught his (the superficial man's) soul to love.' It tears through more than Tennyson and Swinburne. The greatest go down before him.

'So you see what I think of John Masfield. When I say that he has the rapidity, simplicity, nobility of Homer, with the power of drawing character, the dramatic truth to life of Shakespeare, along with a moral and emotional strength and elevation which is all his own, and therefore I am prepared to put him above the level of these two great men--I do not expect you to agree with me.'--(From a paper read at Marlborough, November, 1912.)

That was Sorley at seventeen, and that, it seems to us, is the quality of enthusiasm which should be felt by a boy of seventeen if he is to make his mark. It is infinitely more important to have felt that flaming enthusiasm for an idol who will be cast down than to have felt what we ought to feel for Shakespeare and Homer. The gates of heaven are opened by strange keys, but they must be our own.

Within six months Masfield had gone the way of all flesh. In a paper on *The Shropshire Lad* (May, 1913), curious both for critical subtlety and the faint taste of disillusion, Sorley was saying: 'His (Masfield's) return (to the earth) was purely emotional, and probably less interesting than the purely intellectual return of Meredith.' At the beginning of 1914, having gained a Scholarship at University College, Oxford, he went to Germany. Just before going he wrote:--

'I am just discovering Thomas Hardy. There are two methods of discovery. One is when Columbus discovers America. The other is when some one begins to read a famous author who has already run into seventy editions, and refuses to speak about anything else, and considers every one else who reads the author's works his own special converts. Mine is the second method. I am more or less Hardy-drunk.'

The humorous exactness and detachment of the description are remarkable, and we feel that there was more than the supersession of a small by a great idol in this second phase. By April he is at Jena, 'only 15 miles from Goethe's grave, whose inhabitant has taken the place of Thomas Hardy (successor to Masfield) as my favourite prophet.'

'I hope (if nothing else) before I leave Germany to get a thorough hang of Faust.... The worst of a piece like Faust is that it completely dries up any creative instincts or attempts in oneself. There is nothing that I have ever thought or ever read that is not somewhere contained in it, and (what is worse) explained in it.'

He had a sublime contempt for any one with whom he was not drunk. He lumped together 'nasty old Lyttons, Carlyles, and Dickens.' And the intoxication itself was swift and fleeting. There was something wrong with Goethe by July; it is his 'entirely intellectual' life.

'If Goethe really died saying "more light," it was very silly of

him: what he wanted was more warmth.'

And he writes home for Richard Jefferies, the man of his own county—for through Marlborough he had made himself the adopted son of the Wiltshire Downs.

'In the midst of my setting up and smashing of deities--Masefield, Hardy, Goethe--I always fall back on Richard Jefferies wandering about in the background. I have at least the tie of locality with him.'

A day or two after we incidentally discover that Meredith is up (though not on Olympus) from a denunciation of Browning on the queer non- (or super-) æsthetic grounds of which we have spoken:--

'There is much in B. I like. But my feeling towards him has (ever since I read his life) been that of his to the "Lost Leader." I cannot understand him consenting to live a purely literary life in Italy, or (worse still) consenting to be lionised by fashionable London society. And then I always feel that if less people read Browning, more would read Meredith (his poetry, I mean.)'

Then, while he was walking in the Moselle Valley, came the war. He had loved Germany, and the force of his love kept him strangely free from illusions; he was not the stuff that "our modern Elizabethans" are made of. The keen candour of spiritual innocence is in what he wrote while training at Shorncliffe:--

'For the joke of seeing an obviously just cause defeated, I hope Germany will win. It would do the world good, and show that real faith is not that which says "we must win for our cause is just," but that which says "our cause is just: therefore we can disregard defeat."...

'England--I am sick of the sound of the word. In training to fight for England, I am training to fight for that deliberate hypocrisy, that terrible middle-class sloth of outlook and appalling "imaginative indolence" that has marked us out from generation to generation.... And yet we have the impudence to write down Germany (who with all their bigotry are at least seekers) as "Huns," because they are doing what every brave man ought to do and making experiments in morality. Not that I approve of the experiment in this particular case. Indeed I think that after the war all brave men will renounce their country and confess that they are strangers and pilgrims on the earth. "For they that say such things declare plainly that they seek a country." But all these convictions are useless for me to state since I have not had the courage of them. What a worm one is under the cart-wheels--big, clumsy, careless, lumbering cart-wheels--of public opinion. I might have been giving my mind to fight against Sloth and Stupidity: instead, I am giving my body (by a refinement of cowardice) to fight against the most enterprising nation in the world.'

The wise arm-chair patriots will shake their heads; but there is more wisdom of spirit in these words than in all the newspaper leaders written throughout the war. Sorley was fighting for more than he said; he was fighting for his Wiltshire Downs as well. But he fought in complete and utter detachment. He died too soon (in October, 1915), to suffer the cumulative torment of those who lasted into the long agony of 1917. There is little bitterness in his letters; they have to the last always the crystal clarity of the vision of the unbroken.

His intellectual evolution went on to the end. No wonder that he found Rupert Brooke's sonnets overpraised:--

'He is far too obsessed with his own sacrifice.... It was not that "they" gave up anything of that list he gives in one sonnet: but that the essence of these things had been endangered by circumstances over which he had no control, and he must fight to recapture them. He has clothed his attitude in fine words: but he has taken the sentimental attitude.'

Remember that a boy of nineteen is writing, and think how keen is this criticism of Brooke's war sonnets; the seeker condemns without pity one who has given up the search. 'There is no such thing as a just war,' writes this boy. 'What we are doing is casting out Satan by Satan.' From this position Sorley never flinched. Never for a moment was he renegade to his generation by taking 'the sentimental attitude.' Neither had he in him an atom of the narrowness of the straiter sect.

Though space forbids, we will follow out his progress to the last. We do not receive many such gifts as this book; the authentic voice of those lost legions is seldom heard. We can afford, surely, to listen to it to the end. In November, 1914, Sorley turns back to the Hardy of the poems. After rejecting 'the actual "Satires of Circumstance"' as bad poetry, and passing an incisive criticism on 'Men who March away,' he continues:--

'I cannot help thinking that Hardy is the greatest artist of the English character since Shakespeare; and much of *The Dynasts* (except its historical fidelity) might be Shakespeare. But I value his lyrics as presenting himself (the self he does not obtrude into the comprehensiveness of his novels and *The Dynasts*) as truly, and with faults as well as strength visible in it, as any character in his novels. His lyrics have not the spontaneity of Shakespeare's or Shelley's; they are rough-hewn and jagged: but I like them and they stick.'

A little later, having finished *The Egoist*,--

'I see now that Meredith belongs to that class of novelists with whom I do not usually get on so well (e.g. Dickens), who create and people worlds of their own so that one approaches the characters with amusement, admiration, or contempt, not with liking or pity, as with Hardy's people, into whom the author does not inject his own exaggerated characteristics.'

The great Russians were unknown to Sorley when he died. What would he not have found in those mighty seekers, with whom Hardy alone stands equal? But whatever might have been his vicissitudes in that strange company, we feel that Hardy could never have been dethroned in his heart, for other reasons than that the love of the Wessex hills had crept into his blood. He was killed on October 13, 1915, shot in the head by a sniper as he led his company at the 'hair-pin' trench near Hulluch.

[JANUARY, 1920.

The Cry in the Wilderness

We have in Mr Irving Babbitt's *Rousseau and Romanticism* to deal with a closely argued and copiously documented indictment of the modern mind. We gather that this book is but the latest of several books in which the author has gradually developed his theme, and we regret exceedingly that the preceding volumes have not fallen into our hands, because whatever may be our final attitude towards the author's conclusions, we cannot but regard Rousseau and

Romanticism as masterly. Its style is, we admit, at times rather harsh and crabbed, but the critical thought which animates it is of a kind so rare that we are almost impelled to declare that it is the only book of modern criticism which can be compared for clarity and depth of thought with Mr Santayana's *Three Philosophical Poets*.

By endeavouring to explain the justice of that verdict we shall more easily give an indication of the nature and scope of Professor Babbitt's achievement. We think that it would be easy to show that in the last generation--we will go no further back for the moment, though our author's arraignment reaches at least a century earlier--criticism has imperceptibly given way to a different activity which we may call appreciation. The emphasis has been laid upon the uniqueness of the individual, and the unconscious or avowed aim of the modern 'critic' has been to persuade us to understand, to sympathise with and in the last resort to enter into the whole psychological process which culminated in the artistic creation of the author examined. And there modern criticism has stopped. There has been no indication that it was aware of the necessity of going further. Many influences went to shape the general conviction that mere presentation was the final function of criticism, but perhaps the chief of these was the curious contagion of a scientific terminology. The word 'objectivity' had a great vogue; it was felt that the spiritual world was analogous to the physical; the critic was faced, like the man of science, with a mass of hard, irreducible facts, and his function was, like the scientist's, that of recording them as compendiously as possible and without prejudice. The unconscious programme was, indeed, impossible of fulfilment. All facts may be of equal interest to the scientist, but they are not to the literary critic. He chose those which interested him most for the exercise of his talent for demonstration. But that choice was, as a general rule, the only specifically critical act which he performed, and, since it was usually unmotivated, it was difficult to attach even to that more than a 'scientific' importance. Reasoned judgments of value were rigorously eschewed, and even though we may presume that the modern critic is at times vexed by the problem why (or whether) one work of art is better than another, when each seems perfectly expressive of the artist's intention, the preoccupation is seldom betrayed in the language of his appreciation. Tacitly and insensibly we have reached a point at which all works of art are equally good if they are equally expressive. What every artist seeks to express is his own unique consciousness. As between things unique there is no possibility of subordination or comparison. That does not seem to us an unduly severe diagnosis of modern criticism, although it needs perhaps to be balanced by an acknowledgment that the impulse towards the penetration of an artist's consciousness is in itself salutary, as a valuable adjunct to the methods of criticism, provided that it is definitely subordinated to the final critical judgment, before which uniqueness is an impossible plea. Such a diagnosis will no doubt be welcomed by those who belong to an older generation than that to which it is applied. But they should not rejoice prematurely. We require of them an answer to the question whether they were really in better case--whether they were not the fathers whose sins are visited upon the children. Professor Babbitt, at least, has no doubt of their responsibility. From his angle of approach we might rake their ranks with a cross-fire of questions such as these: When you invoked the sanction of criticism were you more than merely destructive? When you riddled religion with your scientific objections, did you not forget that religion is something more, far more than a nexus of historical facts or a cosmogony? When you questioned everything in the name of truth and science, why did you not dream of asking whether those creations of men's minds were *capax imperii* in man's universe? What right had you to suppose that a man disarmed of tradition is stronger for his nakedness? Why did you not examine in the name of that same truth and science the moral nature of man, and see whether it was fit to bear the burden of intolerable knowledge which you put upon it? Why did you, the truth-seekers and the scientists, indulge yourselves in the most romantic dream of a natural man who followed instinctively the greatest good of the greatest number, which you yourselves never for one moment pursued? What hypocrisy or self-deception enabled you to clothe your statements of fact in a moral aura, and to blind yourselves and the world to the truth that you were killing a domesticated dragon who guarded the cave of a devouring hydra, whom you benevolently loosed? Why did you not see that the end of all your devotion was to shift man's responsibility for himself from his shoulders? Do you, because you clothed yourselves in the shreds of a moral respectability which you had not the time (or was it the courage?) to analyse, dare to denounce us because our teeth are set on edge by the sour grapes which you enjoyed? But this indictment, it may be said by a modern critic, deals with morals, and we are discussing art and criticism. That the objection is conceivable is precisely the measure of our decadence. For the vital centre of our ethics is also the vital centre of our art. Moral nihilism inevitably involves an aesthetic nihilism, which can be obscured only temporarily by an insistence upon technical perfection as in itself a supreme good. Neither the art of religion nor the religion of art is an adequate statement of the possibilities and purpose of art, but there is no doubt that the religion of art is by far the more vacuous of the two. The values of literature, the standards by which it must be criticised, and the scheme according to which it must be arranged, are in the last resort moral. The sense that they should be more moral than morality affords no excuse for accepting them when they are less so. Literature should be a kingdom where a sterner morality, a more strenuous liberty prevails--where the artist may dispense if he will with the ethics of the society in

which he lives, but only on condition of revealing a deeper insight into the moral law to whose allegiance man, in so far as he is man and not a beast, inevitably tends. Never, we suppose, was an age in which art stood in greater need of the true law of decorum than this. Its philosophy has played it false. It has passed from the nebulous Hegelian adulation of the accomplished fact (though one would have thought that to a generation with even a vague memory of Aristotle's Poetics, the mere title, *The Philosophy of History* would have been an evident danger signal) to an adulation of science and of instinct. From one side comes the cry, 'Man is a beast'; from the other, 'Trust your instincts.' The sole manifest employment of reason is to overthrow itself. Yet it should be, in conjunction with the imagination, the vital principle of control. Professor Babbitt would have us back to Aristotle, or back to our senses, which is roughly the same thing. At all events, it is certain that in Aristotle the present generation would find the beginnings of a remedy for that fatal confusion of categories which has overcome the world. It is the confusion between existence and value. That strange malady of the mind by which in the nineteenth century material progress was supposed to create, ipso facto, a concomitant moral progress, and which so plunged the world into catastrophe, has its counterpart in a literature of objective realism. One of the most admired of contemporary works of fiction opens with an infant's memory of a mackintosh sheet, pleasantly warmed with its own water; another, of almost equal popularity among the cultivated, abounds with such reminiscences of the heroine as the paste of bread with which she filled her decaying teeth while she ate her breakfast. Yet the young writers who abuse their talents so unspeakably have right on their side when they refuse to listen to the condemnation pronounced by an older generation. What right, indeed, have these to condemn the logical outcome of an anarchic individualism which they themselves so jealously cherished? They may not like the bastard progeny of the various mistresses they adored--of a Science which they enthroned above instead of subordinating to humanistic values, of a brutal Imperialism which the so-called Conservatives among them set up in place of the truly humane devotion of which man is capable, of the sickening humanitarianism which appears in retrospect to have been merely an excuse for absolute indolence--but they certainly have forfeited the right to censure it. Let those who are so eager to cast the first stone at the æsthetic and moral anarchy of the present day consider Professor Babbitt's indictment of themselves and decide whether they have no sin:--

"If I am to judge by myself," said an eighteenth-century Frenchman, "man is a stupid animal." Man is not only a stupid animal, in spite of his conceit of his own cleverness, but we are here at the source of his stupidity. The source is the moral indolence that Buddha, with his almost infallible sagacity, defined long ago. In spite of the fact that his spiritual and, in the long run, his material success, hinge on his ethical effort, man persists in dodging this effort, in seeking to follow the line of least or lesser resistance. An energetic material working does not mend, but aggravate the failure to work ethically, and is therefore especially stupid. Just this combination has in fact led to the crowning stupidity of the ages--the Great War. No more delirious spectacle has ever been witnessed than that of hundreds of millions of human beings using a vast machinery of scientific efficiency to turn life into a hell for one another. It is hard to avoid concluding that we are living in a world which has gone wrong on first principles, a world that, in spite of all the warnings of the past, has allowed itself to be caught once more in the terrible naturalistic trap. The dissolution of civilisation with which we are threatened is likely to be worse in some respects than that of Greece or Rome, in view of the success that has been obtained in 'perfecting the mystery of murder.' Various traditional agencies are indeed still doing much to chain up the beast in man. Of these the chief is no doubt the Church. But the leadership of the Occident is no longer here. The leaders have succumbed in greater or less degree to naturalism, and so have been tampering with the moral law. That the brutal imperialist who brooks no obstacle to his lust for domination has been tampering with this law goes without saying, but the humanitarian, all adrip with brotherhood and profoundly convinced of the loveliness of his own soul, has been tampering with it also, and in a more dangerous way,

for the very reason that it is less obvious. This tampering with the moral law, or, what amounts to the same thing, this overriding of the veto power in man, has been largely a result, though not a necessary result, of the rupture with the traditional forms of wisdom. The Baconian naturalist repudiated the past because he wished to be more positive and critical, to plant himself on the facts. But the veto power is itself a fact--the weightiest with which man has to reckon. The Rousseauistic naturalist threw off traditional control because he wished to be more imaginative. Yet without the veto power imagination falls into sheer anarchy. Both Baconian and Rousseauist were very impatient of any outer authority that seemed to stand between them and their own perceptions. Yet the veto power is nothing abstract, nothing that one needs to take on hearsay, but is very immediate. The naturalistic leaders may be proved wrong without going beyond their own principles, and their wrongness is of a kind to wreck civilisation.'

We find it impossible to refuse our assent to the main counts of this indictment. The deanthropocentred universe of science is not the universe in which man has to live. That universe is at once smaller and larger than the universe of science: smaller in material extent, larger in spiritual possibility. Therefore to allow the perspective of science seriously to influence, much less control, our human values, is an invitation to disaster. Humanism must reassert itself, for even we can see that Shakespeares are better than Hamlets. The reassertion of humanism involves the re-creation of a practical ideal of human life and conduct, and a strict subordination of the impulses of the individual to this ideal. There must now be a period of critical and humanistic positivism in regard to ethics and to art. We may say frankly that it is not to our elders that we think of applying for its rudiments. We regard them as no less misguided and a good deal less honest than ourselves, It is among our anarchists that we shall look most hopefully for our new traditionalists, if only because, in literature at least, they are more keenly aware of the nature of the abyss on the brink of which they are trembling.
[FEBRUARY, 1920.]

Poetry and Criticism

Nowadays we are all vexed by this question of poetry, and in ways peculiar to ourselves. Fifty years ago the dispute was whether Browning was a greater poet than Tennyson or Swinburne; to-day it is apparently more fundamental, and perhaps substantially more threadbare. We are in a curious half-conscious way incessantly debating what poetry is, impelled by a sense that, although we have been living at a time of extraordinarily prolific poetic production, not very much good has come out of it. Having thus passed the stage at which the theory that poetry is an end in itself will suffice us, we vaguely cast about in our minds for some fuller justification of the poetic activity. A presentiment that our poetic values are chaotic is widespread; we are uncomfortable with it, and there is, we believe, a genuine desire that a standard should be once more created and applied. What shall we require of poetry? Delight, music, subtlety of thought, a world of the heart's desire, fidelity to comprehensible experience, a glimpse through magic casements, profound wisdom? All these things--all different, yet not all contradictory--have been required of poetry. What shall we require of her? The answer comes, it seems, as quick and as vague as the question. We require the highest. All that can be demanded of any spiritual activity of man we must demand of poetry. It must be adequate to all our experience; it must be not a diversion from, but a culmination of life; it must be working steadily towards a more complete universality. Suddenly we may turn upon ourselves and ask what right we have to demand these things of poetry; or others will turn upon us and say: 'This is a lyrical age.' To ourselves and to the others we are bound to reply that poetry must be maintained in the proud position where it has always been, the sovereign language of the human spirit, the sublimation of all experience. In the past there has never been a lyrical age, though there have been ages of minor poetry, when poetry was no longer deliberately made the vehicle of man's profoundest thought and most searching experience. Nor was it the ages of minor poetry which produced great lyrical poetry. Great lyrical poetry has always been an incidental achievement, a parergon, of great poets, and great

poets have always been those who believed that poetry was by nature the worthiest vessel of the highest argument of which the soul of man is capable. Yet a poetic theory such as this seems bound to include great prose, and not merely the prose which can most easily be assimilated to the condition of poetry, such as Plato's Republic or Milton's Areopagitica, but the prose of the great novelists. Surely the colloquial prose of Tchehov's Cherry Orchard has as good a claim to be called poetry as The Essay on Man, Tess of the D'Urbervilles as The Ring and the Book, The Possessed as Phèdre? Where are we to call a halt in the inevitable process by which the kinds of literary art merge into one? If we insist that rhythm is essential to poetry, we are in danger of confusing the accident with the essence, and of fastening upon what will prove to be in the last analysis a merely formal difference. The difference we seek must be substantial and essential. The very striking merit of Sir Henry Newbolt's New Study of English Poetry is that he faces the ultimate problem of poetry with courage, sincerity, and an obvious and passionate devotion to the highest spiritual activity of man. It has seldom been our good fortune to read a book of criticism in which we were so impressed by what we can only call a purity of intention; we feel throughout that the author's aim is single, to set before us the results of his own sincere thinking on a matter of infinite moment. Perhaps better, because subtler, books of literary criticism have appeared in England during the last ten years--if so, we have not read them; but there has been none more truly tolerant, more evidently free from malice, more certainly the product of a soul in which no lie remains. Whether it is that Sir Henry has like Plato's Cephalus lived his literary life blamelessly, we do not know, but certainly he produces upon us an effect akin to that of Cephalus's peaceful smile when he went on his way to sacrifice duly to the gods and left the younger men to the intricacies of their infinite debate. Now it seems to us of importance that a writer like Sir Henry Newbolt should declare roundly that creative poetry and creative prose belong to the same kind. It is important not because there is anything very novel in the contention, but because it is opportune; and it is opportune because at the present moment we need to have emphasis laid on the vital element that is common both to creative poetry and creative prose. The general mind loves confusion, blest mother of haze and happiness; it loves to be able to conclude that this is an age of poetry from the fact that the books of words cut up into lines or sprinkled with rhymes are legion. An age of fiddlesticks! Whatever the present age is--and it is an age of many interesting characteristics--it is not an age of poetry. It would indeed have a better chance of being one if fifty instead of five hundred books of verse were produced every month; and if all the impresarios were shouting that it was an age of prose. The differentia of verse is a merely trivial accident; what is essential in poetry, or literature if you will, is an act of intuitive comprehension. Where you have the evidence of that act, the sovereign æsthetic process, there you have poetry. What remains for you, whether you are a critic or a poet or both together, is to settle for yourself a system of values by which those various acts of intuitive comprehension may be judged. It does not suffice at any time, much less does it suffice at the present day, to be content with the uniqueness of the pleasure which you derive from each single act of comprehension made vocal. That contentment is the comfortable privilege of the amateur and the dilettante. It is not sufficient to get a unique pleasure from Mr De la Mare's Arabia or Mr Davies's Lovely Dames or Miss Katherine Mansfield's Prelude or Mr Eliot's Portrait of a Lady, in each of which the vital act of intuitive comprehension is made manifest. One must establish a hierarchy, and decide which act of comprehension is the more truly comprehensive, which poem has the completer universality. One must be prepared not only to relate each poetic expression to the finest of its kind in the past, or to recognise a new kind if a new kind has been created, but to relate the kind to the finest kind. That, as it seems to us, is the specifically critical activity, and one which is in peril of death from desuetude. The other important type of criticism which is analysis of poetic method, an investigation and appreciation of the means by which the poet communicates his intuitive comprehension to an audience, is in a less perilous condition. Where there are real poets--and only a bigot will deny that there are real poets among us now: we have just named four--there will always be true criticism of poetic method, though it may seldom find utterance in the printed word. But criticism of poetic method has, by hypothesis, no perspective and no horizons; it is concerned with a unique thing under the aspect, of its uniqueness. It may, and happily most often does, assume that poetry is the highest expression of the spiritual life of man; but it makes no endeavour to assess it according to the standards that are implicit in such an assumption. That is the function of philosophical criticism. If philosophical criticism can be combined with criticism of method--and there is no reason why they should not coexist in a single person; the only two English critics of the nineteenth century, Coleridge and Arnold, were of this kind--so much the better; but it is philosophical criticism of which we stand in desperate need at this moment. A good friend of ours, who happens to be one of the few real poets we possess, once wittily summed up a general objection to criticism of the kind we advocate as 'always asking people to do what they can't.' But to point out, as the philosophical critic would, that poetry itself must inevitably languish if the more comprehensive kinds are neglected, or if a non-poetic age is allowed complacently to call itself lyrical, is not to urge the real masters in the less comprehensive kinds to desert their work. Who but a fool would ask Mr De la Mare to write an epic or Miss Mansfield to give us a novel? But he might be a wise man who called upon Mr Eliot to set himself to the composition of a poetic drama; and without a doubt he

would deserve well of the commonwealth who should summon the popular imitators of Mr De la Mare, Mr Davies, or Mr Eliot to begin by trying to express something that they did comprehend or desired to comprehend, even though it should take them into thousands of unprintable pages. It is infinitely preferable that those who have so far given evidence of nothing better than a fatal fluency in insipid imitation of true lyric poets should fall down a precipice in the attempt to scale the very pinnacles of Parnassus. There is something heroic about the most unmitigated disaster at such an altitude. Moreover, the most marked characteristic of the present age is a continual disintegration of the consciousness; more or less deliberately in every province of man's spiritual life the reins are being thrown on to the horse's neck. The power which controls and disciplines sensational experience is, in modern literature, daily denied; the counterpart of this power which envisages the ideal in the conduct of one's own or the nation's affairs and unfalteringly pursues it is held up to ridicule. Opportunism in politics has its complement in opportunism in poetry. Mr Lloyd George's moods are reflected in Mr ----'s. And, beneath these heights, we have the queer spectacle of a whole race of very young poets who somehow expect to attain poetic intensity by the physical intensity with which they look at any disagreeable object that happens to come under their eye. Perhaps they will find some satisfaction in being reckoned among the curiosities of literature a hundred years hence; it is certainly the only satisfaction they will have. They, at any rate, have a great deal to gain from the acid of philosophical criticism. If a reaction to life has in itself the seeds of an intuitive comprehension it will stand explication. If a young poet's nausea at the sight of a toothbrush is significant of anything at all except bad upbringing, then it is capable of being refined into a vision of life and of being expressed by means of the appropriate mechanism or myth. But to register the mere facts of consciousness, undigested by the being, without assessment or reinforcement by the mind is, for all the connection it has with poetry, no better than to copy down the numbers of one's bus-tickets. We do not wish to suggest that Sir Henry Newbolt would regard this lengthy gloss upon his book as legitimate deduction. He, we think, is a good deal more tolerant than we are; and he would probably hesitate to work out the consequences of the principles which he enunciates and apply them vigorously to the present time. But as a vindication of the supreme place of poetry as poetry in human life, as a stimulus to critical thought and a guide to exquisite appreciation of which his essay on Chaucer is an honourable example--A New Study of English Poetry deserves all the praise that lies in our power to give.

[MARCH, 1920.

Coleridge's Criticism

It is probably true that *Biographia Literaria* is the best book of criticism in the English language; nevertheless, it is rash to assume that it is a book of criticism of the highest excellence, even when it has passed through the salutary process of drastic editing, such as that to which, in the present case,[15] the competent hands of Mr George Sampson have submitted it. Its garrulity, its digressions, its verbiage, the marks which even the finest portions show of submersion in the tepid transcendentalism that wrought such havoc upon Coleridge's mind--these are its familiar disfigurements. They are not easily removed; for they enter fairly deeply even in the texture of those portions of the book in which Coleridge devotes himself, as severely as he can, to the proper business of literary criticism.

[Footnote 15: Coleridge: *Biographia Literaria*, Chapters I-IV., XIV.-XXII.--Wordsworth: *Prefaces and Essays on Poetry*, 1800-1815. Edited by George Sampson, with an Introductory Essay by Sir Arthur Quiller-Couch. (Cambridge University Press.)]

It may be that the prolixity with which he discusses and refutes the poetical principles expounded by Wordsworth in the preface of *Lyrical Ballads* was due to the tenderness of his consideration for Wordsworth's feelings, an influence to which Sir Arthur Quiller-Couch directs our attention in his introduction. That is honourable to Coleridge as a man; but it cannot exculpate him as a critic. For the points he had to make for and against Wordsworth were few and simple. First, he had to show that the theory of a poetic diction drawn exclusively from the language of 'real life' was based upon an equivocation, and therefore was useless. This Coleridge had to show to clear himself of the common condemnation in which he had been involved, as one wrongly assumed to endorse Wordsworth's theory. He had an equally important point to make for Wordsworth. He wished to prove to him that the finest part of his poetic

achievement was based upon a complete neglect of this theory, and that the weakest portions of his work were those in which he most closely followed it. In this demonstration he was moved by the desire to set his friend on the road that would lead to the most triumphant exercise of his own powers. There is no doubt that Coleridge made both his points; but he made them, in particular the former, at exceeding length, and at the cost of a good deal of internal contradiction. He sets out, in the former case, to maintain that the language of poetry is essentially different from the language of prose. This he professes to deduce from a number of principles. His axiom--and it is possibly a sound one--is that metre originated in a spontaneous effort of the mind to hold in check the workings of emotion. From this, he argues, it follows that to justify the existence of metre, the language of a poem must show evidence of emotion, by being different from the language of prose. Further, he says, metre in itself stimulates the emotions, and for this condition of emotional excitement 'correspondent food' must be provided. Thirdly, the emotion of poetical composition itself demands this same 'correspondent food.' The final argument, if we omit one drawn from an obscure theory of imitation very characteristic of Coleridge, is the incontrovertible appeal to the authority of the poets. Unfortunately, the elaborate exposition of the first three arguments is not only unnecessary but confusing, for Coleridge goes on to distinguish, interestingly enough, between a language proper to poetry, a language proper to prose, and a neutral language which may be used indifferently in prose and poetry, and later still he quotes a beautiful passage from Chaucer's *Troilus and Cressida* as an example of this neutral language, forgetting that, if his principles are correct, Chaucer was guilty of a sin against art in writing *Troilus and Cressida* in metre. The truth, of course, is that the paraphernalia of principles goes by the board. In order to refute the Wordsworthian theory of a language of real life supremely fitted for poetry you have only to point to the great poets, and to judge the fitness of the language of poetry you can only examine the particular poem. Wordsworth was wrong and self-contradictory without doubt; but Coleridge was equally wrong and self-contradictory in arguing that metre necessitated a language essentially different from that of prose. So it is that the philosophic part of the specifically literary criticism of the *Biographia* takes us nowhere in particular. The valuable part is contained in his critical appreciation of Wordsworth's poetry and that amazing chapter--a little forlorn, as most of Coleridge's fine chapters are--on 'the specific symptoms of poetic power elucidated in a critical analysis of Shakespeare's *Venus and Adonis*. In these few pages Coleridge is at the summit of his powers as a critic. So long as his attention could be fixed on a particular object, so long as he was engaged in deducing his general principles immediately from particular instances of the highest kind of poetic excellence, he was a critic indeed. Every one of the four points characteristic of early poetic genius which he formulates deserves to be called back to the mind again and again:--

'The delight in richness and sweetness of sound, even to a faulty excess, if it be evidently original and not the result of an easily imitable mechanism, I regard as a highly favourable promise in the compositions of a young man....

'A second promise of genius is the choice of subjects very remote from the private interests and circumstances of the writer himself. At least I have found, that where the subject is taken immediately from the author's personal sensations and experiences the excellence of a particular poem is but an equivocal mark, and often a fallacious pledge, of genuine poetical power....

'Images, however beautiful, though faithfully copied from nature, and as accurately represented in words, do not of themselves characterise the poet. They become proofs of original genius only as far as they are modified by a predominant passion; or by associated thoughts or images awakened by that passion; or when they have the effect of reducing multitude to unity, or succession to an instant; or lastly, when a human and intellectual life is transferred to them from the poet's own spirit....

'The last character ... which would prove indeed but little, except as taken conjointly with the former--yet without which the former could scarce exist in a high degree ... is depth and energy of thought. No man was ever yet a great poet without being at the same time a profound philosopher. For poetry is the blossom and the

fragrancy of all human knowledge, human thoughts, human passions, emotions, language.'

In the context the most striking peculiarity of this enunciation of the distinguishing marks of poetic power, apart from the conviction which it brings, is that they are not in the least concerned with the actual language of poetry. The whole subject of poetic diction is dropped when Coleridge's critical, as opposed to his logical, faculty is at work; and, although this Chapter XV is followed by many pages devoted to the analysis and refutation of the Wordsworthian theory and to the establishment of those principles of poetic diction to which we have referred, when Coleridge comes once more to engage his pure critical faculty, in the appreciation of Wordsworth's actual poetry in Chapter XXII, we again find him ignoring his own principles precisely on those occasions when we might have thought them applicable.

Coleridge enumerates Wordsworth's defects one by one. The first, he says, is an inconstancy of style. For a moment he appears to invoke his principles: 'Wordsworth sinks too often and too abruptly to that style which I should place in the second division of language, dividing it into the three species; first, that which is peculiar to poetry; second, that which is proper only in prose; and third, the neutral or common to both.' But in the very first instance which Coleridge gives we can see that the principles have been dragged in by the hair, and that they are really alien to the argument which he is pursuing. He gives this example of disharmony from the poem on 'The Blind Highland Boy' (whose washing-tub in the 1807 edition, it is perhaps worth noting, had been changed at Coleridge's own suggestion, with a rash contempt of probabilities, into a turtle shell in the edition of 1815):--

'And one, the rarest, was a shell
Which he, poor child, had studied well:
The Shell of a green Turtle, thin
And hollow;--you might sit therein,
It was so wide, and deep.

'Our Highland Boy oft visited
The house which held this prize; and led
By choice or chance, did thither come
One day, when no one was at home,
And found the door unbarred.'

The discord is, in any case, none too apparent; but if one exists, it does not in the least arise from the actual language which Wordsworth has used. If in anything, it consists in a slight shifting of the focus of apprehension, a sudden and scarcely perceptible emphasis on the detail of actual fact, which is a deviation from the emotional key of the poem as a whole. In the next instance the lapse is, however, indubitable:--

'Thou hast a nest, for thy love and thy rest.
And though little troubled with sloth,
Drunken Lark! thou would'st be loth
To be such a traveller as I.
Happy, happy liver!
With a soul as strong as a mountain River
Pouring out praise to th' Almighty Giver,
Joy and jollity be with us both,
Hearing thee or else some other
As merry as a Brother
I on the earth will go plodding on,
By myself, cheerfully, till the day is done.'

The two lines in italics are discordant. But again it is no question of language in itself; it is an internal discrepancy between the parts of a whole already debilitated by metrical insecurity. Coleridge's second point against Wordsworth is 'a matter-of-factness in certain poems.' Once more there is no question of language. Coleridge takes the issue on to the highest and most secure ground. Wordsworth's obsession with realistic detail is a contravention of the essential catholicity of poetry; and this accidentality is manifested in laboriously exact description both of places and persons.

The poet sterilises the creative activity of poetry, in the first case, for no reason at all, and in the second, because he proposes as his immediate object a moral end instead of the giving of æsthetic pleasure. His prophets and wise men are pedlars and tramps not because it is probable that they should be of this condition--it is on the contrary highly improbable--but because we are thus to be taught a salutary moral lesson. The question of language in itself, if it enters at all here, enters only as the indifferent means by which a non-poetic end is sought. The accidentality lies not in the words, but in the poet's intention. Coleridge's third and fourth points, 'an undue predilection for the dramatic form,' and 'an eddying instead of a progression of thought,' may be passed as quickly as he passes them himself, for in any case they could only be the cause of a jejuneness of language. The fifth, more interesting, is the appearance of 'thoughts and images too great for the subject ... an approximation to what might be called mental bombast.' Coleridge brings forward as his first instance of this four lines which have taken a deep hold on the affections of later generations:--

'They flash upon the inward eye
Which is the bliss of solitude!
And then my heart with pleasure fills
And dances with the daffodils.'

Coleridge found an almost burlesque bathos in the second couplet after the first. It would be difficult for a modern critic to accept that verdict altogether; nevertheless his objection to the first couplet as a description of physical vision is surely sound. And it is interesting to note that the objection has been evaded by posterity in a manner which confirms Coleridge's criticism. The 'inward eye' is almost universally remembered apart from its context, and interpreted as a description of the purely spiritual process to which alone, in Coleridge's opinion, it was truly apt. The enumeration of Wordsworth's excellences which follows is masterly; and the exhilaration with which one rises through the crescendo to the famous: 'Last and pre-eminently, I challenge for this poet the gift of Imagination in the highest and strictest sense of the word ...' is itself a pleasure to be derived only from the gift of criticism of the highest and strictest kind. The object of this examination has been to show, not that the *Biographia Literaria* is undeserving of the high praise which has been bestowed upon it, but that the praise has been to some extent indiscriminating. It has now become almost a tradition to hold up to our admiration Coleridge's chapter on poetic diction, and Sir Arthur Quiller-Couch, in a preface that is as unconventional in manner as it is stimulating in most of its substance, maintains the tradition. As a matter of fact, what Coleridge has to say on poetic diction is prolix and perilously near commonplace. Instead of making to Wordsworth the wholly sufficient answer that much poetry of the highest kind employs a language that by no perversion can be called essentially the same as the language of prose, he allows himself to be led by his German metaphysic into considering poetry as a *Ding an sich* and deducing therefrom the proposition that poetry must employ a language different from that of prose. That proposition is false, as Coleridge himself quite adequately shows from his remarks upon what he called the 'neutral' language of Chaucer and Herbert. But instead of following up the clue and beginning to inquire whether or not narrative poetry by nature demands a language approximating to that of prose, and whether Wordsworth, in so far as he aimed at being a narrative poet, was not working on a correct but exaggerated principle, he leaves the bald contradiction and swerves off to the analysis of the defects and excellences of Wordsworth's actual achievement. Precisely because we consider it of the greatest importance that the best of Coleridge's criticism should be studied and studied again, we think it unfortunate that Sir Arthur Quiller-Couch should recommend the apprentice to get the chapters on poetic diction by heart. He will be condemned to carry about with him a good deal of dubious logic and a false conclusion. What is worth while learning from Coleridge is something different; it is not his behaviour with 'a principle,' but his conduct when confronted with poetry in the concrete, his magisterial ordonnance (to use his own word) and explication of his own æsthetic intuitions, and his manner of employing in this, the essential task of poetic criticism, the results of his own deep study of all the great poetry that he knew.

APRIL, 1920.

Shakespeare Criticism

It is an exciting, though exhausting, experience to read a volume of the great modern Variorum Shakespeare from cover to cover. One derives from the exercise a sense of the evolution of Shakespeare criticism which cannot be otherwise obtained; one begins to understand that Pope had his merits as an editor, as indeed a man of genius could

hardly fail to have, to appreciate the prosy and pedestrian pains of Theobald, to admire the amazing erudition of Steevens. One sees the phases of the curious process by which Shakespeare was elevated at the beginning of the nineteenth century to a sphere wherein no mortal man of genius could breathe. For a dizzy moment every line that he wrote bore the authentic impress of the divine. Efflavit deus. In a century, from being largely beneath criticism Shakespeare had passed to a condition where he was almost completely beyond it. King John affords an amusing instance of this reverential attitude. The play, as is generally known, was based upon a slightly earlier and utterly un-Shakespearean production entitled *The Troublesome Raigne of King John*. The only character Shakespeare added to those he found ready to his hand was that of James Gurney, who enters with Lady Falconbridge after the scene between the Bastard and his brother, says four words, and departs for ever.

'Bast.--James Gurney, wilt thou give us leave awhile?

Gur.--Good leave, good Philip.

Bast.--Philip! Sparrow! James.'

It is obvious that Shakespeare's sole motive in introducing Gurney is to provide an occasion for the Bastard's characteristic, though not to a modern mind quite obvious, jest, based on the fact that Philip was at the time a common name for a sparrow. The Bastard, just dubbed Sir Richard Plantagenet by the King, makes a thoroughly natural jibe at his former name, Philip, to which he had just shown such breezy indifference. The jest could not have been made to Lady Falconbridge without a direct insult to her, which would have been alien to the natural, blunt, and easygoing fondness of the relation which Shakespeare establishes between the Bastard and his mother. So Gurney is quite casually brought in to receive it. But this is not enough for the Shakespeare-drunken Coleridge.

'For an instance of Shakespeare's power in minimis, I generally quote James Gurney's character in *King John*. How individual and comical he is with the four words allowed to his dramatic life!'

Assuredly it is not with any intention of diminishing Coleridge's title as a Shakespearean critic that we bring forward this instance. He is the greatest critic of Shakespeare; and the quality of his excellence is displayed in one of the other few notes he left on this particular play. In Act III, scene ii., Warburton's emendation of 'airy' to 'fiery' had in Coleridge's day been received into the text of the Bastard's lines:--

'Now by my life, this day grows wondrous hot;
Some airy devil hovers in the sky.'

On which Coleridge writes:--

'I prefer the old text: the word 'devil' implies 'fiery.' You need only to read the line, laying a full and strong emphasis on 'devil,' to perceive the uselessness and tastelessness of Warburton's alteration.'

The test is absolutely convincing--a poet's criticism of poetry. But that Coleridge went astray not once but many times, under the influence of his idolatry of Shakespeare, corroborates the general conclusion that is forced upon any one who will take the trouble to read a whole volume of the modern *Variorum*. There has been much editing, much comment, but singularly little criticism of Shakespeare; a half-pennyworth of bread to an intolerable deal of sack. The pendulum has swung violently from niggling and insensitive textual quibble to that equally distressing exercise of human ingenuity, idealistic encomium, of which there is a typical example in the opening sentence of Mr Masefield's remarks upon the play: 'Like the best Shakespearean tragedies, *King John* is an intellectual form in which a number of people with obsessions illustrate the idea of treachery.' We remember that Mr Masefield has much better than this to say of Shakespeare in his little book; but we fasten upon this sentence because it is set before us in the *Variorum*, and because it too 'is an intellectual form in which a literary man with obsessions illustrates his idea of criticism.' Genetically, it is a continuation of the shoddy element in Coleridge's Shakespeare criticism, a continual bias towards transcendental interpretation of the obvious. To take the origin a phase further back, it is the portentous offspring of the feeble constituent of German philosophy (a refusal to see the object) after it

had been submitted to an idle process of ferment in the softer part of Coleridge's brain. King John is not in the least what Mr Masefield, under this dangerous influence, has persuaded himself it is. It is simply the effort of a young man of great genius to rewrite a bad play into a good one. The effort was, on the whole, amazingly successful; that the play is only a good one, instead of a very good one, is not surprising. The miracle is that anything should have been made of *The Troublesome Raigne* at all. The *Variorum* extracts show that, of the many commentators who studied the old play with Shakespeare's version, only Swinburne saw, or had the courage to say, how utterly null the old play really is. To have made Shakespeare's Falconbridge out of the old lay figure, to have created the scenes between Hubert and John, and Hubert and Arthur, out of that decrepit skeleton--that is the work of a commanding poetical genius on the threshold of full mastery of its powers, worthy of all wonder, no doubt, but doubly worthy of close examination. But 'ideas of treachery!' Into what cloud cuckoo land have we been beguiled by Coleridge's laudanum trances? A limbo--of this we are confident--where Shakespeare never set foot at any moment in his life, and where no robust critical intelligence can endure for a moment. We must save ourselves from this insidious disintegration by keeping our eye upon the object, and the object is just a good (not a very good) play. Not an Ibsen, a Hauptmann, a Shaw, or a Masefield play, where the influence and ravages of these 'ideas' are certainly perceptible, but merely a Shakespeare play, one of those works of true poetic genius which can only be produced by a mind strong enough to resist every attempt at invasion by the 'idea'-bacillus. In considering a Shakespeare play the word 'idea' had best be kept out of the argument altogether; but there are two senses in which it might be intelligibly used. You might call the dramatic skeleton Shakespeare's idea of the play. It is the half-mechanical, half-organic factor in the work of poetic creation--the necessary means by which a poet can conveniently explicate and express his manifold æsthetic intuitions. This dramatic skeleton is governed by laws of its own, which were first and most brilliantly formulated by Aristotle in terms that, in essentials, hold good for all time. You may investigate this skeleton, seize, if you can, upon the peculiarity by which it is differentiated from all other skeletons; you may say, for instance, that *Othello* is a tragedy of jealousy, or *Hamlet* of the inhibition of self-consciousness. But if your 'idea' is to have any substance it must be moulded very closely upon the particular object with which you are dealing; and in the end you will find yourself reduced to the analysis of individual characters. On the other hand, the word 'idea' might be intelligibly used of Shakespeare's whole attitude to the material of his contemplation, the centre of comprehension from which he worked, the aspect under which he viewed the universe of his interest. There is no reason to rest content with Coleridge's application of the epithet 'myriad-minded,' which is, at the best, an evasion of a vital question. The problem is to see Shakespeare's mind sub specie unitatis. It can be done; there never has been and never will be a human mind which can resist such an inquiry if it is pursued with sufficient perseverance and understanding. What chiefly stands in the way is that tradition of Shakespearolatry which Coleridge so powerfully inaugurated, not least by the epithet 'myriad-minded.' But of 'ideas' in any other senses than these--and in neither of these cases is 'idea' the best word for the object of search--let us beware as we would of the plague, in criticism of Shakespeare or any other great poet. Poets do not have 'ideas'; they have perceptions. They do not have an 'idea'; they have comprehension. Their creation is æsthetic, and the working of their mind proceeds from the realisation of one æsthetic perception to that of another, more comprehensive if they are to be great poets having within them the principle of poetic growth. There is undoubtedly an organic process in the evolution of a great poet, which you may, for convenience of expression, call logical; but the moment you forget that the use of the word 'logic,' in this context, is metaphorical, you are in peril. You can follow out this 'logical process' in a poet only by a kindred creative process of æsthetic perception passing into æsthetic comprehension. The hunt for 'ideas' will only make that process impossible; it prevents the object from ever making its own impression upon the mind. It has to speak with the language of logic, whereas its use and function in the world is to speak with a language not of logic, but of a process of mind which is at least as sovereign in its own right as the discursive reason. Let us away then with 'logic' and away with 'ideas' from the art of literary criticism; but not, in a foolish and imperipient reaction, to revive the impressionistic criticism which has sapped the English brain for a generation past. The art of criticism is rigorous; impressions are merely its raw material; the life-blood of its activity is in the process of ordonnance of æsthetic impressions. It is time, however, to return for a moment to Shakespeare, and to observe in one crucial instance the effect of the quest for logic in a single line. In the fine scene where John hints to Hubert at Arthur's murder, he speaks these lines (in the First Folio text):--

I had a thing to say, but let it goe:
The Sunne is in the heauen, and the proud day,
Attended with the pleasure of the world,
Is all too wanton, and too full of gawdes
To giue me audience: If the midnight bell
Did with his yron tongue, and brazen mouth

Sound on into the drowzie race of night,
If this same were a Churchyard where we stand,
And thou possessed with a thousand wrongs:
... Then, in despight of brooded watchfull day,
I would into thy bosome poure my thoughts....'

If one had to choose the finest line in this passage, the choice would fall upon

'Sound on into the drowsy race of night.'

Yet you will have to look hard for it in the modern editions of Shakespeare. At the best you will find it with the mark of corruption:--

+ 'Sound on into the drowsy race of night ('Globe');

and you run quite a risk of finding

'Sound one into the drowsy race of night' ('Oxford').

There are six pages of close-printed comment upon the line in the Variorum. The only reason, we can see, why it should be the most commented line in King John is that it is one of the most beautiful. No one could stand it. Of all the commentators, only one, Miss Porter, whom we name honoris causa, stands by the line with any conviction of its beauty. Every other person either alters it or regrets his inability to alter it.

'How can a bell sound on into a race?' pipe the little editors. What is 'the race of night?' What can it mean? How could a race be drowsy? What an awful contradiction in terms! And so while you and I, and all the other ordinary lovers of Shakespeare are peacefully sleeping in our beds, they come along with their little chisels, and chop out the horribly illogical word and pop in a horribly logical one, and we (unless we can afford the Variorum, which we can't) know nothing whatever about it. We have no redress. If we get out of our beds and creep upon them while they are asleep--they never are--and take out our little chisels and chop off their horribly stupid little heads, we shall be put in prison and Mr Justice Darling will make a horribly stupid little joke about us. There is only one thing to do. We must make up our minds that we have to combine in our single person the scholar and the amateur; we cannot trust these gentlemen. And, indeed, they have been up to their little games elsewhere in King John. They do not like the reply of the citizens of Angiers to the summons of the rival kings:--

'A greater powre than We denies all this,
And till it be undoubted, we do locke
Our former scruple in our strong-barr'd gates;
Kings of our feare, untill our feares resolu'd
Be by some certaine king, purg'd and depos'd.'

Admirable sense, excellent poetry. But no! We must not have it. Instead we are given 'King'd of our fears' ('Globe') or 'Kings of ourselves' ('Oxford'). Bad sense, bad poetry.

They do not like Pandulph's speech to France:--

'France, thou maist hold a serpent by the tongue,
A cased lion by the mortall paw,
A fasting tiger safer by the tooth
Than keep in peace that hand which thou dost hold.'

'Cased,' caged, is too much for them. We must have 'chafed,' in spite of

'If thou would'st not entomb thyself alive
And case thy reputation in thy tent.'

Again, the Folio text of the meeting between the Bastard and Hubert in Act V., when Hubert fails to recognise the Bastard's voice, runs thus:--

'Unkinde remembrance: thou and endles night,
Have done me shame: Brave Soldier, pardon me
That any accent breaking from thy tongue
Should scape the true acquaintaince of mine eare.'

This time 'endless' is not poetical enough for the editors. Theobald's emendation 'eyeless' is received into the text. One has only to read the brief scene through to realise that Hubert is wearied and obsessed by the night that will never end. He is overwrought by his knowledge of

'news fitting to the night,
Black, fearful, comfortless, and horrible,'

and by his long wandering in search of the Bastard:--

'Why, here I walk in the black brow of night
To find you out.'

Yet the dramatically perfect 'endless' has had to make way for the dramatically stupid 'eyeless.' Is it surprising that we do not trust these gentlemen?

[APRIL, 1920

7. 20th Century: Louis Untermeyer. *Modern British Poetry*

INTRODUCTORY

The New Influences and Tendencies

Mere statistics are untrustworthy; dates are even less dependable. But, to avoid hairsplitting, what we call "modern" English literature may be said to date from about 1885. A few writers who are decidedly "of the period" are, as a matter of strict chronology, somewhat earlier. But the chief tendencies may be divided into seven periods. They are (1) The decay of Victorianism and the growth of a purely decorative art, (2) The rise and decline of the Æsthetic Philosophy, (3) The muscular influence of Henley, (4) The Celtic revival in Ireland, (5) Rudyard Kipling and the ascendancy of mechanism in art, (6) John Masefield and the return of the rhymed narrative, (7) The war and the appearance of "The Georgians." It may be interesting to trace these developments in somewhat greater detail.

the end of victorianism

The age commonly called Victorian came to an end about 1885. It was an age distinguished by many true idealists and many false ideals. It was, in spite of its notable artists, on an entirely different level from the epoch which had preceded it. Its poetry was, in the main, not universal but parochial; its romanticism was gilt and tinsel; its realism was as cheap as its showy glasspendants, red plush, parlor chromos and antimacassars. The period was full of a pessimistic resignation (the note popularized by Fitzgerald's Omar Khayyám) and a kind of cowardice or at least a negation which, refusing to see any glamour in the actual world, turned to the Middle Ages, King Arthur, the legend of Troy—to the suave surroundings of a dream-world instead of the hard contours of actual experience.

At its worst, it was a period of smugness, of placid and pious sentimentality—epitomized by the rhymed sermons of Martin Farquhar Tupper, whose *Proverbial Philosophy* was devoured with all its cloying and indigestible sweetmeats by thousands. The same tendency is apparent, though far less objectionably, in the moralizing lays of Lord Thomas Macaulay, in the theatrically emotionalized verses of Robert Buchanan, Edwin Arnold and Sir Lewis Morris—even in the lesser later work of Alfred Tennyson.

And, without Tupper's emptiness or absurdities, the outworn platitudes again find their constant lover in Alfred Austin, Tennyson's successor as poet laureate. Austin brought the laureateship, which had been held by poets like Ben Jonson, Dryden, Southey and Wordsworth, to an incredibly low level; he took the thinning stream of garrulous poetic conventionality, reduced it to the merest trickle—and diluted it.

The poets of a generation before this time were fired with such ideas as freedom, a deep and burning awe of nature, an insatiable hunger for truth in all its forms and manifestations. The characteristic poets of the Victorian[xiii] Era, says Max Plowman, "wrote under the dominance of churchliness, of 'sweetness and light,' and a thousand lesser theories that have not truth but comfort for their end."

The revolt against this and the tawdriness of the period had already begun; the best of Victorianism can be found not in men who were typically Victorian, but in pioneers like Browning and writers like Swinburne, Rossetti, William Morris, who were completely out of sympathy with their time.

But it was Oscar Wilde who led the men of the now famous 'nineties toward an æsthetic freedom, to champion a beauty whose existence was its "own excuse for being." Wilde's was, in the most outspoken manner, the first use of æstheticism as a slogan; the battle-cry of the group was actually the now outworn but then revolutionary "Art for Art's sake"! And, so sick were people of the shoddy ornaments and drab ugliness of the immediate past, that the slogan won. At least, temporarily.

the rise and decline of the æsthetic philosophy

The *Yellow Book*, the organ of a group of young writers and artists, appeared (1894-97), representing a reasoned and intellectual reaction, mainly suggested and influenced by the French. The group of contributors was a peculiarly mixed one with only one thing in common. And that was a conscious effort to repudiate the sugary airs and prim romantics of the Victorian Era.

Almost the first act of the "new" men was to rouse and outrage their immediate predecessors. This end-of-the-century desire to shock, which was so strong and natural an impulse, still has a place of its own—especially as an

antidote, a harsh corrective. Mid-Victorian propriety and self-satisfaction crumbled under the swift and energetic audacities of the sensational younger authors and artists; the old walls fell; the public, once so apathetic to belles lettres, was more than attentive to every phase of literary experimentation. The last decade of the nineteenth century was so tolerant of novelty in art and ideas, that it would seem, says Holbrook Jackson in his penetrative summary, *The Eighteen-Nineties*, "as though the declining century wished to make amends for several decades of artistic monotony. It may indeed be something more than a coincidence that placed this decade at the close of a century, and fin de siècle may have been at once a swan song and a death-bed repentance."

But later on, the movement (if such it may be called), surfeited with its own excesses, fell into the mere poses of revolt; it degenerated into a half-hearted defense of artificialities.

It scarcely needed W. S. Gilbert (in *Patience*) or Robert Hichens (in *The Green Carnation*) to satirize its distorted attitudinizing. It strained itself to death; it became its own burlesque of the bizarre, an extravaganza of extravagance. "The period" (I am again quoting Holbrook Jackson) "was as certainly a period of decadence as it was a period of renaissance. The decadence was to be seen in a perverse and finicking glorification of the fine arts and mere artistic virtuosity on the one hand, and a militant commercial movement on the other.... The eroticism which became so prevalent in the verse of many of the younger poets was minor because it was little more than a pose—not because it was erotic.... It was a passing mood which gave the poetry of the hour a hothouse fragrance; a perfume faint yet unmistakable and strange."

But most of the elegant and disillusioned young men overshot their mark. Mere health reasserted itself; an inherent repressed vitality sought new channels. Arthur Symons deserted his hectic Muse, Richard Le Gallienne abandoned his preciosity, and the group began to disintegrate. The æsthetic philosophy was wearing thin; it had already begun to fray and reveal its essential shabbiness. Wilde himself possessed the three things which he said the English would never forgive—youth, power and enthusiasm. But in trying to make an exclusive cult of beauty, Wilde had also tried to make it evade actuality; he urged that art should not, in any sense, be a part of life but an escape from it. "The proper school to learn art in is not Life—but Art." And in the same essay ("The Decay of Lying") he wrote, "All bad Art comes from returning to Life and Nature, and elevating them into ideals." Elsewhere he said, "The first duty in life is to be as artificial as possible. What the second duty is no one has discovered."

Such a cynical and decadent philosophy could not go unchallenged. Its aristocratic blue-bloodedness was bound to arouse the red blood of common reality. This negative attitude received its answer in the work of that yea-sayer, W. E. Henley.

William Ernest Henley repudiated this languid æstheticism; he scorned a negative art which was out of touch with the world. His was a large and sweeping affirmation. He felt that mere existence was glorious; life was coarse, difficult, often dangerous and dirty, but splendid at the heart. Art, he knew, could not be separated from the dreams and hungers of man; it could not flourish only on its own essences or technical accomplishments. To live, poetry would have to share the fears, angers, hopes and struggles of the prosaic world. And so Henley came like a swift salt breeze blowing through a perfumed and heavily-screened studio. He sang loudly (sometimes even too loudly) of the joy of living and the courage of the "unconquerable soul." He was a powerful influence not only as a poet but as a critic and editor. In the latter capacity he gathered about him such men as Robert Louis Stevenson, Rudyard Kipling, Thomas Hardy, H. G. Wells, W. B. Yeats, T. E. Brown, J. M. Barrie. None of these men were his disciples, but none of them came into contact with him without being influenced in some way by his sharp and positive personality. A pioneer and something of a prophet, he was one of the first to champion the paintings of Whistler and to proclaim the genius of the sculptor Rodin.

If at times Henley's verse is imperialistic, over-muscular and strident, his noisy moments are redeemed not only by his delicate lyrics but by his passionate enthusiasm for nobility in whatever cause it was joined. He never disdained the actual world in any of its moods—bus-drivers, hospital interiors, scrubwomen, a panting train, the squalor of London's alleys, all found a voice in his lines—and his later work contains more than a hint of the delight in science and machinery which was later to be sounded more fully in the work of Rudyard Kipling.

the celtic revival and j. m. synge

In 1889, William Butler Yeats published his *Wanderings of Oisín*; in the same year Douglas Hyde, the scholar and folk-loreist, brought out his *Book of Gaelic Stories*.

The revival of Gaelic and the renaissance of Irish literature may be said to date from the publication of those two books. The fundamental idea of both men and their followers was the same. It was to create a literature which would express the national consciousness of Ireland through a purely national art. They began to reflect the strange background of dreams, politics, suffering and heroism that is immortally Irish. This community of fellowship and aims is to be found in the varied but allied work of William Butler Yeats, "A. E." (George W. Russell), Moira O'Neill, Lionel Johnson, Katharine Tynan, Padraic Colum and others. The first fervor gone, a short period of dullness set in. After reanimating the old myths, surcharging the legendary heroes with a new significance, it seemed for a while that the movement would lose itself in a literary mysticism. But an increasing concern with the peasant, the migratory laborer, the tramp, followed; an interest that was something of a reaction against the influence of Yeats and his mystic otherworldliness. And, in 1904, the Celtic Revival reached its height with John Millington Synge, who was not only the greatest dramatist of the Irish Theatre, but (to quote such contrary critics as George Moore and Harold Williams) "one of the greatest dramatists who has written in English." Synge's poetry, brusque and all too small in quantity, was a minor occupation with him and yet the quality and power of it is unmistakable. Its content is never great but the raw vigor in it was to serve as a bold banner—a sort of a brilliant Jolly Roger—for the younger men of the following period. It was not only this dramatist's brief verses and his intensely musical prose but his sharp prefaces that were to exercise such an influence.

In the notable introduction to the *Playboy of the Western World*, Synge declared, "When I was writing *The Shadow of the Glen* some years ago, I got more aid than any learning could have given me from a chink in the floor of the old Wicklow house where I was staying, that let me hear what was being said by the servant girls in the kitchen. This matter is, I think, of some importance; for in countries where the imagination of the people, and the language they use, is rich and living, it is possible for a writer to be rich and copious in his words—and at the same time to give the reality which is at the root of all poetry, in a natural and comprehensive form." This quotation explains his idiom, possibly the sharpest-flavored and most vivid in modern literature.

As to Synge's poetic power, it is unquestionably greatest in his plays. In *The Well of the Saints*, *The Playboy of the Western World* and *Riders to the Sea* there are more poignance, beauty of form and richness of language than in any piece of dramatic writing since Elizabethan times. Yeats, when he first heard Synge's early one-act play, *The Shadow of the Glen*, is said to have exclaimed "Euripides." A half year later when Synge read him *Riders to the Sea*, Yeats again confined his enthusiasm to a single word:—"Æschylus!" Years have shown that Yeats's appreciation was not as exaggerated as many might suppose.

But although Synge's poetry was not his major concern, numbering only twenty-four original pieces and eighteen translations, it had a surprising effect upon his followers. It marked a point of departure, a reaction against both the too-polished and over-rhetorical verse of his immediate predecessors and the dehumanized mysticism of many of his associates. In that memorable preface to his *Poems* he wrote what was a slogan, a manifesto and at the same time a classic credo for all that we call the "new" poetry. "I have often thought," it begins, "that at the side of poetic diction, which everyone condemns, modern verse contains a great deal of poetic material, using 'poetic' in the same special sense. The poetry of exaltation will be always the highest; but when men lose their poetic feeling for ordinary life and cannot write poetry of ordinary things, their exalted poetry is likely to lose its strength of exaltation in the way that men cease to build beautiful churches when they have lost happiness in building shops.... Even if we grant that exalted poetry can be kept successfully by itself, the strong things of life are needed in poetry also, to show that what is exalted or tender is not made by feeble blood."

rudyard kipling

New tendencies are contagious. But they also disclose themselves simultaneously in places and people where there has been no point of contact. Even before Synge published his proofs of the keen poetry in everyday life, Kipling was illuminating, in a totally different manner, the wealth of poetic material in things hitherto regarded as too commonplace for poetry. Before literary England had quite recovered from its surfeit of Victorian priggishness and pre-Raphaelite delicacy, Kipling came along with high spirits and a great tide of life, sweeping all before him. An obscure Anglo-Indian journalist, the publication of his *Barrack-room Ballads* in 1892 brought him sudden notice. By 1895 he was internationally famous. Brushing over the pallid attempts to revive a pallid past, he rode triumphantly on a wave of buoyant and sometimes brutal joy in the present. Kipling gloried in the material world; he did more—he glorified it. He pierced the coarse exteriors of seemingly prosaic things—things like machinery, bridge-building, cockney soldiers, slang, steam, the dirty by-products of science (witness "M'Andrews Hymn" and "The Bell Buoy")—and uncovered their hidden glamour. "Romance is gone," sighed most of his contemporaries,

"... and all unseen

Romance brought up the nine-fifteen."

That sentence (from his poem "The King") contains the key to the manner in which the author of *The Five Nations* helped to rejuvenate English verse.

Kipling, with his perception of ordinary people in terms of ordinary life, was one of the strongest links between the Wordsworth-Browning era and the latest apostles of vigor, beginning with Masfield. There are occasional and serious defects in Kipling's work—particularly in his more facile poetry; he falls into a journalistic ease that tends to turn into jingle; he is fond of a militaristic drum-banging that is as blatant as the insularity he condemns. But a burning, if sometimes too simple faith, shines through his achievements. His best work reveals an intensity that crystallizes into beauty what was originally tawdry, that lifts the vulgar and incidental to the place of the universal.

john masfield

All art is a twofold revivifying—a recreation of subject and a reanimating of form. And poetry becomes perennially "new" by returning to the old—with a different consciousness, a greater awareness. In 1911, when art was again searching for novelty, John Masfield created something startling and new by going back to 1385 and *The Canterbury Pilgrims*. Employing both the Chaucerian model and a form similar to the practically forgotten Byronic stanza, Masfield wrote in rapid succession, *The Everlasting Mercy* (1911), *The Widow in the Bye Street* (1912), *Dauber* (1912), *The Daffodil Fields* (1913)—four astonishing rhymed narratives and four[xxii] of the most remarkable poems of our generation. Expressive of every rugged phase of life, these poems, uniting old and new manners, responded to Synge's proclamation that "the strong things of life are needed in poetry also ... and it may almost be said that before verse can be human again it must be brutal."

Masfield brought back to poetry that mixture of beauty and brutality which is its most human and enduring quality. He brought back that rich and almost vulgar vividness which is the very life-blood of Chaucer, of Shakespeare, of Burns, of Villon, of Heine—and of all those who were not only great artists but great humanists. As a purely descriptive poet, he can take his place with the masters of sea and landscape. As an imaginative realist, he showed those who were stumbling from one wild eccentricity to another to thrill them, that they themselves were wilder, stranger, far more thrilling than anything in the world—or out of it. Few things in contemporary poetry are as powerful as the regeneration of Saul Kane (in *The Everlasting Mercy*) or the story of Dauber, the tale of a tragic sea-voyage and a dreaming youth who wanted to be a painter. The vigorous description of rounding Cape Horn in the latter poem is superbly done, a masterpiece in itself. Masfield's later volumes are quieter in tone, more measured in technique; there is an almost religious ring to many of his Shakespearian sonnets. But the swinging surge is there, a passionate strength that leaps through all his work from *Salt Water Ballads* (1902) to *Reynard the Fox* (1919).[xxiii] "the georgians" and the younger men

There is no sharp statistical line of demarcation between Masfield and the younger men. Although several of them owe much to him, most of the younger poets speak in accents of their own. W. W. Gibson had already reinforced the "return to actuality" by turning from his first preoccupation with shining knights, faultless queens, ladies in distress and all the paraphernalia of hackneyed mediæval romances, to write about ferrymen, berry-pickers, stone-cutters, farmers, printers, circus-men, carpenters—dramatizing (though sometimes theatricalizing) the primitive emotions of uncultured and ordinary people in *Livelihood*, *Daily Bread and Fires*. This intensity had been asking new questions. It found its answers in the war; repressed emotionalism discovered a new outlet. One hears its echoes in the younger poets like Siegfried Sassoon, with his poignant and unsparing poems of conflict; in Robert Graves, who reflects it in a lighter and more fantastic vein; in James Stephens, whose wild ingenuities are redolent of the soil. And it finds its corresponding opposite in the limpid and unperturbed loveliness of Ralph Hodgson; in the ghostly magic and the nursery-rhyme whimsicality of Walter de la Mare; in the quiet and delicate lyrics of W. H. Davies. Among the others, the brilliant G. K. Chesterton, the facile Alfred Noyes, the romantic Rupert Brooke (who owes less to Masfield and his immediate predecessors than he does to the passionately intellectual Donne), the introspective D. H. Lawrence and the versatile J. C. Squire, are perhaps best known to American readers.

All of the poets mentioned in the foregoing paragraph (with the exception of Noyes) have formed themselves in a loose group called "The Georgians," and an anthology of their best work has appeared every two years since 1913. Masfield, Lascelles Abercrombie and John Drinkwater are also listed among the Georgian poets. When their first

collection appeared in March, 1913, Henry Newbolt, a critic as well as poet, wrote: "These younger poets have no temptation to be false. They are not for making something 'pretty,' something up to the standard of professional patterns.... They write as grown men walk, each with his own unconscious stride and gesture.... In short, they express themselves and seem to steer without an effort between the dangers of innovation and reminiscence." The secret of this success, and for that matter, the success of the greater portion of English poetry, is not an exclusive discovery of the Georgian poets. It is their inheritance, derived from those predecessors who, "from Wordsworth and Coleridge onward, have worked for the assimilation of verse to the manner and accent of natural speech." In its adaptability no less than in its vigor, modern English poetry is true to its period—and its past.

This collection is obviously a companion volume to *Modern American Poetry*, which, in its restricted compass, attempted to act as an introduction to recent native verse. *Modern British Poetry* covers the same period (from about 1870 to 1920), follows the same chronological scheme, but it is more amplified and goes into far greater detail than its predecessor.

The two volumes, considered together, furnish interesting contrasts; they reveal certain similarities and certain strange differences. Broadly speaking, modern American verse is sharp, vigorously experimental; full of youth and its occasional—and natural—crudities. English verse is smoother, more matured and, molded by centuries of literature, richer in associations and surer in artistry. Where the American output is often rude, extremely varied and uncoördinated (being the expression of partly indigenous, partly naturalized and largely unassimilated ideas, emotions, and races), the English product is formulated, precise and, in spite of its fluctuations, true to its past. It goes back to traditions as old as Chaucer (witness the narratives of Masfield and Gibson) or tendencies as classic as Drayton, Herrick and Blake—as in the frank lyrics of A. E. Housman, the artless lyricism of Ralph Hodgson, the naïf wonder of W. H. Davies. And if English poetry may be compared to a broad and luxuriating river (while American poetry might be described as a sudden rush of unconnected mountain torrents, valley streams and city sluices), it will be inspiring to observe how its course has been temporarily deflected in the last forty years; how it has swung away from one tendency toward another; and how, for all its bends and twists, it has lost neither its strength nor its nobility.

15. 20th Century: Henry R. Plomer. *A Short History of English Printing*

Henry R. Plomer

A Short History of English Printing

EDITOR'S PREFACE

When Mr. Plomer consented at my request to write a short history of English printing which should stop neither at the end of the fifteenth century, nor at the end of the sixteenth century, nor at 1640, but should come down, as best it could, to our own day, we were not without apprehensions that the task might prove one of some difficulty. How difficult it would be we had certainly no idea, or the book would never have been begun, and now that it is finished I would bespeak the reader's sympathies, on Mr. Plomer's behalf, that its inevitable shortcomings may be the more generously forgiven. If we look at what has already been written on the subject the difficulties will be more easily appreciated. In England, as in other countries, the period in the history of the press which is best known to us is, by the perversity of antiquaries, that which is furthest removed from our own time. Of all that can be learnt about Caxton the late Mr. William Blades set down in his monumental work nine-tenths, and the zeal of Henry Bradshaw, of Mr. Gordon Duff, and of Mr. E. J. L. Scott, has added nearly all that was lacking in this storehouse. Mr. Duff has extended his labours to the other English printers of the 15th century, giving in his *Early English Printing* (Kegan Paul, 1896) a conspectus, with facsimiles of their types, and in his privately printed *Sandars Lectures* presenting a detailed account of their work, based on the personal examination of every book or fragment from their presses which his unwearied diligence has been able to discover. Originality for this period being out of the question, Mr. Plomer's task was to select, under a constant sense of obligation, from the mass of details which have been brought together for this short period, and to preserve due proportion in their treatment.

Of the work of the printers of the next half-century our knowledge is much less detailed, and Mr. Plomer might fairly claim that he himself, by the numerous documents which he has unearthed at the Record Office and at Somerset House, has made some contributions to it of considerable value and interest. It is to his credit, if I may say so, that so little is written here of these discoveries. In a larger book the story of the brawl in which Pynson's head came so nigh to being broken, or of John Rastell's suit against the theatrical costumier who impounded the dresses used in his private theatre, would form pleasant digressions, but in a sketch of a large subject there is no room for digressions, and these personal incidents have been sternly ignored by their discoverer. Even his first love, Robert Wyer, has been allotted not more than six lines above the space which is due to him, and generally Mr. Plomer has compressed the story told in the *Typographical Antiquities* of Ames, Herbert, and Dibdin with much impartiality.

When we pass beyond the year 1556, which witnessed the incorporation of the Stationers' Company, Mr. Arber's *Transcripts from the Company's Registers* become the chief source of information, and Mr. Plomer's pages bear ample record of the use he has made of them, and of the numerous documents printed by Mr. Arber in his prefaces. After 1603, the date at which Mr. Arber discontinues, to the sorrow of all bibliographers, his epitome of the annual output of the press, information is far less abundant. After 1640 it becomes a matter of shreds and patches, with no other continuous aid than Mr. Talbot Reed's admirable work, *A History of the Old English Letter Foundries*, written from a different standpoint, to serve as a guide. His own researches at the Record Office have enabled Mr. Plomer to enlarge considerably our knowledge of the printers at work during the second half of the seventeenth century, but when the State made up its mind to leave the printers alone, even this source of information lapses, and the pioneer has to gather what he may from the imprints in books which come under his hand, from notices of a few individual printers, and stray anecdotes and memoranda. Through this almost pathless forest Mr. Plomer has threaded his way, and though the road he has made may be broken and imperfect, the fact that a road exists, which they can widen and mend, will be of incalculable advantage to all students of printing.

Besides the indebtedness already stated to the works of Blades, Mr. Gordon Duff, Mr. Arber, and Mr. Reed, acknowledgments are also due for the help derived from Mr. Allnutt's papers on *English Provincial Printing* (*Bibliographica*, vol. ii.) and Mr. Warren's history of the Chiswick Press (*The Charles Whittinghams, Printers; Grolier Club, 1896*). Lest Mr. Plomer should be made responsible for borrowed faults, it must also be stated that the account of the Kelmscott Press is mainly taken from an article contributed to *The Guardian* by the present writer. The hearty thanks of both author and editor are due to Messrs. Macmillan and Bowes for the use of two devices; to

the Clarendon Press for the three pages of specimens of the types given to the University of Oxford by Fell and Junius; to the Chiswick Press for the examples of the devices and ornamental initials which the second Whittingham reintroduced, and for the type-facsimiles of the title-page of the book with which he revived the use of old-faced letters; to Messrs. Macmillan for the specimen of the Macmillan Greek type, and to the Trustees of Mr. William Morris for their grant of the very exceptional privilege of reproducing, with the skilful aid of Mr. Emery Walker, two pages of books printed at the Kelmscott Press.

That the illustrations are profuse at the beginning and end of the book and scanty in the middle must be laid to the charge of the printers of the seventeenth and eighteenth centuries, in whose work good ornament finds no place. It was due to Caslon and Baskerville to insert their portraits, though they can hardly[Pg xii] be called works of art. That of Roger L'Estrange, which is also given, may suggest, by its more prosperous look, that in the evil days of the English press its Censor was the person who most thrived by it.

Alfred W. Pollard.

CHAPTER I CAXTON AND HIS CONTEMPORARIES

The art of printing had been known on the Continent for something over twenty years, when William Caxton, a citizen and mercer of London, introduced it into England.

Such facts as are known of the life of England's first printer are few and simple. He tells us himself that he was born in the Weald of Kent, and he was probably educated in his native village. When old enough, he was apprenticed to a well-to-do London mercer, Robert Large, who carried on business in the Old Jewry. This was in 1438, and in 1441 his master died, leaving, among other legacies, a sum of twenty marks to William Caxton.

In all probability Caxton, whose term of apprenticeship had not expired, was transferred to some other master to serve the remainder of his term; but all we know is that he shortly afterwards left England for the Low Countries. In the prologue to the Recuyell of the Historyes of Troye he tells us that, at the time he began the translation, he had been living on the Continent for thirty years, in various places, Brabant, Flanders, Holland, and Zealand, but the city of Bruges, one of the largest centres of trade in Europe at that time, was his headquarters. Caxton prospered in his business, and rose to be 'Governor to the English Nation at Bruges,' a position of importance, and one that brought him into contact with men of high rank.

In the year 1468 Caxton appears to have had some leisure for literary work, and began to translate a French book he had lately been reading, Raoul Le Fevre's Recueil des Histoires de Troyes; but after writing a few quires he threw down his pen in disgust at the feebleness of his version.

Very shortly after this he entered the service of Margaret, Duchess of Burgundy, sister of Edward IV. of England, either as secretary or steward. The Duchess used to talk with him on literary matters, and he told her of his attempt to translate the Recueil. She asked him to show her what he had written, pointed out how he might amend his 'rude English,' and encouraged him to continue his work. Caxton took up the task again, and in spite of many interruptions, including journeys to both Ghent and Cologne, he completed it, in the latter city, on the 19th September 1471. All this he tells us in the prologue, and at the end of the second book he says:—

'And for as moche as I suppose the said two bokes ben not had to fore this tyme in oure English langage | therefore I had the better will to accomplishe this said werke | whiche werke was begonne in Brugis | and contynued in Gaunt, and finyshed in Coleyn, ... the yere of our lord a thousand four honderd lxxi.' He then goes on to speak of John Lydgate's translation of the third book, as making it needless to translate it into English, but continues:—

'But yet for as moche as I am bounde to contemplate my fayd ladyes good grace and also that his werke is in ryme | and as ferre as I knowe hit is not had in prose in our tonge ... and also because that I have now god leyzer beyng in Coleyn, and have none other thing to doo at this tyme, I have,' etc.

Then at the end of the third book he says that, having become weary of writing and yet having promised copies to divers gentlemen and friends,—

'Therfor I have practysed and lerned at my grete charge and dispense to ordeyne this said book in prynte after the maner and forme as ye may here see,' etc.

The book when printed bore neither place of imprint, date of printing, or name of printer. The late William Blades, in his *Life of Caxton* (vol. i. chap. v. pp. 45-61), maintained that this [Pg 4] book, and all the others printed with the same type, were printed at Bruges by Colard Mansion, and that it was at Bruges, and in conjunction with Mansion, that Caxton learned the art of printing. His principal reasons for coming to this conclusion were: (1) That Caxton's stay in Cologne was only for six months, long enough for him to have finished the translation of the book, but too short a time in which to have printed it. (2) That the type in which it was printed was Colard Mansion's. (3) That the typographical features of the books printed in this type (No. 1) point to their having all of them come from the same printing office.

Caxton's own statement in the epilogue to the third book certainly appears to mean that during the course of the translation, in order to fulfil his promise of multiplying copies, he had learned to print. He might easily have done so in the six months during which he remained in Cologne, or during his stay in Ghent. That it was in Cologne rather

than elsewhere, is confirmed by the oft-quoted stanza added by Wynkyn de Worde as a colophon to the English edition of Bartholomæus de proprietatibus rerum.

'And also of your charyte call to remembraunce

The soule of William Caxton, the first prynter of this boke,

In laten tongue at Coleyn, hymself to avaunce

That every well-disposed man may thereon loke.'

Fig. 2.—Part of Caxton's Preface to the 'Recuyell of the Histories of Troye.' (Type 1.)

If any one should have known the true facts of [Pg 6] the case it was surely Caxton's own foreman, who almost certainly came over to England with him. On the other hand, it cannot be denied that type No. 1 is totally unlike any type that we know of as used by a Cologne printer, and, moreover, Caxton's methods of working, and his late adoption of spacing and signatures, point to his having learnt his art in a school of printing less advanced than that of Cologne. In the face of the statements of Caxton himself and Wynkyn de Worde, we seem bound to believe that Caxton did study printing at Cologne, but the inexpertness betrayed in his early books proves conclusively that his studies there did not extend very far. In any case it must have been with the help of Colard Mansion that he set up and printed the Recuyell, probably in 1472 or 1473. In addition to this book several others, printed in the same type, and having other typographical features in common with it, were printed in the next few years. These were:—

The Game and Playe of the Chess Moralised, translated by Caxton, a small folio of 74 leaves.

Le Recueil des Histoires de Troye, a folio of 120 leaves.

Les Fais et Prouesses du noble et vaillant chevalier Jason, a folio of 134 leaves, printed, it is believed, by Mansion, after Caxton's removal to England. And,

Meditacions sur le sept Psaulmes Penitenciaulx, a folio of 34 leaves, also ascribed to Mansion's press, about the year 1478.

About the latter half of 1476 Caxton must have left Bruges and come to England, leaving type No. 1 in the hands of Mansion, and bringing with him that picturesque secretary type, known as type 2. This, as Mr. Blades has undoubtedly proved, had already been used by Caxton and Mansion in printing at least two books: *Les quatre derrenieres choses*, notable from the method of working the red ink, a method found in no other book of Colard Mansion; and *Propositio Johannis Russell*, a tract of four leaves, containing Russell's speech at the investiture of the Duke of Burgundy with the order of the Garter in 1470.

Fig. 3.—Part of Caxton's Epilogue to the 'Dictes and Sayinges of the Philosophers.' (Type 2.)

On his arrival in England, Caxton settled in Westminster, within the precincts of the Abbey, at the sign of the Red Pale, and from thence, on November 18th 1477, he issued *The Dictes and Sayinges of the Philosophers*, the first book printed in England. It was a folio of 76 leaves, without title-page, foliation, catchwords or signatures, in this respect being identical with the books printed in conjunction with Mansion. Type 2, in which it was printed, was a very different fount to that which is seen in the Recuyell and its companion books. It was undoubtedly modelled on the large Gros Batarde type of Colard Mansion, and was in all probability cut by Mansion himself. The letters are [Pg 9] bold, and angular, with a close resemblance to the manuscripts of the time, the most notable being the lowercase 'w,' which is brought into prominence by large loops over the top. The 'h's' and 'l's' are also looped letters, the final 'm's' and 'n's' are finished with an angular stroke, and the only letter at all akin to those in type No. 1 is the final 'd,' which has the peculiar pump-handle finial seen in that fount. *The Dictes and Sayinges* is printed throughout in black ink, in long lines, twenty-nine to a page, with space left at the beginning of the chapters for the insertion of initial letters. It has no colophon, but at the end of the work is an Epilogue, which begins thus:—

'Here endeth the book named the dictes or sayengis | of the philosophers, enprynted, by me william | Caxton at Westmestre the yere of our lord ·M· | CCCC·LXXVij.'

Caxton followed *The Dictes and Sayings* with an edition of Chaucer's *Canterbury Tales*, a folio of 372 leaves. The size of the book makes it probable that it was put in hand simultaneously with its predecessor, and that the chief work of the poet, to whom Caxton paid more than one eloquent tribute, engaged his attention as soon as he set up his press in England. He also printed in the same type a *Sarum Ordinale*, known only by a fragment in the Bodleian, and a number of small quarto tracts, such as *The Moral Proverbs of Christyne*, which bears date the 20th of February; a Latin school-book called *Stans Puer ad Mensam*; two translations from the *Distichs of Dionysius Cato*, entitled respectively *Parvus Catho* and *Magnus Catho*, of which a second edition was speedily called for; Lydgate's fable of the *Chorl and the Bird*, a quarto of 10 leaves, which also soon went to a second edition; Chaucer's *Anelida* and *Arcite*, and two editions of Lydgate's *The Horse, the Sheep, and the Goose*.

During the first three years of Caxton's residence at Westminster he printed at least thirty books. In 1479 he recast type 2 (cited in its new form by Blades as type 2*), and this he continued to use until 1481. But about the same time he cast two other founts, Nos. 3 and 4. The first of these was a large black letter of Missal character, used chiefly for printing service books, but appearing in the books printed with type 2* for headlines. With it he printed *Cordiale*, or the *Four Last Things*, a folio of 78 leaves, the work being a translation by Earl Rivers of *Les Quatre Derrenieres Choses Advenir*, first printed in type 2 in the office of Colard Mansion. A second edition of *The Dictes and Sayings* was also printed in this type, while to the year 1478 or 1479 must be ascribed the *Rhetorica Nova* of Friar Laurence of Savona, a folio of 124 leaves, long attributed to the press of Cambridge.

After 1479 Caxton began to space out his lines and to use signatures, customs that had been in vogue on the Continent for some years before he left. In 1480 he brought the new type 4 into use. This was modelled on type 2, but was much smaller, the body being most akin to modern English. Although its appearance was not so striking as that of the earlier fount, it was a much neater letter and more adapted to the printing of Indulgences, and it has been suggested that it was the arrival of John Lettou in London, and the neat look of his work, that induced Caxton to cut the fount in question. The most noticeable feature about it is the absence of the loop to the lowercase 'd,' so conspicuous a feature of the No. 2 type. With this type No. 4 he printed *Kendale's indulgence* and the first edition of *The Chronicles of England*, dated the 10th June 1480, a folio of 152 leaves. In the same year he printed with type 3 three service-books. Of one of these, the *Horæ*, William Blades found a few leaves, all that are known to exist, in the covers of a copy of *Boethius*, printed also by Caxton, which he discovered in a deplorable state from damp, in a cupboard of the St. Albans Grammar School. This was an uncut copy, in the original binding, and the covers yielded as many as fifty-six half sheets of printed matter, fragments of other books printed by Caxton. These proved the existence of three hitherto unknown examples of his press, the *Horæ* above noted, the *Ordinale*, and the *Indulgence of Pope Sixtus IV.*, the remaining fragments yielding leaves from the *History of Jason*, printed in type 2, the first edition of the *Chronicles*, the *Description of Britain*; the second edition of the *Dictes and Sayings*, the *De Curia Sapientiae*, *Cicero's De Senectute*, and the *Nativity of Our Lady*, printed in the recast of type 4, known as type 4*.

Fig. 4.—Caxton's earliest Woodcut. Headline in Type 3.

The first book printed by Caxton with illustrations was the third edition of *Parvus and Magnus Chato*, printed without date, but probably in 1481. It contained two woodcuts, one showing five pupils kneeling before their tutor. These illustrations were very poor specimens of the wood-cutter's art.

To this period also belongs *The History of Reynard the Fox* and the second edition of *The Game and Play of Chess*, printed with type 2*, and distinguished from the earlier edition by the eight woodcuts, some of which, according to the economical fashion of the day, were used more than once.

In type 4, Caxton printed (finishing it on the 20th November 1481) *The History of Godfrey of Bologne*; or, the *Conquest of Jerusalem*, a folio of 144 leaves. In the following year (1482) appeared the second edition of the *Chronicles*, and another work of the same kind, the compilation of Roger of Chester and Ralph Higden, called *Polychronicon*. This work John of Trevisa had translated into English prose, bringing it down to the year 1387. Caxton now added a further continuation to the year 1460, the only original work ever undertaken by him. Another English author whom Caxton printed at this time was John Gower, an edition in small folio (222 leaves in double columns) of whose *Confessio Amantis* was finished on the 2nd September 1483. In this we see the first use of type 4*, the two founts being found in one instance on the same page. The first edition of the *Golden Legend* also

belongs to 1483, being finished at Westminster on the 20th November. This was the largest book that Caxton printed, there being no less than 449 leaves in double columns, illustrated with as many as eighteen large and fifty-two small woodcuts. The text was in type 4*, the headlines, etc., in type 3. For the performance of this work Caxton received from the Earl of Arundel, to whom the book was dedicated, the gift of a buck in summer and a doe in winter, gifts probably exchanged for an annuity in money. Several copies of this book are still in existence, its large size serving as a safeguard against complete destruction, but none are perfect, most of them being made up from copies of the second edition. The insertions may be recognised by the type of the headlines, those in the second edition being in type 5. Other books printed in type 4* were Chaucer's *Book of Fame*, Chaucer's *Troilus*, the *Lyf of Our Ladye*, the *Life of Saint Winifred*, and the *History of King Arthur*, this last, finished on July 31, 1485, being almost as large a book as the *Golden Legend*.

Fig. 5.—From Caxton's '*Golden Legend*.' (Types 4* and 5.)

No work dated 1486 has been traced to Caxton's press, but in 1487 he brought into use type 5, a smaller form of the black letter fount known as No. 3, with which he sometimes used a set of Lombardic capitals. With this he printed, between 1487 and 1489, several important books, among them the *Royal Book*, a folio of 162 leaves, illustrated with six small illustrations, the *Book of Good Manners*, the first edition of the *Directorium Sacerdotum*, and the *Speculum Vitæ Christi*. During 1487 also he had printed for him at Paris an edition of the *Sarum Missal*, from the press of George Maynyal, the first book in which he used his well-known device. The second edition of the *Golden Legend* is believed to have been published in 1488, and to about the same time belongs the *Indulgence* which Henry Bradshaw discovered in the University Library, Cambridge, and which seems to have been struck off in a hurry on the nearest piece of blank paper, which happened to be the last page of a copy of the *Colloquium peccatoris et Crucifixi J. C.*, printed at Antwerp. This was not the only remarkable find which that master of the art of bibliography made in connection with Caxton. On a waste sheet of a copy of the *Fifteen Oes*, he noticed what appeared to be a set off of another book, and on closer inspection this turned out to be a page of a *Book of Hours*, of which no copy has ever been found. It appeared to have been printed in type 5, was surrounded by borders, and was no doubt the edition which Wynkyn de Worde reprinted in 1494.

In 1489 Caxton began to use another type known as No. 6, cast from the matrices of No. 2 and 2*, but a shade smaller, and easily distinguishable by the lowercase 'w,' which is entirely different in character from that used in the earlier fount. With this he printed on the 14th July 1489, the *Faytts of Armes and Chivalry*, and between that date and the day of his death three romances, the *Four Sons of Aymon*, *Blanchardin*, and *Eneydos*; the second editions of *Reynard the Fox*, the *Book of Courtesy*, the *Mirror of the World*, and the *Directorium Sacerdotum*, and the third edition of the *Dictes and Sayinges*. To the same period belong the editions of the *Art and Craft to Know Well to Die*, the *Ars Moriendi*, and the *Vitas Patrum*.

But in addition to type 6, which Blades believed to be the last used by Caxton, there is evidence of his having possessed two other founts during the latter part of his life. With one of them, type No. 7 (see E. G. Duff, *Early English Printing*), somewhat resembling types Nos. 3 and 5, he printed two editions of the *Indulgence of Johannes de Gigliis* in 1489, and it was also used for the sidenotes to the *Speculum Vitæ Christi*, printed in 1494 by Wynkyn de Worde. Type No. 8 was also a black letter of the same character, smaller than No. 3, and distinguished from any other of Caxton's founts by the short, rounded, and tailless letter 'y' and the set of capitals with dots. He used it in the *Liber*[Pg 18] *Festivalis*, the *Ars Moriendi*, and the *Fifteen Oes*, his only extant book printed with borders, and it was afterwards used by Wynkyn de Worde.

Caxton died in the year 1491, after a long, busy, and useful life. His record is indeed a noble one. After spending the greater part of his life in following the trade to which he was apprenticed, with all its active and onerous duties, he, at the time of life when most men begin to think of rest and quiet, set to work to learn the art of printing books. Nor was he content with this, but he devoted all the time that he could spare to editing and translating for his press, and according to Wynkyn de Worde it was 'at the laste daye of his lyff' that he finished the version of the *Lives of the Fathers*, which De Worde issued in 1495. His work as an editor and translator shows him to have been a man of extensive reading, fairly acquainted with the French and Dutch languages, and to have possessed not only an earnest purpose, but with it a quiet sense of humour, that crops up like ore in a vein of rock in many of his prologues.

Fig. 6.—From Caxton's '*Fifteen Oes*.' (Type 6.)

Of his private life we know nothing, but the 'Mawde Caxston' who figures in the churchwarden's accounts of St. Margaret's is generally believed to have been his wife. His will has not yet been discovered, though it very likely exists among the uncalendared documents at Westminster Abbey, from which Mr. Scott has already gleaned a few records relating to him, though none of biographical interest. We know, however, from the parish accounts of St. Margaret's, Westminster, that he left to that church fifteen copies of the Golden Legend, twelve of which were sold at prices varying between 6s. 8d. and 5s. 4d.

Caxton used only one device, a simple square block with his initials W. C. cut upon it, and certain hieroglyphics said to stand for the figures 74, with a border at the top and bottom. It was probably of English workmanship, as those found in the books of foreign printers were much more finely cut. This block, which Caxton did not begin to use until 1487, afterwards passed to his successor, who made it the basis of several elaborate variations.

Upon the death of Caxton in 1491, his business came into the hands of his chief workman, Wynkyn de Worde. From the letters of naturalisation which this printer took out in 1496, we learn that he was a native of Lorraine. It was suggested by Herbert that he was one of Caxton's original workmen, and came with him to England, and this has recently been confirmed by the discovery of a document among the records at Westminster, proving that his wife rented a house from the Abbey as early as 1480. In any case there is little doubt that Wynkyn de Worde had been in intimate association with Caxton during the greater part of his career as a printer, and when Caxton died he seems to have taken over the whole business just as it stood, continuing to live at the Red Pale until 1500, and to use the types which Caxton had been using in his latest books. This fact led Blades to ascribe several books to Caxton which were probably not printed until after his death. These are *The Chastising of Gods Children*, *The Book of Courtesye*, and *The Treatise of Love*, printed with type No. 6; but, in addition to these, two other books, probably in the press at the time of Caxton's death, were issued from the Westminster office without a printer's name, but printed in a type resembling type 4*. These are an edition of the *Golden Legend* and the *Life of St. Catherine of Sienna*. Wynkyn de Worde's name is found for the first time in the *Liber Festivalis*, printed in 1493. In the following year was issued *Walter Hylton's Scala Perfectionis*, and a reprint of *Bonaventura's Speculum Vite Christi*, the sidenotes to which were printed in Caxton's type No. 7, which de Worde does not seem to have used in any other book. Besides this, there was the *Sarum Horæ*, no doubt a reprint of Caxton's edition now lost. He used for these books Caxton's type No. 8, with the tailless 'y' and the dotted capitals. Speaking of this type in his *Early Printed Books*, Mr. E. G. Duff points out its close resemblance to that used by the Paris printers P. Levet and Jean Higman in 1490, and argues that it was either obtained from them or from the type-cutter who cut their founts.

To the year 1495 belongs the *Vitas Patrum*, the book of which Caxton had finished the translation on the day of his death, and beside this, there were reprints of the *Polychronicon* and the *Directorium Sacerdotum*. The reprint of the *Boke of St. Albans*, which was issued in 1496, is noticeable as being printed in the type which De Worde obtained from Godfried van Os, the Gouda printer. This broad square set letter is not found in any other book of De Worde's, though he continued to use a set of initial letters which he obtained from the same printer for many years.

Among other books printed in 1496, were *Dives and Pauper*, a folio, and several quartos such as the *Abbey of the Holy Ghost*, the *Meditations of St. Bernard*, and the *Liber Festivalis*. In 1497 we find the *Chronicles of England*, and in 1498 an edition of Chaucer's *Canterbury Tales*, a second edition of the *Morte d'Arthur*, and another of the *Golden Legend*, in fact nearly all De Worde's dated books up to 1500 were reprints of works issued by Caxton. But amongst the undated books we notice many new works, such as *Lydgate's Assembly of Gods*, and *Sege of Thebes*, *Skelton's Bowghe of Court*, *The Three Kings of Cologne*, and several school books. In 1499 De Worde printed the *Liber Equivocorum* of Joannes de Garlandia, using for it a very small Black Letter making nine and a half lines to the inch, probably obtained from Paris. This type was generally kept for scholastic books, and in addition to the book above noted, Wynkyn de Worde printed with it, in the same year or the year following, an *Ortus Vocabulorum*. From the time when he succeeded to Caxton's business down to the year 1500, in which he left Westminster and settled in Fleet Street, De Worde printed at least a hundred books, the bulk of them undated.

As will be seen, several printers from the Low Countries seem to have come to England soon after Caxton. The year after he settled at Westminster, a book was printed at Oxford without printer's name, and with a misprint of the date, that has set bibliographers by the ears ever since. This book was the *Exposicio sancti Jeromini us simbolum apostolorum*, and the colophon ran, 'Impressa Oxonie et finita anno domini M.cccc.lxviiij., xvij. die decembris.' The facts that two other books that are dated 1479 (the *Aegidius de originali peccato* and *Sextus ethicorum Aristotelis*) have many points in common with the *Exposicio*, that the *Exposicio* has been found bound with other books of

1478, and that the dropping of an x from the date in a colophon is not an uncommon misprint, have led to the conclusion that the *Expositio* was printed in 1478 and not 1468. The printer of these first Oxford books is believed to have been Theodoric Rood of Cologne, whose name appeared in the colophon to the *De Anima* of Aristotle, printed at Oxford in 1481. This was followed in 1482 by a *Commentary on the Lamentation of Jeremiah*, by John Lattebury, and later editions of these two books are distinguished by a handsome woodcut border printed round the first page of the text.

About 1483 Rood took as a partner Thomas Hunt, a stationer of Oxford, and together they issued John Anwykyll's *Latin Grammar*, together with the *Vulgaria Terencii*, Richard Rolle of Hampole's *Explanationes super lectiones beati Job*, a sermon of Augustine's, of which the only known copy is in the British Museum, a collection of treatises upon logic, one of which is by Roger Swyneshede, the first edition of Lyndewode's *Provincial Constitutions* (a large folio of 366 leaves with a woodcut, the earliest example found in any Oxford book), and the *Epistles of Phalaris*, with a lengthy colophon in Latin verse. The last book to appear from the press was the *Liber Festivalis* by John Mirk, a folio of 174 leaves, containing eleven large woodcuts and five smaller ones, apparently meant for an edition of the *Golden Legend*, as they were cut down to fit the *Festial*. After the appearance of this book, printing at Oxford suddenly ceased, and it has been surmised that Theodoric Rood returned to Cologne. Altogether the Oxford press lasted for eight years, and fifteen books remain to testify to its activity. In these, three founts of type were used, the first two having all the characteristics of the Cologne printers, while the third shows the influence of Rood's residence in England. A full account of these will be found in Mr. Falconer Madan's admirable work *The Early Oxford Press*.

The St. Albans Press started in 1479. Only eight books are known with this imprint, not all of them perfect, none give the name of the printer, and only one has a device. Most of them are scholastic books, printed for the use of the Grammar School. These included the *Augustini Dati elegancie*, a quarto, dated 1480, the *Rhetorica Nova*, which Caxton was printing at Westminster at the same time, and *Antonius Andreae super Logica Aristotelis*. But in addition to these, two other notable works came from this press, the *Chronicles of England* and the *Book of St. Albans*.

Out of the four types which are found in these books, two at least were Caxton's type No. 2 and type No. 3. There was plainly some connection between the two offices, and as it was a frequent custom for monasteries to subsidize printers to print their service books, it seems possible that Caxton may have had some hand in establishing this press, and that it was for St. Albans Abbey that he cast type No. 3, which (putting aside its subordinate employment for headlines) we find used exclusively for service books.

Three years after Caxton had settled at Westminster, viz. in 1480, an Indulgence was issued by John Kendale, asking for aid against the Turks. Caxton printed some copies of this, and others are found in a small neat type, and are ascribed to the press of John Lettou. Lettou is an old form of Lithuania, but whether John Lettou came from Lithuania is not known.

In this same year 1480, Lettou published the *Quæstiones Antonii Andreae super duodecim libros metaphysicæ Aristotelis*, a small folio of 106 leaves, printed in double columns, of which only one perfect copy is known, that in the Library of Sion College. The type is small, and remarkable from its numerous abbreviations. Mr. E. G. Duff in his *Early Printed Books*, p. 161, speaks of its great resemblance to those of Matthias Moravus, a Naples printer, and suggests a common origin for their types. In his *Early English Printing*, on the other hand, he writes: 'There are very strong reasons for believing that he [Lettou] is the same person as the Johannes Bremer, alias Bulle, who is mentioned by Hain as having printed two books at Rome in 1478 and 1479. The type which this printer used is identical (with the exception of one of the capital letters) with that used in the books printed by John Lettou in London.'

A few years later Lettou was joined by William de Machlinia. They were chiefly associated in printing law-books, but whether they had any patent from the king cannot be discovered. Only one of the five books they are known to have printed, the *Tenores Novelli*, has any colophon, and none of them has any date. The address they gave was 'juxta ecclesiam omnium sanctorum,' but as there were several churches so dedicated, the locality cannot be fixed.

We next find Machlinia working alone, but out of the twenty-two books or editions that have been traced to his press, only four contain his name, and none have a date. All we can say is that he printed from two addresses, 'in

Holborn,' and 'By Flete-bridge.' Mr. Duff inclines to the opinion that the 'Flete-bridge' is the earlier, but it seems almost hopeless to attempt to place these books in any chronological order from their typographical peculiarities.

In the Fleet-Bridge type are two books by Albertus Magnus, the *Liber aggregationis* and the *De Secretis Mulierum*. The type is of a black letter character, not unlike that in which the *Nova Statuta* were printed, and is distinguishable by the peculiar shape of the capital M. In the same type we find the *Revelation of St. Nicholas to a Monk of Evesham*, a reprint of the *Tenores Novelli*, and some fragments of a *Sarum Horæ* found in old bindings; a woodcut border was used in some parts of it. Besides these Machlinia printed an edition of the *Vulgaria Terentii*.

A larger number of books is found in the Holborn types, the most important being the *Chronicles of England*, of which only one perfect copy is known.

The *Speculum Christiani* is interesting as containing specimens of early poetry, and *The Treatise on the Pestilence*, of Kamitus or Canutus, bishop of Aarhus, ran to three editions, one of which contains a title-page, and was therefore presumably printed late in Machlinia's career, i.e. about 1490.

In addition to these, there were three law-books, the *Statutes of Richard III.*, and several theological and scholastic works. One of the founts of type used by Machlinia is of peculiar interest, by reason of its close resemblance to Caxton's type No. 2*, and its still greater similarity to the type used by Jean Brito of Bruges.

Machlinia's business seems to have been taken over by Richard Pynson. There is no direct evidence of this, but like Machlinia he took up the business of printing law-books (being the first printer in this country to receive a royal patent); he is found using a woodcut border used in Machlinia's *Horæ*; and, in addition to this, waste from Machlinia books has been found in Pynson bindings. Richard Pynson was a native of Normandy. He had business relations with Le Talleur, a printer of Rouen. His methods also were those of Rouen, rather than of any English master. Wherever he came from, Richard Pynson was the finest printer this country had yet seen, and no one, until the appearance of John Day, approached him in excellence of work.

Fig. 7.—Pynson's Mark.

The earliest examples of his press appear to be a fragment of a *Donatus* in the Bodleian and the *Canterbury Tales of Chaucer*. The type he used for these was a bold, unevenly cast fount of black letter, somewhat resembling that used by Machlinia at Fleet Bridge. The *Chaucer*, however, contained a second fount of small sloping Gothic.

The first book of Pynson found with a date is a *Doctrinale*, printed in November 1492, now in the John Rylands Library. This was followed by the *Dialogue of Dives and Pauper*, printed in 1493 with a new type, distinguishable by the sharp angular finish to the letter 'h.' Several quartos without date were printed in the same type.

>From this time till 1500, the majority of his books were printed in the small type of the *Chaucer*.

Another printer who worked at this time was Julian Notary. He was associated in the production of books with Jean Barbier, and another whose initials, J. H., are believed to be those of J. Huvin, a printer of Paris. They established themselves in London at the sign of St. Thomas the Apostle, and their most important book was the *Questiones Alberti de modis significandi*, which they followed up in 1497 with an octavo edition of the *Horæ ad usum Sarum*. In 1498 Barbier and Notary removed to King Street, Westminster, where they printed in folio a *Missale ad usum Sarum*. Soon afterwards Notary was printing by himself, his partner, Barbier, having returned to France. Two quartos, the *Liber Festivalis* and *Quattuor Sermones*, are all that can be traced to his press in 1499, and a small edition of the *Horæ ad usum Sarum* is the sole record of this work in 1500.

CHAPTER II

FROM 1500 TO THE DEATH OF WYNKYN DE WORDE

In the year 1500 Wynkyn de Worde moved from Westminster to the 'Sunne' in Fleet Street. His business had probably outgrown the limited accommodation of the 'Red Pale,' and the change brought him nearer the heart of the bookselling trade then, and for many years after, seated in St. Paul's Churchyard and Fleet Street. He carried with

him the black letter type with which he had printed the *Liber Festivalis* in 1496, and continued to use it until 1508 or 1509, when he seems to have sold it to a printer in York, Hugo Goes. He brought with him also the scholastic type in use in 1499.

Besides these, we find, e.g. in the 1512 reprint of the *Golden Legend*, two other founts of black letter. The larger of the two seems to have been introduced about 1503, to print a *Sarum Horæ*. The smaller fount came into use a few years later. It was somewhat larger, less angular, and much more English in character, than that which the [Pg 32] printer had brought with him from Westminster. The bulk of Wynkyn de Worde's books to the day of his death were printed with these types. They were, doubtless, recast from time to time, but a close examination fails to detect any difference in size or form during the whole period.

De Worde first began to use Roman type in 1520 for his scholastic books, but he does not seem ever to have made any general use of it, remaining faithful to English black letter to the end of his days. The only exceptions are the educational books, which he invariably printed, as in fact did all the other printers of the period, in a miniature fount of gothic of a kind very popular on the Continent in the fifteenth and sixteenth centuries, being used by the French and Italian printers as well as those of the Low Countries. De Worde's, however, was an exceptionally small fount. Those most generally in use averaged eight full lines of a quarto page, set close, to the inch, whereas De Worde's averaged nine lines to the inch. But in 1513 he procured another fount of this type, in which he printed the *Flowers of Ovid*, quarto, and in this the letters are of English character, as may be seen particularly in the lowercase 'h.' This fount, which was slightly larger, averaging only eight lines to the inch, he does not seem to have used very frequently. As Julian Notary printed the *Sermones Discipuli* in 1510, in the same type, it may have been lent by one printer to the other. In or about 1533 De Worde introduced the italic letter into some of his scholastic books, and in Colet's *Grammar*, which was amongst the last books he printed, we find it in combination with English black letter, the small 'grammar type,' and Roman.

In these various types, between the beginning of the century and his death in 1534, Wynkyn de Worde printed upwards of five hundred books which have come down to us, complete or in fragments. Thanks to the indefatigable energy of Mr. Gordon Duff, we possess now a very full record of his books, enabling us not only to estimate his merit as a printer, but to see at a glance how consistently as a publisher he maintained the entirely popular character which Caxton had given to his press.

As regards books which required a considerable outlay, he was far less adventurous than Caxton, his large folios being confined almost entirely to those in which his master had led the way, such as the *Golden Legend*, of which he issued several editions, the *Speculum Vitæ Christi*, the *Morte d'Arthur*, *Canterbury Tales*, *Polychronicon*, and *Chronicles of England*. The *Vitas Patrum* of 1495 he could hardly help printing, as Caxton had laboured on its translation in the last year of his life, and it may have been respect for Caxton also which led to the publication of his finest book, the really splendid edition of Bartholomæus' *De Proprietatibus Rerum*, issued towards the close of the fifteenth century, from the colophon of which I have already quoted the lines referring to Caxton's having worked at a Latin edition of it at Cologne. The *Book of St. Albans* was another reprint to which the probable connection of the Westminster and St. Albans presses gave a Caxton flavour; and when we have enumerated these and the *Dives and Pauper*, produced apparently out of rivalry with Pynson in 1496, and a few devotional books such as the *Orchard of Syon* and the *Flour of the Commandments of God*, to which this form was given, very few Wynkyn de Worde folios remain unmentioned.

But to one book in folio, Wynkyn de Worde printed some five-and-twenty in quarto, eschewing as a rule smaller forms, though now and again we find a *Horæ*, or a *Manipulus Curatorum*, or a *Book of Good Manners for Children* in eights or twelves.

He was in fact a popular printer who issued small works in a cheap form, and without, it must be added, greatly concerning himself as to their appearance. Popular books of devotion or of a moral character figure most largely among the books he printed; but students of our older literature owe him gratitude for having preserved in their later forms many old romances, and also a few plays, and he published every class of book, including many educational works, for which a ready sale was assured. The majority of these books were illustrated, if only with a cut on the title-page of a schoolmaster with a birch-rod, or a knight on horseback who did duty for many heroes in succession. When the illustrations were more profuse, they were too often produced from worn blocks, purchased from French

publishers, or rudely copied from French originals, and used again and again without a thought as to their relevance to the text. It must also be owned that many of Wynkyn de Worde's cheap books are badly set up and badly printed, and that altogether his reputation stands rather higher than his work as a printer really deserves. But he printed some fine books, and rescued many popular works from destruction, and we need not grudge him the honour he has received—an honour amply witnessed by the high prices fetched by books from his press whenever they come into the market.

Fig. 9.—De Worde's 'Sagittarius' Device.

There was no originality about Wynkyn de Worde's devices, of which he used no fewer than sixteen different varieties. The most familiar, as it was the earliest of these, was Caxton's, and next to this must be placed what is usually described as the Sagittarius device. There were two forms of this, a square and an oblong. It consisted of three divisions, the upper part containing the sun and stars, the centre, the Caxton device, and the lower part, a ribbon with his name, with a dog on one side and an archer on the other. There are three distinct stages of this device, that used between 1506-1518 being replaced in 1519, and again in 1528. This last is distinguished by having only ten small stars to the left of the sun and ten to the right, whereas the two preceding had eleven stars to the left of the sun and nine to the right. The oblong block had the moon added in the top compartment, and in the bottom division the sagittarius and dog are reversed. This block continued in use from 1507 to 1529, and the stages in its dilapidation are useful in dating the books in which it occurs. Besides these, and some smaller forms, Wynkyn de Worde used a large architectural device, sometimes enclosed with a border of four pieces, the upper and lower of which seem to have afterwards come into the possession of John Skot.

Wynkyn de Worde died in 1534, his will being proved on the 19th January 1535. His executors were John Byddell, who succeeded to his business, and James Gaver, while three other London stationers, Henry Pepwell, John Gough, and Robert Copland were made overseers of it, and received legacies.

Julian Notary remained at Westminster two years after the departure of Wynkyn de Worde, when he too flitted eastwards, settling at the sign of the Three Kings without Temple Bar, probably to be nearer De Worde. He combined with his trade of printer that of bookbinder, and probably bound as well as printed many books for Wynkyn de Worde. His printing lay principally in the direction of service books for the church, but he printed both the Golden Legend and the Chronicle of England in folio, one or two lives of saints, and a few small tracts of lighter vein, such as 'How John Splynter made his testament,' and 'How a serjeant wolde lerne to be a frere,' both in quarto without date.

In the Golden Legend of 1503 and the Chronicles of England of 1515, the black letter type used was identical in character with that of Wynkyn de Worde.

No book is found printed by Notary between the years 1510 and 1515. In the former year he appears to have had a house in St. Paul's Churchyard, as well as the Three Kings without Temple Bar. In 1515 he speaks only of the sign of St. Mark in St. Paul's Churchyard, and three years later this is altered to the sign of the Three Kings. It is just conceivable that this last was a misprint, or that the St. Mark was a temporary office used only while the Three Kings was under repair.

In 1507 Notary exchanged the simple merchant's mark that had hitherto served him as a device for one of a more elaborate character. This took the form of a helmet over a shield with his mark upon it, with decorative border, and below all his name. From this a still larger block was made in the same year, and this was strongly French in character. It showed the smaller block affixed to a tree with bird and flowers all round it, and two fabulous creatures on either side of the base. The initials 'J. N.' are seen at the top. This he sometimes used as a frontispiece, substituting for the centre piece a block of a different character.

Richard Pynson also changed his address shortly after Wynkyn de Worde, moving from outside Temple Bar to the George in Fleet Street, next to St. Dunstan's Church. He also appears to have entirely given up the use of Gothic type in favour of English black letter about this time. It is not easy to form a conjecture as to the motive which led to the abandonment of this type, and it is impossible to regard the step without regret. Even in its rudest forms it was a striking type; in the hands of a man like Pynson it was far more effective than the black letter which took its place. With regard to this latter, there seems reason to believe, from the great similarity both in size and form of the fount

in use by De Worde, Notary, and Pynson at this time, that it was obtained by all the printers from one common foundry. Nor is it only the letters which lead to this conclusion, but the common use of the same ornaments points in the same direction. The only difference between the black letter in use by Pynson in the first years of the sixteenth century and that of his contemporaries, is the occurrence of a lower case 'w' of a different fount.

In 1509 Pynson is believed to have introduced Roman type into England, using it with his scholastic type to print the *Sermo Fratris Hieronymi de Ferraria*. In the same year he also issued a very fine edition of Alexander Barclay's translation of Brandt's *Shyp of Folys of the Worlde*. In this, the Latin original and the English translation are set side by side. The book was printed in folio in two founts, one of Roman and one of black letter. It was profusely illustrated with woodcuts copied from those in the German edition.

About 1510 Pynson became the royal printer in the place of W. Faques, and continued to hold the post until his death. At first he received a salary of 40s. per annum (see L. and P. H. 8, vol. 1, p. 364), but this was afterwards increased to £4 per annum (L. and P. H. 8, vol. 2, p. 875). In this capacity he printed numbers of Proclamations, numerous Year-books, and all the Statutes, and received large sums of money. In 1513 he printed *The Sege and Dystrucyon of Troye*, of which several copies (some of them on vellum) are still in existence. Other books of which he printed copies on vellum are the *Sarum Missal* of 1520, and *Assertio Septem Sacramentorum* of 1521.

Besides these and his official work, Pynson printed numbers of useful books in all classes of literature. The works of Chaucer and Skelton and Lydgate, the history of Froissart and the *Chronicle of St. Albans*; books such as *Æsop's Fables* and *Reynard the Fox*, romances such as *Sir Bevis of Hampton* are scattered freely amongst works of a more learned character. On the whole he deserves a much higher place than De Worde. It is rare, indeed, to find a carelessly printed book of Pynson's, whilst such books as the *Boccaccio* of 1494, the *Missal* printed in 1500 at the expense of Cardinal Morton, and known as the *Morton Missal*, and the *Intrationum excellentissimus liber* of 1510 are certainly the finest specimens of typographical art which had been produced in this country.

Fig. 10.—Richard Pynson's Device.

Pynson's earliest device, as Mr. Duff has noted, resembled in many ways that of Le Talleur, and consisted of his initials cut on wood. In 1496 he used two new forms. One shows his mark upon a shield surmounted by a helmet with a bird above it. Beneath is his name upon a ribbon, and the whole is enclosed in a border of animals, birds, and flowers. The other was a metal block of much the same character, having the shield with his mark, and as supporters two naked figures. The border, which was separate and in one piece, had crowned figures in it and a ribbon. The bottom portion of this border began to give way about 1500, was very much out of shape in 1503, and finally broke entirely in 1513. This border was sometimes placed the wrong way up, as in the British Museum copy of *Mandeville's*[Pg 43] *Ways to Jerusalem* (G. 6713). It was succeeded by a woodcut block of a much larger form, which may be seen in the *Mirrore of Good Manners* (s.a., fol.). The block itself measures 5-5/8" x 3-5/8" and has no border. The initials print black on a white ground. The figures supporting the shield have a much better pose, and those of the king and queen differ materially. The bird on the shield is much larger, and is more like a stork or heron.

Pynson died in the year 1529, while passing through the press *L'Esclaircissement de la Langue Francoyse*, which was finished by his executor John Hawkins, of whom nothing else is definitely known.

Whilst these three printers had been at work, many other stationers, booksellers, and printers had settled in London. They seem to have favoured St. Paul's Churchyard and Fleet Street; but they were also scattered over various parts of the city and outlying districts, even as far west as the suburb of Charing.

In 1518, Henry Pepwell settled at the sign of the Trinity in St. Paul's Churchyard, and used the device previously belonging to Jacobi and Pelgrim, two stationers who imported books printed by Wolfgang and Hopyl. His books fall into two classes—those printed between 1518-1523, and those between 1531-1539. The first were printed entirely in a black-letter fount[Pg 44] that appears to have belonged to Pynson. The second series were printed entirely in Roman letter. A copy of his earliest book, the *Castle of Pleasure*, 4to, 1518, is in the British Museum, as well as the *Dietary of Ghostly Helthe*, 4to, 1521; *Exornatorium Curatorum*, 4to, n.d.; *Du Castel's Citty of Ladyes*, 4to, 1521. His edition of *Christiani hominis Institutum*, 4to, 1520, is only known from a fragment in the Bodleian. Several books have been ascribed wrongly to this printer (Duff, *Bibliographica*, vol. i. pp. 93, 175, 499).

Fig. 11.—William Faques' Device.

In the year 1504, a printer named William Faques had settled in Abchurch Lane. He was a Norman by birth, and Ames suggested that he learnt his art with John Le Bourgeois at Rouen, but this is unconfirmed. He styled himself the king's printer. Of his books only some eight are in existence, three with the date 1504, and the remainder undated. His workmanship was excellent. The Psalterium which he printed in octavo was in a large well cut English black letter, and each page was surrounded by a chain border. The Statutes of Henry VII. are also in the same type with the same ornament, but the Omelia Origenis, one of the undated books, is in the small foreign letter so much in vogue with the printers of this time. His device has the double merit of beauty and originality. It consisted of two triangles intersected with his initials in the centre and the word 'Guillam' beneath. His subsequent career is totally unknown, but his type, ornaments, etc., passed into the hands of Richard Fawkes or Faques, who printed at the sign of the Maiden's Head, in St. Paul's Churchyard, in the year 1509, Guillame de Saliceto's *Salus corporis Salus anime*, in folio. Not only is the type used in this identical with that in the Psalterium of William Faques, but the chain ornament is also found in it. After this we find no other dated book by Richard Faques until 1523, when he printed Skelton's *Goodly Garland* in quarto, in three founts of black letter, and a fount of Roman, and a great primer for titles. Amongst his undated works is a copy of the *Liber Festivalis*, believed to have been printed in 1510, and an *Horæ ad usum Sarum* printed for him in Paris by J. Bignon. During the interval he had moved from the Maiden's Head in St. Paul's Churchyard to another house in the same locality, with the sign of the A. B. C, and he also had a second printing office in Durham Rents, without Temple Bar, that is in some house adjacent to Durham House in the Strand. The earliest extant printed ballad was issued by Richard Faques, the *Ballad of the Scottish King*, of which the only known copy is in the British Museum, and amongst his undated books is one which he printed for Robert Wyer, the Charing Cross printer, under the title of *De Cursione Lunæ*. It was printed with the Gothic type, and the blocks were supplied by Wyer. Richard Faques' device was a copy of that of the Paris bookseller Thielmann Kerver, with an arrow substituted for the tree, and the design on the shield altered. The custom of adapting other men's devices was very common, and is one of the many evidences of dearth of originality on the part of the early English printers.

Fig. 12.—Richard Faques' Device.

The latest date found in the books of this printer is 1530.

Another prominent figure in the early years of the sixteenth century was that of Robert Copland. He was a man of considerable ability, a good French scholar, and a writer of mediocre verse. Apart from this, he was also, in the truest sense of the word, a book lover, and used his influence to produce books that were likely to be useful, or such as were worth reading. In the prologue to the *Kalendar of Shepherdes*, which Wynkyn de Worde printed in 1508, he described himself as servant to that printer. This has been taken to mean that he was one of De Worde's apprentices. But in 1514, if not earlier, he had started in business for himself as a stationer and printer, at the sign of the *Rose Garland* in Fleet Street. Very few of the books that he printed now exist, and this, taken in conjunction with the fact that he translated and wrote prologues for so many books printed by De Worde, has led all writers upon early English printing to conclude that he was an odd man about De Worde's office, and that he was in fact subsidised by that printer. There is evidence, however, that many of the books printed by De Worde, that have prologues by Robert Copland, were first printed by him, and that in others he had a share in the copies.

Fig. 13.—Robert Copland's Device.

In the British Museum copy of the *Dyeynge Creature*, printed by De Worde in 1514, it is noticeable that on the last leaf is the mark or device of Robert Copland, not that of the printer, while in the copy now in the University Library, Cambridge, De Worde's device is on the last leaf.

This would appear to indicate that both printers were associated in the venture, though the work actually passed through De Worde's press, and that those copies which Copland took and paid for were distinguished by his device. Again, in several of these books, found with De Worde's colophons, Copland speaks of himself as the 'printer,' or 'the buke printer,' and the inference is that they were reprints of books which Copland had previously printed. Indeed in one instance the evidence is still stronger. In 1518, Henry Pepwell printed at the sign of the Trinity the *Castell of Pleasure*. The prologue to this takes the form of a dialogue in verse between Copland and the author, of which the following lines are the most important:—

'Emprynt this boke, Copland, at my request

And put it forth to every maner state.'

To which Copland replies:—

'At your instaunce I shall it gladly impresse

But the utterance, I thynke, will be but small

Bokes be not set by: there tymes is past, I gesse;

The dyse and cardes, in drynkyng wyne and ale,

Tables, cayles, and balles, they be now sette a sale

Men lete theyr chyldren use all such harlotry

That byenge of bokes they utterly deny.'

If this means anything, it is impossible to avoid the inference that Robert Copland printed the first edition of this book. Amongst others that he was in some way interested in may be noticed a curious book by Alexander Barclay, *Of the Introductory to write French*, fol., 1521, of which there is a copy in the Bodleian; *The Mirrour of the Church*, 4to, 1521, a devotional work, printed by Wynkyn de Worde, with a variety of curious woodcuts; the *Rutter of the Sea*, the first English book on navigation, translated from *Le Grande Routier* of Pierre Garcie; *Chaucer's Assembled of Foules* and the *Questionary of Cyrurgyens*, printed by Robert Wyer in 1541.

Copland was also the author, and without doubt the printer, of two humorous poems that are amongst the earliest known specimens of this kind of writing. The one called *The Hye Way to the Spyttell hous* took the form of a dialogue between Copland and the porter of St. Bartholomew's, and turns upon the various kinds of beggars and impostors, with a running commentary upon the vices and follies that bring men to poverty. *Iyll of Brentford*, the second of these compositions, is a somewhat different production. It recounts the legacies left by a certain lady, but the humour, though to the taste of the times, was excessively broad.

In 1542 Dr. Andrew Borde spoke of his *Introduction of Knowledge* as printing at 'old Robert Copland's, the eldest printer in England.' Whether he meant the oldest in point of age or in his craft is not clear; but it may well be that, seeing that De Worde, Pynson, and the two Faques were dead, this printing house was the oldest then in London.

John Rastell also began to print about the year 1514. He is believed to have been educated at Oxford, and was trained for the law. In addition to his legal business, he translated and compiled many law-books, the most notable being the *Great Abridgement of the Statutes*. This book he printed himself, and it is certainly one of the finest examples of sixteenth century printing to be found. The work was divided into three parts, each of which consisted of more than two hundred large folio pages. When it is remembered that the method of printing books at this period was slow, at the most only two folio pages being printed at a pull, the time and capital employed upon the production of this book must have been very great. The type was the small secretary in use at Rouen, and it is just possible the book was printed there and not in England.

John Rastell's first printing office in London was on the south side of St. Paul's Churchyard. William Bonham, the stationer with whom Rastell was afterwards associated, had some premises there, and as late as the seventeenth century there was a house in Sermon Lane, known as the Mermaid, and it may be that in one or other of these Rastell printed the undated edition of Linacre's *Grammar*, which bears the address, 'ye sowth side of paulys.' But in 1520 he moved to 'the Mermayd at Powlys gate next to chepe syde.' There he printed *The Pastyme of People*, and Sir Thomas More's *Supplicacyon of Souls*, besides several interludes and two remarkable jest-books, *The Twelve mery gestys of one called Edith* and *A Hundred Mery Talys*. The last named became one of the most popular books of the time, but only one perfect copy of it is now known, and that, alas! is not in this country. Rastell was brother-in-law of Sir Thomas More, and up to the year 1530 a zealous Roman Catholic. So strong were his religious

opinions that in that year he wrote and printed a defence of the Roman Catholic doctrine of Purgatory, under the title of the *New Boke of Purgatory*. This was answered by John Frith, the Reformer, who is credited with having achieved John Rastell's conversion. By whatever means the change was brought about, John Rastell did soon afterwards become a Protestant; but the change in his belief made him many enemies. He was arrested for his opinions, and if he did not die in prison, he was in prison just before his death, which took place in 1536. During the last sixteen years of his life he does not appear to have paid much attention to his business. A document now in the Record Office shows that he was in the habit of locking up his printing office in Cheapside, and going down into the country for months at a time. But a part of the premises he sublet, and this was occupied for various periods by several stationers—William Bonham, Thomas Kele, John Heron, and John Gough, being particularly named. Like all his predecessors, he dropped the use of the secretary type in favour of black letter, and his books, as specimens of printing, greatly deteriorated. Dibdin, in his reprint of *The Pastyme of the People*, was very severe upon the careless printing of the original, but it is more than likely that it was the work of one of Rastell's apprentices, rather than his own. Amongst those whom he employed we find the names of William Mayhewes, of whom nothing is known; Leonard Andrewe, who may have been a relative of Laurence Andrewe, another English printer; and one Guerin, a Norman. John Rastell left two sons, William and John. The former became a printer during his father's lifetime and succeeded him in business, but his work lies outside the scope of the present chapter. The same remark applies to William Bonham.

John Gough began his career as a bookseller in Fleet Street in 1526. In 1528 he was suspected of dealing in prohibited books (see *Letters and Papers of Henry VIII.*, vol. iv. pt. ii. art. 4004), but managed to clear himself. In 1532 he moved to the 'Mermaid' in Cheapside, and in the same year Wynkyn de Worde printed two books for him concerning the coronation of Anne Boleyn. In 1536, whilst still living there, he issued a very creditable *Salisbury Primer*. He calls himself the printer of this, but it is extremely doubtful if this can be taken to mean anything more than that he found the capital, and, perhaps, the material with which it was printed. Wynkyn de Worde appointed John Gough one of the overseers of his will. Of his subsequent career more will be said at a later period.

Another of the printers who worked for Wynkyn de Worde during the latter part of his life was John Skot. In 1521, when we first meet with him, he was living in St. Sepulchre's parish, without Newgate. In that year he printed the *Body of Policie* and the *Justyces of Peas*, and in 1522 *The Myrrou of Gold*; amongst his undated books are, *Jacob and his xii sons*, *Carta Feodi simplicis*, and the *Book of Maid Emlyn*, all these being in quarto. His next dated book appeared in 1528, with the colophon 'in Paule's Churchyard,' and here he appears to have remained for some years. He is next found in Fauster Lane, St. Leonard's parish, where he printed, amongst other books, the ballad of *The Nut Browne Maid*. He also appears to have been at George Alley Gate, St. Botolph's parish, where he printed, but without date, *Stanbridge's Accidence*. His devices were three in number, and several of his border pieces were obtained from Wynkyn de Worde.

Richard Bankes began business at the long shop in the Poultry, next to St. Mildred's church, and six doors from the Stockes or Stocks Market, which at that time stood on the present site of the Mansion House. In 1523 he printed a very curious tract with the following title:—

'Here begynneth a lytell newe treatyse or mater intytuled and called The ix. Drunkardes, which tratythe of dyuerse and goodly storyes ryght plesaunte and frutefull for all parsones to pastyme with.'

It was printed in octavo, black letter, and the only known copy is in the Douce collection at the Bodleian. Another equally rare piece of Bankes' printing was the old English romance [Pg 56] of *Sir Eglamour*, known only by a fragment of four leaves in the possession of Mr. Jenkinson of the University Library, Cambridge. This was also somewhat roughly printed in black letter. In 1525 he printed a medical tract called the *Seynge of Uryns*, in quarto, and three years later was associated with Robert Copland in the production of the *Rutter of the Sea*. He also issued from this address *A Herball*, and another popular medical work called the *Treasure of Pore Men*. Bankes is, however, best known as the printer of the works of Richard Taverner, the Reformer, but this was later, and will be noticed when we come to them.

Peter Treveris, or Peter of Treves, was working at the sign of the Wodows, in Southwark, between the years 1521 and 1533. He used as his device the 'wild men,' first seen in the device of the Paris printer, P. Pigouchet. The fact of his printing the *Opusculum Insolubilium*, to be sold at Oxford 'apud J. T.', that is probably for John Thome the bookseller, points to his being at work about the year 1520. In 1521 he is believed to have issued an edition of

Arnold's Chronicles, translated by Laurence Andrewe. Two other books of his printing were the Handy Worke of Surgery, in folio, 1525, a book notable for the many anatomical diagrams with which it was illustrated, and as a companion to that work, The Great Herball Treveris also shared with [Pg 57] Wynkyn de Worde most of the printing of Richard Whittington's scholastic works, all in quarto, and mostly without date.

Laurence Andrewe, who lived for some years at Calais, translated one or more books for John van Doesborch, the Antwerp printer, set up a press in London about 1527, and printed a second edition of the Handy Worke of Surgery, above noticed, a tract called The Debate and Strife betwene Somer and Winter, to be sold by Robert Wyer at Charing Cross; The destillacyon of Waters, in 1527; and a reprint of Caxton's edition of the Mirroure of the Worlde, in folios, 1527. His printing calls for no special notice, but Mr. Proctor, in his monograph on Doesborgh, surmises that he learnt his art in an English printing house rather than abroad, and the presence of a Leonarde Andrewe in the service of John Rastell may mean that the two men were related and were both pupils of the same master.

Turning now westwards, we find 'in the Bishop of Norwiche's Rentes in the felde besyde Charynge Cross,' that is near the present Villier Street, a printer named Robert Wyer, the sign of whose house was that of St. John the Evangelist. There are several early references to the house as that of a bookseller's, but without any name mentioned. For instance, Richard Pynson printed, without date, an edition of the curious tract of Solomon and Marcolphus, to be sold at [Pg 58] the sign of St. John the Evangelist beside Charing Cross; the Debate between Somer and Winter, printed by Laurence Andrewe, has the same colophon, and the De Cursione Lune, from the press of Richard Faques, has the same words, but not Wyer's name. His first dated book was the Golden Pystle, printed in 1531. It was printed in a small secretary of Parisian character. His great primer, for which he has been especially noted by some bibliographers, was very probably that used by Richard Faques. He had also a number of woodcut face initials similar to those used by Wynkyn de Worde, and many of the small blocks found in his books were copies of those belonging to Antoine Verard, the famous Paris publisher.

Fig. 14.—Robert Wyer's Device.

Robert Wyer was essentially a popular printer. Many of his publications were mere tracts of a few leaves, abridgments of larger works, and the subjects which they chiefly treated were theology and medicine. Unfortunately, the great bulk of his work bears no date, but several circumstances in his career, coupled with internal evidence gathered from the books themselves, enable us to get very near their date of issue. Like his contemporaries he abandoned the secretary type in favour of black letter, but neither so readily nor so entirely as they did. His first black letter, in use before 1536, was also a very well cut and beautiful letter; with it he [Pg 59] printed the Epistle of Erasmus, in octavo, and the Book of Good Works, of which the only copy known is in the library of St. John's College, Oxford. But unquestionably the two most important books known of this printer are William Marshall's Defence of Peace, folio, 1535, printed in secretary, and the Questionary of Cyrurgyens, which he printed for Henry Dabbe and R. Bankes. In 1536 the house in which he was working changed hands, passing into the pos [Pg 60] session of the Duke of Suffolk, consequently all books which have in the colophon 'in the Duke of Suffolkes Rentes,' or 'Beside the Duke of Suffolkes Place,' were printed after that year. As Wyer continued to print until 1555, this circumstance does not help us much; it may, however, be taken as some further guide that all his later work was done in black letter.

Robert Wyer appears to have done a great deal of work for his contemporaries, notably Richard Bankes, Richard Kele, and John Gough.

Most of his books have woodcuts, the most profusely illustrated was his translation of Christine de Pisan's Hundred Histories of Troy. This book had been printed in Paris by Pigouchet, and the illustrations in Wyer's edition are rude copies of those in the French edition. They are, without doubt, wretched specimens of the woodcutter's art; but in this respect they are no worse than the woodcuts found in other English books at this date, and the number and variety of them speak well for the printer's patience. Robert Wyer's device represented the Evangelist on the Island of Patmos, with an eagle on his right hand holding an inkhorn. With this he used a separate block with his name and mark. He had also a smaller block of the Evangelist from which the eagle was omitted. This is generally found on the title-page or in the front part of his books.

THOMAS BERTHELET TO JOHN DAY

In the death of Pynson, in 1529, the office of royal printer was conferred upon Thomas Berthelet, who was in business at the sign of the Lucretia Romana in Fleet Street. Herbert gives the first book from his press as an edition of the Statutes, printed in 1529; but there is some evidence that he was at work two or three years, and perhaps more, before this. Among the writings of Robert Copland, the printer-author, was a humorous tract entitled *The Seuen sorowes that women have when they husbandes be dead* (British Museum, C. 20, c. 42 (5)), which has at the end this curious passage:—

'Go lytle quayr, god gyve the wel to sayle

To that good sheppe, ycleped Bertelet.

* * * * *

And from all nacyons, if that it be thy lot

Lest thou be hurt, medle not with a Scot.'

This is, without doubt, an allusion to the two London printers, Thomas Berthelet and John[Pg 62] Skot; and certain references in the prologue seem to point to the printing of the first edition of the *Seuen Sorowes*, as a year or two earlier than the date given by Herbert.

Fig. 15.—Thomas Berthelet's Device.

There also seems to be conclusive evidence that Berthelet, or, as he was sometimes called, Bartlett, was a native of Wales. He certainly held land in the county of Hereford, and he was succeeded in business by a nephew, Thomas Powell, a Welshman. Berthelet was one of the few English printers of that period whose work is worth looking at. He had a varied assortment of types, all of them good, and his workmanship was as a rule excellent; and as very few of his books are illustrated, we may infer that he was loth to spoil a good book with the rough and often unsightly woodcuts of that time.

Berthelet was also a bookbinder and bookseller, and some of his fine bindings for Henry VIII. and his successors are still to be seen. He was apparently the first English binder to use gold tooling.

Of his official work very little need be said. It consisted in printing all Acts of Parliament, proclamations, injunctions, and other official documents. In the second volume of the *Transcript* (pp. 50-60), Professor Arber has printed three of Berthelet's yearly accounts, in which the titles of the various documents are given, with the number of copies of each that were struck off, and the nature and cost of their bindings.

In the year 1530 the divorce of Queen Katherine and the King's marriage to Anne Boleyn filled the public mind, and in connection with this event he printed, both in Latin and English, a small octavo, with the title:

The determinations of the moste famous and moofte excellent Vniversities of Italy and France that it is so unlefyll for a man to marie his brother's wyfe that the Pope hath no power to despense therewith.

Berthelet, in 1531, printed Sir Thomas Elyot's *Boke* named the Governour, an octavo, in a large Gothic type, very bold and clear. This type, however, is seen to much better advantage in the folio edition of Gower's *Confessio Amantis*, which came from this press in 1532. In this instance the title-page is striking, the title being enclosed within a panel which gives it the appearance of a book cover. The text of the work was printed in double columns of forty-eight lines each.

In 1533 Berthelet appears to have purchased a new fount of this type, with which he printed Erasmus's *De Immensa Dei Misericordia*. If possible this new letter was more beautiful than the other, the lowercase 'h' finishing in a bold outward curve, which was absent in the earlier fount. These founts of Gothic closely resemble some in use in Italy at this time.

To the year 1534 belongs St. Cyprian's Sermon on the mortality of man, translated by Sir Thomas Elyot, as well as a second edition of *The Boke named the Governour*. Berthelet also brought into use during this year a woodcut border of an architectural character, with the date 1534 cut upon it. It was used only in octavo books, and he continued to use it for some years without erasing the date, a fact that has led to much confusion in the classification of his books.

We meet with the large Gothic type again in 1535, in an edition of the *De Proprietatibus Rerum* of Bartholomæus Anglicus, which Berthelet printed in that year. But his most notable undertaking during the next few years was the book for regulating and settling nice points of religious belief, which had been compiled by the bishops, and was issued under the King's authority, with the title:—

The Institution of a Christian Man conteyninge the Exposition or Interpretation of the commune Crede, of the Seven sacraments, of the X commandments, and of the Pater Noster, and the Ave Maria, Justification & Purgatory.

When the book was finished, Latimer, then Bishop of Worcester, suggested to Cromwell that the printing should be given to Thomas Gibson. But Latimer's recommendation was overlooked, and the work was given to Berthelet. It would be interesting to know how many copies of the first edition of this book he printed. It was issued both in quarto and octavo form, the quarto printed in a very beautiful fount of English black [Pg 66] letter, modelled on the lines of De Worde's founts. The opening lines of the title were, however, printed in Roman of four founts, and the whole page was enclosed within a woodcut border of children.

The octavo editions of this notable book were printed in a smaller fount of black letter, and the title-page was enclosed within the 1534 border. Several editions were issued in 1537, and the book was afterwards revised and reprinted under a new title.

At the same time Berthelet was passing through the press Sir Thomas Elyot's Dictionary, a work of no small labour, if one may judge from the number of founts used in printing it. It was finished and issued in 1538.

Berthelet, who, as befitted a royal printer, plainly took some pains to keep himself clear of all controversies, did not stir in the matter of Bible translation until the 1538 edition by Grafton and Whitchurch was already in the market.

In 1539, however, he published, but did not print, Taverner's edition of the Bible, and in the following year an edition of Cranmer's Bible. That of 1539 came from the press of John Byddell, and that of 1540 was printed for him by Robert Redman and Thomas Petit.

Among the Patent Rolls for the year 1543 (P. R. 36 Hen. 8. m. 12) is a grant to Berthelet of certain crown lands in London and other parts of the country, in payment of a debt of £220. His office as royal printer ceased upon the accession of Edward VI., and though many books are found with the imprint, 'in aedibus Thomas Berthelet,' down to the time of his death in 1556, he probably took very little active part in business affairs after that time.

Meanwhile Pynson's premises were taken by Robert Redman, who, from about the year 1523, had been living just outside Temple Bar. No new facts have come to light about Redman, and the reasons why he moved into Pynson's house and continued to use his devices are as puzzling as ever. He began as a printer of law books, and printed little else. In conjunction with Petit he printed an edition of the Bible for Berthelet, and among his other theological books was *A treatise concernynge the division betwene the Spiryтуaltie and Temporaltie*, the date of which is fixed by a note in the Letters and Papers of Henry VIII. (vol. vi., p. 215), from which it appears that, in 1553, Redman entered into a bond of 500 marks not to sell this book or any other licensed by the King. Redman was also the printer of Leonard Coxe's *Arte and Crafte of Rethoryke*, one of the earliest treatises on this subject published in English. It has recently been republished by Professor Carpenter of Chicago, with copious notes.

Redman's work fell very much below that of his predecessor. Much of his type had been in use in Pynson's office for some years, and was badly worn. He had, however, a good fount of Roman, seen in the *De Judiciis et Praecognitionibus* of Edward Edgardus. The title of this book is enclosed in a border, having at the top a dove, and at the bottom the initials J. N.

Redman's will was proved on the 4th November 1540. His widow, Elizabeth, married again, but several books were printed with her name in the interval. His son-in-law, Henry Smith, lived in St. Clement's parish without Temple Bar, and printed law books in the years 1545 and 1546.

Redman's successor at the George was William Middleton, who continued the printing of law books, and brought out a folio edition of Froissart's Chronicles, with Pynson's colophon and the date 1525, which has led some to assume that this edition was printed by Pynson.

Upon Middleton's death in 1547, his widow married William Powell, who thereupon succeeded to the business.

Among those for whom Wynkyn de Worde worked shortly before his death was John Byddell, a stationer living at the sign of 'Our Lady of Pity,' next Fleet Bridge, who for some reason spoke of himself under the name of Salisbury. He used as his device a figure of Virtue, copied from one of those in use by Jacques Sacon, printer at Lyons between 1498 and 1522 (see Silvestre, Nos. 548 and 912). The same design, only in a larger form, was also in use in Italy at this time. In the collection of title-pages in the British Museum (618, ll. 18, 19) is one enclosed within a border found in books printed at Venice, on which the figure of Virtue occurs. The only difference between it and the mark of Byddell being that the two shields show the lion of St. Mark, and the whole thing is much larger.

Byddell had probably been established as a stationer some years before the appearance of Erasmus's *Enchiridion Militis Christiani* from the press of De Worde in 1533, with his name in the colophon. Another book printed for him by De Worde, in the same year, was a quarto edition of the *Life of Hyldebrand*. Both these works De Worde reprinted in 1534, in addition to printing for him John Roberts' *A Mustre of scismatyke Bysshoppes*. Byddell was appointed one of the executors to De Worde's will, and very shortly after his death, i.e. in 1535, moved to De Worde's premises, the 'Sun,' in Fleet Street.

Most of Byddell's books were of a theological character. He printed a quarto *Horae ad usum Sarum* in 1535, a small Primer in English in 1536, and a folio edition of Taverner's Bible in 1539 for Thomas Berthelet.

Among the miscellaneous books that came through his press, one or two are especially interesting. In 1538 we find him printing in quarto Lindsay's *Complaynte and Testament of a Popinjay*, a work that had first appeared in Scotland eight years before, and created considerable stir. A quarto edition of William Turner's *Libellus de Re Herbaria* bears the same date; while among the books of the year 1540 are editions, in octavo, of Tully's *Offices* and *De Senectute*.

The latest date found in any book of Byddell's printing is 1544, after which Edward Whitchurch is found at the 'Sun,' in Fleet Street, whither he moved after dissolving partnership with Richard Grafton.

The early history of these two men has a powerful interest, not only for students of early English printing, but for all English-speaking people. To their enterprise and perseverance the nation was indebted for the second English Bible.

Some very interesting and highly valuable evidence respecting the history of these men has been brought to light of recent years, perhaps the most valuable being Mr. J. A. Kingdon's *Incidents in the Lives of Thomas Poyntz and Richard Grafton*, privately printed in 1895.

Fig. 16.—Richard Grafton's Device.

From the affidavit of Emmanuel Demetrius [i.e. Van Meteren], discovered in 1884 at the Dutch Church in Austin Friars, it seems clear that in 1535 Edward Whitchurch was working with Jacob van Metern at Antwerp in printing Coverdale's translation of the Bible.

Richard Grafton was the son of Nicholas Grafton of Shrewsbury. The first record we have of him is his apprenticeship to John Blage, a grocer of London, in 1526. He was admitted a freeman of the Company in 1534, and at that time seems to have employed himself chiefly in furthering the project of an English translation of the whole Bible. On the 13th August 1537, Grafton sent to Archbishop Cranmer a copy of the Bible printed abroad. The text was a modification of Coverdale's translation ostensibly by Thomas Mathew, but in reality by John Rogers the editor. In 1538, Coverdale, Grafton, and Whitchurch were together in Paris, busy upon a third edition of the Bible.

In June of that year they sent two specimens of the text to Cromwell, with a letter stating that they followed the Hebrew text with Chaldee or Greek interpretations. The printing was done at the press of Francis Regnault, but before many sheets had been struck off, the University of Paris seized the press and 2000 copies of the printed sheets, while the promoters had to make a hasty escape to this country. The presses and types were afterwards bought by Cromwell, and the work was subsequently finished and published in 1539. The work had an engraved title-page, ascribed to Holbein, and the price was fixed at ten shillings per copy unbound, and twelve shillings bound.

Before leaving Paris, Grafton and Whitchurch had issued an edition of Coverdale's translation of the New Testament, giving as their reason that James Nicholson of Southwark had printed a very imperfect version of it.

In 1540 Grafton and Whitchurch printed in 'the house late the graye freers,' The Prymer both in Englysshe and Latin, to be sold at the sign of the Bible in St. Paul's Churchyard. In the same year they printed with a prologue by Cranmer, a second edition of the Great Bible, half of which bore the name of Grafton and half of Whitchurch, and in all probability the subsequent editions were published in the same way. Two very good initial letters were used in the New Testament, and seem to have been cut especially for Whitchurch. On the 28th January 1543-44 Grafton and Whitchurch received an exclusive patent for printing church service books (Rymer, *Fœdera*, xiv. 766), and a few years later they are found with an exclusive right for printing primers in Latin and English. Upon the accession of Edward VI. Grafton became the royal printer, but upon the king's death he printed the proclamation of Lady Jane Grey, and was for that reason deprived of his office by Queen Mary. The remainder of his life he spent in the compilation of English Chronicles in keen rivalry with John Stow.

Richard Grafton died in 1573. He was twice married. By his first wife, Anne, daughter of ——— Crome of Salisbury, he had four sons and one daughter, Joan, who married Richard Tottell, the law printer. By his second wife, Alice, he left one son, Nicholas.

Grafton used as his device a tun with grafted fruit-tree growing through it.

Among the noted booksellers and printers in St. Paul's Churchyard at this time must be mentioned William Bonham. As yet it is not clear whether he belonged to the Essex family of that name, or to another branch that is found in Kent.

>From a series of documents discovered at the Record Office relating to John Rastell and his house called the Mermaid in Cheapside, it appears that in the year 1520 William Bonham was working in London as a bookseller, and on two different occasions was a sub-tenant of Rastell's at the Mermaid. Yet not a single dated book with his name is found before 1542, at which time he was living at the sign of the Red Lion in St. Paul's Churchyard, and issued a folio edition of Fabian's Chronicles, besides having a share with his neighbour, Robert Toye, in a folio edition of Chaucer. Even at this time William Bonham held some sort of office in the Guild or Society of Stationers, for from a curious letter written by Abbot Stevenage to Cromwell in 1539, about a certain book printed in St. Albans Abbey, he says he has sent the printer to London with Harry Pepwell, Toy, and 'Bonere' (Letters and Papers, H. 8, vol. xiv. p. 2, No. 315), so that it would look as if they were commissioned to hunt down popish heretical and seditious books. By the marriage of his daughter, Joan, to William Norton, the bookseller, who in turn named his son Bonham Norton, the history of the descendants of William Bonham can be followed up for quite a century later.

At the Long Shop in the Poultry we can see the press at work almost without a break from the early years of the sixteenth century till the close of the first quarter of the seventeenth. Upon the removal of Richard Bankes into Fleet Street its next occupant seems to have been one John Mychell, of whose work a solitary fragment, fortunately that bearing the colophon, of an undated quarto edition of the Life of St. Margaret, is now in the hands of Mr. F. Jenkinson of the University Library, Cambridge. Whether this John Mychell is the same person as the John Mychell found a few years later printing at Canterbury there is no evidence to show. Nor do we know how long he occupied the Long Shop. In 1542 Richard Kele's name is found in a Primer in Englysh, which was issued from this house. He may have been some relation to the Thomas Kele who, in 1526, had occupied John Rastell's house, the Mermaid, as stated by Bonham in his evidence. During 1543, in company with Byddell, Grafton, Middleton, Mayler, Petit, and Lant, Richard Kele was imprisoned in the Poultry Compter for printing unlawful books (Acts of Privy Council, New Series, vol. i. pp. 107, 117, 125). Most of the books that bear his name came from the presses of William Seres, Robert Wyer, and William Copland. Perhaps the most interesting of his publications next to the edition of Chaucer,

which he shared with Toye and Bonham, are the series of poems by John Skelton, called *Why Come ye not to Courte?* Colin Clout, and *The Boke of Phyllip Sparowe*. They were issued in octavo form, and were evidently very hastily turned out from the press, type, woodcuts, and workmanship being of the worst description. At the end of Colin Clout is a woodcut of a figure at a desk, supposed to represent the author, but it is doubtful whether it is anything more than an old block with his name cut upon it.

Looking back over the work done at this time, it is impossible to avoid the conclusion that the art of printing in England had much deteriorated since the days of Pynson, while the best of it, even that of Berthelet, could not be compared with that of the continental presses of the same period. There was an entire absence of origin[^{Pg 77}]ality among the English printers. Types, woodcuts, initial letters, ornaments, and devices, were obtained by the printers from abroad, and had seen some service before their arrival in this country. But just at this time a printer came to the front in this country, who for a few years placed the art on a higher footing than any of his predecessors.

Fig. 17.—John Day.

CHAPTER IV JOHN DAY

John Day, one of the best and most enterprising of printers, was born in the year 1522 at Dunwich, in Suffolk, a once flourishing town, now buried beneath the sea.

From the fact that Day was in possession of a device found in the books of Thomas Gibson, the printer whom Latimer unsuccessfully recommended to Cromwell, it has been supposed that it was from Gibson he learnt the art. He may have done so; but whatever he learnt there or elsewhere, in his 'prentice days, he later on threw aside, and by his own enterprise and the excellence of his workmanship raised himself to the proud position of the finest printer England had ever seen.

In John Day's first books there was no sign of the skill he afterwards manifested. These were published in conjunction with William Seres, of whom we know little or nothing, outside his connection with Day. These partners began work in the year 1546 at the sign of the Resurrection on Snow Hill, a little above Holborn Conduit, that is somewhere in the neighbourhood of the present viaduct. They had also another shop in Cheapside. Their first book, so far as we know, was Sir David Lindsay's poem, 'The Tragical death, of David Beaton, Bishop of St. Andrews in Scotland; Wherunto is joyned the martyrdom of maister G. Wyseharte ... for whose sake the aforesayd bishophe was not long after slayne' (1546, 8vo).

In the following year (1547) Day and Seres printed several other books of a religious character, nearly all of them in octavo, including Cope's *Godly Meditation upon the psalms*, and Tyndale's *Parable of the Wicked Mammon*. Their work in 1548 included a second edition of the *Consultation of Hermann*, the bishop of Cologne, Robert Crowley's *Confutation of Myles Hoggarde*, a sermon of Latimer's, a metrical dialogue aimed at the priesthood and entitled *John Bon and Mast Person*, and, as a relief to so much theological literature, the *Herbal of William Turner*.

The types used in printing these books were not a whit better than anybody else's, in fact if anything they were a shade worse. There was the usual fount of large black letter, not by any means new, another much smaller letter of the same character, and a fount of Roman capitals, very bad indeed. Whether these types belonged to Day or to Seres it is impossible to say, but I think the smaller of the two belonged to Day, as it is sometimes found in his later books.

The workmanship was no better than the types. There was no pagination in these books, and no devices, and the setting of the letterpress was very uneven.

In 1548 Seres seems to have joined partnership with another London printer, Anthony Scoloker, and to have moved to a house in St. Paul's Churchyard, called Peter College; but his name still continued to appear with Day's down to the year 1551, when the partnership was dissolved, Day moving to Aldersgate, but retaining his shop in Cheapside.

Fig. 18.—From a Bible printed by John Day. London, 1551. 4to.

The most important undertaking of the partnership was a folio edition of the Bible in 1549. This was printed in the smaller of the two founts of black letter in double columns, with some good initials and a great many woodcuts that had evidently been used before, as they extend beyond the letterpress. Another edition printed by Day alone appeared in 1551, in which a good initial E, showing Edward VI. on his throne, is found.

On the accession of Queen Mary, Day went abroad and his press was silent for several years; meanwhile the ancient brotherhood of Stationers was incorporated by Royal Charter as the 'Worshipful Company of Stationers.' The existence of the brotherhood has been traced to very early times, and it is frequently mentioned in the wills of printers and booksellers in the first half of the sixteenth century. By the Charter of 1556 it now received the Royal authority to make its own laws for the regulation of the trade, although, as Mr. Arber has pointed out, the charter 'rather confirmed existing customs than erected fresh powers.' There is abundant evidence that the Queen's main reason for granting the charter was the wish to keep the printing trade under closer control.

The newly incorporated company included nearly all the men connected with the book trade, not only printers, but booksellers, bookbinders, and typefounders. There were some who, for some unexplained reason, were not enrolled. On the other hand, two of those whose names appeared in the charter died the year of its incorporation. These were Thomas Berthelet, who was dead before the 26th January 1556, and Robert Toy, who died in February.

In the registers of the Company were recorded the names of the wardens and masters, the names of all apprentices, with the masters to whom they were bound, and the names of those who took up their freedom. The titles of all books were supposed to be entered by the printer or publisher, a small fee being paid in each case. As a matter of fact many books were not so entered. Entries of gifts to the Corporation, and of fines levied on the members, also form part of the annual statements.

Literary men of the eighteenth century were the first to discover and make use of the wealth of information contained in the Registers of the Stationers' Company; but it fell to the lot of Mr. Arber to give English scholars a full transcript of the earlier registers. In order to make it complete, he has supplemented the work with numerous valuable papers in the Record Office and other archives, and a bibliographical list down to the year 1603, which is of such immense value that it is impossible to be content until it has been continued to the year 1640.

The first master of the Company was Thomas Dockwray, Proctor of the Court of Arches; and the wardens were John Cawood, the Queen's Printer, and Henry Cooke.

Fig. 19.—Heraldic Initial containing the Arms of Dudley, Earl of Leicester.

It does not follow that because Day's name occurs in the charter that he was in England in 1556, but he certainly was so in the following year, for there is a Sarum Missal of that date with his imprint, besides several other books, including Thomas Tusser's *Hundred Points of Good Husserye* (i.e. *Housewifery*); William Bullein's *Government of Health*, and sundry proclamations. But it was not until 1559 that his books began to show that excellence of workmanship that laid the foundation of his fame. In that year he issued in folio *The Cosmographically Glasse of William Cunningham*, a physician of Norwich. As a specimen of the printer's art this was far in advance of any of Day's previous work, and, moreover, was in advance of anything seen in England before that time. The text was printed in a large, flowing italic letter of great beauty, further enhanced by several well-executed woodcut initials. Amongst these was a letter 'D,' containing the arms of the Earl of Leicester, to whom the work was dedicated. There were also scattered through the book several diagrams and maps, a fine portrait of the author, and a plan of the city of Norwich. Some of these illustrations and initials were signed J. B., others J. D. The title-page was also engraved with allegorical figures of the arts and sciences. There can be very little doubt that Day had spent his time abroad in studying the best models in the typographical art.

Students and lovers of good books may well pay a tribute to the memory of that scholarly churchman, who rescued so many of the books that were scattered at the dissolution of the monasteries, and enriched Cambridge University and some of its colleges by his gifts of books and manuscripts. But Matthew Parker did not stop short at book-collecting. He believed that good books should be well printed, and on his accession to power under Elizabeth, he encouraged John Day and others, both with his authority and his purse, to cut new founts of type and to print books in a worthy form.

In 1560 Day began to print the collected works of Thomas Becon, the reformer. The whole impression occupied three large folio volumes, and was not completed until 1564. The founts chiefly used in this were black letter of two sizes, supplemented with italic and Roman. The initials used in the *Cosmographicall Glasse* [Pg 86] appeared again in this, and the title-page to each part was enclosed in an elaborate architectural border, having in the bottom panel Day's small device, a block showing a sleeper awakened, and the words, 'Arise, for it is Day.' At the end was a fine portrait of the printer.

Another important undertaking of the year 1560 was a folio edition of the *Commentaries* of Joannes Philippon, otherwise Sleidanus. This Day printed for Nicholas England, the fount of large italic being used in conjunction with black letter.

Sermons of Calvin, Bullinger, and Latimer are all that we have to illustrate his work during the next two years. But in 1563 appeared a handsome folio, the *editio princeps* of *Acts and Monumentes* of these latter and perillous Dayes, touching matters of the Church, better known as *Foxe's Book of Martyrs*.

During Mary's reign Foxe had found a home on the Continent, and may there have met with Day. In 1554, while at Strasburg, he had published, through the press of Wendelin Richel, a Latin treatise on the persecutions of the reformers, under the title of *Commentarii rerum in Ecclesia gestarum maximarumque persecutionem a Vuiclevi temporibus descriptio*. From Strasburg he removed to Basle, and from the press of Oporinus, in 1559, appeared the Latin edition of the *Book of Martyrs*. He did not return to England until October of that year, when he settled in Aldgate, and made weekly visits to the printing-house of John Day, who was then busy on the English edition.

Fig. 20.—From Foxe's '*Actes and Monumentes*,' printed by John Day, 1576.

Foxe's *Actes and Monumentes* is a work of 2008 folio pages, printed in double columns, the [Pg 88] type used being a small English black letter, the same which had been used in Becon's Works, supplemented with various sizes of italic and Roman. It was illustrated throughout with woodcuts, representing the tortures and deaths of the martyrs. A very handsome initial letter E, showing Queen Elizabeth and her courtiers, is also found in it. A Royal proclamation ordered that a copy of it should be set up in every parish church. From this time Foxe appears to have worked as translator and editor for John Day, and was for a while living in the printer's house.

Archbishop Parker meanwhile had induced Day to cast a fount of Saxon types in metal. The first book in which these were used was Aelfric's '*Saxon Homily*,' i.e. the Sermon of the Paschal Lamb, appointed by the Saxon bishop to be read at Easter before the Sacrament, an Epistle of Aelfric to Wulfsine, the Lord's Prayer, the Creed, and the Ten Commandments, all of which were included in the general title of *A Testimonie of Antiquity*, 'shewing the auncient fayth in the Church of England touching the Sacrament of the body and bloude of the Lord here publykely preached and also receaved in the Saxons tyme, above 600 yeares agoe.'

Speaking of Day's Saxon fount, the late Mr. Talbot Reed, in his *Old English Letter Foundries* (p. 96), says:—

'The Saxon fount ... is an English in body, very clear and bold. Of the capitals eight only, including two diphthongs are distinctively Saxon, the remaining eighteen letters being ordinary Roman; while in the lowercase there are twelve Saxon letters, as against fifteen of the Roman. The accuracy and regularity with which this fount was cut and cast is highly creditable to Day's excellence as a founder.'

Although this book (an octavo) bore no date, the names of the subscribing bishops fix it as 1566 or 1567. In the latter year appeared the Archbishop's metrical version of the Psalter, which he had compiled during his enforced exile under Mary. In connection with this it may be well to point out that Day printed many editions of the Psalter with musical notes. In 1568 he used the Saxon types again to print William Lambard's *Archaionomia*, a book of Saxon laws. Amongst his other productions of that year must be mentioned the folio edition of Peter Martyr's *Commentary on the Epistle to the Romans*; Gildas the historian's *De excidio et conquestu Britanniaë*, 1568, 8vo; and a French version of Vandernoot's *Theatre for Worldlings*, '*Le Theatre auquel sont exposés et montrés les inconveniens et misères qui suivent les mondains et vicieux, ensemble les plaisirs et contentemens dont les fidèles jouissent.*' There is a copy of this very rare book in the Grenville collection. The *Theatre for Worldlings* was translated into English the following year, and contained verses from the pen of Edmund Spenser, then a [Pg 90] boy of sixteen. But Day's press played little part in the spread of the romantic literature with which the name of Spenser

is so closely linked. Day's work was with the Reformation and the religious questions of the time. Nevertheless, that he felt the influence of the coming change is shown from a publication that issued from his press in 1570. This was the authorised version of a play which had been acted nine years before by the gentlemen of the Inner Temple before Her Majesty. It had shortly afterwards been published by William Griffith of Fleet Street as:—

'The Tragedy of Gorboduc, whereof Three Actes were wrytten by Thomas Norton and the two last by Thomas Sackvyle. Set forth as the same was shewed before the Queenes most excellent Maiestie in her highnes Court of Whitehall, the xviii day of January Anno Domini 1561, By the gentlemen of Thynner Temple in London.' Day's edition was entitled:—

'The Tragidie of Ferrex and Porrex, set forth without addition or alteration, but altogether as the same was showed on stage before the Queens Maiestie about nine yeares past, viz. the xviii day of Januarie 1561, by the gentlemen of the Inner Temple.'

Another important work of this year (1570) was Roger Ascham's *Scholemaster*, in quarto. In 1571 Day was busy with Church matters. There was just then much talk of Church discipline, and it shows itself in the *Reformatio Legum Ecclesiasticarum*, a quarto of some 300 pages, published by him this year. In this book we find a new device used by Day. It represents two hands holding a slab upon which is a crucible with a heart in it, surrounded by flames, the word 'Christus' being on the slab. From the wrists hangs a chain, and in the centre of this is suspended a globe, and beneath that again is a representation of the sun. Round the chain is a ribbon with the words 'Horum Charitas.' This device was placed on the title-page, which was surrounded by a neat border of printers' ornaments.

The *Booke of certaine Canons*, 4to, was another publication of this year for the due ordering of the Church. This, like most public documents, was in a large black letter. There were also 'Articles of the London Synod of 1562.' As a specimen of the religious sermons or discourses of the time, we have a very good example in another of Day's publications in 1571, a reprint of *The Poore Mans Librarie*, a discourse by George Alley, Bishop of Exeter, upon the First Epistle of St. Peter, which made up a very respectable folio, printed in Day's best manner, and with a great number of founts.

But Day's prosperity roused the envy of his fellow-stationers, and they tried their best to hinder the sale of his books and cause him annoyance. This opposition took a violent form in 1572, when Day, whose premises at Aldersgate had become too small to carry on his growing business, his stock being valued at that time between £2000 and £3000, obtained the leave of the Dean and Chapter of St. Paul's to set up a little shop in St. Paul's Churchyard for the sale of his books. The booksellers appealed to the Lord Mayor, who was prevailed upon to stop Day's proceedings, and it required all the power and influence of Archbishop Parker, backed by an order of the Privy Council, to enable the printer to carry out his project.

The Archbishop meanwhile had been busy furnishing replies to Nicholas Sanders' book *De Visibili Monarchia*, and amongst those whom he selected for the work was Dr. Clerke of Cambridge, who accordingly wrote a Latin treatise entitled *Fidelis Servi subdito infideli Responsio*. From a letter written by the Archbishop to Lord Burleigh at this time, we learn that John Day had cast a special fount of Italian letter for this book at a cost of forty marks.

By Italian letter is here meant Roman, and not Italic, as Mr. Reed supposes, for the *Responsio* was printed in a new fount of that type, clear, even, and free from abbreviations.

In the same year (1572) Day printed at the Archbishop's private press at Lambeth his great work *De Antiquitate Britannicae Ecclesiae* in folio, in a new fount of Italic, with preface in Roman, and the titles and sub-titles in the larger Italic of the *Cosmographical Glasse*. It was a special feature of Day's letter-founding that he cut the Roman and Italic letters to the same size. Before his time there was no uniformity; the separate founts mixed badly, and spoil the appearance of many books that would otherwise have been well printed.

The *De Antiquitate* is believed to have been the first book printed at a private press in England. The issue was limited to fifty copies, and the majority of them were in the Archbishop's possession at the time of his death.

But while he encouraged printing in one direction, Matthew Parker rigorously persecuted it in another. Just at this time there was much division among Protestants on matters of doctrine and ceremonial, and one Thomas Cartwright

published, in 1572, a book entitled *A Second Admonition to the Parliament*, in which he defended those who had been imprisoned for airing their opinions in the first *Admonition*. This book, like many others of the time, was printed secretly, and strenuous search was made by the Wardens of the Stationers' Company, Day being one, to discover the hidden press. The search was successful, but unpleasant consequences followed for John Day. One of the printers of the prohibited book turned out to be an apprentice of his own, named Asplyn. He was released after examination, and again taken into service by his late master. But the following year the Archbishop reported to the Council that this man Asplyn had tried to kill both Day and his wife.

Day's work in 1573 included a folio edition of the whole works of William Tyndale, John Frith, and Doctor Barnes, in two volumes. This was printed in two columns, with type of the same size and character as that used in the 'Works' of Becon, some of the initial letters closely resembling those found in books printed by Reginald Wolfe. In the same year Day issued a life of Bishop Jewel, for which he cut in wood a number of Hebrew words.

In 1574 we reach the summit of excellence in Day's work. It was in that year that he printed for Archbishop Parker Asser's *Life of Alfred the Great (Aelfredi Regis Res Gestæ)* in folio. In this the Saxon type cast for the Saxon Homily in 1567 was again used in conjunction with the magnificent founts of double pica Roman and Italic. With it is usually bound Walsingham's *Ypodigme Neustria* and *Historia Brevis*, the first printed by Day, and the second by Bynneman, who unquestionably used the same types, so that it may be inferred that the fount was at the disposal of the Archbishop, at whose expense all three books were issued.

Another series of publications that came from the press of John Day, in 1574, were the writings of John Caius on the history and antiquities of the two Universities. They are generally found bound together in the following order:—

1. *De Antiquitate Cantabrigiensis Academix.*
2. *Assertio Antiquitatis Oxoniensis Academix.*
3. *Historia Cantabrigiensis Academix.*
4. *Johannis Caii Angli De Pronunciatione Græcæ et Latinæ linguæ cum scriptione noua libellus.*

The 'Antiquities' and 'History' of Cambridge were both books of considerable size, the first having 268 pages, without counting prefatory matter and indexes. The other two were little better than tracts, the one having only 27 and the other 23 pages. Some editions of the *De Antiquitate* are found with a map of Cambridge, while the 'History' contained plates showing the arms of the various colleges. All four were printed in quarto. The type used for the text was in each case an Italic of English size, with a small Roman for indexes. The title-page was enclosed in a border of printers' ornaments, and the printer's device of the Heart was on the last leaf of two out of the four.

Matthew Parker died in 1575, and the art of printing, as well as every other art and science, lost a generous patron. But Day's work was not yet done, though he printed few large books after this date. A very curious folio, written by John Dee, the famous astronomer, entitled *General and Rare Memorials concerning Navigation*, came from his press in 1577. This work had an elaborate allegorical title-page, by no means a bad specimen of wood-engraving. It was a history in itself, the central object being a ship with the Queen seated in the after part.

In 1578 Day printed a book in Greek and Latin for the use of scholars, *Christianæ pietatis prima institutio*, the Greek type being a great improvement on any that had previously appeared. Indeed, it has been considered equal to those in use by the Estiennes of Paris.

The year 1580 saw Day Master of the Stationers' Company. Two years later he was engaged in a series of law-suits about his *A B C* and *litell Catechism*, a book for which he had obtained a patent in the days of Edward VI.

As we have already noted, the aim of the Corporation of the Stationers' Company was not primarily the promotion of good printing or literature. Printers were looked upon by the authorities as dangerous persons whom it was necessary to watch closely. Only six years after coming to the throne, Elizabeth signed a decree [Pg 97] passed by the Star Chamber, requiring every printer to enter into substantial recognisances for his good behaviour. No books were to be printed or imported without the sanction of a Special Commission of Ecclesiastical Authorities, under a penalty of three months' imprisonment and the forfeiture of all right to carry on business as a master printer or

bookseller in future, while the officers of the Company were instructed to carry out strict search for all prohibited books.

On the other hand, while thus retaining a tight rein on the printing trade, the Queen, no doubt for monetary considerations, granted special patents for the sole printing of certain classes of books to individual master printers, and threatened pains and penalties upon any other member of the craft who should print any such books. In this way all the best-paying work in the trade became the property of some dozen or so of printers. Master Tottell was allowed the sole printing of Law Books, Master Jugg the sole printing of Bibles, James Roberts and Richard Watkins the sole printing of Almanacs; Thomas Vautrollier, a stranger, was allowed to print all Latin books except the Grammars, which were given to Thomas Marsh, and John Day had received the right of printing and selling the A B C and Litell Catechism, a book largely bought for schools, and which Christopher Barker, in his Complaint, declared was once 'the onely reliefe of the porest sort of that Company.' On every side the best work was seized and monopolised. Nor did the evil cease there. These patents were invariably granted for life with reversion to a successor, and they were bought and sold freely. Hence the poorer members of the Company daily found it harder to live. There was very little light literature, and what there was had few readers. Their appeals for redress of grievances, whether addressed to the State or to the Company, which pretended to look after their welfare, were alike in vain, and at length they rose in open revolt. Half a dozen of them, headed by Roger Ward and John Wolf, boldly printed the books owned by the patentees. Roger Ward seized upon this A B C of Day's, and at a secret press, with type supplied to him by a workman of Thomas Purfoot, printed many thousand copies of the work with Day's mark. Hence the proceedings in the Star Chamber. They did very little good. Ward defied imprisonment; and the agitators would undoubtedly have gained more than they did, and might even have saved the art of printing from falling into the hopeless state it afterwards reached, had it not been for the desertion of John Wolf, who, after declaring that he would work a reformation in the printing trade similar to that which Luther had worked in religion, quietly allowed himself to be bought over, and died in eminent respectability as Printer to the City of London, leaving Ward and others to carry on the war. This they did with such effect, that, forced to find a remedy, the patentees of the Company at length agreed to relax their grasp of some of the books that they had laid their hands upon. Day is said to have been most generous, relinquishing no less than fifty-three, and this number is in itself a commentary on the magnitude of the monopolies.

Fig. 21.—Day's large Device.

John Day died at Walden, in Essex, on the 23rd July 1584, at the age of sixty-two, and was buried at Bradley Parva, where there is a fair tomb and a lengthy poetical epitaph on his virtues and abilities. He was twice married, and is said to have had twenty-six children, of whom one son, Richard, was for a short time a printer, and another, John, took Orders, and became rector of Little Thurlow, in Suffolk.

John Day had three devices. His earliest, and perhaps his best, was a large block of a skeleton lying on an elaborately chased bier, with a tree at the back, and two figures, an old man and a young, standing beside it. This may have been typical of the Resurrection, the sign of the house in which he began business. Then we find the device of the Heart in his later books, and finally there is the block of the Sleeper Awakened, but this almost always formed part of the title-page.

APPENDIX

LIST OF PRINTERS AND STATIONERS ENROLLED IN THE CHARTER

Alday, John.
Baldwyn, Richard.
Baldwyn, William.
Blythe, Robert.
Bonham, John.
Bonham, William.
Bourman, Nicholas.
Boyden, Thomas.
Brodehead, Gregory.
Broke, Robert.
Browne, Edward.
Burtoft, John.

Bylton, Thomas.
Case, John.
Cater, Edward.
Cawood, John.
Clarke, John.
Cleston, Nicholas.
Cooke, Henry.
Cooke, William.
Copland, William.
Cottesford, Hugh.
Coston, Simon.
Croke, Adam.
Crosse, Richard.
Crost, Anthony.
Day, John.
Devell, Thomas.
Dockwray, Thomas.
Duxwell, Thos.
Fayreberne, John.
Fox, John.
Frenche, Peter.
Gamlyn or Gammon, Allen.
Gee, Thomas.
Gonneld, James.
Gough, John.
Greffen or Griffith, William.
Grene, Richard.
Harryson, Richard.
Harvey, Richard.
Hester, Andrew.
Hyll, John.
Hyll, Richard.
Hyll, William.
Holder, Robert.
Holyland, James.
Huke, Gyles.
Ireland, Roger.
[Pg 102]Jaques, John.
Judson, John.
Jugge, Richard.
Kele, John.
Keball, John.
Kevall, junior, Richard.
Kevall, Stephen.
Kyng, John.
Lant, Richard.
Lobel, Michael.
Marten, Will.
Marsh, Thos.
Markall, Thomas.
Norton, Henry.
Norton, William.
Paget, Richard.
Parker, Thomas.
Pattinson, Thomas.
Pickering, William.

Powell, Humphrey.
Powell, Thomas.
Powell, William.
Purfoot, Thomas.
Radborne, Robert.
Richardson, Richard.
Rogers, John.
Rogers, Owen.
Ryddall, Will.
Sawyer, Thomas.
Seres, William.
Shereman, John.
Sherewe, Thomas.
Smyth, Anthony.
Spylman, Simon.
Steward, William.
Sutton, Edward.
Sutton, Henry.
Taverner, Nicholas.
Tottle, Richard.
Turke, John.
Tyer, Randolph.
Tysdale, John.
Walley, Charles.
Walley, John.
Wallys, Richard.
Way, Richard.
Whitney, John.
Wolfe, Reginald.

Amongst the men whose names were not included in the charter were:—

Baker, John, made free 24th Oct. 1555.
Caley, Robert.
Chandeler, Giles, made free 24 Oct. 1555.
Charlewood, John.
Hacket, Thomas.
Singleton, Hugh.
Wayland, John
Wyer, Robert.

CHAPTER V

JOHN DAY'S CONTEMPORARIES

Most notable of all the men who lived and worked with Day, was Reginald or Reyner Wolfe, of the Brazen Serpent in St. Paul's Churchyard. Much as we have to regret the scantiness of all material for a study of the lives of the early English printers, it is doubly felt in the case of Reginald Wolfe. The little that is made known to us is just sufficient to whet the appetite and kindle the curiosity. It reveals to us an active business man, evidently with large capital behind him, setting up as a bookseller, under the shadow of the great Cathedral, and rapidly becoming known to the learned and the rich. We see him passing backwards and forwards between this country and the book-fair at Frankfort, executing commissions for great nobles, and at the same time acting as the King's courier. Later on we find him adding the trade of printer to that of bookseller, and I have very little doubt that it was partly to the advice and influence of Reginald Wolfe that we owe the improvement that took place in John Day's printing after his return from abroad. As a printer he stands beside Day in the excellence of his workmanship, and he was the first in England who possessed any large stock of Greek type.

Reyner Wolfe was a native of Dretunhe(?), in Gelderland, as shown by the letters of denization which he took out on the 2nd January 1533-4. (State Papers, Hen. 8. vol. 6. No. 105.) He had been established in Saint Paul's Churchyard some years before this, however, as in a letter from Thomas Tebold to the Earl of Wiltshire, dated the 4th April 1530, he says he has arrived at Frankfort, and hopes to hear from his lordship through 'Reygnard Wolf, bookseller, of St. Pauls Churchyard, London, who will be here in two days.'

Again, in 1539, in the same series of Letters and Papers (vol. xiv. pt. 2. No. 781), is an entry of the payment of 100s. to 'Rayner Wolf' for conveying the King's letters to Christopher Mounte, his Grace's agent in 'High Almayne'. But it was not until 1542 that he began to print. The British Museum fortunately possesses copies of all his early works as a printer, which began with several of the writings of John Leland the antiquary. The first was *Naeniae in mortem T. Viati, Equitis incomparabilis, Joanne Lelando, antiquario, authore, a quarto*, printed in a well-cut fount of Roman. This was followed in the same year by *Genethliacon*, a work specially written by Leland for Prince Edward, with a dedication to Prince Henry, the first part being printed in Italic and the second in Roman type. On the verso of the last leaf is the printer's very beautiful device of children throwing at an apple-tree, certainly one of the most artistic devices in use amongst the printers of that time.

Fig. 22.—Wolfe's Device.

To this work succeeded, in 1543, the Homilies of Saint Chrysostom, of which John Cheke, Professor in Greek at Cambridge University, was editor. The whole of the first part of the work, with the exception of the dedication, was in Greek letter, making thirty lines to the quarto page. The second part, which had a separate title-page, was printed with the Italic, and the supplementary parts with the Roman types. Some very fine pictorial initial letters were used throughout the work, and the larger form of the apple-tree device occurs on the last leaf, with a Greek and Latin motto.

A very rare specimen of Wolfe's work in 1543 is Robert Recorde's *The ground of artes teaching the worke and practise of Arithmetike moch necessary for all states of men*, a small octavo printed in black letter, but of no particular merit. In the same type and form he issued in the following year a tract entitled *The late expedicion in Scotlande, etc.* Chrysostom's *De Providentia Dei* and *Laudatio Pacis* were printed in the Roman and Italic founts during 1545 and 1546, and are the only record we have left of Wolfe's work as a printer during those years. In 1547 he was appointed the king's printer in Latin, Greek, and Hebrew, and was granted an annuity of twenty-six shillings and eightpence during his life (Pat. Rol. 19 April 1547).

In 1553 trouble arose between Wolfe and Day as to their respective rights of printing Edward the Sixth's catechism. The matter was settled by Wolfe having the privilege for printing the Latin version, and Day that in English, but neither party reaped much benefit, as upon the king's death the book was called in, having only been in circulation a few months. During Mary's reign the only important work that seems to have come from Wolfe's press was Recorde's *Castle of Knowledge*, a folio, with an elaborately designed title-page, and a dedication to Cardinal Pole. In 1560 Wolfe became Master of the Company of Stationers, a position to which he was elected on three subsequent occasions, in 1564, 1567, and 1572. His patents were renewed to him under Elizabeth, and he came in for his share of the patronage of Matthew Parker, whose edition of Jewel's *Apologia* he printed in quarto form in 1562. In 1563 appeared from his press the *Commonplaces of Scripture*, by Wolfgang Musculus, a folio, chiefly notable for a very fine pictorial initial 'I,' measuring nearly 3-1/2 inches square, and representing the Creation, which had obviously formed part of the opening chapter of Genesis in some early edition of the Bible. It was certainly used again in the 1577 edition of Holinshed's Chronicle.

Almost his last work was Matthew Paris's *Historia Major*, edited by Matthew Parker, a handsome folio with an engraved title-page, several good pictorial initials, and his large device of the apple-tree, printed in 1571. Without doubt the printer was greatly interested in this work. He had himself collected materials for a chronicle of his adopted country, which he amused himself with in his spare time. But he did not live to print it, his death taking place late in the year 1573. His will was short, and mentioned none of his children by name. His property in St. Paul's Churchyard, which included the Chapel or Charnel House on the north side, which he had purchased of King Henry VIII., he left to his wife, and the witnesses to his will were George Bishop, Raphael Holinshed, John Hunn, and John Shepparde. His wife, Joan Wolfe, only survived him a few months, her will, which is also preserved in the Prerogative Court of Canterbury, being proved on the 20th July 1574. In it occurs the following passage:

'I will that Raphell Hollingshed shall have and enjoye all such benefit, proffit, and commoditie as was promised unto him by my said late husbände Reginald Wolfe, for or concerning the translating and prynting of a certain crownacle which my said husband before his decease did prepare and intende to have prynted.'

She further mentioned in her will a son Robert, a son Henry, and a daughter Mary, the wife of John Harrison, citizen and stationer, as well as Luke Harrison, a citizen and stationer, while among the witnesses to it was Gabriel [Pg 109] Cawood, the son of John Cawood, who lived hard by at the sign of the Holy Ghost, next to 'Powles Gate.'

>From a document in the Heralds' College (W. Grafton, vi., A. B. C., Lond.), it appears that John Cawood, who began to print about the same time as Day, came from a Yorkshire family of good standing. He was apprenticed to John Reynes, a bookseller and bookbinder, who at that time, about 1542, worked at the George Inn in this locality. Cawood greatly respected his master, and in aftertimes, when he had become a prosperous man, placed a window in Stationers' Hall to the memory of John Reynes. Reynes died in 1543, but there is no mention of Cawood in his will, perhaps because Cawood was no longer in his service; but in that of his widow, Lucy Reynes, there was a legacy to John Cawood's daughter.

Cawood began to print in the year 1546, the first specimen of his press work being a little octavo, entitled *The Decree for Tythes to be payed in the Citye of London*.

With few exceptions the printers of this period easily enough conformed to the religious factions of the day. Thus Cawood prints Protestant books under Edward VI., Catholic books under Mary, and again Protestant books under Elizabeth. Upon the accession of Mary he was appointed royal printer in the place of Grafton, [Pg 110] who had dared to print the proclamation of Lady Jane Grey (Rymer's *Fœdera*, vol. xv., p. 125). He also received the reversion of Wolfe's patent for printing Latin, Greek, and Hebrew books, as well as all statute books, acts, proclamations, and other official documents, with a salary of £6, 13s. 4d. The British Museum possesses a volume (505. g. 14) containing the statutes of the reign of Queen Mary, printed in small folio by Cawood. From these it will be seen that he used some very artistic woodcut borders for his title-pages, notably one with bacchanalian figures in the lower panel signed 'A. S.' in monogram, evidently the same artist that cut the woodcut initials seen in these and other books printed by this printer, and who is believed to have been Anton Sylvius, an Antwerp engraver. Cawood was one of the first wardens of the Stationers' Company in 1554, and again served from 1555-7, and continued to take great interest in its welfare throughout his life. In 1557, Cawood, in company with John Waley and Richard Tottell, published the *Works of Sir Thomas More* in a large and handsome folio. The editor was William Rastell, Chief Justice of the Queen's Bench, son of John Rastell the printer, and nephew of the great chancellor.

The book was printed at the Hand and Star in Fleet Street by Tottell, but the woodcut initials were certainly supplied by Cawood, and perhaps some of the type. On the accession of Elizabeth, he again received a patent as royal printer, but jointly with Richard Jugge, whose name is always found first. Nevertheless, Cawood printed at least two editions of the Bible in quarto, with his name alone on the title-page. They were very poor productions, the text being printed in the diminutive semi-gothic type that had done duty since the days of Caxton, and the woodcut borders being made up of odds and ends that happened to be handy. His rapidly increasing business had already compelled him to lease from the Dean and Chapter of St. Paul's a vault under the churchyard, and two sheds adjoining the church, and in addition to this he now took a room at Stationers' Hall at a rental of 20s. per year.

In conjunction with Jugge he printed many editions of the Book of Common Prayer in all sizes. He also reprinted in 1570 Barclay's *Ship of Fools* with the original illustrations. Cawood was three times Master of the Company of Stationers, in 1561, 1562, and 1566. In 1564 he was appointed by Elizabeth Toye, the widow of Robert Toye, one of the overseers to her will, and his partner Jugge was one of the witnesses to the document (P. C. C., 25 Morrison). His death took place in 1572, and from his epitaph it appeared that he was three times married, and by his first wife, Joan, had three sons and four daughters. His eldest son, John, was bachelor of laws and fellow of New College, Oxford, and died in 1570; Gabriel, the second son, succeeded to his father's business, and the third son died young. His eldest daughter, Mary, married George Bishop, one of the deputies to Christopher Barker; a second, Isabel, married Thomas Woodcock, a stationer; Susannah was the wife of Robert Bullock, and Barbara married Mark Norton.

Richard Jugge was another of those who owed much to the patronage and encouragement of Archbishop Parker. He is believed to have been born at Waterbeach in Cambridgeshire, and was educated, first at Eton, and afterwards at

Cambridge. He set up at the sign of The Bible in 1548, and used as his device a pelican plucking at her breast to feed her young who are clamouring around her. In 1550 he obtained a licence to print the New Testament, and in 1556 books of Common Law. Under Elizabeth in 1560 he was made senior Queen's Printer. When the new edition of the Bible was about to be issued in 1569, Archbishop Parker wrote to Cecil, asking that Jugge might be entrusted with the printing, as there were few men who could do it better. In this way he became the printer of the first edition of the 'Bishops' Bible,' a second edition coming from his press the year following. In this work he used several large decorative initial letters, with the arms of the several patrons of the work, as well as a finely designed engraved title-page, with a portrait of the Queen, and other portraits of Burleigh and Leicester. In his edition of the New Testament were numerous large cuts, evidently of foreign workmanship, some of them signed with the initials 'E. B.' Richard Jugge died in 1577.

Another of Day's contemporaries, whose name is remembered by all students of English literature, was Richard Tottell, who lived at the Hand and Star in Fleet Street, and printed there the collection of poetry known as Tottell's Miscellany.

There is reason to believe that Richard Tottell was the third son of Henry Tottell, a famous citizen of Exeter. The name was spelt in a great variety of ways, such as Tothill, Tuthill, Tottle, Tathyll, and Tottell. Richard Tottell at the time of his death held lands in Devon, and some of the same lands that belonged to the Tothill family of Exeter. Moreover, his coat of arms was the same as theirs. But before 1552 he was in London, for in that year he received a patent for the printing of law books, and was generally known as Richard Tottell of London, gentleman. He appears to have married Joan, a sister of Richard Grafton, and in this way became possessed of considerable land in the county of Bucks. From this we may assume that he had business relations with Richard Grafton, and it becomes only natural that he should have printed various editions of Grafton's Chronicle, and come into possession of some of his finest woodcut borders.

Fig. 23.—Richard Tottell's Device.

It was in June 1557 that he printed his 'Miscellany,' an unpretentious quarto, with the title: Songes and Sonnettes, written by the Ryght Honorable Lorde Henry Hawarde, late Earl of Surrey and other. Before the 31st July a second edition became necessary, and several new poems were added. The third edition appeared in 1559, the fourth in 1565, and before the end of the sixteenth century, four more editions were called for. Another of Tottell's works was Gerard Legh's Accedens of Armory, an octavo, printed throughout in italic type, with a curiously engraved title-page, besides numerous illustrations of coats of arms, and several full-page illustrations. It was printed in 1562, and again in 1576 and 1591.

The best of Tottell's work as a printer is to be found in the law-books, for which he was a patentee. In these he used several handsome borders to title-pages, one of an architectural character with his initials R. T. at the two lower corners, another, evidently Grafton's, with a view of the King and Parliament in the top panel, and Grafton's punning device in the centre of the bottom panel.

In 1573 Richard Tottell tried to establish a paper mill in England. He wrote to Cecil, pointing out that nearly all paper came from France, and undertaking to establish a mill in England if the Government would give him the necessary land and the sole privilege of making paper for thirty years (Arber, i. 242). But as nothing was ever done in the matter, the Government evidently did not entertain the proposal. Tottell was Master of the Company of Stationers in 1579 and 1584. During the latter part of his life he withdrew from business, and lived at Wiston, in Pembrokeshire, where he died in 1593. He left several children, of whom the eldest, William Tottell, succeeded to his estates.

In the precincts of the Blackfriars, Thomas Vautrollier, a foreigner, was at work as a printer in 1566, having been admitted a 'brother' of the Company of Stationers on the 2nd October 1564. He soon afterwards received a patent for the printing of certain Latin books, and Christopher Barker, in a report to Lord Burghley in 1582, says:—

'He has the printing of Tullie, Ovid, and diverse other great workes in Latin. He doth yet, neither great good nor great harme withall.... He hath other small thinges wherewith he keepeth his presses on work, and also worketh for bookesellers of the Companye, who kepe no presses.'

In 1580, on the invitation of the General Assembly, Vautrollier visited Scotland, taking with him a stock of books, but no press, and in 1584 he again went north, and set up a press at Edinburgh, still keeping on his business in London. The venture does not seem to have turned out a success, for Vautrollier returned to London in 1586, taking with him a MS. of John Knox's History of the Reformation, but the work was seized while it was in the press (Works of John Knox, vol. i. p. 32). As a printer Vautrollier ranks far above most of the men around him, both for the beauty of his types and the excellence of his presswork. The bulk of his books were printed in Roman and Italic, of which he had several well-cut founts. He had also some good initials, ornaments, and borders. In the folio edition of Plutarch's Lives, which he printed in 1579, each life is preceded by a medallion portrait, enclosed in a frame of geometrical pattern; some of these, notably the first, and also those shown on a white background, are very effective. His device was an anchor held by a hand issuing from clouds, with two sprigs of laurel, and the motto 'Anchora Spei,' the whole enclosed in an oval frame.

Vautrollier was succeeded in business by his son-in-law, Richard Field, another case of the apprentice marrying his master's daughter. Field was a native of Stratford-on-Avon, and therefore a fellow-townsmen of Shakespeare's, whose first poem, Venus and Adonis, he printed for Harrison in 1593. But we have no knowledge of any intercourse between them.

Field succeeded to the stock of his predecessor, and his work is free from the haste and slovenly appearance so general at that time. Another work from his press was Puttenham's Arte of English Poesy, 1589, 4to. The first edition, of which there is a copy in the British Museum, had no author's name, but was dedicated by the printer [Pg 118] to Lord Burghley. In the second book, four pages were suppressed. They are inserted in the copy under notice, but are not paged. This edition also contained as a frontispiece a portrait of the Queen. Another notable work of Field's was Sir John Harington's translation of Orlando Furioso (1591, fol.). This book had an elaborate frontispiece, with a portrait of the translator, and thirty-six engraved illustrations, that make up in vigour of treatment, and breadth of imagination, for shortcomings in the matter of draughtsmanship. The text was printed in double columns, and each verse of the Argument was enclosed in a border of printers' ornaments. A second edition, alike in almost every respect, passed through the same press in 1607. In 1594 Field printed a second edition of Venus and Adonis, and the first edition of Lucrece. His later work included David Hume's Daphne-Amaryllys, 1605, 4to; Chapman's translation of the Odyssey (1614, folio); and an edition of Virgil in quarto in 1620.

Foremost among the later men of this century stands Christopher Barker, the Queen's printer, who was born about 1529, and is said to have been grand-nephew to Sir Christopher Barker, Garter King-at-Arms. Originally a member of the Drapers' Company, he began to publish books in 1569 (Arber, i. p. 398), and to print in 1576, and purchased from Sir Thomas Wilkes his patent to print the Old and New Testament in English. Barker issued in 1578 a circular offering his large Bible to the London Companies at the rate of 24s. each bound, and 20s. unbound, the clerks of the various Companies to receive 4d. apiece for every Bible sold, and the hall of each Company that took £40 worth to receive a presentation copy (Lemon's Catal. of Broadsides).

Fig. 24.—Christopher Barker's Device..

In 1582 Barker sent to Lord Burghley an account of the various printing monopolies granted since the beginning of the reign, and expresses himself freely on them. He also attempted to suppress the printers in Cambridge University. In and after 1588 he carried on his business by deputies, George Bishop and Ralph Newbery, and in the following year, on the disgrace of Sir Thomas Wilkes, he obtained an exclusive patent for himself and his son to print all official documents, as well as Bibles and Testaments. At one time Barker had no fewer than five presses, and between 1575 and 1585 he printed as many as thirty-eight editions of the Scriptures, an almost equal number being printed by his deputies before 1600. Christopher Barker died in 1599, and was succeeded in his post of royal printer by Robert Barker, his eldest son.

On the 23rd June 1586 was issued The Newe Decrees of the Starre Chamber for orders in Printing, which is reprinted in full in the second volume of Arber's Transcripts, pp. 807-812. It was the most important enactment concerning printing of Queen Elizabeth's reign, and formed the model upon which all subsequent 'whips and scorpions' for the printers were manufactured. Its chief clauses were these: It restricted all printing to London and the two Universities. The number of presses then in London was to be reduced to such proportions as the Archbishop of Canterbury and the Bishop of London should think sufficient. No books were to be printed without

being licensed, and the wardens were given the right to search all premises on suspicion. The penalties were imprisonment and defacement of stock.

CHAPTER VI PROVINCIAL PRESSES OF THE SIXTEENTH CENTURY[8]

In the first half of the sixteenth century, before the incorporation of the Stationers' Company and the subsequent restriction of printing to London and the Universities, there were ten places in England where the art was carried on. Taking them chronologically, the earliest was the city of York. Mr. Davies, in his *Memoirs of the York Press*, claims that Frederick Freez, a book-printer, was at work there in 1497; but Mr. Allnutt has clearly shown that there is no evidence in support of this, no specimen of his printing being in existence. The first printer in the city of York who can be traced with certainty was Hugo Goez, said to have been the son of Matthias van der Goez, an Antwerp printer. Two school-books, a *Donatus Minor* and an *Accidence*, as well as the *Directorium Sacerdotum*, dated in the colophon February 18th, 1509, were printed by him, and it is believed that he was for a time in partnership in London with a bookseller named Henry Watson (E. G. Duff, *Early Printed Books*). Ames, in his *Typographical Antiquities*, mentions a broadside 'containing a wooden cut of a man on horseback with a spear in his right hand, and a shield of the arms of France in his left. "Emprynted at Beverley in the Hyegate by me Hewe Goes," with his mark, or rebus, of a great H and a goose.' But this cannot now be traced.

Another printer in York, of whom it is possible to speak with certainty, was Ursyn Milner, who printed a *Festum visitationis Beate Marie Virginis*, without date, and a Latin syntax by Robert Whitinton, entitled *Editio de concinnitate grammatices et constructione noviter impressa*, with the date December 20th, 1516, and a woodcut that had belonged to Wynkyn de Worde.

The second Oxford press began about 1517. In that year there appeared, *Tractatus expository super libros posteriorum Aristotelis*, by Walter Burley, bearing the date December 4th, 1517, without printer's name, but ascribed from the appearance of the types to the press of John Scolar, whose name is found in some of the similar tracts that appeared the following year. These included *Questiones moralissime super libros ethicorum*, by John Dedicus, dated May 15, 1518. On June 5th was issued *Compendium questionum de luce et lumine*, on June 7th Walter Burley's *Tractatus perbrevis de materia et forma*, on June 27th Whitinton's *De Heteroclitis nominibus*. The latest book, dated 5th February 1519, *Compotus manualis ad usum Oxoniensium*, bore the name of Charles Kyrfoth, but nothing further is known of any such printer.

No more is heard of a press at Oxford until nearly the close of the sixteenth century, a gap of nearly seventy years, and a strange and unaccountable interval. At any rate, the next Oxford printed book, so far as is at present known, was John Case's *Speculum Moralium quaestionum in universam ethicen Aristotelis*, with the colophon, 'Oxonix ex officina typographica Josephi Barnesii Celeberrimae Academiae Oxoniensis Typographi. Anno 1585.'

Joseph Barnes, the printer, had been admitted a bookseller in 1573, and on August 15th, 1584, the University lent him £100 with which to start a press. During the time that he remained printer to the University, his press was actively employed, no less than three hundred books, many of them in Greek and Latin, being traced to it. In 1595 appeared the first Welsh book printed at the University, a translation into Welsh by Hugh Lewis of O. Wermueller's *Spiritual and Most Precious Pearl*, and in 1596 two founts of Hebrew letter were used by Barnes, but the stock of this letter was small.

In 1528, John Scolar, no doubt the same with the Oxford printer, is found at Abingdon, where he printed a *Breviary* for the use of the abbey there; only one copy has survived, and is now at Emmanuel College, Cambridge.

Fig. 25.—Device of Joseph Barnes.

The first Cambridge printer was John Siberch, whose history, like that of so many other early printers, is totally unknown. Nine specimens of his printing during the years 1521-22 are extant. The first is the *Oratio* of Henry Bullock, a tract of eight quarto leaves, with a dedication dated February 13, 1521, and the date of the imprint February 1521, so that it probably appeared between the 13th and 28th of that month. The type used was a new fount of Roman. The book had no ornamentation of any kind, neither device nor initial letters. A facsimile of this book, with an introduction and bibliographical study of Siberch's productions, was issued by the late Henry

Bradshaw in 1886. The title-page of the second book, *Cuiusdam fidelis Christiani epistola ad Christianos omnes*, by Augustine, shows the title between two upright woodcuts, each containing scenes from the Last Judgment. The third book, an edition of Lucian, has a very ugly architectural border. The fifth book from Siberch's press, the *Libellus de Conscribendis epistolis, autore D. Erasmo*, printed between the 22nd and 31st of October 1521, contains the privilege which, it is believed, he obtained from Bishop Fisher.

In the far west of England a press was established in the monastery of Tavistock, in Devon, of which two curious examples are preserved. The first is *The Boke of Comfort*, called in Latin *Boetius de Consolatione philosophie*.

Translated into English tonge ... Enprented in the exempt monastery of Tauestock in Deñshyre, By me Dan Thomas

Rycharde, monke of the sayde monastery, To the instant desyre of the ryght worshypful esquier Mayster Robert Langdon. Anno d. M.Dxxv., 4to. The Bodleian Library at Oxford has two imperfect copies of this book, and a third, also imperfect, is in the library of Exeter College, Oxford. The latter college is also fortunate in possessing the only known copy of the second book, which has this title:—

Here foloweth the confirmation of the Charter perteynyng to all the tynners wythyn the Coūty of devonshyre, with there Statutes also made at Crockeryntorre.

Imprented at Tavystoke ye xx day of August the yere of the reygne off our souerayne Lord Kyng Henry ye viii the xxvi yere, i.e. 1534.

To this same year, 1534, belongs the first dated book of John Herford, the St. Albans printer. It seems probable that he was established there some years earlier, but this is the first certain date we have. In that year appeared a small quarto, with the title, *Here begynnethe ye glorious lyfe and passion of Seint Albon prothomartyr of Englande*, and also the lyfe and passion of Saint Amphabel, whiche conuerted saint Albon to the fayth of Christe, of which John Lydgate was the author. It was printed at the request of Robert Catton, abbot of the monastery, and it would seem as if Herford's press was situated within the abbey precincts. The next book, *The confutacyon of the first parte of Frythes boke ... put forth by John Gwynneth clerk*, 1536, 8vo, was the work of one of the monks of the abbey, who in the previous year had signed a petition to Sir Francis Brian on the state of the monastery (*Letters and Papers, Henry VIII.*, vol. ix. p. 394). Another of the signatories to that petition was Richard Stevenage, who was at that time chamberer of the abbey, and was created abbot on the deprivation of Robert Catton in 1538. Of the three books which Herford printed in that year, two were expressly printed for Richard Stevenage. These were *A Godly disputation betweene Justus and Peccator and Senex and Juvenis*, and *An Epistle agaynste the enemies of poore people*, both octavos, of which no copies are now known. In some of Herford's books is a curious device with the letters R. S. intertwined on it, which undoubtedly stand for Richard Stevenage. His reign as abbot was a short one, for on 5th December 1539 he delivered the abbey over to Henry VIII's commissioners. Just before that event, on the 12th October, he wrote a letter to Cromwell in which the following passage occurs:—

'Sent John Pryntare to London with Harry Pepwell, Bonere and Tabbe, of Powlles churchyard stationers, to order him at your pleasure. Never heard of the little book of detestable heresies till the stationers showed it me.'—(*Letters and Papers, Hen. VIII.*, Vol. xiv., Pt. 2, No. 315.)

The 'John Pryntare' can be none other than John Herford. 'Bonere' was a misreading for Bonham, and these three, Pepwell, Tab, and Bonham, all of them printers or booksellers in St. Paul's Churchyard, were evidently sent down especially to inquire into the matter.

We next hear of John Herford as in London in 1542, but meanwhile a modification of Stevenage's device was used by a London printer named Bourman. From the *Letters and Papers of Henry VIII.*, vol. xv. pp. 115, etc., it appears that after his retirement from the abbey, Richard Stevenage went by the name of Boreman. He is invariably spoken of as 'Stevenage alias Boreman,' so that the Nicholas Bourman, the London printer, was perhaps a relative.

The Rev. S. Sayers in his *Memoirs of Bristol*, 1823, vol. ii. p. 228, states, on the authority of documents in the city archives, that a press was at work in the castle in the year 1546. Of this press, if it ever existed, not so much as a leaf remains.

In 1547 Anthony Scoloker was established as a printer at Ipswich. In that year he printed *The just rekenyng or accompt of the whole number of yeares, from the beginnyng of the world, vnto this present yeare of 1547. Translated out of Germaine tonge by Anthony Scoloker the 6 daye of July 1547.* He was chiefly concerned with the movements of the Reformation, and his publications were mostly small octavos, the writings of Luther, Zwingli, and Ochino, printed in type of a German character and of no great merit. In 1548 he moved to London, where for a time he was in partnership with William Seres. The adjoining cut, the earliest English representation of a printing press, is taken from the *Ordinarye of Christians*, printed by Scoloker after he had settled in London.

Fig. 26.—From the *Ordinarye of Christians*, c. 1550.

A second printer in Ipswich is believed to have been John Overton, who in 1548 printed there two sheets of Bale's *Illustrium maioris Britanniae scriptorum summarium*, the remainder of which was printed at Wesel. Nothing else of his appears to be known. The third printer at Ipswich was John Oswen, who was also established there in 1548. Nine books can be traced to his press there. The first was *The Mynde of the Godly and excellent lerned man M. Jhon Caluyne what a Faithful man, whiche is instructe in the Worde of God ought to do, dwellinge amongst the Papistes.* Imprinted at Ippyswiche by me John Oswen. 8vo. This was followed by Calvin's *Brief declaration of the fained sacrament commonly called the extreame unction.* The remainder of his books were of a theological character. He left Ipswich about Christmas 1548, and is next found at Worcester, where, on the 30th January 1549, he printed *A Consultarie for all Christians most godly and earnestly warnyng al people to beware least they beare the name of Christians in vayne. Now first imprinted the xxx day of Januarie Anno M. D. xlix. At Worceter by John Oswen. Cum priuilegio Regali ad imprimendum solum. Per septennium.* The privilege, which was dated January 6th, 1548-9, authorised Oswen to print all sorts of service or prayer-books and other works relating to the scriptures 'within our Principallitie of Wales and Marches of the same.'

Oswen followed this by another edition of the *Domestycal or Household Sermons of Christopher Hegendorff*, which was printed on the last day of February 1549.

Then came his first important undertaking, a quarto edition of *The boke of common praier.* Imprinted the xxiv day of May Anno MDXLIX. The folio edition appeared in July of the same year. Two months later he printed an edition of the *Psalter or Psalmes of David*, 4to. On January 12, 1550, appeared a quarto edition of the *New Testament*, of which there is a copy in Balliol College Library, and this was followed in the same year by Zwingli's *Short Pathwaye*, translated by John Veron; by a translation by Edward Aglionby of Mathew Gribalde's *Notable and marveilous epistle*, and the *Godly sayings of the old auncient fathers*, compiled by John Veron. Two or three books of the same kind were issued in 1551, and in 1552 he issued another edition of the *Book of Common Prayer.* The last we hear of him is in 1553, when he printed an edition of the *Statutes of 6th Edward VI.*, and *An Homelye to read in the tyme of pestylence.* What became of Oswen is not known. He very likely went abroad on the accession of Queen Mary.

In Kent there was a press at Canterbury, from which eleven books are known to have been printed between 1549 and 1556.

John Mychell, the printer of these, began work in London at the Long Shop in the Poultry, some time between the departure of Richard Banckes in 1539 and the tenancy of Richard Kele in 1542. In 1549 he appears to have moved to Canterbury, where he printed a quarto edition of the *Psalms*, with the colophon, 'Printed at Canterbury in Saynt Pauls paryshe by John Mychell.' In 1552 he issued *A Breuiat Cronicle contayninge all the Kynges from Brute to this daye*, and in 1556, the *Articles of Cardinal Pole's Visitation.* He also issued several minor theological tracts without dates.

The Norwich press began about 1566, when Anthony de Solemne, or Solempne, set up a press among the refugees who had fled from the Netherlands and taken refuge in that city. Most of his books were printed in Dutch, and all of them are excessively rare. The earliest was:—

Der Siecken Troost, Onderwijsinghe on gewillichlick te steruen. Troostinghe | on den siecken totte rechten gheloue ende betrouwen in Christo te onderwijsen. Ghemeyn bekenisse der sonden | met | soon gebeden. Ghedruct in Jaer ons Heeren. Anno 1566. The only known copy of the book is in Trinity College Library, Dublin.

The Psalms of David in Dutch appeared in 1568, and the New Testament in the same year.

He was also the printer of certain Tables concerning God's word, by Antonius Corranus, pastor of the Spanish Protestant congregation at Antwerp. It was printed in four languages, Latin, French, Dutch, and English.

The only known specimen of Solempne's printing in the English language is a broadside now in the Bodleian:—

Certayne versis | written by Thomas Brooke Gētleman | in the tyme of his imprysōment | the daye before his deathē | who sufferyd at Norwich the 30 of August 1570. Imprynted at Norwiche in the Paryshe of Saynct Andrewe | by Anthony de Solempne 1570.

In this year Solempne also printed Eenen Calendier Historiael | eewelick gheduerende, 8vo, a tract of eight leaves printed in black and red, of which there are copies in the library of Trinity College, Dublin, and the Bodleian.

There is then a gap of eight years in his work, the next book found being a sermon, printed in 1578, Het tweede boeck vande sermoenen des wel vermaerden Predicant B. Cornelis Adriaensen van Dordrecht minrebroeder tot Brugges. Of this there are two copies known, one in the library of Trinity College, Dublin.

The last book traced to Solempne's press is Chronyc. Historie der Nederlandtscher Oorlogen. Gedruct tot Norrtwitz na de copie van Basel, Anno 1579, 8vo, of which there remain copies in the Bodleian, University Library, Cambridge, and in the private collection of Lord Amherst. In 1583, after an interval similar to that at Oxford, another press was started at Cambridge, when, on May 3rd of that year, Thomas Thomas was appointed University printer. His career was marked by many difficulties. The Company of Stationers at once seized his press as an infringement of their privileges, and this in the face of the fact that for many years the University had possessed the royal licence, though hitherto it had not been used. The Bishop of London, writing to Burghley, declared on hearsay evidence that Thomas was a man 'vtterlie ignoraunte in printinge.' The University protested, and as it was clearly shown that they held the royal privilege, the Company were obliged to submit, but they did the Cambridge printer all the injury they could by freely printing books that were his sole copyright (Arber's Transcripts, vol. ii. pp. 782, 813, 819-20). He printed for the use of scholars small editions of classical works. In 1585 he issued in octavo the Latin Grammar of Peter Ramus, and in 1587 the Latin Grammar of James Carmichael in quarto (Hazlitt, Collections and Notes, 3rd series, p. 17). He was also the compiler of a Dictionary, first printed about 1588, of which five editions were called for before the end of the century.

Thomas died in August 1588, and the University, on the 2nd November, appointed John Legate his successor, as 'he is reported to be skilful in the art of printing books.' On the 26th April 1589 he received as an apprentice Cantrell Legge, who afterwards succeeded him. From 1590 to 1609 he appears in the parish books of St. Mary the Great, Cambridge, as paying 5s. a year for the rent of a shop. He had the exclusive right of printing Thomas's Dictionary, and he printed most of the books of William Perkins. He subsequently left Cambridge and settled in London.

Fig. 27.—Device used by John Legate.

The books printed by these two Cambridge printers show that they had a good variety of Roman and Italic, very regularly cast, besides some neat ornaments and initials. Whether these founts belonged to the University, or to Thomas in the first place, is not clear. Nor do these books bear out the Bishop of London's statement as to Thomas being ignorant of printing; on the contrary, the presswork was such as could only have been done by a skilled workman.

In addition to the foregoing, there were several secret presses at work in various parts of the country during the second half of the century. The Cartwright controversy, which began in 1572 with the publication of a tract entitled An Admonition to the Parliament, was carried out by means of a secret press at which John Stroud is believed to have worked, and had as assistants two men named Lacy and Asplyn. The Stationers' Company employed Toy and Day to hunt it out, with the result that it was seized at Hempstead, probably Hemel Hempstead, Herts, or Hempstead

near Saffron Walden, Essex. The type was handed over to Bynneman, who used it in printing an answer to Cartwright's book. It was in consequence of his action in this matter that John Day was in danger of being killed by Asplyn.

A few years later books by Jesuit authors were printed from a secret press which, from some notes written by F. Parsons in 1598, and now preserved in the library of Stonyhurst College, we know began work at Greenstreet House, East Ham, but was afterwards removed to Stonor Park. The overseer of this press was Stephen Brinckley, who had several men under him, and the most noted book issued from it was Campion's *Rationes Decem*, with the colophon, 'Cosmopoli 1581.'

Finally, there was the Marprelate press, of which Robert Waldegrave was the chief printer. He was the son of a Worcestershire yeoman, and put himself apprentice to William Griffith, from the 24th June 1568, for eight years. He was therefore out of his time in 1576, and in 1578 there is entered to him a book entitled *A Castell for the Soul*. His subsequent publications were of the same character, including, in 1581, *The Confession and Declaration of John Knox*, *The Confession of the Protestants of Scotland*, and a sermon of Luther's. It was not, however, until the 7th April 1588 that he got into trouble. In that year he printed a tract of John Udall's, entitled *The State of the Church of England*. His press was seized and his type defaced, but he succeeded in carrying off some of it to the house of a Mrs. Crane at East Molesey, where he printed another of Udall's tracts, and the first of the Marprelate series: *O read over D. John Bridges for it is a worthy work*. Printed oversea in Europe within two furlongs of a Bouncing Priest, at the cost and charges of M. Marprelate, gentleman.

>From East Molesey the press was afterwards removed to Fawsley, near Daventry, and from thence to Coventry. But the hue and cry after the hidden press was so keen that another shift was made to Wolston Priory, the seat of Sir R. Knightley, and finally Waldegrave fled over sea, taking with him his black-letter type. He went first to Rochelle, and thence to Edinburgh, where in 1590 he was appointed King's printer.

The Marprelate press was afterwards carried on by Samuel Hoskins or Hodgkys, who had as his workmen Valentine Symmes and Arthur Thomlyn. The last of the Marprelate tracts, *The Protestacyon of Martin Marprelate*, was printed at Haseley, near Warwick, about September 1589.

PRINTING IN SCOTLAND AND IRELAND DURING THE SIXTEENTH CENTURY

On the 15th September 1507, King James IV. of Scotland granted to his faithful subjects, Walter Chepman and Andrew Myllar, burgesses of Edinburgh, leave to import a printing-press and letter, and gave them licence to print law books, breviaries, and so forth, more particularly the Breviary of William, Bishop of Aberdeen. Walter Chepman was a general merchant, and probably his chief part in the undertaking at the outset was of a financial character. Andrew Myllar had for some years carried on the business of a bookseller in Edinburgh, and books were printed for him in Rouen by Pierre Violette. There is, moreover, evidence that Myllar himself learnt the art of printing in that city.

The printing-house of the firm in Edinburgh was in the Southgait (now the Cowgate), and they lost no time in setting to work, devoting themselves chiefly to printing some of the popular metrical tales of England and Scotland. A volume containing eleven such pieces, most of them printed in 1508, is preserved in the Advocates' Library, Edinburgh.

Among the pieces found in it are—*Sir Eglamoure of Artoys*, *Maying or desport of Chaucer*, *Buke of Gude Counsale to the Kyng*, *Flytting of Dunbar & Kennedy*, and *Twa Marrit Wemen and the wedo*.

Three founts of black letter, somewhat resembling in size and shape those of Wynkyn de Worde, were used in printing these books, and the devices of both men are found in them. That of Chepman was a copy of the device of the Paris printer, Pigouchet, while Myllar adopted the punning device of a windmill with a miller bearing sacks into the mill, with a small shield charged with three fleur-de-lys in each of the upper corners.

Fig. 28.—Device of Andrew Miller.

After printing the above-mentioned works, Myllar disappears, and the famous *Breviarium Aberdonense*, the work for which the King had mainly granted the license, was finished in 1509-10 by Chepman alone. It is an

unpretentious little octavo, printed in double columns, in red and black, as became a breviary, but with no special marks of typographical beauty. Four copies of it are known to exist, but none of these are perfect. Chepman then disappears as mysteriously as his partner. In the Glamis copy of the *Bremarium*, Dr. David Laing discovered a single sheet of eight leaves of a book with the imprint: *Impressū Edinburgi per Johane Story nomine & mandato Karoli Stule*. Nothing more, however, is known of this John Story.

In 1541-2 another printer, Thomas Davidson, is found printing *The New Actis and Constitutionis of Parliament maid Be the Rycht Excellent Prince James the Fift King of Scottis*, 1540. Davidson's press, which was situated 'above the nether bow, on the north syde of the gait,' was also very short-lived, and very few examples of it are now in existence; one of these, a quarto of four leaves, with the title *Ad Serenissimum Scotorum Regem Jacobum Quintum de suscepto Regni Regimine a diis feliciter ominato Strena*, is the earliest instance of the use of Roman type in Scotland. His most important undertaking, besides the *Acts of Parliament*, was a Scottish history, printed about 1542.

The next printer we hear of is John Scot or Skot. There was a printer of this name in London between 1521 and 1537, but whether he is to be identified with this slightly later Scottish printer is not known. Between 1552 and 1571 Scot printed a great many books, most of them of a theological character. Among them was *Ninian Winziet's Certane tractatis for Reformatioun of Doctryne and Maneris*, a quarto, printed on the 21st May 1562, and the same author's *Last Blast of the Trumpet*. For these he was arrested and thrown into prison, and his printing materials were handed over to Thomas Bassandyne. In 1568 he was at liberty again and printed for Henry Charteris, *The Warkes of the famous & vorthie Knicht Schir David Lyndesay*; while among his numerous undated books is found *Lyndsay's Ane Dialog betwix Experience and Ane Courtier*, of which he printed two editions, the second containing several other poems by the same author.

Scot was succeeded by Robert Lekpreuik, who began to print, in 1561, his first dated book, a small black-letter octavo of twenty-four pages, called *The Confessione of the fayght and doctrin beleued and professed by the Protestantes of the Realme of Scotland*. Imprinted at Edinburgh be Robert Lekpreuik, *Cum privilegio*, 1561.

In the following year the Kirk lent him £200 with which to print the *Psalms*. The copy now in the *Advocates' Library*, Edinburgh, bound with the *Book of Common Order* printed by Lekpreuik in the same year, probably belongs to this edition. Two years later, in 1564-5, he obtained a license under the Privy Seal to print the *Acts of Parliament of Queen Mary and the Psalms of David in Scottish metre*. Of this edition of the *Psalms* there is a perfect copy in the library of *Corpus Christi College*, Oxford. Again, in 1567, Lekpreuik obtained the royal license as king's printer for twenty years, during which time he was to have the monopoly of printing *Donatus pro pueris*, *Rudimentis of Pelisso*, *Acts of Parliament*, *Chronicles of the Realm*, the book called *Regia Majestas*, the *Psalms*, the *Homelies*, and *Rudimenta Artis Grammaticae*.

Among his other work of that year may be noticed a ballad entitled *The testament and tragedie of vmquhile King Henry Stewart of gude memory*, a broadside of sixteen twelve-line stanzas, from the pen of Robert Sempil. A copy of this is in the *British Museum* (Cott. Caligula, C. i. fol. 17). In 1568 there was danger of plague in Edinburgh, and Lekpreuik printed a small octavo of twenty-four leaves, in Roman type, with the title, *Ane breve description of the Pest, Quhair in the Cavis signes and sum speciall preservatioun and cvre thair of ar contenit. Set furth be Maister Gilbert Skeyne, Doctoure in Medicine*.

In 1570 he printed for Henry Charteris a quarto edition of the *Actis and Deides of Sir William Wallace*, and in 1571 *The Actis and Lyfe of Robert Bruce*. This was printed early in the year, as on the 14th April Secretary Maitland made a raid upon Lekpreuik's premises, under the belief that he was the printer of *Buchanan's Chameleon*. The printer, however, had received timely warning and retired to Stirling, where, before the 6th of August, he printed *Buchanan's Admonition*, and also a letter from John Knox 'To his loving Brethren.' His sojourn there was very short, as on the 4th September Stirling was attacked and Lekpreuik thereupon withdrew to St. Andrews, where his press was active throughout the year 1572 and part of 1573. In the month of April 1573 Lekpreuik returned to Edinburgh and printed *Sir William Drury's Regulations for the army under his command*. But in January 1573-74 he was thrown into prison and his press and property confiscated. How long he remained a prisoner is not clear, but in all probability until after the execution of the Regent Morton in 1581. In that year he printed the following books—*Patrick Adamson's Catechismus Latino Carmine Redditus et in libros quatuor digestus*, a small octavo of forty

leaves, printed in Roman type; Fowler's Answer to John Hamilton, a quarto of twenty-eight leaves; and a Declaration without place or printer's name, but attributed to his press: after this nothing more is heard of him.

Contemporary with Lekpreuik was Thoma Bassandyne, who is believed to have worked both in Paris and Leyden before setting up as a printer in Edinburgh.

His first appearance, in 1568, was not a very creditable one. An order of the General Assembly, on the 1st July of that year, directs Bassandyne to call in a book entitled *The Fall of the Roman Kirk*, in which the king was called 'supreme head of the Primitive Church,' and also orders him to delete an obscene song called *Welcome Fortune* which he had printed at the end of a psalm-book. The Assembly appointed Mr. Alexander Arbuthnot to revise these things.

In 1574 Bassandyne printed a quarto edition of Sir David Lindsay's Works, of which he had 510 copies in stock at the time of his death.

Fig. 29.—Device of Alexander Arbuthnot.

On the 7th March 1574-75, in partnership with Alexander Arbuthnot (who was not the same as the Alexander Arbuthnot who had been appointed to exercise a supervision of Bassandyne's books in 1568), Bassandyne laid proposals before the General Assembly for printing an edition of the Bible, the first ever printed in Scotland. The General Assembly gave him hearty support, and required every parish to provide itself with one of the new Bibles as soon as they were printed. On the other hand, the printers were to deliver a certain number of copies before the last of March 1576, and the cost of it was to be £5. The terms of this agreement were not carried out by the printers. The New Testament only was completed and issued in 1576, with the name of Thomas Bassandyne as the printer. The whole Bible was not finished until the close of the year 1579, and Bassandyne did not live to see its completion, his death taking place on the 18th October 1577.

Like most of his predecessors, Bassandyne was a bookseller; and on pp. 292-304 of their work *Annals of Scottish Printing*, Messrs. Dickson and Edmond have printed the Inventory of the goods he possessed, including the whole of his stock of books, which is of the greatest interest and value. Unfortunately such inventories are not to be met with in the case of English printers.

Bassandyne used as his device a modification of the serpent and anchor mark of John Crespin of Geneva.

Arbuthnot was now left to carry on the business alone, and was made King's printer in 1579. But he was a slow, slovenly, and ignorant workman, and the General Assembly were so disgusted with the delivery of the Bible and the wretched appearance of his work, that, on the 13th February 1579-80, they decided to accept the offer of Thomas Vautrollier, a London printer, to establish a press in Edinburgh.

Arbuthnot died on September 1st, 1585. His device was a copy of that of Richard Juge of London, and is believed to have been the work of a Flemish artist, Assuerus vol Londersel.

Another printer in Edinburgh between 1574-80 was John Ross. He worked chiefly for Henry [Pg 149] Charteris, for whom he printed the *Catechisme* in 1574, and a metrical version of the Psalms in 1578. For the same bookseller he also printed a poem, *The seuin Seages*, Translatit out of prois in Scottis meter be Johne Rolland in Dalkeith, a quarto, now so rare that only one copy is now known, that in the Britwell Library.

In 1579 Ross printed *Ad virulentum Archbaldi Hamiltonii Apostatæ dialogum, de confusione Calvinianæ Sectæ apud Scotos, impie conscriptum, orthodoxa responsio, Thoma Smetonio Scoto anctore*, a quarto, printed in Roman letter, and followed it up with two editions of Buchanan's *De Jure Regni apud Scotos dialogus*.

Ross used a device showing Truth with an open book in her right hand, a lighted candle in her left, surrounded with the motto 'Vincet tandem veritas.' This device was afterwards used by both Charteris and Waldegrave. Ross died in 1580, when his stock passed into the hands of Henry Charteris, who began printing in the following year. As we have seen, he employed Scot, Lekpreuik, and Ross to print for him. Up to 1581 he confined himself to bookselling. His printing was confined to various editions of Sir David Lindsay's Works and theological tracts. He used two

devices, that of Ross, and another emblematical of Justice and Religion, with his initials. He died on the 9th August 1599. In 1580, at the express invitation of the General Assembly, Thomas Vautrollier visited Edinburgh, and set up as a bookseller, no doubt with the view of seeing what scope there was likely to be for a printer with a good stock of type. The Treasurer's accounts for this period show that he received royal patronage.

On his second visit, a year or two later, he went armed with a letter to George Buchanan from Daniel Rodgers, and set up a press in Edinburgh. But in spite of the support of the Assembly and the patronage that an introduction to Buchanan must have brought him, he evidently soon found there was not enough business in Edinburgh to support a printer, for he remained there little more than a year, when he again returned to London. During his short career as a printer in Edinburgh he printed at least eight books, of which the most important were Henry Balnave's *Confession of Faith*, 1584, 8vo, and King James's *Essays of a Prentice in the Divine Art of Poesie*, 4to.

Scotland's next important printer was Robert Waldegrave, who, after his adventures as a secret printer in England, set up a press in Edinburgh in 1590, and continued printing there till the close of the century.

One of his first works was a quarto in Roman type entitled *The Confession of Faith, Subscribed by the Kingis Maiestie and his householde: Together with the Copie of the Bande, maid touching the maintenaunce of the true Religion*. Among his other work, which was chiefly theological, may be mentioned King James's *Demonologie*, 1597, 4to, and the first edition of the *Basilikon Doron*, in quarto, of which it is said only seven copies were printed.

Contemporary with him was a Robert Smyth, who married the widow of Thomas Bassandyne, and who in 1599 received license to print the following books:—'The double and single catechism, the plane Donet, the haill four pairtes of grammar according to Sebastian, the Dialauges of Corderius, the celect and familiar Epistles of Cicero, the buik callit Sevin Seages, the Ballat buik, the Secund rudimentis of Dunbar, the Psalmes of Buchanan and Psalme buik.'

The only known copy of Smyth's edition of Holland's *Seven Sages* is that in the British Museum.

The last of the Scottish printers of the sixteenth century was Robert Charteris, the son and successor of Henry Charteris, but he did not succeed to the business until 1599, and his work lies chiefly in the succeeding century.

It may safely be said that the earliest press in Ireland of which there is any authentic notice was that of Humphrey Powell, of which there is the following note in the Act Books of the Privy Council (New Series, vol. iii. p. 84), under date 18th July 1550:—

'A warrant to —, to deliver xxli unto Powell the printer, given him by the Kinges Majestie towarde his setting up in Ireland.'

Nothing is known of Humphrey Powell's work in England beyond several small theological works issued between 1548 and 1549 from a shop in Holborn above the Conduit.

On his arrival in Ireland he set up his press in Dublin, and printed there the *Prayer Book of Edward VI.* with the colophon:—

'Imprinted by Humphrey Powell, printer to the Kynge's Maieste, in his Highnesse realme of Ireland dwellynge in the cite of Dublin in the great toure by the Crane Cum Privelegio ad imprimendum solum. Anno Domini, M.D.L.I.'

Timperley, in his *Encyclopædia* (p. 314), says that Powell continued printing in Dublin for fifteen years, and removed to the southern side of the river to St. Nicholas Street.

In 1571 the first fount of Irish type was presented by Queen Elizabeth to John O'Kearney, treasurer of St. Patrick's, to print the *Catechism* which appeared in that year from the press of John Franckton. (Reed, *Old English Letter Foundries*, pp. 75, 186-7.) It was not a Pure Irish character, but a hybrid fount consisting for the most part of Roman and Italic letters, with the seven distinctly Irish sorts added. A [Pg 153] copy of the *Catechism* is exhibited in the King's Library, British Museum, and in the Library of Corpus Christi College, Cambridge, is a copy of a broadside Poem on the last Judgement, sent over to the Archbishop of Canterbury as a specimen.

This type was afterwards used to print William O'Donnell's, or Daniel's, Irish Testament in 1602.

CHAPTER VII
THE STUART PERIOD
1603-1640

One of the first acts of King James on his accession to the English throne was to strengthen the hands of the already powerful Company of Stationers. Hitherto all Primers and Psalters had been the exclusive privilege of the successors of Day and Seres, while Almanacs and Prognostications, another large and profitable source of revenue, had been the property of James Roberts and Richard Watkins. But now, by the royal authority, these two valuable patents were turned over to the Stationers to form part of their English stock. At the same time, the privileges of Robert Barker, son and successor to Christopher Barker, and king's printer by reversion, were increased by grants for printing all statutes, hitherto the monopoly of other printers. On the other hand, Robert Barker did not retain the sole possession of the royal business as men like Berthelet and Pynson had been wont to do, but had joined with him in the patent John Norton, who had a special grant for printing all books in Latin, Greek, and Hebrew, and John Bill, who probably obtained his share by purchase. These three men were thus the chief printers during the early part of this reign.

Robert Barker had been made free of the Stationers' Company in 1589, when he joined his father's assigns, George Bishop and Ralph Newbery, in the management of the business. He was admitted to the livery of the Company in 1592, and upon his father's death succeeded to the office of King's printer by reversion. In 1601-2 he was warden of the Company, and filled the office of Master in 1605. Some time before 1618 he sold his moiety of the business to Bonham Norton and John Bill, and this arrangement was confirmed by Royal Charter in 1627.

Upon the death of Bonham Norton, Barker's name again appears in the imprint of the firm, and he continued printing until about 1645. It is said by Ames (vol. ii. p. 1091), and has been repeated by all writers since his day, that Robert Barker was committed to the King's Bench Prison in 1635, and that he remained a prisoner there until his death in 1645. No confirmation of this can be found in the State Papers; indeed the fact that he accompanied Charles I. to Newcastle in 1636, and was printing in other parts of England until 1640, proves that he could not have been in prison the whole of the time from 1635 to 1645.

Robert Barker's work was almost entirely of an official character, the printing of the Scriptures, Book of Common Prayer, Statutes and Proclamations.

His work was very unequal, and his type, mostly of black letter, was not of the best.

His most important undertaking was the so-called 'authorised version' of the Bible in 1611. As a matter of fact it never was authorised in any official sense. The undertaking was proposed at a conference of divines, held at Hampton Court in 1604. The King manifested great interest in the scheme, but did not put his hand in his pocket towards the expenses, and the divines who undertook the translation obtained little except fame for their labours, while the whole cost of printing was borne by Robert Barker. Like all previous editions of the Scriptures in folio, this Bible of 1611 was printed in great primer black letter. It was preceded by an elaborately engraved title-page, the work of C. Boel of Richmond, and had also an engraved map of Canaan, partly the work of John Speed.

The type and ornaments were the same as had been used to print the first edition of the 'Bishops' Bible,' the initial letter to the Psalms containing the arms of Whittingham and Cecil.

Fig. 30.—From the Bible of 1611.

Barker also possessed the handsome pictorial initial letters which had been used by John Day, and many of the ornaments and initials previously in the office of Henry Bynneman.

John Norton was the son of Richard Norton, a yeoman of Billingsley, county Shropshire; he was nephew of William Norton, and cousin of Bonham Norton, and was thus connected by marriage with the sixteenth century bookseller, William Bonham. He was three times Master of the Stationers' Company, in 1607, 1610, and 1612. On his death, in 1612, he left £1000 to the Company of Stationers, not as is generally stated as a legacy of his own, but rather as

trustee of the bequest of his uncle, William Norton. The bulk of his property he left to his cousin, Bonham Norton (P. C. C. 5 Capell).

His press will always be remembered for the magnificent edition of the Works of St. Chrysostom, in eight folio volumes, printed at Eton in 1610, at the charge of Sir Henry Savile, the editor. The late T. B. Reed, in his History of the Old English Letter Foundries (p. 140), speaks of this edition as 'one of the most splendid examples of Greek printing in this country,' and further describes the types with which it was printed as 'a great primer body, very elegantly and regularly cast, with the usual numerous ligatures and abbreviations which characterised the Greek typography of that period' (p. 141).

Fig. 31.—Dedication of Savile's St. Chrysostom. Eton, 1610.
The work is said to have cost its promoter £8000.

The title-page to the first volume was handsomely engraved, and a highly ornamental series of initial letters were used in it.

Another Greek work that Norton completed at Eton in the same year was the Sancti Gregorii Nazianzeni in Julianum Invectivæ duae, in quarto.

In addition to his patent for printing Greek and Latin books, Norton also acquired from Francis Rea his patent for printing grammars, and by his will he directed a sum of money to be paid out of the profits of this patent to his wife Joyce.

John Bill was the son of Walter Bill, husbandman, of Wenlock, county Salop, and on the 25th July 1592 he apprenticed himself to John Norton. In 1601 he was admitted a freeman of the Company.

He appears to have been a man of shrewd business ability and some scholarship, as we find him writing in Latin to Dr. Wideman of Augsburg on the subject of books. He was also looked upon by the Government as an authority on matters concerning his business. Under his partnership with Bonham Norton, he secured a large share in the Royal business. John Norton bequeathed him a legacy of £10, and a similar sum to his wife. John Bill died in 1632, and on the 26th August of that year the whole of his stock was assigned to Mistress Joyce Norton, the widow of John Norton, and Master Whittaker. The list fills upwards of two pages of Arber's Transcripts (vol. iv. pp. 283-285), and includes the following notable works:—

Beza's Testament in Latin, Camden's Britannia, Comines' History, Cornelius Tacitus, Du Moulin's Defence of the Catholique Faith, Gerard's Herball, Goodwin's History of Henry VIII., Plutarch's Works, Rider's Dictionary, Spalato's Sermons, Usher's Gravissimæ questiones, Verstegan's Restitution of Decayed Intelligence.

The reversion of John Norton's patent for Greek and Latin books had been granted in 1604 to Robert Barker (Dom. S. P. 1604), but the year following Norton's death it was granted to Bonham Norton for thirty years (Dom. S. P. I., vol. 72, No. 5), and he also seems to have acquired the patent for printing grammars.

Bonham Norton was the only son of William Norton, stationer of London, who died in 1593, by his wife Joan, the daughter of William Bonham. He took up his freedom on the 4th February 1594, and was Master of the Stationers' Company in the years 1613, 1626, and 1629, and must have been one of the richest men in the trade. He was joined with Thomas Wight in a patent for printing Abridgements of the Statutes in 1599, and later with John Bill in a share of the Royal printing-house. He is frequently mentioned in wills and other documents of this period. At the time of John Norton's death Bonham had a family of five sons and four daughters. He died intestate on the 5th April 1635, and administration of his estate was granted to his son John on the 28th May 1636 (Admon, Act Book 1636).

On the 9th May 1615 an order was made by the Court of the Stationers' Company, upon complaint made by the master printers of the number of presses then at work, that only nineteen printers, exclusive of the patentees, i.e. Robert Barker, John Bill, and Bonham Norton, should exercise the craft of printing in the city of London. There is nothing in the work of these men, judged as specimens of the printer's art, to interest us, but there were some whose work was of very much better character than others.

Richard Field, the successor of Thomas Vautrollier, and a fellow-townsmen of Shakespeare, has already been spoken of in an earlier chapter. He printed many important books between 1601-1624, had two presses at work in 1615, and was Master of the Company in 1620. He maintained the high character that Vautrollier had given to the productions of his press.

Felix Kingston was the son of John Kingston of Paternoster Row, and was admitted a freeman of the Stationers' Company on the [Pg 163] 25th of June 1597, being translated from the Company of Grocers. Throughout the first half of the seventeenth century his press was never idle. He was Master of the Company in 1637.

Edward Aide was the son of John Aide of the Long Shop in the Poultry. He had two presses, and printed very largely for other men, but his type and workmanship were poor.

William and Isaac Jaggard are best known as the printers of the works of Shakespeare. They were associated in the production of the first folio in 1623, which came from the press of Isaac Jaggard and Edward Blount, at the charges of William Jaggard, Edward Blount, J. Smethwicke, and William Aspley; the editors being the poet's friends, J. Heminge and H. Condell.

In addition to being the first collected edition of Shakespeare's works, this was in many respects a remarkable volume. The best copies measure 13-1/2 x 8-1/2". The title-page bears the portrait of the poet by Droeshout. The dedicatory epistle is in large italic type, and is followed by a second epistle, 'To the Readers,' in Roman. The verses in praise of the author, by Ben Jonson and others, are printed in a second fount of italic, and the Contents in a still smaller fount of the same letter. The text, printed in double columns, is in Roman and Italic, each page being enclosed within printer's rules. Of these various types, the best is the large italic, which somewhat resembles Day's fount of the same letter. That of the text is exceedingly poor, while the setting of the type and rules leaves much to be desired. The arrangement and pagination are erratic. The book, like many other folios, was made up in sixes, and the first alphabet of signatures is correct and complete, while the second runs on regularly to the completion of the Comedies on cc.2. The Histories follow with a fresh alphabet, which the printer began as 'aa,' and continued as 'a' until he got to 'g,' when he inserted a 'gg' of eight leaves, and then continued from 'i' to 'x' in sixes to the end of the Histories. The Tragedies begin with Troilus and Cressida, the insertion of which was evidently an afterthought, as there is no mention of it in the 'Contents' of the volume, and the signatures of the sheets are ¶ followed by ¶¶ six leaves each. Then they start afresh with 'aa' and proceed regularly to 'hh,' the end of the Macbeth, the following signature being 'kk,' thus omitting the remainder of signature 'hh' and the whole of 'ii.' In a series of interesting letters communicated to Notes and Queries (8 S. vol. viii. pp. 306, 353, 429), the make up of this volume is explained very plausibly. The copyright of Troilus and Cressida belonged to R. Bonian and H. Walley, who apparently refused at first to give their sanction to its publication. But by that time it had been printed, [Pg 165] and the sheets signed for it to follow Macbeth, so that it had to be taken out. Arrangements having at last been made for its insertion in the work, it was reprinted and inserted where it is now found. It is also surmised that the original intention was to publish the work in three parts, and to this theory the repetition of the signatures lends colour.

One of the most interesting presses of the early Stuart period, both for the excellence of its work and the nature of the books that came from it, was that of William Stansby. This printer took up his freedom on the 7th January 1597, after serving a seven years' apprenticeship with John Windet. The following April he registered a book entitled The Polycie of the Turkische Empire. This little quarto was, however, printed for him by his old master, John Windet, and there is no further entry in the registers until 1611, or fourteen years after the date at which he took up his freedom.

It would appear that Stansby began to print in 1609 with an edition of Greene's Pandosto, which was not registered. In 1611 he purchased the copyright in the books of John Windet for 13s. 40d., but three of them the Company added to its stock, with the undertaking that Stansby should always have the printing of them. One of these books was The Assize of Bread. On the 23rd February 1625 the whole of William East's copies, including music, was assigned over to him. This list of books is the longest to be found in the registers, and covers every branch of literature.

About this time Stansby got into trouble with the Company for printing a seditious book, and his premises were nailed up, but eventually they were restored to him, and he continued in business until 1639, when his stock was transferred to Richard Bishop, and eventually came into the hands of John Haviland and partners.

Among his more important works may be mentioned the second and subsequent editions of Hooker's Ecclesiastical Politie, in folio; the Works of Ben Jonson, 1616, folio; Eadmer's Historia Novorum, 1623, folio; Selden's Mare Clausum, 1635, folio; Blundeville's Exercises, 1622, quarto; Coryate's Crudities, 1611, quarto.

He possessed a considerable stock of type, most of it good. Some of the ornamental headbands and initial letters that he used were of an artistic character, and were used with good effect. An instance of this may be seen in his edition of Hooker, 1611, which has an engraved title-page by William Hole, showing a view of St. Paul's. The page of Contents is surrounded on three sides by a border made up of odds and ends of printers' ornaments, yet, in spite of its miscellaneous character, the effect is by no means bad. The border to the title-page of the fifth book [Pg 167] was one of a series that formed part of the stock of the Company, and were lent out to any who required them. Stansby's presswork was uniformly good, and in this respect alone he may be ranked among the best printers of his time.

Another of the printers referred to in the list was somewhat of a refractory character, a printer of popular books at the risk of imprisonment, a class of men who were to figure largely in the events of the next few years. Nicholas Okes is known best, perhaps, as the printer of some of the writings of Dekker, Greene, and Heywood; but in 1621 he printed, without license, Wither's Motto, a tract from the pen of George Wither, which had been published by John Marriot a short time before. This satire aroused the ire of the Government, and all connected with it at once made the acquaintance of the nearest jail. In the State Papers for that year are preserved the examination of the author, the booksellers, and the printer, Nicholas Okes. One of the witnesses declared that Okes told him that he had printed the book with the consent of the Company, and that the Master (Humphrey Lownes) had declared that if he was committed they would get him discharged. Another declared that Okes had printed two impressions of 3000 each, using the same title-page as that to the first edition, and that one of the wardens of the Company (Matthew Lownes) continued to [Pg 168] sell the book, and called for more copies. The only defence Okes made was that he believed the book to be duly licensed, and when challenged as to why he printed Marriot's name on the title-page, declared he simply printed the book as he found it. (S. P. Dom. James I., vol. cxxii. Nos. 12 et seq.)

On the 10th December 1623 an end was put for the time to the disputes that had for so long a period been raised by the Stationers' Company to the rights of the printers of the University of Cambridge.

The Company's last attempt to suppress Cantrell Legg, and prevent him from printing grammars and prayer-books, led to an appeal to the King, who made short work of the matter by ordering the two parties to come to an agreement. The terms of the settlement were:—

1. That all books should be sold at reasonable prices.
2. That the University should be allowed to print, conjointly with the London stationers, all books except the Bible, Book of Common Prayer, grammar, psalms, psalters, primers, etc., but they were only to employ one press upon privileged books.
3. That the University should print no almanacs then belonging to the Stationers, but they might print prognostications brought to them first.
4. That the Stationers should not hinder the sale of University books.
5. That the University printer should be at liberty to sell all grammars and psalms that he had already printed, and such as had been seized by the Company were to be restored.

To the last clause a note was added to the effect that Bonham Norton was prepared to buy them at reasonable prices.

On the accession of Charles I. plague paralysed trade and made gaps in the ranks of the Stationers' Company. During the autumn of 1624 and the following year several noted printers died, probably from this cause. Chief among these were George Eld, Edward Aide, and Thomas Snodham. Eld was succeeded by his partner, Miles Flesscher or Fletcher, and Aide by his widow, Elizabeth. Thomas Snodham had inherited the business of Thomas East. The copyright in these passed to William Stansby, one of his executors; but the materials of the office, that is the types, woodcut letters, and ornaments, and the presses, were sold to William Lee for £165, and shortly afterwards passed into the possession of Thomas Harper. They included a fount of black letter, and several founts of

Roman and Italic of all sizes, and one of Greek letter, all of which had belonged to Thomas East, and were by this time the worse for wear.

But the plague was at the worst only a temporary hindrance; the censorship of the press the printers had always with them, and this, which had been comparatively mildly used during the late reign, was now in the hands of men who wielded it with severity. During the next fifteen years the printers, publishers, and booksellers of London were subjected to a persecution hitherto unknown. During that time there were few printers who did not know the inside of the Gatehouse or the Compter, or who were not subjected to heavy fines. For the literature of that age was chiefly of a religious character, and its tone mainly antagonistic to Laud and his party. All other subjects, whether philosophical, scientific, or dramatic, were sorely neglected. The later works of Bacon, the plays of Shirley and Shakerley Marmion, and a few classics, most of which came from the University presses, are sparsely scattered amongst the flood of theological discussion. The history of the best work in the trade in London is practically the history of three men—John Haviland, Miles Fletcher, and Robert Young, who joined partnership and, in addition to a share in the Royal printing-house, obtained by purchase the right of printing the Abridgements to the Statutes, and bought up several large and old-established printing-houses, such as those of George Purslowe, Edward Griffin, and William Stansby. Bernard Alsop and Thomas Fawcett were also among the large capitalists of this time, while Nathaniel Butter, Nicholas Bourne, and Thomas Archer were also interested in several businesses beside their own. From the press of Haviland came editions of Bacon's Essays, in quarto, in 1625, 1629, 1632; of his Apophthegmes, in octavo, in 1625; of his Miscellanies, an edition in quarto, in 1629, and his Opera Moralia in 1638. From the press of Fletcher came the Divine Poems of Francis Quarles, in 1633, 1634, and 1638, and the Hieroglyphikes of the life of Man, by the same author, in 1638; while amongst Young's publications, editions of Hamlet and Romeo and Juliet appeared in 1637. Bernard Alsop and his partner printed the plays of Beaumont and Fletcher, Decker, Greene, Lodge, and Shirley, the poems of Brathwait, Breton, and Crashaw, and the writings of Fuller and More.

But the most notable books of this period were not those enumerated above, but rather those which brought their authors, printers, and publishers within the clutches of the law, and the story of the struggle for freedom of speech is one of the most interesting in the history of English printing. Three men—Henry Burton, rector of St. Matthews, Friday Street; William Prynne, barrister of Lincoln's Inn; and John Bastwick, surgeon, are generally looked upon as the chief of the opposition to Laud and his party; but there were a number of other writers on the same subject, whose works brought them into the Court of High Commission. Thus, on the 15th February 1626, Benjamin Fisher, bookseller, John Okes, Bernard Alsop, and Thomas Fawcett, printers, were examined concerning a book which they had caused to be printed and sold, called *A Short View of the Long Life and reign of Henry the Third*, of which Sir Robert Cotton was the author. Fisher stated in his evidence that five sheets of this book were printed by John Okes, and one other by Alsop and Fawcett, which in itself is an indication of the immense difficulty that must have attended the discovery of the printers of forbidden books. The manuscript Fisher declared he had bought from Alsop, who, in his turn, said that he bought it of one Ferdinando Ely, 'a broker in books,' for the sum of twelvecpence, and printed what was equivalent to a thousand copies of the one sheet delivered to him, 'besides waste.' Nicholas Okes declared that his son John had printed the book without his knowledge and while he (Nicholas) was a prisoner in the Compter. Ferdinando Ely was a second-hand bookseller in Little Britain.

No very serious consequences seem to have followed in this instance; but in the following year (1628), Henry Burton was charged by the same authorities with being the author of certain unlicensed books, *The Baiting of the Pope's Bull*, *Israel's Fast*, *Trial of Private Devotions*, *Conflicts and Comforts of Conscience*, *A Plea to an Appeal*, and *Seven Vials*. The first of these was licensed, but the remainder were not. They were said to have been printed by Michael Sparke and William Jones; Sparke was a bookseller, carrying on business at the sign of the Blue Bible, in Green Arbour, in little Old Bayley, and he employed William Jones to print for him. The parties were then warned to be careful, but on 2nd April 1629 Sparke was arrested and thrown into the Fleet, and with him, at the same time, were charged William Jones, Augustine Mathewes, printers, and Nathaniel Butter, printer and publisher. Butter's offence was the issuing of a newspaper or pamphlet called *The Reconciler*; Sparke was charged with causing to be printed another of Burton's works, entitled *Babel no Bethel*, and Spencer's *Musquil Unmasked*; while Augustine Mathewes was accused of printing, for Sparke, William Prynne's *Antithesis of the Church of England*. Each party put in an answer, and of these, Michael Sparke's is the most interesting. He declared that the decree of 1586 was contrary to Magna Charta, and an infringement of the liberties of the subject, and he refused to say who, beside Mathewes, had printed Prynne's book; it afterwards turned out to be William Turner of Oxford, who confessed to printing several other unlicensed books. A short term of imprisonment appears to have been the punishment inflicted on the parties in this instance.

Both in 1630 and 1631 several other printers suffered imprisonment from the same cause, and Michael Sparke, who appears to have given out the work in most cases, was declared to be more refractory and offensive than ever.

In 1632 appeared William Prynne's noted book, *The Histrio-Mastix, The Player's Scourge or Actor's Tragedie*, a thick quarto of over one thousand closely printed pages, which bore on the title-page the imprint, 'printed by E. A. and W. J. for Michael Sparke.' This book, as its title implies, was an attack on stage-plays and acting. There was nothing in it to alarm the most sensitive Government, and even the licenser, though he afterwards declared that the book was altered after it left his hands, could find nothing in it to condemn. But, as it happened, there was a passage concerning the presence of ladies at stage-plays, and as the Queen had shortly before attended a masque, the passage in question was held to allude to her, and accordingly Prynne, Sparke, and the printers—one of whom was William Jones—were thrown into prison, and in 1633 were brought to trial before the Star Chamber. The printers appear to have escaped punishment; but Prynne was condemned to pay a fine of £1000, to be degraded from his degree, to have both his ears cropped in the pillory, and to spend the rest of his days in prison; while Sparke was fined £500, and condemned to stand in the pillory, but without other degradation.

During this year John Bastwick also issued two books directed against Episcopacy, both of which are now scarce. One was entitled *Elenchus Religionis Papisticæ*, and the other *Flagellum Pontificis*. They were printed abroad, and as a punishment their author was condemned to undergo a sentence little less severe than that passed upon Prynne, who, in spite of his captivity, continued to write and publish a great number of pamphlets. Amongst these was one entitled *Instructions to Church Wardens*, printed in 1635. In the course of the evidence concerning this book, mention was made of a special initial letter C, which was said to represent a pope's head when turned one way, and an army of soldiers when turned the other, and to be unlike any other letter in use by London printers at that time.

For printing this and other books, Thomas Purslowe, Gregory Dexter, and William Taylor of Christchurch were struck from the list of master printers.

In 1637 appeared Prynne's other notorious tract, *Newes from Ipswich*, a quarto of six leaves, for which he was fined by the Star Chamber a further sum of £5000, and condemned to lose the rest of his ears, and to be branded on the cheek with the letters S. L. (i.e. scurrilous libeller), a sentence that was carried out on the 30th June of this year with great barbarity. The imprint to this tract ran 'Printed at Ipswich,' but its real place of printing was London, and perhaps the name of Robert Raworth, which occurs in the indictment, may stand for Richard Raworth, the printer whom Sir John Lambe declared to be 'an arrant knave.' Or the printer may have been William Jones, who about this time was fined £1000 for printing seditious books.

In 1634 the King wrote to Archbishop Laud to the effect that Doctor Patrick Young, keeper of the King's library, who had lately published the *Clementis ad Corinthios Epistola* prior in Greek and Latin, and in conjunction with Bishop Lindsell of Peterborough, now proposed to make ready for the press one or more Greek copies every year, if Greek types, matrices, and money were forthcoming. The King expressed his desire to encourage the work, and therefore commanded the Archbishop that the fine of £300, which had been inflicted upon Robert Barker and Martin Lucas in the preceding year, for what was described as a base and corrupt printing of the Bible in 1631 (the omission of the word 'not' from the seventh commandment, which has earned for the edition the name of the *Wicked Bible*), should be converted to the buying of Greek letters. The King further ordered that Barker and Lucas should print one work every year at their own cost of ink, paper, and workmanship, and as many copies as the Archbishop should think fit to authorise. The Archbishop thereupon wrote to the printers, who expressed their willingness to fall in with the scheme, and a press, furnished with a very good fount of Greek letter, was established at Blackfriars. But the result was not what might have been expected. Partly owing to the political troubles that followed its foundation, and partly perhaps to delay on the part of the printers, the only important works that came from this press were Dr. Patrick Young's translation of the book of Job, from the *Codex Alexandrinus*, a folio printed in 1637, and an edition in Greek of the Epistles of St. Paul, with a commentary by the Bishop of Peterborough, also a folio, which came from the same press in 1636. The Greek letter used in this office cannot be compared for beauty or delicacy of outline with that which Norton had used in the *Chrysostom* of 1610.

On the 11th July 1637 was published another Star Chamber Decree concerning printers. Professor Arber, in his fourth volume (p. 528), states that the appearance of a tract entitled *The Holy Table, Name and Thing must ever be associated with this decree*; but it may be doubted whether it was not rather to general causes, such as the growing

power of the press, the long-continued attack upon the Prelacy by pamphleteers, which no fear of mutilation or imprisonment could stop, than any one particular tract, which led to that severe and crushing edict.

This act, which was published on the 11th July 1637, consisted of thirty-three clauses, and after reciting former ordinances, and the number of 'libellous, seditious, and mutinous' books that were then daily published, decreed that all books were to be licensed: law books by the Lord Chief Justices and the Lord Chief Baron; books dealing with history, by the principal Secretaries of State; books on heraldry, by the Earl Marshal; and on all other subjects, by the Archbishop of Canterbury, the Bishop of London, or the Chancellors or Vice-Chancellors of the two Universities. Two copies of every book submitted for publication were to be handed to the licensee, one of which he was to keep for future reference. Catalogues of books imported into the country were to be sent to the Archbishop of Canterbury or Bishop of London, and no consignments were to be opened until the representatives of one of these dignitaries and of the Stationers' Company were present. The name of the printer, the author, and the publisher was to be placed in every book, and, with a view to encouraging English printing, it was decreed further that no merchant or bookseller should import any English book printed abroad. No person was to erect a printing-press, or to let any premises for the purpose of carrying on printing, without first giving notice to the Company, and no joiner or carpenter was to make a press without similar notice.

The number of master printers was limited by this decree to twenty, and those chosen were:—

Felix Kingston.
Adam Islip.
Thomas Purfoote.
Miles Fletcher.
Thomas Harper.
John Beale.
John Raworth.
John Legate.
Robert Young.
John Haviland.
George Miller.
Richard Badger.
Thomas Cotes.
Marmaduke Parsons.
Bernard Alsop.
Richard Bishop.
Edward Griffin.
Thomas Purslowe.
Rich. Hodgkinsonne.
John Dawson.

Each of these was to be bound in sureties of £300 to good behaviour. No printer was allowed to have more than two presses unless he were a Master or Warden of the Company, when he might have three. A Master or Warden might keep three apprentices but no more, a master printer on the livery might have two, and the rest one only; but every printer was expected to give work to journeyman printers when required to do so, because it was stated that it was they who were mainly responsible for the publication of the libellous, seditious, and mutinous books referred to. All reprints of books were to be licensed in the same way as first editions. The Company were to have the right of search, and four typefounders, John Grismand, Thomas Wright, Arthur Nichols, and Alexander Fifield were considered sufficient for the whole trade. Finally, a copy of every book printed was to be sent to the Bodleian Library at Oxford. The penalties for breaking this decree included imprisonment, destruction of stock, and a whipping at the cart's tail.

The twenty printers appointed by this decree were the subject of much investigation by Sir John Lamb, whose numerous notes and lists concerning them, as reprinted in the third volume of Professor Arber's transcripts from documents at the Record Office, are an invaluable acquisition to the history of the English press. It will be seen that four of the chief offenders of the previous ten or eleven years, namely William Jones, Nicholas Okes, Augustine Mathewes, and Robert or Richard Raworth, were absolutely excluded, their places being taken by Marmaduke

Parsons, Thomas Paine, and a new man, Thomas Purslowe, probably the son of Widow Purslowe. Conscious perhaps that their positions were in jeopardy, all four petitioned the Archbishop to be placed among the number, but in vain, and another man who was excluded at the same time was John Norton, a descendant of a long family of printers of that name, and who had served his apprenticeship in the King's printing-house. Only one of those [Pg 181] who had at times come before the High Commission Court was pardoned, and allowed to retain his place. This was Bernard Alsop.

The clause requiring all reprints to be licensed caused a good deal of murmuring, as did also that which forbade haberdashers, and others who were not legitimate booksellers, to sell books.

The small number of type-founders allowed to the trade has also been a subject of much comment by writers on this subject; but judging from the evidence of Arthur Nicholls, one of the four appointed, the number was quite sufficient. Nicholls was the founder of the Greek type used in the new office of Blackfriars, and his experience was certainly not likely to encourage other men to set up in the same trade. At the time when he was appointed one of the four founders under the decree, he could not make a living by his trade, and though he does not expressly state the fact, his evidence seems to imply that English printers at that time obtained most of their type from abroad, and it is beyond question that they had long since ceased to cast their own letter.

Drastic as this decree was, it practically remained a dead letter, for the reason that in the troublous times that followed within the next five years, the Government had their hands full in other directions, and were obliged to let the printers alone. Between this date and the year 1640, there was very little either of interest or value that came from the English press. The memory of rare Ben Jonson induced Henry Seile, of the Tiger's Head in Fleet Street, to publish in 1638 a quarto with the title *Jonsonus Virbius: or the Memory of Ben Jonson*. Revived by the friends of the Muses, and among the contributors were Lord Falkland, Sir John Beaumont the younger, Sir Thomas Hawkins, Henry King, Edmund Waller, Shackerley Marmion, and several others. The printer's initials are given as E. P., but these do not suit any of those who were authorised under the decree of the year before, and they may refer to Elizabeth Purslowe. That there was a considerable number of persons who, in spite of the Puritan tendencies of the age, loved a good play, is clearly seen from the number turned out during the years 1638, 1639, and 1640 by Thomas Nabbes, Henry Glapthorne, James Shirley, and Richard Brome. These of course were mostly quartos, very poorly printed, and chiefly from the presses of Richard Oulton, John Okes, and Thomas Cotes. Of collected works, there came out in small octavo form the *Poems of Thomas Carew* from the press of John Dawson in 1640, and a collection of Shakespeare's *Poems* from the press of Thomas Cotes in the same year. There were also published in 1640 from the press of Richard Bishop, who had succeeded to the business of William Stansby, *Selden's De Jure Naturali et Gentium juxta disciplinam Ebræorum*, in folio, and William Somner's *Antiquities of Canterbury*, one of the earliest and best of the contributions to county bibliography.

Having now brought the record of the London press down to the time when it became engulfed in the chaos of civil war, it is time to turn to the University presses of Oxford and Cambridge.

Since the year 1585, these were the only provincial presses allowed by law, and removed as they were from the turmoil of conflicting parties, and the severity of trade competition, in which the London printers lived, their work showed more uniformity of excellence, and on the whole surpassed that of the London printers.

Down to the year 1617 Oxford appears to have had but one printer, John Barnes; but in that year we find two at work, John Lichfield and William Wrench, the latter giving place the following year to James Short. In 1624 the two Oxford printers were John Lichfield and William Turner—the second, as we have seen, being notorious as the printer of unlicensed pamphlets for Michael Sparke the London publisher; but in spite of this we find him holding his position until 1640, though in the meantime John Lichfield had been succeeded in business by his son, Leonard. In the introduction to his bibliography of the Oxford Press, Mr. Falconer Madan has given a list of the most important books printed at Oxford between 1585 and 1640, which we venture to reprint here with a few additions:—

- 1599. Richard de Bury's *Philobiblon*.
- 1608. Wycliff's *Treatises*.
- 1612. Captain John Smith's *Map of Virginia*.
- 1621. Burton's *Anatomy of Melancholy*.
- 1628. Field *On the Church*.

1633. Sandys' Ovid.
1634. The University Statutes.
1635. Chaucer's Troilus and Cressida in English and Latin.
1638. Chillingworth's Religion of Protestants.
1640. Bacon's Advancement and Proficiency of Learning.

As we have noted, the University of Cambridge had after a long struggle established its claim to print editions of the Scriptures and other works, and like its sister University turned out some of the best work of that period.

A notable book from this press was Phineas Fletcher's *Purple Island*, a quarto published in 1633. The title-page was printed in red and black, in well-cut Roman of four founts, with the lozenge-shaped device of the University in the [Pg 185] centre, the whole being surrounded by a neat border of printers' ornaments. Each page of the book was enclosed within rules, which seems to have been the universal fashion of the trade at this period, and at the end of each canto the device seen on the title-page was repeated. The *Eclogues and Poems* had each a separate title-page, and two well-executed copper-plate engravings occur in the volumes.

We must not close this chapter without noting that in 1639 printing began in the New England across the sea. The records of Harvard College tell us that the Rev. Joseph Glover 'gave to the College a font of printing letters, and some gentlemen of Amsterdam gave towards furnishing of a printing-press with letters forty-nine pounds, and something more.' Glover himself died on the voyage out from England, but Stephen Day, the printer whom he was bringing with him, arrived in safety and was installed at Harvard College. The first production of his press was the *Freeman's Oath*, the second an *Almanac*, the third, published in 1640, *The Psalms in Metre, Faithfully translated for the Use, Edification, and Comfort of the Saints in Publick and Private, especially in New England*. This, the first book printed in North America, was an octavo of three hundred pages, of passably good workmanship, and is commonly known as the *Bay Psalter*—Cambridge, the home of Harvard College, lying near Massachusetts Bay. Stephen Day continued to print at Cambridge till 1648 or 1649, when he was succeeded in the charge of the press by Samuel Green, whose work will be mentioned at the end of our next chapter.

CHAPTER VIII FROM 1640 TO 1700

Having at length reached what is without doubt the darkest and the most wretched period in the history of English printing, it may be well before passing a severe condemnation on those who represented the trade at that time, to remind ourselves of the difficulties against which they had to contend.

The art of printing in England had never at any time reached such a point of excellence as in Paris under the Estiennes, in Antwerp under Plantin, or in Venice under the Aldi. So great was the competition between the printers, and so heavy the restrictions placed upon them, that profit rather than beauty or workmanship was their first consideration; and when to these drawbacks was added the general disorganisation of trade consequent upon the outbreak of civil war, it is not surprising that English work failed to maintain its already low standard of excellence. Literature, other than that which chronicled the fortunes of the opposing factions, was almost totally neglected. Writers, even had they found printers willing to support them, would have found no readers. On the other hand, such was the feverish anxiety manifested in the struggle, that it was scarcely possible to publish the *Diurnals* and *Mercuries* which contained the latest news fast enough, and the press was unequal to the strain, although the number of printers in London during this period was three times larger than that allowed by the decree of 1637. Professor Arber, in his *Transcript*, says that this increase in the number of printers was due to the removal of the gag by the Long Parliament. There is no proof that the Long Parliament ever intended to remove the gag; but having its hands full with other and weightier matters it could find no time to deal with the printers, and doubtless, in the heat of the fight, it was only too thankful to avail itself of the pens of those who replied to the attacks of the Royalist press. The best evidence of this is, that as soon as opportunity offered, and in spite of the warning of the greatest literary man of that day, who was on their own side, the Long Parliament reimposed the gag with as much severity as the hierarchy which it had deposed.

For the publication of the news of the day, each party had its own organs. On the side of the Parliament the principal journals were *The Kingdoms Weekly Intelligencer*, printed and published by Nathaniel Butter, and *Mercurius Britannicus*, edited by Marchmont Nedham; while *Mercurius Aulicus*, edited by clever John Birkenhead,

represented the Royalists, and was ably seconded by the Perfect Occurrences, printed by John Clowes and Robert Ibbitson.

These sheets, which usually consisted of from four to eight quarto pages, contained news of the movements and actions of the opposing armies, and the proceedings of the Parliament at Westminster, or of the King's Council at Oxford or wherever he happened to be. They were published sometimes twice and even three times a week. The political pamphlets were bitter and scurrilous attacks by each party against the other, or the hare-brained prophecies of so-called astrologers, such as William Lilly, George Wharton, and John Gadbury. These two classes formed more than half the printed literature of those unhappy times, and the remainder of the output of the press was pretty well filled up with sermons, exhortations, and other religious writings. The rapidity with which the literature was turned out accounts for the wretched and slipshod appearance it presents. Any old types or blocks were brought into use, and there is evidence of blocks and initial letters which had formed part of the stock of the printers of a century earlier being brought to light again at this time. Unfortunately the evil did not stop here, for careless workmanship, indifference, and want of enterprise, are the leading characteristics of the printing trade during the latter half of the seventeenth century. But as, even in this darkest hour of the nation's fortunes, the soul of literature was not crushed, and the voice of the poet could still make itself heard, so it is a great mistake to suppose that there were no good printers during the period covered by the Civil Wars and the Commonwealth.

Take as an example the little duodecimo entitled *Instructions for Forreine Travell*, which came from the pen of James Howell, and was printed by T. B., no doubt Thomas Brudnell, for Humphrey Moseley. Some of the founts, especially the larger Roman, are very unevenly and badly cast, but on the whole the presswork was carefully done. The same may also be said of the folio edition of Sir R. Baker's *Chronicle*, published in 1643. In this case we do not know who was the printer; but the ornaments and initials lead us to suppose that it was the work of William Stansby's successor. The prose tracts again that Milton wrote between 1641-45 are certainly far better printed than many of their contemporaries, and prove that Matthew Simmons, who printed most of them, and who was one of the Commonwealth men, deserved the position he afterwards obtained. The first collected edition of Milton's poems was published by Humphrey Moseley in 1645. This was a small octavo, in two parts, with separate title-pages, and a portrait of the author by William Marshall, and came from the press of Ruth Raworth. In 1646 there appeared *A Collection of all the Incomparable Peeeces* written by Sir John Suckling and published by a friend to perpetuate his memory. This came from the press of Thomas Walkley, who had issued the first edition of *Aglaura* and the later plays of the same writer. Walkley also printed in small octavo, for Moseley, the *Poems of Edmond Waller*, but his work was none of the best.

A printer of considerable note at this time was William Dugard, who in 1644 was chosen headmaster of Merchant Taylors' School, and set up a printing-press there. In January 1649 he printed the first edition of the famous book *Eikon Basilike*, and followed it up by a translation of Salmasius' *Defensio Regia*, for which the Council of State immediately ordered his arrest, seized his presses, and wrote to the Governors of the school, ordering them to elect a new schoolmaster, 'Mr. Dugard having shewn himself an enemy to the state by printing seditious and scandalous pamphlets, and therefore unfit to have charge of the education of youths' (*Dom. S. P. Interregnum*, pp. 578-583). Sir James Harrington, member of the Council of State, and author of *Oceana*, who seems to have known something about Dugard, interceded with the Council on his behalf, and at the same time persuaded him to give up the Royalist cause. So his presses were restored to him, and henceforward he appears to have devoted himself with equal zeal to his new masters.

He was the printer of Milton's answer to Salmasius, published by the Council's command, of a book entitled *Mare Clausum*, also published by authority, of the *Catechesis Ecclesiarum*, a book which the Council found to contain dangerous opinions and ordered to be burnt, and of a tract written by Milton's nephew, John Phillips, entitled *Responsio ad apologiam*. His initials are also met with in many other books of that time.

His press was furnished with a good assortment of type, and his press-work was much above the average of that period.

Among other books that came from the London press during this troubled time, we may single out three which have found a lasting place in English literature. The first is Robert Herrick's *Hesperides*, printed in the years 1647-48; the second a volume of verse, by Richard Lovelace, entitled *Lucasta*, *Epodes*, *Odes*, *Sonnets*, *Songs*, etc., printed in

1649 by Thomas Harper; the last Izaak Walton's *Complete Angler*, which came from the press of John Maxey in 1653. All were small octavos, indifferently printed with poor type, and no pretensions to artistic workmanship.

In 1649, the year of Charles I.'s execution, the Council of State, in consequence of the number of 'scandalous and seditious pamphlets' which were constantly appearing, in spite of all decrees and acts to the contrary, ordered certain printers to enter into recognizances in two sureties of £300, and their own bond for a similar amount, not to print any such books, or allow their presses to be used for that purpose. Accordingly, in the *Calendar of State Papers* for the year 1649-50 (pp. 522, 523), we find a list of no less than sixty printers in London and the two Universities who entered into such sureties. In almost every case the address is given in full, in itself a gain, at a time when the printer's name rarely appeared in the imprint of a book. This list has already been printed in *Bibliographica* (vol. ii. pp. 225-26), but as it is of the greatest interest for the history of printing during the remainder of the century, it is inserted here (see Appendix No. 1.).

While it does not include all the printers having presses at that time, yet, if we remember that under the Star Chamber decree of 1637 the number in London was strictly limited to twenty, it shows how rapid the growth of the trade was in those twelve years. Of the original twenty, only three seem to have survived the troubles and dangers of the Civil Wars—Bernard Alsop, Richard Bishop, and Thomas Harper, though the places of three more were filled by their survivors—Elizabeth Purslowe standing in the place of her husband, Thomas Purslowe; Gertrude Dawson succeeding her husband, John Dawson; and James Flesher or Fletcher in the room of his father, Miles Flesher. John Gresmond and James Moxon were type-founders, Henry Hills and John Field were appointed printers to the State under Cromwell, and Thomas Newcomb was also largely employed, and shared with the other two the privilege of Bible printing. Roger Norton was the direct descendant of old John Norton, who died in 1590. Of Roycroft and Simmons we shall hear a good deal later on, as indeed we shall of many others in this list. The only names that hardly seem to warrant insertion in the list as printers are those of John and Richard Royston. Although they were for many years stationers to King Charles II., we cannot hear of any printing-presses in their possession.

With the quieter time of the Commonwealth, several notable works were produced, though the annual output of books was much below the average of the seven years preceding. Foremost among the publications of that time must be placed Sir William Dugdale's *Monasticon Anglicanum*, the first volume of which appeared in 1655.

As a monument of study and research this book will always remain a standard work of English topography; and it was not unworthily printed. The preparation of the numerous plates for the illustrations, and the setting up of so much intricate letterpress, must have been a very onerous work. This first volume, a large and handsome folio, came from the press of Richard Hodgkinson, and was printed in pica Roman in double columns, with a great deal of italic and black letter intermixed. The types were as good as any to be found in England at that time, and the press-work was carefully done. The engravings were chiefly the work of Hollar, aided by Edward Mascall and Daniel King, and are excellently reproduced. The whole work occupied eighteen years in publication, the second volume being printed by Alice Warren, the widow of Thomas Warren, in 1661, and the third and last by Thomas Newcomb in 1673; but these later volumes differed very little in appearance from the first, the same method of setting and the same mixture of founts being adhered to.

Sir William Dugdale followed this up in 1656 by publishing, through the press of Thomas Warren, his *Antiquities of Warwickshire*, a folio of 826 pages. On the title-page is seen the device of old John Wolfe, the City printer. The dedication of this book was printed in great primer; but the look of the text was marred by a bad fount of black letter which did not print well. Like the *Monasticon*, this work was illustrated with maps and portraits by Hollar and Vaughan.

Another considerable undertaking was the *Historical Collections* of John Rushworth, in eight folio volumes, of which the first was printed by Newcomb in 1659, the others between 1680 and 1701.

But the great typographical achievement of the century was the *Polyglott Bible*, edited by Brian Walton. It was the fourth great Bible of the kind which had been published. The earliest was the Complutensian, printed at Alcala in 1517, with Hebrew, Latin, Greek, and Chaldean texts. Next came the Antwerp *Polyglott*, printed at the Plantin Press in 1572, which, in addition to the texts above mentioned, gave the Syriac version. This was followed in 1645 by the Paris *Polyglott*, which added Arabic and Samaritan, was in ten folio volumes, and took seventeen years to complete.

The London Polyglott of 1657, which exceeded all these in the number of texts, was mainly due to the enterprise and industry of Brian Walton, Bishop of Chester. This famous scholar and divine was born at Cleveland, in Yorkshire, in 1600. He was educated at Cambridge, and after serving as curate in All Hallows, in Bread Street, became rector of St. Martin's Orgar and of St. Giles in the Fields. He was sequestered from [Pg 197] his living at St. Martin's during the troubles of the Revolution, and fled to Oxford, and it was while there that he is said to have formed the idea of the Polyglott Bible.

The first announcement of the great undertaking was made in 1652, when a type specimen sheet, believed to be still in existence, was printed by James Flesher or Fletcher of Little Britain, and issued with the prospectus, which was printed by Roger Norton of Blackfriars for Timothy Garthwaite. Walton's Polyglott was the second book printed by subscription in England, Minsheu's Dictionary in Eleven Languages having been published in this manner in 1617. The terms were £10 per copy, or £50 for six copies. The estimated cost of the first volume was £1500, and of succeeding volumes £1200, and such was the spirit with which the work was taken up that £9000 was subscribed before the first volume was put to press.

To the texts which had appeared in previous Polyglotts, Persian and Ethiopic were added, so that in all nine languages were included in the work—that is, Hebrew, Latin, Greek, Chaldean, Syriac, Arabic, Samaritan, Persian, and Ethiopic—besides much additional matter in the form of tables, lexicons, and grammars. No single book was printed in all of these, only the Greek, Latin, Syriac, and Arabic running throughout the work, while the Hebrew appears in the Old Testament, the Psalms in Ethiopic, and the New Testament has, in addition to the four principal texts, the Ethiopic and Persian.

The whole work occupied six folio volumes, measuring 16 x 10-3/4, and was printed by Thomas Roycroft from types supplied by the four recognised typefounders. At the commencement of the first volume is a portrait of Walton by Bombert, followed by an elaborately engraved title-page, the work of Wenceslaus Hollar, an architectural design adorned with scenes from Scripture history. The second title-page was printed in red ink, and the text was so arranged that each double page, when open, showed all the versions of the same passage. The types used in this work have been described in detail by Rowe Mores in his Dissertations upon English Founders, and by Talbot Baines Reed in his work upon the Old English Letter Foundries (Chap. vii. pp. 164, et seqq.). Speaking of the English founts, the last-named writer points out that the double pica, Roman and italic, seen in the Dedication, is the same fount that was cut by the sixteenth-century printer, John Day, and used by him to print the Life of Alfred the Great. Mr. Reed adds that, in spite of a certain want of uniformity in the bodies, the Ethiopic and Samaritan were especially good, and the Syriac and Arabic boldly cut.

But it was not only for its typographic excellence that the book was remarkable. The rapidity with which this great undertaking passed through the press is no less astonishing. All six volumes were printed within four years, the first appearing in September 1654, the second in 1655, the third in 1656, and the last three in 1657. Looking at the labour involved by such an undertaking, it has been rightly described by Mr. T. B. Reed as a lasting glory to the typography of the seventeenth century.

Oliver Cromwell, under whose government this noble work was accomplished, had assisted, as far as lay in his power, by permitting the importation of the paper free of duty; and in the first editions this assistance was gracefully acknowledged by the editor, but on the Restoration those passages were altered or omitted to make room for compliments to Charles II.

Amongst those who ably assisted Walton in his labours was Dr. Edmund Castell, who prepared a Heptaglott Lexicon for the better study of the various languages used in the Polyglott. This work received the support of all the learned men of the time, but the undertaking was the ruin of its author, and a great part of the impression perished in the destruction of Roycroft's premises in the Great Fire of 1666.

The Restoration brought with it little change in the conditions under which printing was carried on in England, or in the lot of the printers themselves. There is still preserved in the Public Record Office a document which throws considerable light on this matter, and is believed to have been drawn up either in 1660 or in 1661. This is a petition signed by eleven of the leading London printers, for the incorporation of the printers into a body distinct from the Company of Stationers, and appended to it are the 'reasons' for the proposed change, which occupy four or five closely written folio sheets. The men who put forward this petition were:—

Richard Hodgkinson,
John Grismond,
Robert Ibbotson,
Thomas Mabb,
Da[niel?] Maxwell,
Thomas Roycroft,
William Godbid,
Jo[h]n Streator,
James Cottrel,
John Hayes, and
John Brudenell;

and it was undoubtedly this band of men, some of them the biggest men in the trade, who formed the 'Companie of Printers,' for whom in 1663 a pamphlet was issued, entitled A Brief Discourse concerning Printers and Printing. For the printed pamphlet embodies the same views put forward in the petition, only backed up with fresh evidence and terse arguments. The claim of the printers amounted to this, that the Company of Stationers had become mainly a Company of Booksellers, that in order to cheapen printing they had admitted a great many more printers than were necessary, and from this cause arose the great quantity of 'scandalous and seditious' books that were constantly being published. They go on to say that the condition of the great body of printers was deplorable, 'they can hardly subsist in credit to maintain their families ... When an ancient printer died, and his copies were exposed to sale, few or none of the young ones were of ability to deal for them, nor indeed for any other, so that the Booksellers have engross'd almost all.' The petitioners show also that the Company of Stationers was grown so large that none could be Master or Warden until he was well advanced in life, and therefore unable to keep a vigilant eye on the trade, while a printer did not become Master once in ten or twenty years. They argue that the best expedient for checking these disorders and ensuring lawful printing, would be to incorporate the printers into a distinct body, and they advocate the registration of presses, the right of search, and the enforcement of sureties. Finally, they claim that this plan would also do much to improve printing as an art, as under the existing conditions there was no encouragement to the printers to produce good work.

This petition, though it does not seem to have received any official reply, was noticed by Sir Roger L'Estrange in the Proposals which he laid before the House of Parliament, and which undoubtedly formed the basis of the Act of 1662. Sir Roger L'Estrange had been an active adherent of the Royal cause, and soon after the Restoration, on the 22nd February 1661-2, he was granted a warrant to search for and seize unlicensed presses and seditious books (State Papers, Charles II. Vol. li. No. 6). A list is still extant of books which he had seized at the office of John Hayes, one of the signatories of the above petition. So that although the office of Surveyor of the Press was not officially created until 1663, it is clear from the issue of the warrant, and also from the fact of L'Estrange having been directed to draw up proposals for the regulation of the Press, that he was acting in that capacity more than a twelvemonth earlier. His proposals were, in 1663, printed in pamphlet form with the title, Considerations and Proposals in order to the Regulation of the Press, and were dedicated to the King, and also to the House of Lords; and they contain much that is interesting. He states that hundreds of thousands of seditious papers had been allowed to go abroad since the King's return, and that there had been printed ten or twelve impressions of Farewell Sermons, to the number of thirty thousand, since the Act of Uniformity, adding that the very persons who had the care of the Press (i.e. the Company of Stationers) had connived at its abuse. In support of this statement he pointed out that Presbyterian pamphlets were rarely suppressed, that rich offenders were passed over, and scarcely any of those who were caught were ever brought to justice. He gives the number of printers then at work in London as sixty, the number of apprentices about a hundred and sixty, besides a large number of journeymen; and he proposed at once to reduce the number of printers to twenty, with a corresponding reduction of apprentices and journeymen. As this would throw a large number of men out of work, he further proposed a scheme for the relief of necessitous and supernumerary printers. He calculated that the twelve impressions of the Farewell Sermons, allowing a thousand copies to each impression, had yielded a profit, 'beside the charge of paper and printing,' of £3300, and he advised that this sum should be levied as a fine upon those booksellers who had sold the book, and be placed to a fund for the benefit of the suppressed printers, the balance of the sum required to be levied on other seditious publications!

SIR ROGER L'ESTRANGE.

In this pamphlet L'Estrange gave the titles of most of the pamphlets to which he objected, with brief extracts from them, and the names of the printers and publishers, amongst whom were Thomas Brewster, Giles Calvert, Simon

Dover, and one other, whose name is not mentioned, but who is referred to as holding a highly profitable office. The reference may be to Thomas Newcomb.

At pages 26 and 27 L'Estrange notices the petition of certain of the printers to be incorporated as a separate body. He says 'that it were a hard matter to pick out twenty master printers, who are both free of the trade, of ability to manage it, and of integrity to be entrusted with it, most of the honester sort being impoverished by the late times, and the great business of the press being engross'd by Oliver's creatures.' He admits that the Company of Stationers and Booksellers are largely responsible for the great increase of presses, being anxious to have their books printed as cheaply as possible, but thinks that there would be as much abuse of power among incorporated printers as among the Company of Stationers.

The Act of 1662, which was mainly based on L'Estrange's report, was in a large measure a re-enactment of the Star Chamber decree of 1637. The number of printers in London was limited to twenty, the type-founders to four, and the other clauses of the earlier decree were reinforced, but with one notable concession. Hitherto printing outside London had been restricted to the two Universities, but in the new Act the city of York was expressly mentioned as a place where printing might be carried on.

This new Act was enforced for a time with greater severity than the old one, and under it, for the first time in English history, a printer suffered the penalty of death for the liberty of the press.

The story of the trial and condemnation of John Twyn is told in vol. 6 of Cobbett's State Trials, and was also published in pamphlet form with the title, *An exact narrative of the Tryal and condemnation of John Twyn, for Printing and Dispersing of a Treasonable Book, With the Tryals of Thomas Brewster, bookseller, Simon Dover, printer, Nathan Brooks, bookseller ... in the Old Bayly, London, the 20th and 22nd February 166-3/4.*

John Twyn was a small printer in Cloth Fair, and his crime was that of printing a pamphlet entitled *A Treatise of the Execution of Justice*, in which, as it was alleged, there were several passages aimed at the King's life and the overthrow of the Government. It was further stated by the prosecution that the pamphlet was part of a plot for a general rebellion that was to have taken effect on the 12th October 1662. The chief witnesses against Twyn were Joseph Walker, his apprentice, Sir Roger L'Estrange, and Thomas Mabb, a printer. Their evidence went to show that Twyn had two presses; that he composed part of the book, printed some of the sheets, and corrected the proofs, the work being done secretly at night-time. On entering the premises it was found that the forme of type had been broken up, only one corner of it remaining standing, and that the printed sheets had been hurriedly thrown down some stairs. In defence Twyn declared that he had received the copy from Widow Calvert's maid, and had received 40s. on account, with more to follow on completion, and he stoutly asserted that he did not know the nature of the work. The jury, amongst whom were Richard Royston and Simon Waterson, booksellers, and James Fletcher and Thomas Roycroft, printers, returned a verdict of Guilty, and Twyn was condemned to death and executed at Tyburn.

The charge against Simon Dover was of printing the pamphlet entitled *The Speeches of some of the late King's Justices*, which we have already seen that Roger L'Estrange had seized in John Hayes' premises, while Thomas Brewster was accused of causing this and another pamphlet, entitled *The Phœnix of the Solemn League and Covenant*, to be printed. In defence, Thomas Brewster declared that booksellers did not read the books they sold; so long as they could earn a penny they were satisfied—an argument that had been used more than a century before by old Robert Copland as an excuse for indifferent printing. Both Dover and Brewster were condemned to pay a fine of 100 marks, to stand in the pillory, and to remain prisoners during the King's pleasure. Sir Roger L'Estrange, as a reward for his services, was appointed Surveyor of the Press, with permission to publish a news-sheet of his own, and liberty to harass the printers as much as possible.

But far greater calamities than the malice of Sir Roger L'Estrange could devise fell upon the printing trade by the outbreak of the Plague in 1665, and the subsequent Fire of London. In a letter written by L'Estrange to Lord Arlington, and dated 16th October 1665, he stated that eighty of the printers had died of the Plague (*Cal. of S. P.* 1665-6, p. 20), in which total he evidently included workmen as well as masters. The loss occasioned by the stoppage of trade and flight of the citizens must have been enormous, and yet it may have been slight in comparison to that occasioned by the Great Fire. Curiously enough, however, there are very few records showing the effect of this second disaster upon the printing trade. We find a petition by Christopher Barker, the King's printer, to be allowed to import paper free of charge in consequence of his loss by the Fire, and the same indulgence is granted to

the Stationers' Company as a body and the Universities; but there are no notes of individual losses, and only one or two references to MSS. that were destroyed in it. There is, however, one very eloquent testimony to the ruin it caused in this, as in other trades. The coercive Act of 1662, which had been renewed with unfailing regularity from session to session down to the year 1665, was not renewed during the remainder of the reign of Charles II. On the 24th of July 1668 a return was made of all the printing-houses in London, which shows at a glance who had survived and who had suffered by that terrible calamity (see Appendix II.).

Comparing this list with that of 1649, we find that no inconsiderable number of the printers there mentioned had survived the thinning-out process, as well as imprisonment, death, and fire. In fact, only eight London printers were actually ruined by the Fire, and among them we find both John Hayes and John Brudenell, and also Alice Warren.

But another paper, written in the same year, and preserved in the same volume of State Papers, is even more interesting, for it shows the position of every man in the trade. This is headed—

A Survey of the Printing Presses with the names and numbers of Apprentices, Officers, and Workemen belonging to every particular press. Taken 29 July 1668. (See Appendix III.). From this we learn that the largest employer in the trade at that time was James Fletcher, who kept five presses, and employed thirteen workmen and two apprentices. Next to him came Thomas Newcomb, with three presses and a proof press, twelve workmen and one apprentice; John Maycocke, with three presses, ten workmen and three apprentices; and then Roycroft, with four presses, ten workmen and two apprentices; while at the other end of the scale was Thomas Leach, with one press, not his own, and one workman.

Whether L'Estrange carried out his threat of prosecuting the three men who had set up since the Act, we do not know, but this is certain, that one of their number, John Darby, continued to work for many years after this, and was the printer of Andrew Marvell's *Rehearsal Transposed*, and a good deal else that galled the Government very much. In fact, the Act of 1662 was openly ignored, and new men set up presses every year.

But of all this work it is almost impossible to trace what was done by individual printers. The bulk of the publications of the time bore the bookseller's name only, and it is very rarely indeed that the printer is revealed. Newcomb had the printing of the *Gazette*, and also printed most of Dryden's works that were published by Herringman; while Roycroft, we know, was employed by all those who wanted the best possible work, such men as John Ogilby, for instance, for whom he printed several works. Milton's *Paradise Lost* came from the press of Peter Parker; but the printer of Bunyan's *Pilgrim's Progress* is unknown to us.

As it happens, there is not much lost by remaining in ignorance on this point. For no change whatever took place in the character of printing as a trade during the second half of the seventeenth century. There were only three foundries of note in London during that time, and none of them is considered to have produced anything particularly good. Indeed, one has only to glance at even the best work of that time to see how wretchedly the majority of the type was cast. The first of the three was the celebrated Joseph Moxon, who, in 1659, added type-founding to his other callings of mathematician and hydrographer. Having spent some years in Holland, he was very much enamoured of the Dutch types, and in 1676 he wrote a book entitled *Regulæ Trium Ordinum Literarum Typographicarum*, in which he endeavoured to prove that each letter should be cast in exact mathematical proportion, and illustrated his theory by several letters cast in that manner. Similar theories had been propounded in earlier days by Albert Durer and the French printer, Geoffrey Tory, but no improvement in printing ever resulted from them. Moxon's foundry was fitted with a large assortment of letter, but his work, judging from the examples left to us, was certainly not up to the theory which he put forward, and he is best remembered for his useful work on printing, which formed the second part of his *Mechanic Exercises*, and was published in 1683. In this he showed an intimate knowledge of every branch of printing and type-founding, and his book is still a standard work on both these subjects. Moxon retired from business some years before his death, and was succeeded in 1683 by Joseph and Robert Andrews, who, in addition to Moxon's founts, had a large assortment of others. Their foundry was particularly rich in Roman and Italic, and the learned founts, and they also had matrices of Anglo-Saxon and Irish. But their work was not by any means good.

The third of these letter foundries was that of James and Thomas Grover in Angel Alley, Aldersgate Street, who after Moxon's retirement shared with Andrews the whole of the English trade. The most notable founts in their possession were, a pica and longprimer Roman, from the Royal Press at Blackfriars, Day's double pica Roman and

Italic, and two good founts of black letter, reputed to have formed part of the stock of Wynkyn de Worde. They also had the English Samaritan matrices from which the type for Walton's Polyglott in 1657 had been cast.[Pg 212] Among the types belonging to this foundry was one which, in the inventory, was returned as New Coptic, but which was in reality a Greek uncial fount, cut for the specimen of the Codex Alexandrinus which Patrick Young proposed to print, but did not live to accomplish. The specimen was printed in 1643 and consisted of the first chapter of Genesis. It is supposed that this fount remained unknown, under the title of New Coptic, until 1758, when the Grover foundry passed into the hands of John James. On the death of Thomas Grover, the foundry remained in possession of his daughters, who endeavoured to sell it, but without success, and it remained locked up for many years in the premises of Richard Nutt, a printer, until 1758 (Reed, *Old English Letter Foundries*, p. 205).

After a lapse of twenty years, the Act of 1662 was renewed by the first parliament of James II. (1685) for a period of seven years, and at the expiration of that time, i.e. in 1692, it was renewed for another twelvemonth, after which we hear no more of it. There is no evidence that it had been very strictly enforced during its short revival; in fact it is clear, from the number of presses found in various parts of the country during the last five and twenty years of the century, that it had remained practically a dead letter from the time of the Great Fire.

Fig. 32.—'Fell' Types.

The troubles of the Civil War had suspended for a time all progress in printing at Oxford. But on the Restoration it made even greater advances than it had done at an earlier period of its history. Archbishop Laud had a worthy successor in Dr. John Fell, who in 1667 enriched the University by a gift of a complete type-foundry, consisting of punches, matrices, and founts of Roman, Italic, Orientals, 'Saxons,' and black letter, besides moulds and other necessary appliances for the production of type. Dr. Fell also introduced a skilled letter-founder from Holland. For a couple of years the foundry and printing office were carried on in private premises hired by Fell, but upon the completion of the Sheldonian Theatre the printing office was removed to the basement of that building, the first book bearing the Theatre imprint being *An Ode in praise of the Theatre and its Founder*, printed in 1669.

Another scholarly benefactor, Francis Junius, presented the University in 1677 with a splendid collection of type, consisting of Runic, Gothic, 'Saxon,' 'Islandic,' Danish, and 'Swedish,' as well as founts of Roman, Italic, and other sorts. By the kindness of Mr. Horace Hart, the Controller of the Clarendon Press, we are able to give here examples of several of the founts, both of Fell and Junius, in most cases from surviving specimens of the types themselves.

Fig. 33.—'Fell' Types.

Very little use seems to have been made of these gifts before the commencement of the [Pg 216] succeeding century. The first Bible printed at Oxford was that of 1674, and no important editions of the classics issued from the University press of this period.

It was left to Cambridge to issue the best works of this class, for which that University borrowed the Oxford types, having no type-foundry of its own. These editions, chiefly in quarto, came from the press of Thomas Buck, who had succeeded Roger Daniel as printer to the University. Buck was in turn succeeded by John Field, who turned out some very creditable work, notably the folio Bible of 1660. John Hayes, the next of the Cambridge printers, issued some notable books, such as Robertson's *Thesaurus*, 1676, 4to, and Barnes's *History of Edward III.*, 1688, 4to, but the bulk of the work that came from the Cambridge press at this date was of a theological character, and was none too well printed.

The history of other provincial presses of this period is very meagre. Mr. Allnutt, to whose valuable papers in the second volume of *Bibliographica* I am indebted for the following notes, expresses the belief that in several cases local knowledge would show that presses were at work some years earlier than the dates he has given.

Fig. 34.—'Junius' Types.

At the time of the Civil War, Robert Barker, the King's printer, had in 1639 been commanded to attend His Majesty in his march against the Scots, and printed several proclamations, news-sheets, etc., at Newcastle-on-Tyne in that year. He is next found at York, where some thirty-nine different sheets, etc., have been traced from his press, and in 1642 a second press was at work in the same city, that of Stephen Bulkeley. When York fell into the hands of the

Parliament, Bulkeley's press was silent for a while, and his place was taken by Thomas Broad, who printed there from 1644 to 1660, and was succeeded by his widow, Alice, who disappears in 1667. After the Restoration, Bulkeley again set up his press at York, where he continued down to 1680. Barker in 1642 had been summoned to attend the King at Nottingham, but no specimen of his work bearing that imprint is known, and the next heard of him is at Bristol, some time in 1643, Mr. Allnut mentioning ten pieces from his press at this place.

In 1645 Thomas Fuller issued in small duodecimo, a collection of pious thoughts, which he aptly termed *Good Thoughts in Bad Times*, and in the Dedication to it expressly stated that it was 'the first fruits of the Exeter presse.' There was no printer's name in the volume, and no other work printed in Exeter at that time is known. In 1688, however, another press was started there, and printed several political broadsides relative to the Prince of Orange. A new start was made in 1698, when a small pamphlet was printed in this city.

Stephen Bulkeley, the York printer, appears to have gone from that city to Newcastle in 1646, and continued printing there until 1652. He then removed to Gateshead, where he remained until after the Restoration, subsequently returning to Newcastle, and so back to York. No more is heard of printing in Newcastle until the opening of the eighteenth century.

A press was established in Bristol in the year 1695 and in Plymouth and Shrewsbury in the year 1696.

In America the progress of printing was very slow throughout the seventeenth century. Until 1660, Samuel Green, at Cambridge, Massachusetts, remained the only printer in the colony. But in that year the Corporation for the propagation of the Gospel in New England among the Indians sent over from London another press, a large supply of good letter, and a printer named Marmaduke Johnson, for the purpose of printing an edition of the Bible in the Indian tongue. This press was set up in the same building as that in which Green was already at work, and the two printers seem to have worked together at the production of the Bible, which appeared in quarto form in 1663, the New Testament having been published two years earlier. Johnson died in the year 1675, but Samuel Green continued to print until 1702. After his death the press at Cambridge was silent for some years.

In 1675 a press was established at Boston by John Foster, a graduate of Harvard College, under a licence from the College. Besides the official work of the colony and theological literature, he printed several pamphlets on the war between the English and the Indians. He died in 1681, when he was succeeded by Samuel Green, junior, who continued printing there until 1690. In the following year three printers' names are found in the imprints of books: R. Pierce, Benjamin Harris, and John Allen. Benjamin Harris is afterwards called 'Printer to his Excellency, the Governor and Council,' but in 1693 Harris removed from 'over against the Old Meeting House,' to 'the Bible over against the Blew Anchor,' and another printer, Bartholomew Green, seems to have shared with him the official work.

Pennsylvania was the next of the colonies to establish a press; its first printer, William Bradford, setting up there in 1685, in which year he printed *Kalendarium Pennsilvaniense*, or, *America's Messinger, Being an Almanack for the Year of Grace 1686*.

In 1688 Bradford issued proposals for printing a large Bible (Hildeburn, *Issues of the Pennsylvania Press*, vol. i. p. 9), but they came to nothing. In 1692 he printed several pamphlets for George Keith, the leader of the schism among the Quakers, and for this he was imprisoned. On his release he removed to New York. A press was also set up in Virginia in 1682, but was suppressed, and no printing allowed there until 1729. The name of the printer is not known, but is believed to have been William Nuthead, who set up a press in Maryland in 1689 with a similar result.

The first printer in New York was William Bradford, who began work there on the 10th April 1693. Among his most famous publications before the close of the seventeenth century was Keith's *Truth Advanced*, a quarto of 224 pages, printed on paper manufactured at his own mill and issued in 1694; in the same year he also printed *The Laws and Acts of the General Assembly*.

APPENDIX No. I
LIST OF ENGLISH PRINTERS 1649-50
NAME OF PRINTER ADDRESS

Alsop, Bernard, Grub Street.
Austin, Robert, Addlehill.
Bell, Jane, Christchurch.
Bentley, William, Finsbury.
Bishop, Richard, St. Peter Paul's Wharf.
Broad, Thomas, City of York.
[Pg 222]Brudenell, Thomas, Newgate Market.
Buck, John, Cambridge.
Buck, or Bucks, Thomas, Cambridge.
Clowes, John, Grub Street.
Coe, Andrew, ...
Cole, Peter, ...
Coles, Amos, Ivy Lane.
Constable, Richard, Smithfield.
Cotes, or Coates, Richard, Aldersgate Street.
Cottrell, James, ...
Crouch, Edward, ...
Crouch, John, ...
Dawson, Gertrude, Aldersgate Street.
Dugard, William, Merchant Taylors' School.
Ellis, William, Thames Street.
Field, John, ...
Fletcher, or Flesher, James, Little Britain.
Griffith, or Griffin, Edward, Old Bailey.
Grismond, John, Ivy Lane.
Hall, Henry, Oxford.
Hare, Adam, Red Cross Street.
Harper, Thomas, Little Britain.
Harrison, Martha, ...
Heldersham, Francis, ...
Hills, Henry, Southwark.
Hunscott, Joseph, Stationers' Hall.
Hunt, William, Pie Corner.
Husbands, Edward, Golden Dragon, Fleet Street.
Ibbitson, Robert, Smithfield.
Lee, William, Fleet Street.
Leyborne, Robert, Mugwell Street.
[Pg 223]Litchfield, Leonard, Oxford.
Mabb, Thomas, Ivy Lane.
Maxey, Thomas, Bennett Paul's Wharf.
Maycock, John, Addlehill.
Meredith, Christopher, St. Paul's Churchyard.
Miller, Abraham, Blackfriars.
Mottershead, Edward, Doctors' Commons.
Moxon, James, Houndsditch.
Neale, Francis, Aldersgate Street.
Newcombe, Thomas, Bennett Paul's Wharf, near Baynards Castle.
Norton, Roger, Blackfriars.
Partridge, John, Blackfriars.
Payne, or Paine, Thomas, ...
Playford, John, ...
Purslowe, Elizabeth, Little Old Bailey.
Ratcliffe, Thomas, Doctors' Commons.
Raworth, Ruth, ...
Ross, Thomas, ...
Rothwell, John, ...

Royston, John, } ...
Royston, Richard,
Roycroft, Thomas, ...
Simmons, Matthew, ...
Thompson, George, ...
Tyton, Francis, ...
Walkeley, Thomas ...
Warren, Thomas, ...
Wilson, William, ...
Wright, John, ...
Wright, William, ...

APPENDIX No. II

List of severall printing houses taken ye 24th July 1668:—

The Kings printing office in English.

The Kings printing office in Hebrew, Greek, and Latine. Roger Norton.

The Kings printer in ye Oriental tongues. Thomas Roycroft.

Collonell John Streater by an especial provisoer in ye Act. [The same who in 1653 had been committed to the Gatehouse for printing seditious pamphlets.]

The other Masters are

Mr. Evan Tyler.
" Robert White.
" James Flesher.
" Richard Hodgkinson.
" Thomas Ratliffe.
" John Maycocke.
" John Field.
" Thomas Newcomb.
" William Godbid.
" John Redman.
" Thomas Johnson.
" Nath Crouch.
" Thomas Purslowe.
" Peter Lillicrapp.
" Thomas Leach.
" Henry Lloyd.
" Thomas Milbourne.
" James Cottrell.
" Andrew Coe.
" Henry Bridges.

Widdowes of printers:—

Mrs. Sarah Gryffyth.
" Cotes.
" Simmons.
" Anne Maxwell.
Custome house printer.

Printers yt were Masters at ye passeing of ye Act wch are disabled by ye fire:—

Mr. John Brudenall.

" Hayes.

" Child.

" Warren.

" Leybourne.

" Wood.

" Vaughan.

" Ouseley.

Printers set up since ye Act and contrary to it:—

Mr. William Rawlins.

" John Winter

" John Darby.

" Edward Oakes.

(Dom. S. P. Chas. II., vol. 243, No. 126.)

APPENDIX No. III

NUMBER OF PRESSES AND WORKMEN EMPLOYED IN THE PRINTING-HOUSES OF LONDON IN 1668

At the King's House, 6 Presses.

8 Compositors.

10 Pressmen.

At Mr. Tyler's, 3 Presses and a Prooffe Press.

1 Apprentice.

6 Workmen.

At Mr. White's, 3 Presses.

3 Apprentices.

7 Workmen.

At Mr. Flesher's, 5 Presses.

2 Apprentices.

13 Workmen.

At Mr. Norton's, 3 Presses.

1 Apprentice.

7 Workmen.

At Mr. Rycroft's [Ryocroft's] 4 Presses.

2 Apprentices.

10 Workmen [three of whom were not free of the Company.]

At Mr. Ratcliffe's, 2 Presses.

2 Apprentices.

7 Workmen.

At Mr. Maycock's, 3 Presses.

3 Apprentices.

10 Workmen.

At Mr. Newcombe's, 3 Presses and a Proof Press.

1 Apprentice.

7 Compositors.

5 Pressmen.

At Mr. Godbidd's, 3 Presses.

2 Apprentices.

5 Workmen.

At Mr. Streater's, 5 Presses.

6 Compositors.

2 Pressmen.

At Mr. Milbourne's, 2 Presses,

0 Apprentices.

2 Workmen.
 At Mr. Catterell's [Cottrell?], 2 Presses.
 0 Apprentices.
 2 Compositors.
 1 Pressman.
 At Mrs. Symond's, 2 Presses.
 1 Apprentice.
 5 Workmen.
 At Mrs. Cotes, 3 Presses.
 2 Apprentices.
 9 Pressmen.
 At Mrs. Griffin's, 2 Presses.
 1 Apprentice.
 6 Workmen.
 At Mr. Leach's, 1 Press and no more provided by Mr. Graydon.
 1 Workman.
 At Mr. Maxwell's, 2 Presses,
 0 Apprentice.
 3 Compositors.
 3 Pressmen.
 At Mr. Lillicropp's, 1 Press.
 1 Apprentice,
 1 Compositor.
 1 Pressman.
 At Mr. Redman's, 2 Presses.
 1 Apprentice.
 4 Compositors.
 2 Pressmen.
 At Mr. Cowes [Coe's?], 1 Press.
 At Mr. Lloyd's, 1 Press.
 At Mr. Oake's, 2 Presses.
 0 Apprentices.
 2 Workmen.
 At Mr. Purslowe's, 1 Press.
 0 Apprentices.
 1 Workman.
 At Mr. Johnson's, 2 Presses.
 0 Apprentices.
 3 Workmen.
 Mr. Darby, } These three printers are to be indicted at ye next session.
 Mr. Winter,
 Mr. Rawlyns,
 At Mr. Crouch's, 1 Press.
 0 Apprentices.
 1 Workman.

CHAPTER IX

1700-1750

aving to some extent shaken itself free from the cramping influences of monopolies and State interference, the output of the English printing press at the commencement of the eighteenth century had almost doubled that of thirty or forty years before, and presses were now at work in various parts of the kingdom. But the long period of thralldom had resulted in completely destroying all originality amongst the printers, and almost in the destruction of the art of letter-founding. In fact, so far as printing with English types was concerned, the first twenty years of the eighteenth century was the worst period in the history of printing in this country. With the exception of the University of Oxford, which, owing to the generous bequests of Bishop Fell and others, was well supplied with good founts, the

printers of this country were compelled to obtain their type from Holland, and all the best and most important books published in Queen Anne's days were printed with Dutch letter, as it was called. Jacob Tonson is said to have spent some £300 in obtaining this foreign letter, and one important English foundry, that of Thomas James, was almost wholly stocked with these foreign founts. Yet this Dutch letter was by no means easy to get, and the experience of James, who in 1710 went to Holland for the purpose, bore out what Moxon had said in his *Mechanick Exercises*, that the art of letter-cutting was jealously guarded by those who practised it. Some of the Dutch typefounders refused to sell him types on any terms, and it was only by getting hold of a man who was more fond of his liquor than his trade, that James was able to get matrices, for even this individual refused to sell his punches. Nor was the vendor in any hurry to part with the matrices, and it cost James much money, time, and patience before he was able to secure them. Writing from Rotterdam on the 27th July in that year, he says:—

'The beauty of letters, like that of faces, is as people opine, ... All the Romans excel what we have in England, in my opinion, and I hope, being well wrought, I mean cast, will gain the approbation of very handsome letters. The Italic I do not look upon to be unhandsome, though the Dutch are never very extraordinary in them.'

James returned to England with 3500 matrices of various founts of Roman and Italics, as well as sets of Greek and some black letter. He set up his foundry in a part of the buildings belonging to the Priory of St. Bartholomew, in Smithfield, and it continued to be the most important in London until the days of Caslon. The proportion of Dutch to English types in the printing offices at that time is well illustrated by the valuable list of the types possessed by John Baskett, the Royal printer at Oxford, in the year 1718. The Royal printing-house was perhaps the largest and most lucrative office in the kingdom. For upwards of a century it had been owned by the descendants of Christopher Barker, the last of whom, Robert Barker, had died in 1645, after assigning his business to Messrs. Newcomb, Hill, Mearne, and others. From these the patent was bought in 1709 by John Baskett, of whose antecedents nothing whatever is known. In addition to the business at Blackfriars, Baskett, in conjunction with John Williams and Samuel Ashurst, obtained a lease from the Chancellor, Masters, and Scholars of Oxford University of their privilege of printing for twenty-one years. From an indenture in the possession of Mr. J. H. Round, the substance of which he communicated to the *Athenæum* of September 5th, 1885, it appears that on the 24th December 1718 Baskett gave a bond to James Brooks, stationer of London, for a loan of £4000, and for security mortgaged his stock, which was set out in a schedule as follows:—

'An Account of the Letter, Presses, and other Stock and Implements of and in the Printing house at Oxford, belonging to John Baskett, citizen and stationer of London.'

1. A large ffont of Perle letter cast by Mr Andrews.
2. A large ffont of Nonpl Letter new cast by ditto.
3. Another ffont of Nonpl Letter, old, the which standing and sett up in a Com'on prayer in 24mo compleat.
4. A large ffont of Minn Letter new cast by Mr Andrews.
5. Another large ffont of Minn Letter, new cast in Holland.
6. The whole Testament standing in Brevr and Minn Letter, old.
7. A large ffont of Brevr Letter, new cast in Holland.
8. A very large ffont of Lo: Primer Letter, new cast by Mr Andrew.
9. A large ffont of pica Letter very good, cast by ditto.
10. Another large ffont of ditto, never used, cast in Holland.
11. A small quantity of English, new cast by Mr Andrews.
12. A small quantity of Great Primr new cast by ditto.

13. A very large fount of Double Pica, new, the largest in England.

14. A quantity of two-line English letters.

15. A quantity of French Cannon, two-line letters of all sorts, and a set of silver initial letters. Cases, stands, etc. Five printing presses very good.

John Baskett is chiefly remembered for the magnificent edition of the Bible which he printed in 1716-1717, in two volumes imperial folio, and which from an error in the headline of the 20th chapter of St. Luke, where the parable of the Vineyard was rendered as the 'parable of the Vinegar,' has ever since been known as the 'Vinegar Bible.' This slip was only one of many faults in the edition, which earned for it the title of 'A Baskett-full of printer's errors.' But apart from these errors, the book was a very splendid specimen of the printer's art, and has been described as the most magnificent of the Oxford Bibles. The type, double pica Roman and Italic, was beautifully cut, and was that which is described in the above list as the 'largest in England.' It was clearly not one of the founts belonging to the University, for, had it been, Baskett would have had no power to mortgage it. It is also noticeable that it was not described as 'cast in Holland,' as many of the others were, so we may infer that it was cast in England, and an interesting question arises, by whom? Clearly it was not cast by Mr. Andrews, or Baskett would have said so.

During a great part of his life, Baskett was engaged in litigation over his monopoly of Bible printing, and in spite of the large profits attached to it, he became bankrupt in 1732. Further trouble fell upon him in 1738 by the destruction of his office by fire. He died on June 22nd, 1742. At one period he had been in danger of losing his patent altogether, for Queen Anne was induced by Lord Bolingbroke and others to constitute Benjamin Tooke and John Barber to be Royal printers in reversion, in anticipation of the ending of Baskett's lease in 1739; but Baskett purchased this reversion from Barber, and afterwards obtained a renewal of his patent for sixty years, the last thirty of which were subsequently acquired by Charles Eyre for £10,000.

John Barber, who for a time held the reversion of Baskett's patent, was the only printer who has ever held the high office of Lord Mayor of London, and for this reason among others he deserves a brief notice. He was born of poor parents in 1675, and according to one account was greatly helped in early life by Nathaniel Settle, the city poet.

He was apprenticed to Mrs. Clark, a printer in Thames Street, and proving himself a steady and good workman, was able to set up for himself in 1700. His first printing-house was in Queen's Head Alley, whence he soon afterwards moved to Lambeth Hill, near Old Fish Street.

Accounts differ as to his first work. Curll, in his *Impartial History of the Life, Character, etc., of Mr. John Barber* (London, 1741), says that the alderman himself admitted that the first fifty pounds he could call his own were earned by printing a pamphlet written by Charles D'Avenant; while in the *Life and Character*, another pamphlet printed in the same year for T. Cooper, it is said that it was Defoe's *Diet of Poland* which brought him the first money he laid up. It is also said that he was greatly indebted to Dean Swift for his rapid advancement. By whatever means it was accomplished, Barber was introduced to Henry St. John, afterwards Lord Bolingbroke, and was engaged as printer to the Ministry, his printing-house becoming the meeting-place of the statesmen, poets, and wits of the day. Barber was himself a genial companion and hard drinker, who spent his money freely, and in this way made many friends. He printed for Dean Swift, for Pope, Matthew Prior, and Dr. King, and was also the printer of nearly all the writings of the versatile and unhappy Mrs. Manley. The story of her connection with Barber is sufficiently well known.

At the time of the South Sea scheme Barber took large shares, and, it is said, amassed a considerable fortune before the bubble burst. But he was indebted mainly to the patronage of Lord Bolingbroke for his success as a printer. Through that statesman he obtained the contract for printing the votes of the House of Commons, and by the same influence he became printer of the *London Gazette*, *The Examiner*, and *Mercator*, printer to the City of London, and finally received from the Queen the reversion of the office of Royal Printer, which he soon after relinquished to Baskett for £1500.

Elected as alderman of Baynard Castle ward, Barber filled the office of Sheriff, and in 1733 became Lord Mayor of the City of London. As Lord Mayor, he gained great popularity from his [Pg 235] opposition to the Excise Bill, and

by permitting persons tried and acquitted at the Old Bailey to be discharged without any fees. He died on the 22nd January 1740.

Much amusement, not altogether unmixed with uneasiness, was caused in the printing trade between 1727 and 1740 by a futile attempt to introduce stereotyping. A Scotch printer having complained to a goldsmith in Edinburgh of the vexatious delays and inconvenience of having to send to London or Holland for type, it occurred to William Ged, the goldsmith in question, that, to use the words of Timperley (p. 584), the transition from founding single letters to founding whole pages, 'should be no difficult matter.' He made several experiments, and at length satisfied himself that his scheme was practicable. Accordingly, in 1727, he entered into a contract with an Edinburgh printer to carry out the invention, but after two years his partner withdrew, being alarmed at the probable cost. Ged then entered into partnership with William Fenner, a stationer in London, by whom he was introduced to Thomas James, the founder, and a company was formed to work the scheme. But James, perhaps influenced by the representations of his 'compositors,' whom the new invention threatened with the loss of work, instead of helping, did his utmost to ruin the undertaking and its inventor. Instead of supplying the best and newest type from which the matrices might be made, he furnished the worst, whilst his workmen damaged the formes. Much the same happened at Cambridge, where Ged was for a time installed as printer to the University. He struggled against the opposition so far as to produce two Prayer Books, but such was the animosity shown to the new invention, that the books were suppressed by authority, and the plates broken up. To add further to his troubles, dissension broke out between James and Fenner, neither of whom had any cause to be proud of their action towards Ged, who, disheartened and ruined, returned to Edinburgh. There another attempt was made by the friends of the inventor to produce a book, but no compositor could be found to set up the type, and it was only by Ged's son working at night that the edition of Sallust, and a few theological books, were finished and printed at Newcastle. Ged died in 1749, and his sons subsequently emigrated to the West Indies.

Next to the King's printing-house, the press of which we have the most accurate knowledge at this time was that of William Bowyer, the elder and the younger. The seven volumes of Nichols's *Literary Anecdotes* give a complete record of the work of this printing-house, and from them the following brief account has been taken. William Bowyer, the elder, had been apprentice to Miles Flesher, and was admitted to the freedom of the Company of Stationers on October 4th, 1686. He started business on his own account in Little Britain in 1699, with a pamphlet of ninety-six pages on the Eikon Basilike controversy. He afterwards moved into White Friars, where, on the night of January 29th, 1712, his printing office was burnt to the ground; among the works that perished in the flames being almost the whole impression of Atkyn's *History of Gloucestershire*, Sir Roger L'Estrange's *Josephus*, 'printed with a fine Elzevir letter never used before'; the fifteenth volume of Rymer's *Fœdera*; Thoresby's *Ducatus Leodiensis*, and an old book, of *Monarchy*, by Sir John Fortescue, in 'Saxon,' with notes upon it, printed on an 'extraordinary paper' (*Nichols's Literary Anecdotes*, vol. i. p. 56). This short list of notable works proves that Bowyer had a flourishing business at the time of the catastrophe. A subscription was at once raised for his relief, and £1162 subscribed by the booksellers and printers in a very short time. A royal brief was also granted to him for the same purposes, and by this he received £1377, making a grand total of £2539, with which he began business anew. In remembrance of his misfortune, Bowyer had several tail-pieces and devices engraved, representing a phoenix rising from the flames.

In 1715 Bowyer the elder printed Miss [Pg 238] Elstob's *Anglo-Saxon Grammar*. The types for this were cut by Robert Andrews from drawings made by Humphrey Wanley, and were given to the printer by Lord Chief-Justice Parker. But these types were very indifferently cut. Wanley himself said 'when the alphabet came into the hands of the workman (who was but a blunderer) he could not imitate the fine and regular stroke of the pen; so that the letters are not only clumsy, but unlike those that I drew.'

In 1721 Bowyer printed an edition of Bishop Bull's Latin works in folio, but lost £200 by the impression. The following year his son, William Bowyer the younger, joined him in the business.

The younger Bowyer had received an University education, though he never succeeded in taking a degree. He was, however, a highly cultivated man, and employed his pen in many of the controversies of the time, writing *Remarks on Mr. Bowman's Visitation Sermon* in 1731, and on *Stephen's Thesaurus* in 1733, and in 1744 a pamphlet on the *Present State of Europe*. But at the beginning of his connection with the printing-house, he was mainly concerned in reading the proofs of the learned works entrusted to his father for printing, and though towards the latter end of the elder Bowyer's days the son may have taken a more active part in the practical work, as we read of his appointment

as printer of the votes in the House of Commons in 1729, and [Pg 239] as printer to the Society of Antiquaries in 1736, it was not until his father's death, in 1737, that the sole management of the business devolved upon him.

One of the earliest works upon which the younger Bowyer was employed as 'reader' was Dr. Wilkins's edition of Selden's Works, printed by Bowyer the elder in six folio volumes in 1722. The publication of this book marks an era in the history of English printing, for the types with which it was printed were cut by William Caslon.

This famous type-founder, who by his skill raised the art of printing to a higher level than it had reached since the days of John Day, was born at Cradley, near Hales Owen in Shropshire. We are indebted for his biography partly to Bowyer and partly to Nichols, but it must be confessed that the earlier part of it is vague and unconvincing. According to this oft-quoted story, Caslon began life as an engraver of gun-locks, and made blocking tools for binders. This was somewhere about 1716, in which year it is said John Watts, the printer, became his patron, and employed him to cut type punches. Bowyer became acquainted with him from seeing some specimen of his lettering on a book, and took him to the foundry of James, in Bartholomew Close. Bowyer next advanced him some money, as also did Watts, and with these loans he set up for himself, his first essay in type-founding being a fount of Arabic for the Psalter published by the Society for the Promotion of Christian Knowledge. When he had finished the Arabic, i.e. somewhere about 1724 or 1725, he cut his own name in Roman type and placed it at the foot of the specimen. This attracted the notice of Samuel Palmer, the author of a very unreliable History of Printing, and with Palmer, Caslon worked for some time, but at length transferred his services to William Bowyer, for whom he cut the types of the 'Selden.'

It is almost impossible to place any reliance upon so vague and inconclusive a biography as this. There was a belief in the Caslon family that he began letter-cutting before 1720, and the equally vague traditions which point to a later date need not make us treat this as impossible.

Was his the unknown hand that cut the double pica type which Baskett used in printing the 'Vinegar' Bible? A close examination of the types used in that Bible, those used in printing the folio edition of Pope's Iliad, and those of the 'Selden,' reveals a striking resemblance, especially in the form of the italic letter, and at least makes it clear that if the two first-mentioned works were printed with Dutch letter, then it was on the best form of that letter that Caslon modelled his types.

The charm of Caslon's Roman letter lay in its wonderful regularity as well as in the shape and proportion of the letters. In this respect it was a worthy successor to the best Aldine founts of the sixteenth century. The italic was also noticeable for its beauty and regularity.

Caslon's superiority over all other letter-cutters, English or Dutch, was quickly recognised, and from this time forward until the close of the century all the best and most important books were printed with Caslon's letter; the old letter-founders, such as James and Grover, being entirely neglected, and even such a powerful rival as John Baskerville being unable to compete with him.

In addition to the printers in London already noticed, there were two others who must not be forgotten. Samuel Richardson, author of Pamela, Clarissa Harlowe, and Sir Charles Grandison, was by trade a printer. Born in Derbyshire, of humble parents, in 1689, he was apprenticed to Mr. John Wilde, a printer in London, whom he served for seven years. He took up his freedom in 1706, and started business for himself in Salisbury Court, Fleet Street. Among his earliest patrons were the Duke of Wharton, for whom he printed some six numbers of a paper called the True Briton, and the Right Hon. Arthur Onslow, by whose interest he obtained the printing of the Journals of the House of Commons. But he did some better work than this, as in 1732 he printed for Andrew Millar a good edition in folio of Churchill's Voyages, and in 1733 the second volume of De Thou's History, a work in seven folio volumes, edited by Samuel Buckley, his share in which reflects credit on Richardson as a printer. Between 1736-37 he printed The Daily Journal, and in 1738 the Daily Gazeteer, and in 1740 the newly-formed Society for the Encouragement of Learning entrusted to him the printing of the first volume of The Negotiations of Sir Thomas Roe, in folio. In this the text was printed in the same type as the De Thou, but the dedication was in a fount of double pica Roman. This work, which was intended to have been in six volumes, was never completed.

Richardson's work as an author began in 1741 with the publication of *Pamela*, in four volumes, duodecimo, printed at his own press. *Clarissa Harlowe* appeared in 1747-48, and in 1753 his final novel, *Sir Charles Grandison*. Through the treachery of one of his workmen in the printing office, the Dublin booksellers were enabled to issue an edition of *Sir Charles Grandison* before the work had left Richardson's press. He vented his aggrieved feelings by printing a pamphlet, *The Case of Samuel Richardson of London, Printer*.

In 1755 Richardson rebuilt his premises, and in 1760 he bought half the patent of law printing, which he shared with Catherine Lintot. His [Pg 243] death took place on the 4th July 1761, his business being afterwards carried on by his nephew, William Richardson.

The other press to which reference has been made was that of Henry Woodfall. In the first series of *Notes and Queries* (vol. xi. pp. 377, 418) an anonymous contributor supplied some very interesting and valuable notes drawn from the ledgers of that printer between the years 1734 and 1747. Such a record is the most valuable material for a history of printing, but unfortunately this is the only known instance in which it is available. It supplies us with the most useful information, the numbers of copies that went to make up an edition, the quality and cost of the paper and the number of sheets contained in each volume, with many other interesting particulars, which it is impossible to get from any other source. While recognising the value of these extracts from Woodfall's ledger, the writer hardly seems to have made the most of his opportunity. In many instances he gives only the title of the work and the number of copies printed, omitting all particulars as regards the cost of printing. But even as it stands this series of papers throws much interesting light upon the publication of some of the notable works of that period.

Woodfall's printing was broadly divided into two classes, 'gentlemen's work' and 'booksellers' work,' and the second is naturally the more interesting.

Among those for whom he printed were Bernard and Henry Lintot, Robert Dodsley, Andrew Millar, and Lawton Gilliver. Against Bernard Lintot is the following entry:—

Decr. 15th, 1735—

Printing the first volume of Mr. Pope's Works,
Cr., Long Primer, 8vo, 3000 (and 75 fine),

£2, 2s. per sheet, 14 sheets and a half, 30. 09. 0

Title in red and black, 1. 1

Paid for 2 reams and 1/4 of writing demy, 2. 16. 3

On May 15, 1736, Woodfall enters to Henry Lintot—

The Iliad of Homer by Mr. Pope, demy,
Long Primer and Brevier. No. 2000 in
6 vols, 68 sheets and 1/2

£2, 2s. per sheet, £143. 17

Under Dodsley's account is entered on 12th May 1737—

Printing the first Epistle of the Second Book
of Horace Imitated, folio, double size, Poetry,
No. 2000, and 150 fine, [seven] shts., at
27s. per sht., 9. 09. 0

May 18, 1737. 150 fol. titles, Second Book of
Epistles, 4. 0

A few weeks later Woodfall received an order from Lawton Gilliver for 1500 crown octavo copies of Epistles of Horace, and 100 fine or large paper copies. The second edition of Pope's Works was also printed by Woodfall for Henry Lintot, the order being for 2000. For Andrew Millar Woodfall printed the following works of Thomson the poet—

Oct. 14th 1734. Spring, a poem, 8vo, 250 copies.

Jan. 8th 173-4/5. Liberty, a poem, 1st part cr. 8vo, No. 3000, and 250 fine copies.

Of the 4th and 6th parts only 1250 copies were printed.

June 6th, 1738, Mr. Thomson's Works. Vol. I. No. 1000, 8vo.

With the issue of the second volume the number was increased to 1500.

The Seasons were printed on June 19th, 1744, in octavo. There were 1500 errata in the work, and a special charge of £2, 4s. was made for 'divers and repeated alterations.'

Among the miscellaneous writers whose works were passed through the elder Woodfall's press was the Rev. John Peters, against whom he entered an account, dated July 17th, 1735, for printing Thoughts concerning Religion, 4to, 16 sheets. This gentleman was a literary shark, ready to devour any unprotected morsel that came in his way. The work above mentioned, and another printed by Woodfall in 1732, called A Letter to a Bishop, were afterwards discovered to be from the pen of Duncan Forbes, and were published in an edition of his works printed in Edinburgh and London in 1751. A lawsuit was at once commenced by George Woodfall and John Peters against the publishers of Forbes' works, the name of Messrs. Rivington being prominently mentioned, and the defendants, in their answer, stated that the two works in question were well known to have been written by Duncan Forbes, and that the MS. was in the possession of his family.

This little incident, taken in conjunction with Henry Woodfall's connection with E. Curll and the letters of Pope, and the story told by Thomas Gent of the printing of The Bishop of Rochester's Effigy, shows that he was a worthy disciple of Iago in the matter of money-getting.

Mention of Thomas Gent leads naturally to a study of the provincial press of this period. This is a much more difficult matter than it has been hitherto, as presses were established not in three or four places only, but in almost every town of any size. The history of provincial printing has never yet been written, and the task of tracing out the various printers and their work would be long and arduous. All that is attempted here is to give a sketch of the earlier and more important presses, adding in an appendix a chronological list of the places in which printing was carried on before 1750.

In the previous chapter it has been shown how the munificence of Bishop Fell and Francis Junius furnished the University of Oxford with an unusually large stock of excellent letter of all descriptions, so that it was in a position to do better work than any other house in the kingdom. Its productions, during the first twenty years of the eighteenth century, were in every way worthy of its reputation, and some of them deserve special mention.

In 1705 Hickee's *Linguarum Vett. Septentrionalium Thesaurus* was issued in three large folio volumes of great beauty. The work required many unusual founts, and these were mainly furnished from the bequest of Junius.

In 1707 the University published Mill's Greek Testament, which Wood in his *Athenæ Oxonienses* (vol. ii. p. 604) says had been begun in 1681 at Bishop Fell's printing-house near the theatre. The double pica italic used in this was a grand letter. Both the foregoing works were ornamented with handsome initial letters, and head and tail pieces engraved by M. Burghers, probably the first engraver of the day in this country. Many classical works were also produced in the same sumptuous manner, notably Hudson's edition of the Works of Dionysius, 1704, which it is difficult to praise too highly. The copies measured nearly eighteen inches in height, the paper was thick and good; the Greek and Latin texts were printed side by side, with notes at the foot, yet ample margins were left. In fact it is one of the finest examples of English printing of this period to be met with.

Cambridge was sadly behind her sister University. Neither Reed in his *Old English Letter Foundries*, nor Mr. Allnut in his valuable articles on Provincial Presses, has anything to say of it. Cornelius Crowndale was the University

printer at this time, but beyond an edition of Eusebius in three folio volumes, issued in 1720, no notable book came from his press, little in fact beyond reprints in octavo and duodecimo of classical works for the use of the scholars, and repeated editions of the Bible and Book of Common Prayer, full of errors, and so badly printed that the less said about them the better. We may notice, however, an edition of Butler's *Hudibras*, edited by Zachary Grey, in two octavo volumes, with Hogarth's plates, and two books by Conyers Middleton, *Bibliothecæ Cantabrigiæ ordinandæ methodus*, 1723, and *A Dissertation concerning the Origin of Printing in England*, 1735, both in quarto.

Among the earliest provincial presses at work in the beginning of the eighteenth century was that at Norwich, where Francis Burges was established in the year 1701. Thomas Tanner, afterwards Bishop of St. Asaph, sent John Bagford a broadside, printed by that printer, a list of the clergy that were to preach in the cathedral at Norfolk from November 1st, 1701, until Trinity Sunday following. In a MS. note at the foot Tanner says:—

'Dr. Bagford,—When you were at Cambridge, I thought you would have come to Norwich. I send this to put among your other collections of printers. It is the first thing that was ever printed here.'

In this statement, however, Tanner was wrong, unless we suppose this broadside to have been printed nearly five weeks in advance, as there had appeared, on September 27th, 1701, *Some Observations on the Use and Original of the Noble Art and Mystery of Printing*, by Francis Burges, which is also claimed as the first book printed at Norwich since the sixteenth century. There is also evidence that Burges began to issue a newspaper called *The Norwich Post* early in September. Among his other work of that year were sermons by John Jeffery and John Graile, and Humphrey Prideaux's *Directions to Churchwardens for the Faithfull Discharge of their Offices. For the Use of the Archdeaconry of Suffolk*. (Norwich 1701, quarto.) Francis Burges died in January 1706, leaving the business to his widow, who in the following year printed and published a little tract of eight quarto pages, with the title, *A true description of the City of Norwich both in its ancient and modern state*.

Meanwhile, in November of the preceding year, a second press was started in the town by Henry Crossgrove, who began to issue a paper called the *Norwich Gazette*.

Burges's business seems to have been taken by Freeman Collins, who printed from the same address, in 1713, Robert Pate's *Complete Syntax*. He in his turn was succeeded by Benjamin Lyon, who in 1718 reprinted the *True Description*, as *The History of the City of Norwich ... To which is added Norfolk's Furies: or a view of Kett's Camp*. (Norwich. Printed by Benj. Lyon near the Red-well, for Robert Allen and Nich. Lemon. 1718. 8vo. pp. 40.) He added to this some useful lists of bishops, etc., and a 'Chronological Account of Remarkable Accidents and Occurrences, to date,' in which the following entries occur:—

'1701. The first printing office was set up in Norwich, near the Red-well, by Francis Surges.

'1706. Sam. Hashart a distiller, set up a Printing Office, in Magdalen St., and sent for Henry Cross-grove from London to be his journeyman.'

Crossgrove appears to have continued work till 1739, being succeeded by William Chase, who had been printing since 1711, and who established the *Norwich Mercury* in 1727.

At Bristol the press that William Bonny had established in 1695 continued to flourish until 1713. About November 1702 he began to issue a weekly paper called the *Bristol Post-Boy*, which [Pg 251] ran until 1712, when it was either replaced or supplanted by Samuel Farley's *Bristol Postman*.

The Parleys were noted printers in the West of England at this time, and the above-named Samuel must not be confounded with Samuel Farley the Exeter printer.

In Cirencester printing began in 1718, in which year Thomas Hinton brought out the first number of the *Cirencester Post*, and the *Gloucester Journal* was printed in that city by R. Raikes and W. Dicey on April 9, 172-1/2. Robert Raikes continued printing there till 1750, and was succeeded by his son Robert, the founder of Sunday Schools.

In the neighbouring county of Devon the Exeter press, finally established after many vicissitudes in 1698 by Samuel Darker, is found busily at work in 1701, Darker having been joined by Samuel Farley, whose relation to the Samuel

Farley of Bristol offers an opportunity to some cunning genealogist to reap distinction. In 1701 Farley issued by himself John Prince's *Danmonii Orientales Illustres; or The Worthies of Devon*, a work of 600 folio pages, with coats of arms. It was certainly one of the largest works printed at that time by any provincial press outside the Universities. In point of workmanship all that can be said for it is that it was no worse than the[Pg 252] bulk of the work turned out by provincial presses; and it furnishes its own criticism in a list of errata on the last page, which closes with the words, 'with many others too tedious to insert.' Thomas Tanner, writing to Browne Willis in 1706, says that he has heard of a bi-weekly paper printing at Exeter. No copy of an Exeter paper of so early a date is known.

In 1705 Farley was joined by Joseph Bliss, and jointly they issued several books; but the partnership lasted a very short time, as by 1708 Joseph Bliss had set up for himself in the Exchange.

On September 24, 1714, Samuel Farley issued the first number of *The Exeter Mercury; or Weekly Intelligence of News*, which in the next year he transferred to Philip Bishop. In 1715 also Joseph Bliss started a rival sheet called the *Protestant Mercury, or The Exeter Post-Boy*, from his new printing-house near the London Inn. Meanwhile Farley appears to have left Exeter, for on September 27, 1715, he published the first number of the *Salisbury Post-Man*. In 1717 Andrew Brice, the most important of Exeter printers, began to print, his address then being 'At the Head of the Serge Market in Southgate Street,' from which he issued, some time in 1718, a paper called the *Post-Master, or the Loyal Mercury*. The history of this printer is too lengthy to be told here, and has already been ably written by Dr. T. N. Brushfield (*The Life and Bibliography of Andrew Brice*). Farley's name occurs again in 1723, when he returned to Exeter and started Farley's *Exeter Journal*. In November 1727 the burial of Samuel Farley is recorded in the registers at St. Paul's, Exeter. He was succeeded in business by an Edward Farley.

Another provincial press that revived very early in the eighteenth century was that of Worcester. It had been silent for upwards of a century and a half; but in June 1709 a printer from London, named Stephen Bryan, set up a press, and started a newspaper called the *Worcester Postman*. In 1722 the title was altered to the *Worcester Post, or Western Journal*. Bryan died in 1748, but just previous to his death he assigned his paper to Mr. H. Berrow, who then gave it the name it has ever since borne, that of *Berrow's Worcester Journal*.

Hazlitt, in his *Collections and Notes* (3rd Series, p. 282), mentions a book entitled *Tunbridgialia, or ye pleasures of Tunbridge*, a poem, as printed 'at Mount Sion at ye end of ye Upper Walk at Tunbridge Wells,' 1705.

At Canterbury printing was revived in 1717, and a very interesting record of it is in the British Museum in the form of a broadside with the following title:—

'A List of the names of the Mayor, Recorder, Aldermen & Common Council of the City of[Pg 254] Canterbury Who (In the year of our Lord 1717) promoted and encouraged the noble Art and Mystery of Printing in this City and County.' Canterbury, Printed by J. Abree for T. James, S. Palmer, and W. Hunter, 1718.' This John Abree died in 1765 at the age of seventy-seven.

Turning northward, the most important presses were those of York and Newcastle.

At York John White, who had settled in the city in 1680, was actively engaged in business in 1701, and he remained the sole printer there until his death in the year 1715. By his will, dated 31st July 1714, he gave his wife Grace White the use of one full half of his printing tools and presses, etc., for her life; and after her death he gave the same to his grandson, Charles Bourne, to whom he bequeathed the remaining half of his printing implements immediately upon his death. To John White, his son, he devised his real estate.

On the 23rd February 1718-19 Grace White issued the first York newspaper, *The York Mercury*. Upon her death in 1721 the printing-house was carried on by Charles Bourne until 1724, when he was in turn succeeded by Thomas Gent, who had served under John White in 1714-15, and married the widow of Charles Bourne. Davies in his *Memoirs of the York Press* (pp. 144 et seq.) gives a detailed and interesting biography of this printer, who, he says, has obtained a wider celebrity than any other York typographer. Gent was an engraver as well as printer, and was the author of a *History of York*, and other works. As a printer his work was wretched; there is little to be said for him as an engraver; while as an author he was below mediocrity. Nevertheless, he deserves credit for the interest he took in the history of York. His history of that city was published in small octavo in 1730, and he followed it up in

1735 with *Annales Regioduni Hullini, or The History of the Royal and Beautiful town of Kingston upon Hull*, also an octavo.

These works were quickly overshadowed by Drake's History, and from this time forward Gent's fortunes began to decline. He made an enemy of John White, the son of his old employer, with the result that White set up a press at York in 1725, and issued the first number of *The York Courant*, a weekly paper, but sold it and the business to Alexander Staples ten years later. Staples in turn was succeeded by Cæsar Ward and Richard Chandler—the first a bookseller in York, the second in London; but Chandler committed suicide in 1744, and left Ward to carry on the business alone. John Gilfillan was another printer at work in the city during this period. Thomas Gent lived to the age of eighty-seven, his death taking place on the 19th May 1778. In Newcastle, John White, the son of the York printer of that name, began printing in 1708. He started the *Newcastle Courant*, the first number of which appeared in 1711. In 1761 the firm became John White and Co., and in 1763 John White and T. Saint. White died in 1769, when he is said to have been the oldest printer in the kingdom. As has been noted, from 1725 to 1735 he had carried on a press at York in opposition to T. Gent. One or two other printers are found here for short periods, but little is known about them.

Among other towns possessing presses early in this century were—Nottingham, 1711; Chester, 1711; Liverpool, 1712; and Birmingham, 1716.

In America the number of printing presses increased but slowly during the first half of the eighteenth century. William Bradford in New York continued the only printer in that province for thirty years. He died on the 23rd May 1752, at the age of ninety-two. For fifty years he had been printer to the Government, and among the numerous books that came through his press were the *Book of Common Prayer* in quarto, in 1709, the only issue in America before the Revolution, a venture by which he is said to have lost heavily. He also printed a *Mohawk Prayer-book* in quarto; this was issued in 1715. On the 16th October 1725 he began to publish a weekly paper called *The New York Gazette*, and continued it until his retirement from business.

In 1726 a German named John Peter Zenger set up as a printer in New York. He is chiefly remembered as the printer of the second New York newspaper, the *New York Weekly Journal*, the first number of which was wrongly dated October 5th, 1733, instead of November 5th. The paper involved the printer in several actions for libel, and led to some lively passages with William Bradford. He is believed to have died about 1746. Bradford was succeeded as printer to the Government by James Parker, one of his apprentices, who is described as a neat workman. He continued the *New York Gazette*, with the alternative title, or *Weekly Post Boy*. He also issued in 1767 an edition of the *Psalms* in metre, one of the earliest books printed from type cast in America.

In 1753 Parker took into partnership William Weyman, but the connection lasted but a short time, Weyman setting up for himself in 1759. Parker also established presses at New Haven and Woodbridge in New Jersey. Among the later printers in New York were Hugh Guine (1750-1800); John Holt (1750-1784), printer to the State during the war; Robert Hodge (1770-1813); and Frederick Shober (1772-1806).

Philadelphia possessed only one printer until 1723—Andrew Bradford, son of William Bradford,[Pg 258] of New York. In 1723 Samuel Keimer set up near the Market House. It was this printer whom Benjamin Franklin worked for in his early days. Bradford started the *American Weekly Mercury* on Tuesday, November 22nd, 1719; and the *Pennsylvania Gazette*, afterwards carried on by Franklin and Meredith, was first printed by Keimer. Andrew Bradford died in 1742. Perhaps the most notable of Keimer's books was the folio edition of Sewell's *History of the Quakers*, which he began in 1725. It was a work of upwards of seven hundred pages and Keimer soon found that he had taken the contract at a ruinous rate. It was only by the help of Franklin and Meredith that he was enabled to finish it in 1728.

Benjamin Franklin's history hardly needs retelling. His career as a printer began in the shop of his brother James at Boston in 1717. Differences arose between them which ended in Franklin's setting out for New York. Work was not to be had there, and by the advice of William Bradford he moved on to Philadelphia. There for some months he worked for Samuel Keimer until, deluded by the promises of Governor Keith, he took ship for England with a view of obtaining materials for a printing office. While in England he worked for James Watts in Bartholomew Close, and James Palmer. On his return to America he once more entered Keimer's office as a journeyman. But after a short time, in company with Hugh Meredith, he set up in business for himself. He was the proprietor and printer of *Poor*

Richard's Almanack, which became celebrated, and also of the Pennsylvania Gazette. After a long and prosperous career Franklin died, on April 19th, 1790, at the age of eighty-five.

Boston was the home of more printers than any other place in America during the eighteenth century. To give anything like a history of even a few of them would be beyond the limits of this work. Only one or two of the more important can be even noticed.

Thomas Fleet arrived in Boston in 1712, set up as a printer, and for nearly fifty years carried on business there. His issues were principally pamphlets for booksellers, small books for children, and ballads. He was also the proprietor of a newspaper called the Weekly Rehearsal, first begun in September 1731. At his death in July 1758, he left three sons, two of whom succeeded him in business.

In 1718 Samuel Kneeland set up in Prison Lane, and his printing house continued for eighty years. He was one of the printers of the Boston Gazette, and he started besides several other journals. Thomas in his history (vol. i. p. 207) says that Kneeland, in company with Bartholomew Green, printed a small quarto edition of the English Bible with Mark Baskett's imprint, but this is not confirmed. Kneeland died on December 14th, 1769. Another celebrated printer in the city of Boston was Gamaliel Rogers, who began business about 1729. In 1742 he entered into partnership with Daniel Fowle. In the following year they issued the first numbers of the American Magazine, and in 1748 started the Independent Advertiser. The partnership with Fowle was dissolved in 1750. Rogers subsequently moved to the western part of the town, but suffered from a fire, which destroyed his plant. He died in 1775.

Daniel Fowle, on the dissolution of his partnership with Rogers, set up for himself. He was arrested in 1754 for printing a pamphlet reflecting on some members of the House of Representatives, and was thrown into prison for several days. Upon his release, he at once left the town and set up in Portsmouth, New Hampshire, where he started the New Hampshire Gazette. He was succeeded in his Boston business by his brother Zachariah Fowle, who continued printing there until the Revolution, when he also retired to New Hampshire, where he died in 1776.

CHAPTER X 1750-1800

the improvement in printing which Caslon had begun quickly spread to other parts of the kingdom, even as far north as Scotland, where, before the middle of the century, there was established at Glasgow a press that became notable for the beauty of its productions.

Robert and Andrew Foulis, the founders of this press, were the sons of Andrew Faulls and Marion Paterson, Robert being born at Glasgow on April 20th, 1707, and his brother on November 23rd, 1712.

Robert Foulis was apprenticed to a barber, but his love for literature led him to study at the University, where he attended the moral philosophy lectures of Francis Hutcheson, who advised him to become a bookseller and printer. His brother, Andrew, entered the University at a later date, destined for the ministry, and during their vacations they travelled throughout England and on the Continent. In the course of these travels they sought for and brought back with them many rare and beautiful books, and gained a wide knowledge of the book trade.

At length, in 1741, Robert Foulis set up as a bookseller in Glasgow. In some of his earlier publications will be found lists of books printed and sold by him, which are very interesting. One of these, which enumerates fifteen books, includes a Greek Testament, Buchanan's edition of the Psalms, Burnet's Life of the Earl of Rochester, seven or eight classics, among which were a Cicero, Juvenal, Cornelius Nepos, Phædrus, and Terence, and two of Tasso's works. The Terence was printed for him by Robert Urie, and shows some excellent founts of small italic and Roman. Robert Foulis seems to have begun printing on his own account in 1742, and among his earliest patrons was Professor Hutcheson, for whom he printed a treatise entitled *Metaphysicæ Synopsis*, a duodecimo of ninety pages, and a work on Moral Philosophy of three hundred and thirty pages. He also printed in the same year the second and third editions of a sermon preached by William Leechman before the Synod of Glasgow and Ayr, *The Meditations of the Emperor Marcus Aurelius Antoninus*, and editions of Cicero and Phædrus. All these were in duodecimo or small octavo, printed in a clear readable type, that probably came from Urie's foundry. On the 31st March 1743, Robert Foulis was appointed printer to the University of Glasgow, and published *Demetrius Phalerus de Elocutione* in two sizes, quarto and octavo. This was the first book printed at Glasgow in Greek type, the Greek and Latin renderings being printed on opposite pages—the Latin in a fount of English Roman that cannot be distinguished

from Caslon's letter, while the italic also has a strong resemblance to that of the English founder. Among other productions of the year 1743 was a specimen of another Glasgow man's work, Bishop Burnet's translation of Sir Thomas More's *Utopia*, to which was prefixed Holbein's portrait of the great Chancellor.

In 1744 Dr. Andrew Wilson, who for some years had been furnishing Scotch and Irish printers with types from his foundry, moved to Camlachie, a spot within a mile of Glasgow, and at once began to furnish letter for Robert Foulis. In the same year Robert took his brother Andrew into partnership, and the firm quickly became famous for the beauty and correctness of their classics, beginning with the edition of Horace, which, from the fact of its having only six errors in the text, was christened the immaculate. Other attractive books were the Sophocles of 1745, quarto; Cicero in twenty volumes, small octavo; the small folio edition of Callimachus, which took the silver medal offered in Edinburgh for the finest book of not fewer than ten sheets; the magnificent Homer, which Reed in his *Old English Letter Foundries* describes as 'for accuracy and splendour the finest monument of the Foulis press.' But the Foulis press did not confine itself to classics only. It published several fine editions of English authors, among them a folio edition of Milton's *Paradise Lost*, and editions of the poems of Gray and Pope. In 1775 Andrew Foulis died suddenly. The blow was very severely felt by his brother, and coming as it did upon the failure of his Academy of Arts, completely crushed him. He removed his art collection to London for sale; but here another disappointment awaited him—the sum realised after paying expenses being fifteen shillings. He returned to Edinburgh, and was on the point of starting for Glasgow when he died on the 2nd June 1776. The Foulis press was carried on by the younger Andrew Foulis until the end of the century.

In England, the chief event of this period was the appearance of John Baskerville at Birmingham.

No satisfactory biography of Baskerville has yet been written, but the best sketches of his life are those by the late T. B. Reed in his *History of the Old English Letter Foundries* (chap. xiii.), which contains some highly interesting and valuable correspondence between Baskerville and his publisher, R. Dodsley, and the more recent article in the *Dictionary of National Biography*, from the pen of Mr. Tedder.

JOHN THOMAS BASKERVILLE.

John Baskerville was born in 1706 at Wolverley, a village in Worcestershire. No one has discovered where he was educated: yet this is one of the points upon which we should like to know something, because it is generally admitted that he was a very beautiful writer; indeed, it was to his love of calligraphy that we owe the regular and well-proportioned letters associated with his name. For some time he earned his living as a writing-master; after which he appears to have gone into the japanning trade, and in 1750 embarked some capital in a letter foundry. Another point upon which his biographers are silent is the place where he learnt the art of printing. For we know that the punches of his foundry were not cut by himself, and that he was not in any sense a practical printer; yet he must have obtained some knowledge of the rudiments of the art before taking over the responsibilities of a foundry of his own. Baskerville appears to have employed the most skilled artists he could obtain, and it is said that he spent upwards of £600—some say £800—before he obtained a fount to suit him. His letters to Dodsley show how anxious he was to attain perfection. The result of all this care and labour was shown in the quarto edition of Virgil which appeared in 1757, and was followed by quarto editions of Milton's *Paradise Lost* and *Paradise Regained*.

The appearance of Baskerville's publications gave rise to no little controversy. By some they were hailed with unstinted praise; while others, such as Mores and Dr. Bedford, looked upon them with something little short of contempt. Yet it is difficult to understand the grounds of these adverse criticisms. As regards type, there is very little to choose between Caslon's Roman and that of Baskerville, while the italic of Baskerville was unquestionably the most beautiful type that had ever been seen in England; and the ridiculous criticism passed on it that its very fineness was injurious to the eyesight, was shown to be utterly worthless by Franklin's letter to the printer, which is printed in Reed's *Old English Letter Foundries*. But there are also other features of excellence about these books of Baskerville's. They are simplicity itself. There is not a single ornament or tail-piece introduced into them to divide the attention. The books were printed with deep and wide margins, and the lines were spaced out with the very best effect.

The first public body to recognise Baskerville's ability was the University of Oxford, which in July 1758 empowered him to cut a fount of Greek types for 200 guineas. This order proved to be beyond his power. It is generally admitted that his Greek type was a failure, and he wisely made no further attempts at cutting learned characters. Some of the

punches of Baskerville's Greek types are still preserved at Oxford, and are the only specimens of his foundry that we have.

In his Preface to *Paradise Lost*, Baskerville stated that the extent of his ambition was to print an octavo Prayer Book and a folio Bible. In connection with this ambition, he applied to the University of Cambridge for appointment as their printer, a privilege which was granted to him, but at the cost of such a heavy premium that he obtained no pecuniary profit from it. The Prayer Book printed in two forms appeared in 1760, and the same year saw the prospectus and specimen of the Bible issued, the Bible itself appearing in 1763 in imperial folio. Both are beautiful specimens of the printer's art.

But Baskerville soon became disgusted with the ill-natured criticism to which he was subjected, coupled with the failure of booksellers to support him, and was anxious to have done with the business. The year before the publication of the Bible, he wrote to Horace Walpole a letter given by Reed (p. 278) in which he says that he is sending specimens of his foundry to foreign courts in the hope of finding among them a purchaser for the whole concern, and during the next few years he was in correspondence with Franklin with the same object. Fortunately for his country, these attempts were unsuccessful during his life-time, and between the years 1760-1773 he produced not only several editions of the Bible and Common Prayer, but the works of Addison, 4 vols. 1761, 4to; the works of Congreve, 3 vols. 1761, 8vo; *Æsop's Fables*; and in 1772 a series of the classics in quarto, which, Reed says, 'suffice, had he printed nothing else, to distinguish him as the first typographer of his time' (p. 281).

Baskerville died on January 8th, 1775, and for a few years his widow carried on the foundry; but at the same time endeavoured to dispose of it. Both our Universities refused it, and no London foundry would touch it, because the booksellers would have nothing but the types of Caslon and Jackson. The type was eventually sold in 1779 to the *Société Littéraire-typographique* of France for £3700, and was used in a sumptuous edition of the works of Voltaire.

Yet one firm was found bold enough to model its letter on that of Baskerville. In 1764 Joseph Fry, a native of Bristol, began letter-founding in that city. He took as a partner William Pine, proprietor of the *Bristol Gazette*, but the business was not carried on in their name but in that of Isaac Moore, their manager. In 1768 they removed the foundry to London, and issued a prospectus. But so strong was the prejudice against Baskerville's letter—or, perhaps, it would be better to say, so strong was the hold which Caslon's foundry had obtained—that they were compelled to recast the whole of their stock. This took them several years; meanwhile, they issued one or two editions of the Bible in their first fount. In 1776 Isaac Moore severed his connection with the firm. In 1782 Mr. Pine also withdrew, and Joseph Fry admitted his two sons, Edmund and Henry, into partnership. At length in 1785 appeared the first specimen-book of Fry's foundry, and it was frankly admitted in the preface that the founts of Roman and italic were modelled on those of Caslon.

Joseph Fry retired from the business in 1787. Amongst the books printed with his later type may be mentioned the quarto edition of the classics edited by Dr. Homer.

Caslon the First died at Bethnal Green on January 23rd, 1766. His son, Caslon the Second, died intestate on the 17th August 1778, when the business came to his son, William Caslon the Third. In the same year that Joseph Fry published his *Specimen of Types*, Caslon the Third also published a specimen-book of sixty-two sheets, in every way worthy of the reputation the firm had established. It included, besides Romans and italics of great beauty and regularity, every variety of oriental and learned founts, and several sheets of ornaments and flowers, arranged in various designs. This book was dedicated to the king, and contained an address to the reader in which, after reviewing the establishment of the foundry, Caslon referred bitterly to the eager rivalry of other printers and their open avowal of imitation. In 1793 Caslon the Third disposed of his share in the Chiswell Street business to his mother and his brother Henry's widow.

Mrs. William Caslon, senior, died in October 1795, when the business was sold by auction and bought by Mrs. Henry Caslon for £520.

Joseph Jackson, who shared with the Caslons the favour of the London booksellers, was one of two apprentices formerly in the employ of William Caslon II. Some dispute arose in the foundry about the price of certain work, and Joseph Jackson and Thomas Cottrell, having acted as ringleaders in the movement, were dismissed, and being thrown on their own resources, set up a foundry of their own in Nevil's Court, Fetter Lane. Of the two Jackson

proved far the more skilful, but seems to have been of a roving disposition. After working for a year or two with Cottrell he went to sea, leaving Cottrell to carry on the business alone. This he did with a fair measure of success, though his foundry was never at any time a large one. After a few years' absence Jackson returned to England in 1763, and again turned his attention to letter-cutting, serving for a time under his old partner Cottrell; but having obtained the services and, what was of more value, the pecuniary help of two of Cottrell's workmen, he set up for himself, and quickly took a foremost place in the trade. Among his most successful work was a fount of English 'Domesday,' for the Domesday Book published by order of Parliament in 1783, which was preferred to that cut by Cottrell for the same purpose. Jackson also cut a fount for Dr. Woide's facsimile of the Alexandrian Codex with great success. But perhaps his most successful effort was the two-line English which he cut for Macklin's edition of the Bible, begun in 1789. At the time of his death in 1792 he was at work upon a fount of double pica for Bowyer's edition of Hume's History of England. After his death his foundry was purchased by William Caslon III.

Both Macklin's Bible and Hume's History were printed at the press of Thomas Bensley in Bolt Court, Fleet Street. As a printer of sumptuous books Bensley had only one rival, William Bulmer, who is generally accorded the first place. But Bensley was certainly earlier in the field. His work was quite equal to that of Bulmer, and, apart from this, the world owes more to his enterprise than it has ever yet acknowledged.

Thomas Bensley was the son of a printer in the Strand, and in 1783 he succeeded to the business of Edward Allen in Bolt Court, a house adjoining that in which Johnson had lived. He at once turned his attention to printing as a fine art. Dibdin, in his *Bibliographical Decameron* (vol. ii. p. 397, etc.), gives a list of the works printed by Bensley, and says that he began with a quarto edition of Lavater's *Physiognomy* in 1789, following this up with an octavo edition of Allan Ramsay's *Gentle Shepherd* in 1790. In this list, however, Dibdin has omitted the folio edition of Bürger's poem *Leonora*, printed by Bensley in 1796, with designs by Lady Diana Beauclerc. In 1797 he printed a very beautiful edition of Thomson's *Seasons*, in royal folio, with engravings by Bartolozzi and P. W. Tomkins from pictures by W. Hamilton.

But the chief glories of his press are the Bible and Hume's History. The first was begun in 1789; but Jackson's death caused some delay when the Book of Numbers had been reached, owing to more type being required. For some reason, not clearly shown, Bensley would not employ Caslon, but applied to Vincent Figgins, who for ten years had been in the service of Jackson, to complete the type. Figgins' foundry was in Swan Yard, Holborn, where he had established himself after Jackson's death in 1792. He succeeded with the task set him, and his type, which was an exact facsimile of Jackson's, was brought into use in the Book of Deuteronomy. The whole work was completed in seven volumes, in the year 1800, and this date appears on the title-page; but the dedication to the king was dated 1791, and the plates, which were the work of Louthembourg, West, Hamilton, and others, were variously dated between those years. The text was printed in double columns, in a handsome two-line English, with the headings to chapters in Roman capitals, no italic type being used, and no marginalia.

Robert Bowyer's edition of Hume was in the press at the time of Jackson's death, but was not completed until 1806. The type used in this is a double pica, and the founder, it is said, declared that it should 'be the most exquisite performance of the kind in this or any other country.' He died before its completion, and the work was completed by Figgins; but the book is a lasting memorial to the skill both of the founder and the printer.

In January 1791 appeared the first number of Boydell's Shakespeare. The history of this notorious undertaking was briefly this. Boydell was an art publisher in Pall Mall, where he had established a gallery and filled it with the work of Sir Joshua Reynolds, Benjamin West, Opie, and Northcote, chiefly in Shakesperian subjects. George Nicol the bookseller proposed to the Boydells that William Martin, brother of Robert Martin of Birmingham, should be employed to cut a set of types with which to print an edition of Shakespeare's works, to be illustrated with the drawings then in Boydell's gallery. This William Martin had learnt his art in the foundry of Baskerville; and such is the irony of fate, that less than twenty years after the death of that eminent founder, his work, scorned by the booksellers of London in his own day, was imitated in what was certainly one of the most pretentious books that had ever come from the English press. The printer selected for the work was William Bulmer, a native of Newcastle-upon-Tyne, where he was apprenticed to Mr. Thomson, the printer, of Burnt House Entry, St. Nicholas Churchyard. At that time he formed a friendship with Thomas Bewick, the engraver, who in his *Memoir* tells us that Bulmer used to 'prove' his cuts for him.

After serving his time, Bulmer came to London and entered the printing-office of John Bell, who was then issuing a miniature edition of the poets. A fortunate accident won him his acquaintance with Boydell and Nicol, and so led to his subsequent employment at the Shakespeare press.

The Shakespeare was followed by the works of Milton in three volumes folio in 1794-5-7, and again in 1795 by the Poems of Goldsmith and Parnell in quarto. In the advertisement to this work, Bulmer pointed out how much had been done by English printers within the last few years to raise the art of printing from the low depth to which it had fallen—a work in which the Shakespeare press had borne no little part. He went on to say that much pains had been taken with this edition of Goldsmith to make it a complete specimen of the arts of type and block printing. The types were Martin's, the woodcuts Bewick's, and the paper Whatman's. One copy of this book was printed on white satin, and three on English vellum.

Among the books that appeared within the last five years of the century was an edition of Lucretius in three volumes large quarto, which certainly ranks for beauty of type and regularity of printing with any book of that period. Like most of the works of Baskerville, this book was quite free from ornament, and claims admiration only from the excellence of the press-work. The notes were printed in double columns in small pica, the text itself in double pica. In the whole three volumes not a dozen printer's errors have been found. This work came from the press of Archibald Hamilton.

Time has not dealt kindly with some of these specimens of what was called 'fine' printing. After the lapse of a century, we begin to see that though the type and press-work were all that could be desired, and placed the English printers on a level with the best of those on the Continent, there was something radically wrong with the production of illustrated books. Whether it was due to the ink, or to the paper, or, as some suppose, to insufficient drying, in all these sumptuous volumes the oil has worked out of the illustrations, leaving an ugly brown stain on the opposite pages, and totally destroying the appearance of the books. This applies not only to large and small illustrations, but in many cases to the ornamental wood blocks used for head and tail pieces. In Macklin's Bible, and in the 'Milton' printed at the Shakespeare press, this discoloration has completely ruined what were undoubtedly, when they came from the press, extremely beautiful works.

Before leaving the work of the eighteenth century, a word or two must be said about the private presses that were at work during that time. The first place must, of course, be given to that at Strawberry Hill. None of the curious hobbies ridden by Horace Walpole became him better, or was more useful, than his fancy for running a printing-press. He was not devoid of taste, and though no doubt he might have done it better, he carried this idea out very well. The productions of his press are very good examples of printing, and are far above any of the other private press work of the eighteenth century. His type was a neat and clear one, though somewhat small, and the ornaments and initial letters introduced into his books were simple and in keeping with the general character of the types, without being in any sense works of art. The following brief account of the Strawberry Hill press is compiled from Mr. H. B. Wheatley's article in *Bibliographica*, and from Austin Dobson's delightful *Horace Walpole, a Memoir*, 1893.

The press was started in August 1757 with the publication, for R. Dodsley, of two 'Odes' by Gray. 'I am turned printer, and have converted a little cottage into a printing office,' he tells one friend; and to another he writes, 'Elzevir, Aldus, and Stephens are the freshest persons in my memory'; and referring to the 'Odes,' he writes to John Chute in July 1757, 'I found him [Gray] in town last week; he had brought his two Odes to be printed. I snatched them out of Dodsley's hands.'

Walpole's first printer was William Robinson, an Irishman, who remained with him for two years. The Odes were followed by Paul Hentzner's *A Journey into England*, of which only 220 copies were printed. In April 1758 came the two volumes of Walpole's *Catalogue of Royal and Noble Authors*, of which 300 copies were printed and sold so rapidly, that a second edition—not printed at Strawberry Hill—was called for before the end of the year.

In 1760 Walpole wrote to Zouch, in reference to an edition of Lucan, 'Lucan is in poor forwardness. I have been plagued with a succession of bad printers, and am not got beyond the fourth book.' It was published in January 1761, and in the following year appeared the first and second[Pg 278] volumes of *Anecdotes of Painting in England*, with plates and portraits, and having the imprint, 'Printed by Thomas Farmer at Strawberry Hill, MD.CCLXII.' Then another difficulty appears to have arisen with the printers, and the third volume, published in 1763, had no printer's

name in the imprint. The fourth volume, not issued till 1780, bears the name of Thomas Kirgate, who seems to have been taken on in 1772, and held his post until Walpole's death. Between 1764 and 1768 the Strawberry Hill press was idle, but in the latter year Walpole printed in octavo 200 copies of a French play entitled *Cornélie Vestale*, Tragédie, and from that time down to 1789 it continued at work at intervals, its chief productions being *Mémoires du Comte de Grammont*, 1772, 4to, of which only 100 copies were printed, twenty-five of which went to Paris; *The Sleep Walker*, a comedy in two acts, 1778, 8vo; *A description of the villa of Mr. Horace Walpole*, 1784, 4to, of which 200 copies were printed; and *Hieroglyphic Tales*, 1785, 8vo.

Next to the press of Horace Walpole, that of George Allan, M. P. for Durham, at the Grange, Darlington, must be noticed. The owner was an enthusiastic antiquary, and he used his press chiefly for printing fugitive pieces relating to the history of the county of Durham. The first piece with a date was *Collections relating to St. Edmunds Hospital*, printed in 1769, and the last a tract which he printed for his friend Thomas Pennant in 1788, entitled *Of the Patagonians*, of which only 40 copies were worked off.

The productions of his press were very numerous, but of no great merit. Allan was his own compositor, and gave much time to his hobby; but his printer appears to have been a dissolute and dirty workman, who caused him much annoyance and trouble. Altogether it may safely be said that Allan's press cost him a great deal more than it was worth.

Another of those who tried their hand at amateur printing was Francis Blomefield, the historian of Norfolk, who started a press at his rectory at Fersfield. Here he printed the first volume of his *History* in 1736, and also the *History of Thetford*, a thin quarto volume, in 1739. But the result was an utter failure. The type was bad to begin with, and the attempt to use red ink on the title-pages only made matters worse. The press-work was carelessly done; and it is not surprising to find that the second volume of the *History*, published in 1745, was entrusted to a Norwich printer.

The celebrated John Wilkes also carried on a private printing-office at his house in Great George Street, Westminster. Three specimens of its work have been identified: *An Essay on Woman*, 1763, 8vo, of which only twelve copies [Pg 280] are said to have been printed [19]; a few copies of the third volume of the *North Briton*; and *Recherches sur l'Origine du Despotisme Orientale*, *Ouvrage posthume de M. Boulanger*, 1763, 12mo. A note in a copy of this volume states that it was printed by Thomas Farmer, who had also assisted Horace Walpole at the Strawberry Hill press.

During the last four years of the century the Rev. John Fawcett, a Baptist minister of some repute, established a press in his house at Brearley Hall, near Halifax, which he afterwards removed to Ewood Hall. He used it chiefly for printing his own sermons and writings, among the most important issue's being *The Life of Oliver Heywood*, 1796, pp. 216; *Miscellanea Sacra*, 1797; *A Summary of the Evidences of Christianity*, 1797, pp. 100; *Constitution and Order of a Gospel Church*, 1797, pp. 58; *The History of John Wise*, 1798; *Gouge's Sure Way of Thriving*; *Watson's Treatise on Christian Contentment*; and *Dr. Williams's Christian Preacher*. Most of these were in duodecimo.

The type used in this press was a very good one, and the press-work was done with care. Owing to his growing infirmities Fawcett was obliged to dispose of the press in 1800. There is reason to believe that the above list might be considerably increased. At Bishopstone, in Sussex, the Rev. James Hurdis printed several works at his own press, the most important being a series of lectures on poetry, printed in 1797, a quarto of three hundred and thirty pages, and a poem called *The Favorite Village*, in 1800, a quarto of two hundred and ten pages.

To these must be added a press at Lustleigh, in Devon, made and worked by the Rev. William Davy, and at which was printed some thirty copies of his *System of Divinity*, 26 vols. 1795, 8vo, a copy of which remarkable work is now in the British Museum, and is considered one of its curiosities; a press at Glynde, in Sussex, the seat of Lord Hampden, from which at least one work can be traced; and a press at Madeley, in Shropshire, from which several religious tracts were printed in 1774 by the Rev. John Fletcher, and in 1792 a work entitled *Alexander's Feast*, by Dr. Beddoes.

CHAPTER XI THE PRESENT CENTURY

It has been said that printing sprang into the world fully armed. At least this is certain, that for nearly four centuries after its birth the printing-press in use in all printing-houses remained the same in form as that which Caxton's workmen had used in the Red Pale at Westminster. There had been some unimportant alterations made in it by an Amsterdam printer in the seventeenth century; but until the year 1800 no important change in the form or mechanism of the printing-press had ever been introduced. Some such change was sorely needed. The productive powers of the old press were quite unable to keep pace with the ever-increasing demand for books and newspapers that a quickened intelligence and national anxiety had awakened. Up to 1815 England was constantly at war, and men and women alike were eager for news from abroad. In 1800 Charles Mahon, third Earl Stanhope, invented a new printing-press.

The Stanhope press substituted an iron frame work for the wooden body of the old press, thus giving greater solidity. The platen was double the size of that previously in use, thus allowing a larger sheet to be printed, and a system of levers was adopted in place of the cumbersome handlebar and screw used in the wooden press. The chief merits of the new invention were increased speed, ease to the workman, evenness of impression, and durability. Further improvements in the mechanism of hand machines were secured in the Columbian press, an American invention, brought to this country in 1818, and later in the Albion press, invented by R. W. Cope of London, and since that time by many others. Yet even with the best of these improved presses no more than 250 or 300 impressions per hour could be worked off, and the daily output of the most important paper only averaged three or four thousand copies. But a great and wonderful change was at hand.

In 1806 Frederick Koenig, the son of a small farmer at Eisleben in Saxon Prussia, came to England with a project for a steam printing press. The idea was not a new one, for sixteen years before an Englishman, named William Nicholson, took out a patent for a machine for printing, which foreshadowed nearly every fundamental improvement even in the most advanced machines of the present day. But from want of means, or some other cause, Nicholson never actually made a machine. Nor did Koenig's project meet with much encouragement until he walked into the printing-house of Thomas Bensley of Bolt Court, who encouraged the inventor to proceed, and supplied him with the necessary funds. There is reason to believe that Koenig made himself acquainted with the details of Nicholson's patent during the time that his machine was building. He also obtained the assistance of Andrew F. Bauer, an ingenious German mechanic. His first patent was taken out on the 29th March 1810, a second in 1812, a third in 1814, and a fourth in 1816. The first machine is said to have taken three years to build, and upon its completion was erected in Bensley's office in Bolt Court. There seems to be considerable uncertainty as to what was the first publication printed on it. Some say it was set to work on the Annual Register, one writer asserting that in April 1811, 3000 sheets of that publication were printed on it; but Mr. Southward, in his monograph *Modern Printing*, confines himself to the statement that two sheets of a book were printed on the machine in 1812. Curiously enough neither Bensley's publication, the Annual Register, nor the Gentleman's Magazine takes any notice of the new invention, although in the Gentleman's Magazine for 1811 there is a notice of a printing machine invented at Philadelphia, which apparently embodied all the same principles as Koenig's (*Gent. Mag.*, vol. lxxxix. p. 576).

In 1814 John Walter, the second proprietor of the Times, saw Koenig's machine, and ordered one to be supplied to the Times office, the first number printed by steam being that of the 28th November 1814. This machine was a double cylinder, which printed simultaneously two copies of a forme of the newspaper on one side only. But it was a cumbersome and complicated affair, and its greatest output 1800 impressions per hour.

In 1818 Edward Cowper, a printer of Nelson Square, patented certain improvements in printing, these improvements consisting of a better distribution of the ink and a better plan for conveying the sheets from the cylinders. Having joined his brother-in-law, Augustus Applegarth, they proceeded to make certain alterations in Koenig's machine in Bensley's office which at one stroke removed forty wheels, and greatly simplified the inking arrangements. In 1827 they jointly invented a four-cylinder machine, which Applegarth erected for the Times. The distinctive features of this machine were its ability to print both sides of a sheet at once, its admirable inking apparatus, and great acceleration of speed, the new machine being capable of printing five thousand copies per hour. These machines at once superseded the Koenig, and were to be found in use in all parts of the country for printing newspapers until quite lately. In 1848 the same firm constructed an eight-cylinder vertical machine, which was one of the sights of the Great Exhibition of 1851. Shortly afterwards Messrs. Hoe, of New York, made further improvements in the mechanism, raising the output to 20,000 per hour. All these machines had to be fed with paper by hand, but in 1869 it occurred to Mr. J. C. Macdonald, the manager of the Times, and Mr. J. C. Calverley, the chief engineer of the same office, that much saving of labour would result if paper could be manufactured in continuous rolls; and the

result of their experiments was the rotary press, which was named after Mr. John Walter, the fourth of that name, then at the head of the Times proprietorship. Since then the improvement in printing machines has steadily continued, and may be said to have culminated in the Hoe 'double supplement' press in use at the present day in many newspaper offices, which is capable of printing, cutting, and folding 24,000 copies per hour of a full-sized newspaper.

These great changes in presses and press-work have occasioned similar changes in type-founding.

At the beginning of the century, the firm of Caslon had been given a new lease of life by the energy of Mrs. Henry Caslon, who in 1799 had [Pg 287] purchased the foundry, a third share in which a few years earlier had been worth £3000, for the paltry sum of £520. She at once set to work to have new founts of type cut, and was ably helped by Mr. John Isaac Drury. The pica then produced was an improvement in the style of Bodoni, and quickly raised the foundry to its old position. Mrs. Caslon took into partnership Nathaniel Catherwood, but both died in the course of the year 1809. The business then came into the hands of Henry Caslon II., who was joined by John James Catherwood. Other notable firms were those already noticed in the last chapter—Mrs. Fry, Figgins, Martin, and Jackson. One and all of these suffered severely from the change in the fashion of types at the beginning of the century, the ugly form of type, known as fat-faced letters, then introduced, remaining in vogue until the revival of Caslon's old-faced type by the younger Whittingham.

Upon the advent of machinery and cylinder printing, the use of movable type for printing from was supplemented by quicker and more durable methods, and William Ged's long-despised discovery of stereotyping is now an absolutely necessary adjunct of modern press-work. This, again, was in some measure due to Earl Stanhope, who in 1800 went to Andrew Tilloch, and Foulis, the Glasgow printer, both of whom had taken out a patent for the invention, and learnt [Pg 288] from them the process. He afterwards associated himself with Andrew Wilson, a London printer, and in 1802 the plaster process, as it was called, was perfected. This remained in use until 1846, when a system of forming moulds in papier mâché was introduced, and this was succeeded by the adaptation of the stereo-plates to the rotary machines.

It would be foreign to the purpose of this work, which is concerned with printing as applied to books, to attempt to describe the Linotype and its rival processes which have been recently introduced to further facilitate newspaper printing. We must, therefore, return to our book-printers, and note first that the Shakespeare Press of William Bulmer, for which Martin the type-founder was almost exclusively employed, continued to turn out beautiful examples of typographic work during the early years of the nineteenth century. A list of the works issued from this press up to 1817 is given by Dibdin in his notes to the second volume of his Decameron, pp. 384-395. Some of the chief items were *The Arabian Nights Entertainments*, 5 vols. 1802, 8vo; *The Book of Common Prayer*, with an introduction by John Reeves, 1802, 8vo; *The Itinerary of Archbishop Baldwin through Wales*, translated by Sir R. C. Hoare, 2 vols. 1806, 4to; *Richardson's Dictionary of the Arabic and Persian Languages*, 2 vols. 1806-10, 4to; Hoare's [Pg 289] *History of Wiltshire*, 1812, folio; Dibdin's *Typographical Antiquities*, 4 vols. 1812, 4to; and the same author's *Bibliotheca Spenceriana*, 4 vols. 1814-15, 8vo, and *Bibliographical Decameron*, 3 vols. 1817, 8vo. These three last are considered to be some of the best work of this press, which also turned out many books for private circulation only. William Bulmer died on September 9th, 1830, after a long and active life, and was succeeded by his partner Mr. William Nichol.

Nor had Thomas Bensley slackened anything of his enthusiasm for fine printing. Twice during the first twenty years of the century he suffered severely by fire: the first time in 1807, when a quarto edition of Thomson's *Seasons*, an edition of the *Works of Pope*, and many other books were destroyed; the second in 1819, on June 26th, when the premises were totally burnt down. This was followed by the death of his son, and shortly afterwards he retired from business, and died on September 11th, 1835. Not only was he an excellent printer, but he did more than any other man of his time to introduce the improved printing machine into this country.

John Nichols was another of the great printers of his day, and he too was burnt out on the night of February 8th, 1808. No better account of the magnitude of his undertakings at that time could be found than his own description of the disaster, [Pg 290] which he contributed to the *Gentleman's Magazine* in the following March:—

'Amongst the books destroyed are many of very great value, and some that can never be replaced. Not to mention a large quantity of handsome quarto Bibles, the works of Swift, Pope, Young, Thomson, Johnson, etc. etc., the *Annals*

of Commerce, and other works which may still be elsewhere purchased, there are several consumed which cannot now be obtained at any price. The unsold copies of the introduction to the second volume of the Sepulchral Monuments; Hutchins' Dorsetshire; Bigland's Gloucestershire; Hutchinson's Durham; Thorpe's Registrum and Custumale Roffense; the few numbers that remained of the Bibliotheca Topographica; the third volume of Elizabethan Progresses; the Illustrations of Ancient Manners; Mr. Gough's History of Pleshy, and his valuable account of the Coins of the Seleucidæ, engraved by Bartolozzi; Colonel de la Motte's Allusive Arms; Bishop Atterbury's Epistolary Correspondence; and last, not least, the whole of six portions of Mr. Nichols' Leicestershire, and the entire stock of the Gentleman's Magazine from 1782 to 1807, are irrecoverably lost.'

'Of those in the press, the most important were the concluding portion of Hutchins' Dorsetshire (nearly finished); a second volume of Manning and Bray's Surrey (about half printed);[Pg 291] Mr. Bawdwin's translation of Domesday for Yorkshire (nearly finished); a new edition of Dr. Whitaker's History of Craven; Mr. Gough's British Topography (nearly one volume); the sixth volume of Biographia Britannica (ready for publishing); Dr. Kelly's Dictionary of the Manx Language; Mr. Neild's History of Prisons; a genuine unpublished comedy by Sir Richard Steele; Mr. Joseph Reid's unpublished tragedy of Dido; four volumes of the British Essayists; Mr. Taylor Combe's Appendix to Dr. Hunter's Coins; part of Dr. Hawes' annual report for 1808; a part of the Biographical Anecdotes of Hogarth; two entire volumes, and the half of two other volumes of a new edition of the anecdotes of Mr. Bowyer,' etc.

Writing to Bishop Percy in July of that year, Nichols stated that he had lost £10,000 beyond his insurance in this outbreak.

John Nichols died on the 26th November 1826, after a long and laborious life. He was a born antiquary, and a voluminous author, his chief works being *The History and Antiquities of the Town and County of Leicester*, completed in 1815 in eight folio volumes, and *Literary Anecdotes of the Eighteenth Century*, 1812-15, an expansion of the *Biographical and Literary Anecdotes of William Bowyer*, which had been printed in 1782. This work was afterwards supplemented by *Illustrations of the Literary History of the Eighteenth Century*, 6 vols. 1817-31, to which his son afterwards added two additional volumes. John Nichols was Common Councillor for the ward of Farringdon Without from 1784 to 1786, and again from 1787 to 1811. In 1804 he was Master of the Stationers' Company. He was succeeded in business by his son John Bowyer Nichols, and the firm subsequently became J. Nichols, Son, and Bentley. Like his father, John Bowyer Nichols was editor and author of many books, and was appointed Printer to the Society of Antiquaries in 1824. He died at Haling on October 16th, 1863, leaving seven children, of whom the eldest, John Gough Nichols, born on 22nd May 1806, became the head of the printing-house, and editor of the *Gentleman's Magazine*, as his father and grandfather had been before him. He was one of the founders of the Camden Society (1838), and edited many of its publications. He was the promoter and editor of *The Herald and Genealogist*, and his researches in this direction were of great importance. The *Dictionary of National Biography* enumerates thirty-four works from his pen, most of which it would be safe to say were also printed by him. He died on 14th November 1873.

Another press of importance in the first half of the nineteenth century was that of Thomas Davison. He was the printer of most of Byron's works, and many of those of Campbell, Moore[Pg 293] and Wordsworth; but his chief claim to notice rests upon the magnificent edition of Whitaker's *History of Rickmondshire* in two large folio volumes, printed in 1823, and upon that of Dugdale's *Monasticon*, in eight folio volumes, issued between 1817 and 1830, an undertaking of great magnitude. In Timperley's *Encyclopædia* it is stated that Davison made important improvements in the manufacture of printing ink, and that few of his competitors could approach him in excellence of work.

The story of the firm of Eyre and Spottiswoode would, if material were available, form an interesting chapter in the history of English printing. It is the direct descendant in the royal line of Pynson, Berthelet, the Barkers, and finally of John and Robert Baskett, the last of whom assigned the patent to John Eyre of Landford House, Wilts, whose son, Charles Eyre, the great-grandfather of the present George Edward Briscoe Eyre, succeeded to the business in 1770. During the seventeenth century, the work of the Government and the sovereign had been divided among several firms, but in the eighteenth century it was again given to one man, John Baskett. In the printing of the Bible and Book of Common Prayer the Universities of Oxford and Cambridge have also a share; but all the other Government work is done by Messrs. Eyre and Spottiswoode. Charles Eyre, not being a practical printer, obtained the co-operation of William Strahan. On the renewal of the patent in 1798, the name of John Reeves was inserted, but Mr. Strahan purchased his interest. In 1829, the patent was again renewed to George Eyre, the son of Charles, John

Reeves, and Andrew Strahan. George Edward Eyre, son of George William Strahan, was born at Edinburgh in April 1715, and, after serving his apprenticeship in Edinburgh, took his way to London, where, it is believed, he found a post in the office of Andrew Miller. In 1770 the printing-house was removed from Blackfriars to New Street, near Gough Square, Fleet Street. William Strahan was intimately associated with the best literature of his time, among those for whom he published being Dr. Johnson, Hume, Adam Smith, Robertson, and many other eminent writers. In 1774 he was Master of the Stationers' Company, Member of Parliament for Malmesbury, and sat for Wootton Bassett in the next Parliament. Among his greatest friends was Benjamin Franklin, who kept up a correspondence with him in spite of the strong political differences between them. Strahan died at New Street on July 9th 1785, leaving three sons and two daughters. The youngest son, Andrew, succeeded his father in the Royal Printing House, and one of the daughters married John Spottiswoode of Spottiswoode, whose son, Andrew, afterwards entered the firm. Andrew Strahan was noted for his benevolence, and on his death in 1831 he left handsome bequests to the Literary Fund and the Company of Stationers.

Andrew Spottiswoode, who died in 1866 at the ripe age of seventy-nine, had a large printing business apart from the office of Queen's Printer, and his imprint will be found in much of the lighter literature of the period. His son, William Spottiswoode, after a distinguished career at Oxford, ultimately attained high rank as a mathematician, and in 1865 became President of the Mathematical Section of the British Association. He was elected a Fellow of the Royal Society in 1853, and became its President on 30th November 1878. He died on 27th June 1883.

Equally renowned is the firm of Gilbert and Rivington. Early in the second half of the eighteenth century (the exact date is not known) John Rivington, the fourth son of John Rivington the publisher, and direct descendant of Charles Rivington of the Bible and Crown in Paternoster Row, succeeded to the business of James Emonson, printer, of St. John's Square, Clerkenwell. John Rivington died in 1785, and was succeeded by his widow, who in 1786 took as partner John Marshall. A series of classical works, of which they were the printers, was very favourably received. These included the Greek Testament, Livy, and Sophocles, as well as a series of Latin poets and authors, edited by Michael Maittaire. The business next passed into the hands of Deodatus Bye. He in turn admitted Henry Law as partner, and the firm became successively Law and Gilbert and Robert and Richard Gilbert. The partnership being dissolved early in the present century by the death of Robert Gilbert, Richard carried on the business alone until 1830, when he took into partnership Mr. William Rivington, a great-grandson of the first Charles Rivington, and from that day the firm has gone by the name of Gilbert and Rivington. Richard Gilbert died in 1852, and for eleven years after his death the printing business was carried on by Mr. William Rivington, who issued many valuable and standard works on subjects of classical and ecclesiastical interest.

William Rivington retired from business in 1868, being succeeded by his son, William John Rivington, and his nephew, Alexander. The business increased largely in their hands; one of their first undertakings being the purchase in 1870 of the plant of the late Mr. William Mavor Watts, by which they secured a large addition to their collection of Oriental types. In 1875 Mr. E. Mosley entered the firm, and Mr. William John Rivington left it to join the publishing house of Sampson Low, Marston and Searle. Mr. Alexander Rivington retired from the firm in 1878, being thus the last Rivington connected with the house, which shortly afterwards was turned into a limited liability company.

Messrs. Gilbert and Rivington's collection of Oriental and other foreign types enables them to print in every known language, their specimen books embracing 267 distinct tongues. They are Oriental printers to the British Museum, India Office, British and Foreign Bible Society. Speaking of the Oriental work, the most striking feature in the firm's business, a correspondent to the British Printer (March-April 1895), says:

'Most of the type faces noticed were on English bodies, and the composition is somewhat similar. Arabic is composed just as with English. Sanskrit possesses some little features of accents and kerned sections, which render justification quite a fine art, accents on varying bodies needing to be utilised... The firm does much Hindustani work, and possesses seven sizes of type in this language. Amongst the curiosities are the cuneiform types, the wedge-like series of faces in which old Persian, Median, and Assyrian inscriptions are written; and last, but by no means least in interest, the odd-looking hieroglyphic type faces, which are on bodies ranging from half nonpareil to three nonpareils, and some idea of their extent may be derived by noting that this type occupies fourteen cases of one hundred boxes each.'

To the firm of Messrs. Clowes of Stamford Street belongs the credit of being the first to print cheap periodical literature. William Clowes the elder, a native of Chichester, born in 1779, was apprenticed to a printer of that town, and coming to London in 1802 commenced business on his own account in the following year 1803. By marriage with the daughter of Mr. Winchester of the Strand, he obtained a share of the Government printing work. On moving to Stamford Street, Blackfriars Road, he was chosen to print the Penny Magazine, edited by Charles Knight, the first attempt to provide the public with good literature in a cheap periodical form. The work was illustrated with woodcuts, and so great was its success that from No. 1 to No. 106 there were sold twenty million copies; but the undertaking was heavily handicapped by the paper tax of threepence per pound (see *The Struggles of a Book*, C. Knight, 1850, 8vo). In 1840 an article appeared in the *Quarterly Review*, written, it is said, by Sir F. B. Head, but which is more in the style of T. F. Dibdin, on the Clowes printing-office. Even at that time there were no less than nineteen of Applegarth and Cowper's machines at work there, with a daily average of one thousand per hour each. Besides these there were twenty-three hand presses and five hydraulic presses. The foundry employed thirty hands, and the compositors numbered one hundred and sixty.

In 1851 Messrs. Clowes printed the official catalogues of the Great Exhibition, for which they specially cast 58,520 lbs. of type. They subsequently printed the catalogues of the Exhibitions of 1883-1886, and the Royal Academy catalogues, and have been connected from their inception with two works of a very different character, *Hymns Ancient and Modern*—the circulation of which has to be reckoned in millions—and the great General Catalogue of the Library of the British Museum, for their excellent printing of which all 'readers' are indebted to them. William Clowes the elder died in 1847. He was succeeded by his son, William, who died in 1883; and a third William, a grandson, is one of the managing directors of the firm which in 1881 was turned into a limited liability company.

But the chief honours of book production in London during the present century have been rightly awarded to the Chiswick Press.

Charles Whittingham the elder was born at Calledon, near Coventry, in 1767, and was apprenticed to a printer of that city. As soon as his time was out he came to London, and set up a press in Fetter Lane, his chief customers being Willis, a bookseller of Stationers' Court, Jordan of Fleet Street, and Symonds of Paternoster Row. His beginning was humble enough, his chief work lying in the direction of stationery, cards, and small bills. His first important publisher was a certain Heptinstall, who set him to print new editions of Boswell's *Johnson*, Robertson's *America*, and other important works. This was enough to set him going, and in 1797 he moved to larger premises in Dean Street, Fetter Lane, and then began to issue illustrated books. In 1803 he took a second workshop at 10 Union Buildings, Leather Lane, and again in 1807 he moved to Goswell Street. In 1811 he took his foreman Robert Rowland into partnership, and shortly afterwards left him to manage the city business, while he himself set up a press at Chiswick and took up his abode at College House. Here he continued to work until his death in 1840. For a short time, from 1824 to 1828, he was joined with his nephew Charles, to whom at his death he left the Chiswick business.

There is not much to be said of the work of the elder Whittingham. He confined his attention to the issue of small books, such as the *British Classics*, which he began to print in 1803. His books are chiefly notable for the printing of the woodcuts, which by the process known as overlaying, he brought to great perfection. His relations with the publishers were, however, none of the best. They accused him of piracy, and considered it to be against the best interests of the trade to issue small and cheap books. The productions of the elder Whittingham's press have, moreover, been largely overshadowed by those of his nephew.

Charles Whittingham the younger was a genuine artist in printing. He loved books to begin with, and thought no pains too great to bestow upon their production. Born at Mitcham, on October 30th, 1795, he was apprenticed to his uncle in 1810. In 1824 he was taken into partnership, but this lasted only four years, and he then set up for himself at 21 Took's Court, Chancery Lane. A near neighbour of his at that time was the publisher William Pickering, who since 1820 had been putting in the hands of the public some excellently printed and dainty volumes. It is stated in the *Dictionary of National Biography* that the series known as the *Diamond Classics* was printed for Pickering at the Chiswick Press. But this was not the case. He had no dealings whatever with the Whittinghams or the Chiswick Press before his introduction to Charles Whittingham the younger in 1829. The *Diamond Classics*, which he began to issue while he was living in Lincoln's Inn Fields in 1822, were printed by C. Corral of Charing Cross, and the *Oxford English Classics*, in large octavo, chiefly by Talboys and Wheeler of Oxford, while most of his other work,

amongst it the first eleven volumes of the works of Bacon, was done by Thomas White, who is first found at Bear Alley, and subsequently at Johnson Court and Crane Court in Fleet Street.

Fig. 35.—Old-faced Type.

Few of these early books of Pickering's had any kind of decoration beyond a device on the title-page. Simplicity, combined with what was best in type and paper, seem to have been the publisher's chief aim at that time; but in some of the Diamond Classics will be found the small and artistic border-pieces which he afterwards used frequently.

The first of Pickering's books in which anything of a very ornamental character occurs is *The Bijou, or Annual of Literature*, a publication which fixes very clearly his association with Whittingham. The *Bijou* first appeared in 1828, printed by Thomas White, with one or two charming head-pieces designed by Stothard. The volume for 1829 was also printed by White, and is noticeable as having the publisher's Aldine device, showing that this came into use during the year 1828. The volume for 1830 was printed by C. Whittingham of Took's Court. The meeting between the two men had been brought about by Basil Montagu in the summer of 1829. They found themselves kindred spirits on the subject of the artistic treatment of books, and a friendship sprang up between them, that ceased only with Pickering's death in 1854, and was productive of some of the most beautiful books that had ever come from an English press. Mr. Arthur Warren in his book, *The Charles Whittinghams, Printers* (p. 203), tells us: 'The two men met frequently for consultation, and whenever the bookseller visited the press, which he often did, there were brave experiments toward. The printer would produce something new in title-pages, or in colour work, or ornament,[Pg 305] and the bookseller would propound some new venture in the reproduction of an ancient volume.... They made it a point, moreover, to pass their Sundays together, either at the printer's house or at Pickering's.'

Fig. 36.—Early Chiswick Press Initials.

In the artistic production of books they were ably assisted by Whittingham's eldest daughter Charlotte, and Mary Byfield. The former designed the blocks, many of which were copied from the best French and Italian work of the sixteenth century, and the latter engraved them.

Among the notable books produced by these means were the Aldine Poets, editions of Milton, Bacon, Isak Walton's *Complete Angler*, the works of George Peele, reprints of Caxton's books, and many Prayer-books. In 1844 Pickering and Whittingham were in consultation as to the production of an edition of Juvenal to be printed in old-face great primer, and the foundry of the latest descendant of the Caslons was ransacked to supply the fount. The edition was to be rubricated and otherwise decorated, and this, or the printer's stock trouble, 'lack of paper,' occasioning some delay, the revived type first appeared in a fiction entitled *Lady Willoughby's Diary*, to which it gave a pleasantly old-world look in keeping with the period of which the story treats. By the kindness of Mr. Jacobi, the present manager of the Chiswick Press, an exact copy of the title-page of this book is here given, and with it, examples of the decorative initials and devices, in the revival of which also the Chiswick Press led the way.

Fig. 37.—Early Chiswick Press Devices.

Pickering died in 1854, and though Charles Whittingham the younger lived to the age of eighty-one, his death not taking place till 1876, he had retired from business in 1860. The business was afterwards acquired by Mr. George Bell.

In the English provinces Messrs. Clay, of Bungay, in Suffolk, have made for themselves a reputation both as general printers and more particularly for the careful production of old English texts; and Messrs. Austin, of Hertford, are well known for their Oriental work. But the pre-eminence certainly rests with the Clarendon Press at Oxford, whose work, whether in its innumerable editions of the Bible and Prayer-book, its classical books, or its great dictionaries, is probably, alike in accuracy of composition, in excellence of spacing and press-work, and in clearness of type, the most flawless that has ever been produced. Book-lovers have been known to complain of it as so good as to be uninteresting, but it certainly possesses all the distinctive virtues of a University Press.

If England has no lack of good printers at the present day, in Scotland they are, at least, equally plentiful.

The Ballantyne Press was founded by James Ballantyne, a solicitor in Kelso, with the aid of Sir Walter Scott. Ballantyne and Scott had been school-fellows and chums, and an incident in their school life recorded by Ballantyne aptly illustrates the characters of the two men. Ballantyne was studious but not quick, and often when he was bothered with his lessons, Scott would whisper to him, 'Come, slink over beside me, Jamie, and I'll tell you a story.' Although their roads lay apart for some years, while Scott was studying in Edinburgh and Ballantyne was carrying on the Kelso Mail, they met and renewed their friendship in the stage coach that ran between Kelso and Glasgow. Shortly afterwards, Ballantyne called on Scott, and begged him to supply a few paragraphs on legal questions of the day to the Kelso Mail. This Scott readily undertook to do, and when the manuscript was ready he took it himself to the printing-office, and with it some of the ballads destined for Lewis's collection then publishing in Edinburgh. Before he left he suggested that Ballantyne should print a few copies of the ballads, so that he might show his friends in Edinburgh what Ballantyne could do. Twelve copies were accordingly printed, with the title of Apologies for Tales of Terror. These were published in 1799, and Scott was so pleased with their appearance that he promised Ballantyne that he should be the printer of a selection of Border ballads that he was then making. This selection was given the title of Minstrelsy of the Scottish Border, and formed two small octavo volumes, with the imprint, 'Kelso, 1802.'

Ballantyne's work, as shown in these volumes, was equal in every way to the best work done by Bensley and Bulmer at this time. Good type and good paper, combined with accuracy and clearness, at once raised Ballantyne's reputation. Longman and Rees, the publishers, declared themselves delighted with the printing, and Scott urged his friend to remove his press to Edinburgh, where he assured him he would find enough work to repay him for the removal. After some hesitation Ballantyne acquiesced in the proposal, and having found suitable premises in the neighbourhood of Holyrood House, set up 'two presses and a proof one,' and shortly afterwards, in April 1803, printed there the third volume of the Minstrelsy of the Scottish Border. From this time forward Scott made it a point that whatever he wrote or edited should be printed at the Ballantyne Press. The first quarto, the Lay of the Last Minstrel, was published in January 1805. The poem was printed in a somewhat heavy-faced type; but in other respects the typography left nothing to be desired. In the same year Ballantyne and Scott entered into partnership, Scott taking a third of the profits of the printing-office. So rapidly did James Ballantyne extend his business that in 1819 Scott, in a letter to Constable, says that the Ballantyne Press 'has sixteen presses, of which only twelve are at present employed.' In 1826 the firm became involved in the bankruptcy of the publishers Messrs. Constable. After this Ballantyne was employed as editor of the Weekly Journal, and the literary management of the printing-house. He died on the 17th January 1833. The firm is now known as Ballantyne, Hanson and Co., and admirably sustains its old traditions.

Another great Scottish printing-house, that of T. and A. Constable, was founded by Thomas Constable, the fourth son of Archibald Constable the publisher. He learned his art in London under Mr. Charles Richards, and on returning to Edinburgh, in 1833, he founded the present printing-house in Thistle Street. Shortly afterwards he was appointed Queen's Printer for Scotland, and the patent was afterwards extended to his son Archibald, the present titular head of the house. Some years later he received the appointment of Printer to the University of Edinburgh. Thomas Constable inherited and incorporated with his own firm the printing business of his maternal grandfather, David Willison, a business founded in the eighteenth century. The firm has always been noted for its scholarly reading and the beauty of its workmanship; and only the fact that this volume is being printed by it prevents a longer eulogy.

Among other Scottish firms who are doing excellent work mention may be made also of Messrs. R. and R. Clark of Edinburgh, who tread very closely on the heels of the Clarendon Press, and Messrs. Maclehose, the printers to the University of Glasgow. In America also there is much good work being done, that of Mr. De Vinne and of the Riverside Press, Cambridge, being of the very highest excellence.

In the history of English printing, the close of the nineteenth century will always be memorable for the brilliant but short-lived career of the Kelmscott Press.

In May 1891 Mr. William Morris, whose poems and romances had delighted many readers, issued a small quarto book entitled *The Story of the Glittering Plain*, which had been printed at a press that he had set up in the Upper Mall, Hammersmith.

Lovers of old books could recognise at once that in its arrangement, and, to some extent, in its types, this first-fruit of the Kelmscott Press went straight back to the fifteenth century, resembling most nearly the quartos printed at Venice about 1490. Until within a few years of that date printed books, like the old manuscripts, had dispensed altogether with a title-page. Their first few pages might be occupied with a prologue or a table of contents, and though, when the text was reached, it was usual to herald it with an Incipit or Incomincia, followed by the title of the work, the information as to date of issue, printer or publisher, and place of imprint or sale, which we look to find in the title-page, was only given in a crowning paragraph or colophon at the end of the book, save for one or two accidental instances. The full title-page, as we know it, is not found before about 1520, and did not come into general use, so as to supersede the colophon, until many years after that date. But about 1480 the advantage of getting the short title of the book clearly stated at its outset was becoming pretty generally recognised, and from this date onwards what may be called the label title-page—that is, a first page containing the title and nothing else—is very frequently found. Ten years later a practice occasionally adopted elsewhere became common at Venice, and the first page of the text of a book was decorated with an ornamental border, and occasionally with a little picture as well. It was this temporary fashion which commended itself to Mr. Morris, and *The Story of the Glittering Plain* was issued with one of these label title-pages and with the first page of the story surrounded by a very beautiful border cut on wood from a design by Mr. Morris himself, here reproduced by the kind permission of his executors. It contained also a number of decorative initial letters, to use the clumsy phrase which the misappropriation of the word capitals to stand for ordinary majuscules, or 'upper case' letters, makes inevitable. Mr. Morris's initials were, of course, true capitals—i.e. they were used to mark the beginnings of chapters, and the only fault that could be found with them was that they were a little too large for the quarto page. These also were from Mr. Morris's own designs, ideas in one or two cases having been borrowed from a set used by Sweynheym and Pannartz, the Germans who introduced printing into Italy; but the borrowing, as always with Mr. Morris, being absolutely free. As for the type, it was clear that it bore some resemblance to that used by Nicolas Jenson, the Frenchman who began printing in Venice in 1470, and whose finer books, especially those on vellum, are generally recognised as the supreme examples of that perfection to which the art of printing attained in its earliest infancy. Mr. Morris's type was as rich as Jenson's at its best, and showed its authorship by not being quite rigidly Roman, some of the letters betraying a leaning to the 'Gothic' or 'black-letter' forms, which had found favour with the majority of the mediæval scribes. At the end of the book came the colophon in due fifteenth-century style, with information as to when and where it was printed. The ornamental design bearing the word 'Kelmscott,' by way of the device or trade-mark without which no fifteenth-century printer thought his office properly equipped, was not used in this book, but speedily made its appearance.

Fig. 38.—The first page of *The Story of the Glittering Plain*.

Pretty as was this edition of the *The Story of the Glittering Plain*, it yet raised a doubt—the doubt as to whether there was any real life in this effort to start afresh from old models, or whether it was a mere antiquarian revival and nothing more. The history of printing—or rather of the handwriting which the first printers took as their models—recorded, at least, one instance in which an antiquarian revival had been of permanent service; for the Roman letter, which the printers have used now for four centuries, was itself a happy reversion on the part of the fifteenth-century scribes to the Caroline minuscules of 600 years earlier, which had gradually been debased past recognition. There was no room for a second such sweeping reform as this, but those who compared the best modern printing with the masterpieces of the craft in its early days knew that the modern books by the side of the old ones looked flat and grey; and the new *Glittering Plain*, though not entirely satisfactory, was certainly free from these faults. A few months later the appearance of the three-volume reprint of Caxton's version of the *Golden Legend* of Jacobus de Voragine, sufficed to show that the Kelmscott Press was capable of turning out a book large enough to tax the resources of a printing-office, and the new book was not only larger but better than its predecessor. It became known that this, but for an accident, should have been the first book issued from the new press; and it was [Pg 316] evident that the initial letters were exactly right for this larger page, while the splendid woodcuts from the designs of Sir Edward Burne-Jones revived the old glories of book-illustration. In the *Golden Legend* also appeared the first of those woodcut frontispiece titles which formed, as far as we know, an entirely new departure, and confer on the Kelmscott books one of their chief distinctions. Printed sometimes in white letters on a background of dark scrollery, sometimes in black letters on a lighter ground, these titles are always surrounded by a border harmonising with that on the first page of text, which they face. They thus carry out Mr. Morris's cardinal principle, that the unit, both for arrangement of type and for decoration, is always the double page. How persistently even the best printers in the trade ignore this principle is known to any one who has asked for a specimen of how a book is to be printed, it being almost impossible to get more than a single page set up. If a double page is insisted on, the craftsman,

ingenious in avoiding trouble, will print the same page twice over, thus confusing the eye by the exact parallelism of line with line and paragraph with paragraph. But Mr. Morris, who had all the capacity of genius for taking pains, understood that, when a book lies open before us, though we only read one page at a time, we see two, and in the selection of the type, the adjustment of letterpress and margins, and finally in the pursuit of a decorative beginning, either to the book itself, or to its sections, he never arranged a single page except in relation to the one which it was to face.

As far as permanent influence is concerned Mr. Morris's Roman letter, the 'Golden type,' as it was dubbed, from its use in the Golden Legend, is the most important of the three founts which he employed. His own sympathies, however, were too pronouncedly mediæval for him to be satisfied with it, and for the next large book which he took in hand, a reprint of Caxton's Recuyell of the Histories of Troy, the first work printed in the English tongue, he designed a much larger and bolder type, an improvement on one of the 'Gothic' founts used by Anton Koberger at Nuremberg in the fifteenth century. This 'Troy' type was subsequently recut in a smaller size for the double-columned Chaucer, and in both its forms is a very handsome fount, while the characters are so clearly and legibly shaped that, despite its antique origin, any child who knows his letters can learn to read it in a few minutes. With these three founts the Kelmscott Press was thoroughly equipped with type; but until his final illness took firm hold on him Mr. Morris was never tired of designing new initials, border-pieces, and decorative titles with a profusion which the old printers, who were parsimonious in these matters, would have thought extravagantly lavish. Including those completed by his executors after his death, he printed in all fifty-three books in sixty-five volumes, and this annual output of nine or ten volumes of all sizes, save the duodecimo, which he refused to recognise, gave his work a cumulative force which greatly increased its influence. Had he printed only a few books his press might have been regarded as a rich man's toy, an outbreak of æstheticism in a new place, of no more permanent interest than the cult of the sunflower and the lily in the 'eighties. Even the great Chaucer by itself might not have sufficed to take his press out of the category of experiments. But when folio, quarto, octavo, and sexto-decimo appeared in quick succession, each with its appropriate decorations, and challenging and defying comparison with the best work of the best printers of the past, the experimental stage was left far behind, and publishers and printers awoke to the fact that a model had been set them which they would do well to imitate.

Fig. 39.—The Kelmscott 'Troy' Type.

As to what will be the permanent result of Mr. Morris's efforts to reform modern printing it is too soon as yet to speak, but signs of their influence are already abundantly visible. The books issued from the 'Vale Press' of Messrs. Ricketts and Shannon have their admirers; but they have that rather irritating degree of likeness which makes every difference—and the differences are numerous—appear a wilful and regrettable divergence.

Fig. 40.—The Macmillan Greek Type.

The 'Macmillan Greek type,' designed by Mr. Selwyn Image, which has now been in use for some time, may be regarded as another offshoot of Mr. Morris's theories, and deserves all the praise due to a brave experiment. By permission of the Messrs. Macmillan a page of it, taken from their 'Parnassus' Homer, is here shown, and few modern types will bear comparison with it. That it is not wholly and entirely successful is due to the fact that for so many centuries Greek types have been dominated by the models set by Aldus and the other printers of the early sixteenth century, who tried to imitate the rapid cursive hand of the Greek scholars of their day. Had the introduction of printing been preceded by a revival of the beautiful Greek book-hand of the eleventh century, similar to the revival of the Caroline minuscules, all would have been well. But in going back himself to the eleventh century Mr. Image was obliged perpetually to conciliate eyes used to the later cursive forms, and the result is too obviously eclectic. The mere fact, however, that such an effort has been made is full of promise for the future, for it is only by new effort, joined with constant reference to old models, that types can be improved.

FOOTNOTES:

[1] E. G. Duff, *Early Printed Books*, pp. 84 and 139.

[2] It is rather remarkable that of the eight books dated 1534 six are in octavo. Readers of the works of Erasmus, Colet, and Lily seem to have shown a preference for this form, which is used most frequently for the works of these friendly authors.

[3] The Registers of the Dutch Church, Austin Friars, edited by W. J. C. Moens (Introduction, pp. xiii.-xiv.).

[4] See Strype's Life of Parker, p. 541. Arber's Transcript, vol. ii.

[5] Strype's Life of Parker, pp. 382, 541.

[6] P. C. C., 1 Martyn.

[7] P. C. C., 32 Martyn.

[8] For the materials of this chapter free use has been made of Mr. Allnut's series of papers contributed to the second volume of Bibliographica, to whom my thanks are due.

[9] Forty-second Report of the Worcester Diocesan Arch, and Archæological Society. Paper by Rev. J. R. Burton on 'Early Worcestershire Printers and Books.'

[10] For the material of this chapter I am chiefly indebted to the valuable work of Messrs. Dickson and Edmond, Annals of Scottish Printing.

[11] Domestic State Papers, vol. 357, No. 172, 173; vol. 371, No. 102.

[12] Domestic State Papers, vol. 354, No. 180.

[13] Dom. S. P., Chas. II., vol. 243, p. 181.

[14] Chancery Proceedings, 1753 (Record Office).

[15] Notes and Queries, First Series, vol. xii. p. 197.

[16] Harl. MS. 5906.
