A cognitive approach to opposites: The case of Swedish *levande* 'alive' and *död* 'dead'

Anna Vogel, University of Stockholm

Abstract

In the present paper, opposites are examined and discussed, and a way of describing them from a cognitive perspective is suggested. Related research disagrees upon whether opposites are symmetrical, and whether concepts should be integrated in the relation of opposites. The Swedish opposites *levande* 'alive' and *död* 'dead' have been studied thoroughly in order to provide empirical data. Arguments are presented in favour of an analysis in which opposites show semantic symmetry to some extent. When it comes to distribution and domains, however, opposites do not show symmetry. Further, it is argued that concepts should be included in the relation of opposites. The asymmetries found are related to markedness, information value, Aktionsart and the prototype of the word connected to referent of the subject/NP that one of the opposites describes.

1. Background and purpose

Opposite terms and the nature of opposites intrigue and fascinate. Myths have it that opposites are both far apart and close, like the allegedly thin line between madness and genius. Untrained native speakers have clear intuitions about the overall category of opposites (Cruse 1994:178). The opposites in language supposedly reflect a human cognitive tendency to categorise experiences with the help of dichotomous relations (Lyons 1977:277). Terms of oppositeness incorporate both closeness and distance. The distance reflects only one semantic dimension. The closeness, on the other hand, includes syntactic distribution, which is supposed to be identical, as well as contextual factors (Cruse 1986:197, Pohl 1970:188). The present paper aims to explore the nature of opposites in terms of symmetry, similarity and difference, and suggest how this can be undertaken within a cognitive semantic framework.

In the article, Swedish *levande* - *död* 'alive - dead' is examined. The alleged symmetry/closeness is in focus. Are the two words semantically symmetrical, i.e., do they differ in only one dimension? What does their use look like and how do language users understand them?

2. Related research in the past

As Lehrer & Lehrer (1982) points out, the terminology concerning opposites suffers from some confusion. The present paper follows Lyons (1977:279), which uses *opposition* to describe dichotomous contrast. The term *antonymy* is reserved for gradable opposites (e.g. *high* - *low*), while *complementarity* denotes ungradable opposites (e.g. *dead* - *alive*). However, complementaries can appear in a gradable

context, such as "Is John *dead*?" "No, he is very much *alive*". This fact is discussed in several studies; see for example [Cruse \(1980\)](#), [Jackson \(1988\)](#), [Jones \(2002\)](#), [Murphy \(2003\)](#), and [Paradis & Willners \(2006\)](#).

[Willners \(2001\)](#) declares that the words in an antonymous pair must be similar in all respects but one. This is in accordance with [Cruse \(1986\)](#) who writes that opposites typically differ along only one dimension of meaning. In respect of all other features they are identical, and thus show almost identical distributions.

[Justeson & Katz](#) suggest that "adjectives may be more or less antonymous rather than simply antonymous or not antonymous" (1992:182). [Muehleisen \(1997:4\)](#) writes that good opposites have "the clang", which means that language users identify two words as opposites: this is the case with *hot - cold*, but not with *loud - faint*. Further, good opposites should also be associated with the same kind of nouns (things) (1997:113).

A main issue in the related research on opposites concerns what is included in the relation of opposition. Some studies on opposition and antonymy regard concept(s) as constituting the sense of a word ([Nowak 2006](#) and [Cruse 1992](#)), and as such, concepts must be incorporated into the relation of oppositeness. Other studies view concepts as separated from the sense ([Miller et al. 1990](#), [Gross & Miller 1990](#), and [Murphy 2003](#)) and thus, they are not part of the relation of oppositeness. [Fellbaum \(1995\)](#) does not overtly commit to either side, but presents arguments that opposition (in her case, antonymy) is a relation between concepts, pointing out that antonymy can exist between words belonging to different word classes. Nowak agrees with her, and argues that the grammatical category of difference, between for example *dead* (adjective) and *dead* (noun), consists of different profiling. The conceptualiser chooses to adopt a certain profiling for a given conceptual content.

[Krishnamurty \(2002\)](#) shows that the two words of an antonymous pair exhibit differences in their collocational profile, and thus do not have identical distribution. [Murphy \(2003\)](#) sheds further light on the distribution of opposites. She indicates some antonyms that do not exhibit symmetrical distribution in linguistic contexts or in speakers' behaviours. Murphy links the phenomenon to the notion of markedness. She points out that while the antonym relation is logically symmetric, there is word-association evidence indicating that specific antonym relations may be mentally stored in a directional way, so that for example the directional link from *TABLE* to *CHAIR* is stronger than the link from *CHAIR* to *TABLE*. (The small capitals in italics indicate metalinguistic concepts of words.) Murphy regards markedness behaviour in linguistic contexts as predictable from conceptual information, and therefore, she finds it inappropriate for inclusion in the lexicon.

3. Theoretical framework

As was mentioned in the [section 2](#) on related research, earlier studies take different standpoints regarding the issue of whether concepts should be integrated into or separated from meaning. In the present study it is, in accordance with cognitive linguistics, assumed that concepts are crucial in the study of meaning. As [Langacker \(2002:2\)](#) puts it: Meaning is conceptualization. According to the view adopted in this study, lexical relations are not stored solely in the lexicon. The relation between words becomes available by virtue of their links to common background frames, as well as to indications of the manner in which their meanings highlight particular elements of these frames ([Fillmore 1985:229](#)). The concept is understood to be formed by two units, called profile and base ([Langacker 1987](#)). Alternative terms for base are the above-mentioned frame ([Fillmore 1982](#)), domain ([Langacker 1987](#), [Lakoff 1987](#)) or idealized cognitive

model (Lakoff 1987). According to Langacker, the profile "stands out in bas-relief" against the base (here, Langacker cites Susan Lindner). The semantic value of an expression resides in neither the base nor the profile alone, but in their combination (Langacker 1987:183). The willingness to include domains (bases, frames etc.) in the semantics distinguishes cognitive linguistics from some other schools, mainly within structural semantics, where these spheres are rather understood as belonging to something that is not part of the lexical semantics, but as belonging strictly to conceptual information, separate from the meaning of a single word, as was mentioned in section 2 (see e.g. [Murphy 2003](#) Chapter 3 for an overview). In the present paper, the term *domain* is preferred.

According to [Langacker \(2002\)](#), linguistic meaning is associated with experience-based conceptual archetypes. Examples of such archetypes are Physical object and the Motion of a physical object in space. Further, Langacker (2002:209) writes about energy. The transmission of energy and how energy may cause events together form a domain or an idealized cognitive model, which language users have in common, and which explains and describes patterns in the world. Langacker makes use of the "billiard-ball model" as an archetypal conception of how energy is transmitted from the mover to the impacted object. Langacker argues that this model has influence on our thought process. The model is important both for physical energy and abstract energy, like transmitting information or documents.

Langacker's use of energy as a domain can be contrasted to [Johnson \(1987\)](#), where Force is regarded an image schema. It is slightly unclear whether Johnson addresses force or energy, since he counts notions such as Enablement (for example the ability to carry a child), which, in strictly physical terms, is rather seen as potential or stored energy than force. In the present paper, Physical object and Motion are regarded as conceptual archetypes, while energy is seen as a domain. The image schema Force is not used.

According to [Cruse & Togia \(1995\)](#), antonymy forms a relation between construals. Construal operations should be understood as conceptual processes. The relation involves the structuring of content domains by means of one of a limited repertory of image-schemas. The general notion of opposite would correspond to a single image-schema, which would display diametric opposition, for example manifest in the set-up in a tug-of-war ([Cruse 1994:183](#)). The different types (complementaries and antonyms) correspond to more specific image-schemas. Cruse & Togia (1995) suggests that the principal image-schema for antonymy is Scale. For complementarity, the basic image-schema would probably be Existence, and then in terms of presence or absence. ([Croft & Cruse 2004:44, 166-167](#)).

The present study further relies on a few other theoretical standpoints suggested within the cognitive linguistic framework. These involve the way meaning is represented in network models and how polysemy is treated.

The network conception, proposed by [Langacker](#), can be regarded as a synthesis of prototype theory and categorisation based on schemas. The members of a category are analysed as nodes in a network, which are linked to each other by relationships (such as extension and specification). One node forms the prototype. The precise configuration of the network is variable, even indeterminate, so every attempt must be seen as an abstraction (2002:267).

[Geeraerts \(1993\)](#) discusses polysemy, and demonstrates how two different operational tests may yield contradictory results concerning the polysemy of a word, and also that one and the same test may show inconsistencies when testing the polysemy of a word. In the article Geeraerts questions the existence of sense

boundaries. Instead, he wants to view meaning with the help of a floodlight metaphor, where words are searchlights that highlight, upon each application, a particular subfield of their domain of application. Geeraerts suggests that instead of viewing meanings as "things", meanings should be viewed as processes of sense creation (1993:260). To regard meaning as a process can be connected to construal, which is also a process that involves meaning and context. [Cruse \(2000\)](#), on the other hand, acknowledges sharp sense boundaries, but stresses that these are subject to construal. Cruse distinguishes between a variety of difference and similarity. Polysemy equals full sense boundaries, while there are weaker types of differences, such as facets and ways-of-seeing. The present paper only deals with polysemy, and, following Cruse, departs from a view where sharp sense boundaries exist. However, even if Geeraerts and Cruse have different opinions, both perspectives seem to base their theory on a relatively common ground where the context may modulate some raw-material area of meaning. Therefore, the view of the present paper is that Geeraerts's work need not be rejected or accepted in full, but should rather be taken into consideration as a request to work consciously and carefully with polysemy tests.

4. Data and methodology

There are two main traditions in the study of opposites when it comes to collecting data: on the one hand, studies that examine the relation with the help of the researcher's linguistic intuition (see e.g. [Lehrer & Lehrer 1982](#) and [Cruse 1994](#)) and on the other hand, studies that explore the relation using corpus data (see e.g. [Justeson & Katz 1991](#) and [Willners 2001](#)). An alternative to these approaches is research which makes use of elicited data (see e.g. [Murphy & Andrew 1993](#) and [Paradis & Willners 2006](#)). The present paper tries to combine all three types of data (linguistic intuition, corpus data, and elicited data) as well as introducing a fourth type: dictionary articles. Below, the four types of data are described in more detail:

The first source is formed by [8 Swedish dictionaries](#), whose articles on *levande* 'alive' and *död* 'dead' have been used. The dictionary articles include distinctions on various senses and sub-senses. [SAOB](#) is the most thorough of the dictionaries, and its distinction into senses has served as a hypothesis for a plausible model for polysemy in the present study. The dictionaries differ quite extensively from each other when it comes to how many senses are suggested. One dictionary ([SAOB](#)) proposes 12 senses for *levande* 'alive' while another dictionary ([NEO](#)) discerns two senses.

The second source is the linguistic intuition of the author, who is a native speaker of Swedish. This source has been essential when performing the polysemy tests. This source has also been important in the process of suggesting "claims", i.e., short sentences which are supposed to capture the sense of *levande* 'alive' and *död* 'dead' respectively. An example of such a claim concerning *levande* 'alive' is: "the referent of the subject/NP has a pounding heart". All the claims are declared in [section 6.1.2](#).

The third source is a corpus, from which all lemmas of *levande* and *död* have been gathered. In total, 598 samples of *levande* 'alive' occurred in the corpus, and 697 samples of the lemma *död* 'dead'. The corpus (press98, Språkbanken) contains newspaper text, published in major Swedish newspapers in 1998. It contains 12 million tokens, and around 400 000 types. [\[1\]](#) The corpus data have been used to study various types of subjects/noun phrases that are described as *levande* 'alive' and *död* 'dead', syntactic distribution of *levande* 'alive' and *död* 'dead', as well as their metaphorical and non-metaphorical uses. As was the case with data from linguistic intuition, the corpus data have also been used in the process of

suggesting "claims". Finally, the corpus data were used when suggesting the polysemy and the sense boundaries of the words. All corpus uses needed to fit into one of the senses.

The fourth source includes data from 24 adult informants, evenly distributed regarding sex, age, and level of education. The author met each informant individually and showed 6 pairs of pictures. The pictures showed a healthy man - a dead man, a living cat - a dead cat, fresh roses - withered roses, a living tree - a dead tree, a live chicken/hen - a chicken drum stick, and finally an amorous couple - stones. The informant was asked to describe what he/she saw. The interview was video-recorded. The interviews produced data about how language users talk about people, animals and plants that are alive and dead. One main issue was whether the informants would use the word *levande* 'alive' at all. These data were used for suggesting a model for the relation of oppositeness between *levande* 'alive' and *död* 'dead'. After the interview, the same informants were asked to write down the answer to two questions, (1) *Hur är något som är levande?* 'please describe what something that is alive is like' and (2) *Hur är något som är dött?* 'please describe what something that is dead is like.' The answers to questions 1-2 were used in the process of suggesting "claims".

The methodology for studying polysemy involves a few tests. The first is the identity constraint test which [Lakoff \(1970\)](#) used. The identity test operates on co-ordinated clauses. One word should be used in a co-ordinated clause, where the word should modify two or more units. The test is positive, if the word can be interpreted in two ways, as long as only one interpretation is valid for both units at the same time. This can be illustrated by the following: The sentence "Mary was wearing a *light* coat, so was Jane" can either be interpreted as both women wearing bright coats (*light* in terms of colours), or both women wearing coats made of thin fabric (*light* in terms of weight). If the test has a positive result for polysemy, a reading will invoke one meaning (either bright for both women, or of little weight for both women), not two (bright for Mary, of little weight for Jane). According to the outcome of the test, *light* is polysemous. Related to the identity constraint test is the zeugma test: zeugma sometimes occurs when the identity constraint test is performed. The sentence "John and his driving licence *expired* last Thursday" has a comical effect (a pun or a zeugma) which shows that *expire* is polysemous. The third test is the truth condition test, used by [Quine \(1960\)](#). A word is polysemous if it can be true and false about the same referent at the same time, such as "Sandeman is a *port*, but not a *port*" (=it is a wine, but not a harbour). A fourth test is introduced in [Hellberg \(2007\)](#), which makes use of gradability. If a word can occur both in a gradable and in a non-gradable form with different senses, the word is polysemous.

As mentioned in the [section 3](#) above on theory, [Geeraerts \(1993\)](#) is critical of the polysemy tests, both the identity constraint test (which he refers to as the linguistic test) and the truth condition test (logical test). He further questions whether sharp sense boundaries really exist. The adapted view in this paper is that these tests may serve as a starting-point. In testing the polysemy of *levande* 'alive' and *död* 'dead' four tests have been used, but it has not been possible to test every (supposed) sense with the help of all four tests. It has not been possible (or it has felt very awkward) to construct a test sentence where both (supposed) senses occur in a "natural" way. The context-dependence of the tests is one of the points that Geeraerts (1993) refers to in his critique. Further, the tests may indicate a semantic oddness, while, in fact, the oddness may be due to syntactic phenomena (too). The reliability of the method when testing the polysemy of *levande* 'alive' and *död* 'dead' in the present paper may thus be subject to discussion, but hopefully, the awareness of such a problem helps to prevent interpretations and arguments that are too far-fetched.

The methodology of the present study has both quantitative and qualitative applications. The quantitative aspects involve frequencies in the corpus, measurable data from the elicitations and rankings in the dictionaries. The qualitative parts concern types of samples in the corpus, odd samples, association patterns in the elicited data and type of definition in the dictionary articles. For the corpus samples, the principle of "total accountability" has been observed. This means that no sample is considered too odd to be included in the analysis (Johansson 1985).

5. Questions at issue

The present study will give an account for the semantics of *levande* 'alive' and *död* 'dead'. This task includes examining whether the words are polysemous. The paper will also examine whether the words have somewhat identical distribution. This will be performed by studying word-class and syntactic function (attributive vs. predicative). These two areas have been chosen since at an early, tentative period in the study these areas seemed to include deviations from the general picture in which it was assumed that *levande* 'alive' and *död* 'dead' behaved alike. Further, the domains and the metaphorical uses will be studied. One issue that will be addressed is: What is the balance between non-metaphorical senses and metaphorical senses for the two words? Another issue relates to the terms of oppositeness: Are there domains where *levande* 'alive' and *död* 'dead' are not opposites? What other opposites can be connected to each word? The paper also wants to examine the gradability of complementaries. Are there patterns for this, i.e., what factors produce or provoke the gradability? Finally the paper will study if *levande* 'alive' and *död* 'dead' describe the same kind of things.

6. Results

In this section, results regarding semantic symmetry, distribution, domains and the relation of oppositeness will be presented and discussed.

6.1 Semantic symmetry

First, the polysemy of *levande* 'alive' and *död* 'dead' respectively will be investigated. Then, an account of the semantics will be given, and an analysis of whether the words show semantic symmetry. After that, results relating to syntactic distribution will be foregrounded.

6.1.1 Polysemy

When performing the polysemy tests outlined in section 4 on data and methodology, the outcome indicates three senses for *levande* 'alive' and four senses for *död* 'dead'. Concerning *levande* 'alive', Hellberg's gradability test shows that *levande* 'alive' about humans, animals, plants and micro-organisms (having what is tentatively called here "biological life") is separated from *levande* 'alive' about artistic expressions (texts, pieces of art, films, theatre performances etc.), ideas, memories, places (meeting-spots, neighbourhoods), and social relations. *Levande* 'alive' about humans, animals, plants etc. is not gradable (unless humorously or, for humans, if *levande* 'alive' is used metaphorically, which will be discussed later). An authentic sample about test-tube children from the corpus is shown in (1). In (2), the sentence has been modified by the intensifier *oerhört* 'tremendously'.

- (1) I Sverige föds mellan 1 400 och 1 500 *levande* provrörsbarn varje år.
'In Sweden, between 1 400 and 1 500 live test-tube children are born

every year.'

- (2) ? I Sverige föds mellan 1 400 och 1 500 *oerhört levande* provrörsbarn varje år. (constructed)

'In Sweden, between 1 400 and 1 500 tremendously live test-tube children are born every year.'

Sentence (2) seems strange, and one gets the feeling that the speaker has some hidden agenda against abortion or that he/she indicates that test-tube children are unusually active in some pathological way. *Levande* 'alive' about artistic expressions etc. is perfectly gradable, see (3).

- (3) En konflikt som gör Alexanders Røslers film ytterst *levande*.

'A conflict that renders Alexanders Røslers's film extremely alive.'

In (3), an authentic sample from the corpus is shown. It already contains an intensifier, *yttst* 'extremely'. (3) sounds perfectly fine.

When performing the identity constraint test, zeugma occurs. In (4), a constructed sentence is shown, where *levande* modifies both something that has biological life (crayfish) and something that does not (food traditions).

- (4) Innan vi kokar kräftorna är de fortfarande *levande*, och det tycker jag att vår matkultur här hemma är också. (constructed)

'Before we prepare the crayfish, they are still alive, as is, I think, the food culture in this house.'

The comical impression that (4) conveys is that the food culture would be alive in a biological way. (This could for example imply that the fridge is full of creeping germs.)

Further tests show that *levande* 'alive' about humans, animals, plants and micro-organisms has one sense, and *levande* 'alive' about artistic expressions (texts, pieces of art, films, theatre performances etc.), ideas, memories, places (meeting-spots, neighbourhoods), and social relation has another sense. *Levande* 'alive' about candles is a third sense. In (5), an attempt is made to let *levande* 'alive' describe both an artistic expression (a text) and a candle.

- (5) ? Jag tyckte att Dostojevskijs text kändes lika *levande* som de stearinljus, i vars belysning jag satt och läste. (constructed)

'I found Dostoevsky's text as living as the candles that lit my reading spot.'

Sample (5) sounds odd. Either, one gets the feeling that the candles are running about, or that the pages of the book are burning. Intuitively, there is a distance between the text and the candles, and *levande* 'live' cannot describe both in this way. [Hellberg's](#) gradability test supports the suggestion that *levande* 'live' about candles is another sense, see the authentic sample of (6) where an intensifier has been inserted (within brackets) by the author of this article. The question mark indicates that to insert an intensifier makes the sentence odd.

- (6) Hon tar emot i sin valstuga som värms upp av stämningfulla (? oerhört) *levande* ljus och talar om hur ideologi och arbete är samma sak för henne.

'She welcomes us into her polling hut, which is heated by atmospheric (extremely) live candles, and speaks about how ideology and work is the

same thing for her.'

Sentence (6) with the intensifier sounds odd. *Levande* 'live' about candles is not gradable.

In the present article, these three senses of *levande* 'alive' are labelled *levande*_{BIO} (about humans, animals, plants and micro-organisms), *levande*_{ART} (about artistic expressions, ideas, memories, places and social relations), and *levande*_{CANDLE} (about candles).

Figure 1. Network model of the semantics of *levande* 'alive'.

In Figure 1, a network model of the polysemy of *levande* 'alive' is shown. The bold line around *levande*_{BIO} indicates that this sense is the proposed prototype. This is argued with support from dictionary data, the author's linguistic intuition, and elicited data. *Levande* 'alive' implying biological life is, without exception, listed first in all dictionaries. Out of 24 informants, 7 wrote definitions referring to a medical/biological domain (such as "has a working heart and brain", "breathes"). Intuitively, the idea that any other sense could be the prototype is odd. However, *levande*_{BIO} is not the most common sense in the corpus. There, *levande*_{ART} was the most common sense. And among the informants, in actual fact an even greater group, namely 11 out of 24, wrote definitions referring to commitment/influence/connection, clearly pointing out the sense of *levande*_{ART}. (The numbers of informants overlap, which means that one informant may have included both types of definitions.) Possibly, *levande*_{ART} is in the process of becoming a new prototype, to take the place of *levande*_{BIO}. Only time can tell if this will be the case.

The dotted arrow between *levande*_{BIO} and *levande*_{ART} indicates that the relation is extension. The figure partly anticipates results presented in 6.1.2. There, it will be shown that *levande*_{BIO} includes several characteristics, formulated as seven "claims". Of these characteristics, four claims (slightly modified) are valid for *levande*_{ART} as well. For *levande*_{ART}, no claims concerning biology are included, but claims on motion, energy, change and expression/influence. If the claims concerning *levande*_{BIO} and *levande*_{ART} are compared, the claims of *levande*_{ART} have a wider application and some of the terms used, such as energy, have a metaphorical meaning, while for *levande*_{BIO}, it has a non-metaphorical meaning. This is the reason for the proposal that the relation between *levande* and

*levande*_{ART} is one of "extension". The relation between *levande*_{BIO} and *levande*_{CANDLE} is specification. For *levande*_{BIO}, one claim is expressed as "the referent of the subject/NP has the capacity of self-propelled motion". For *levande*_{CANDLE}, this claim has been modified into "the referent of the subject/NP includes motion". This should be understood as the referent mimicking the motion of a live referent as the flame of a candle mimics a live being. This restricted sense of *levande*_{CANDLE} can thus be regarded as a specification.

Concerning *död* 'dead', the outcome of the tests shows a correspondence on the one hand between *levande*_{BIO} 'alive' and one of the senses of *död* 'dead', and on the other hand between *levande*_{ART} 'alive' and one of the other senses of *död* 'dead'. It seems that *död* 'dead' about humans, plants, animals and micro-organisms forms one sense, while *död* 'dead' about places, artistic expressions, ideas, politics, and social relations forms another sense. Hellberg's gradability test is performed on an authentic sample from the corpus; see (7), where an intensifier has been inserted by the author (within brackets).

- (7) I en berättelse om mannen som finner en (? oerhört) *död* kalv på sina ägor kan han visserligen nå en laddad gåtfullhet.
'In a short story about the man who finds a(n extremely) dead calf on his land, he may certainly reach a loaded mysteriousness.'

To combine *död* 'dead' about a calf with the intensifier *oerhört* 'extremely' sounds odd. To combine *död* 'dead' about a social relation with the same intensifier sounds good. In (8), an authentic sample is given, and an intensifier has been inserted by the author (within brackets).

- (8) Ett mindre skräpkulturellt exempel på västerländska representationer av Orientens erotiskt laddade natur utgörs av Bernardo Bertoluccis *Den skyddande himlen* från 1990, där ett amerikanskt par ser sitt kalla och (oerhört) *döda* förhållande plötsligt livas upp när de åker till Nordafrikas öknar.
'A somewhat less trashy culture example of western representations of the erotically charged scenery of the Orient is provided by Bernardo Bertolucci's *The Sheltering Sky* from 1990, where an American couple see how their cold and (extremely) dead relationship is suddenly enlivened when they go to the deserts of North Africa.'

To combine *död* 'dead' about a social relation with an intensifier renders a well-formed expression, and according to Hellberg's test, *död* 'dead' has at least two senses. The zeugma test supports this suggestion:

- (9) ? Föräldrarna är *döda* och det är syskonens inbördes relationer också.
(constructed)
'The parents are dead and so are the relations between the siblings.'

Sentence (9) shows zeugma - there is something odd about it. Relations are not dead in the same way as humans are.

Further, *död* 'dead' combined with *lopp* 'heat/race' seems to be another sense. In (10), an authentic sample from the corpus is shown, and within brackets, the intensifier *oerhört* 'extremely' has been inserted by the author.

- (10) Söndagsnattens sifferexercis slutade med (? oerhört) *dött* lopp mellan

blocken, eller 25-25 sedan kommunväljarna visat stor misstro mot Edvinssons politik, hon tappade 8 mandat, från 24 till 16.

'Sunday night's mathematical exercise ended in a(n extremely) dead heat between the blocks, or 25-25 after the voters of the municipality had shown great distrust of Edvinsson's politics, she lost 8 seats, from 24 to 16.'

This sense of *död* 'dead' is hardly gradable, as is clear from sample (10), where *oerhört* 'extremely' makes the sentence odd. [2] That *död* 'dead' about heats is a separate sense is supported by Quine's test, see (11).

- (11) Loppet var *dött*, men det var inte *dött*. (constructed)
'The race/heat was dead, but it was not dead.'

Sentence (11) conveys the impression that the heat did not produce a single winner, but that it nevertheless contained a great amount of excitement. It was *dött* 'dead' in the sense that there was no winner, but it was not *dött* 'dead' in the sense that nothing happened. SAOB suggests that *död* 'dead' about capital (*dött kapital* 'dead capital') and space/surface (for example in a house) (*dött utrymme* 'dead surface') has the same sense that *död* 'dead' about heats has, something which the author's linguistic intuition supports. The heat cannot produce a winner, the capital cannot produce any interest and the space cannot be used. *Dött lopp* 'dead race/heat', however, is more of a lexicalized phrase than the two other collocations, and as such, it is not gradable. It could be argued that the two other collocations (*dött kapital* 'dead capital' and *dött utrymme* 'dead space') may be somewhat gradable. This shows that even within the senses, various uses and contexts may influence and make *död* 'dead' more or less gradable on a relative scale.

Another candidate for a separate sense is *död* 'dead' about electrical (etc.) devices, such as computers, TV-sets, engines and telephones. In (12), such a use is shown.

- (12) Nakna, utan varken sköldar eller antennula - när högtryckstvättens slang har spruckit och pc:ns skärm är (? oerhört) *död* - kommer vi då förtvivlat söka en ny verklighet att förankra oss i?
'Naked, with neither shields nor antennula - when the hose of the high pressure washer has split and the computer screen is (extremely) dead - will we then desperately seek a new reality in which to anchor?'

Sample (12) sounds odd when the intensifier is inserted. Hellberg's test thus suggest that *död* 'dead' on electrical devices is a sense which is separated from *död* 'dead' about places, artistic expressions, ideas, politics, and social relations. The zeugma test supports this suggestion, see (13).

- (13) ? Datorn är *död* precis som hela den här hålan. (constructed)
'The computer is dead, just like this hole.'

The sentence sounds odd. The impression is that the computer is *död* 'dead' in one way (it simply does not work) while the hole (small town) is *död* 'dead' in another way: calm, quiet, nothing new happens. A third test is performed to see if *död* 'dead' about electrical devices is a sense, separate from *död* 'dead' about heats, capital etc.

- (14) ? Loppet var *dött*, liksom datorn. (constructed)
'The heat was dead, like the computer.'

Sample (14) sounds odd, it shows zeugma. One gets the feeling that a heat and a computer are dead in very different ways. A heat is very exciting, full of motion, until it is clear that no one wins, while a computer shows no activity at all.

Död 'dead', according to the outcome of the polysemy test, has four senses, labelled $död_{\text{BIO}}$ (about humans, animals, plants and micro-organisms), $död_{\text{ART}}$ (about artistic expressions, places, ideas, politics), $död_{\text{HEAT}}$ (about heats, capital and space), and $död_{\text{ELEC}}$ (about (mostly) electrical devices such as computers, phones but also engines).

Figure 2. Network model of the semantics of *död* 'dead'.

In Figure 2, a network model of the polysemy of *död* 'dead' is shown. It is suggested that $död_{\text{BIO}}$ is the prototype. This is argued with support from dictionary data, the author's linguistic intuition, elicited data and corpus data. In the dictionaries, a sense implying lack of biological life is, without exception, listed first. From author's linguistic intuition, this sense comes first to mind. In the elicited data, 5 informants related *död* 'dead' to something that lacked biological life, while 5 informants related *död* 'dead' to lack of motion and 5 informants related it to lack of warmth. (5 was the highest number that an area - such as lack of biological life or lack of motion - gained.) In the corpus, this sense was the most common. The relations between the nodes are extension and specification. In order to justify this, results presented in [section 6.1.2](#) are anticipated to some extent. $död_{\text{ART}}$ 'dead' is an extension of $död_{\text{BIO}}$, since the claims for $död_{\text{ART}}$ are fewer and have a wider application, and some of the terms, such as energy, have a metaphorical meaning. The relation $död_{\text{BIO}} - död_{\text{HEAT}}$ and the relation $död_{\text{BIO}} - död_{\text{ELEC}}$ is specification. In the case of $död_{\text{BIO}} - död_{\text{HEAT}}$, the common claim regards propagation/outcome. For $död_{\text{BIO}}$, the subject of the referent/NP cannot propagate any longer, while for $död_{\text{HEAT}}$, the referent does not produce any result. This result is rather specific, it concerns the winner of a race, interest of a capital or the use of a space. In the case of $död_{\text{BIO}} - död_{\text{ELEC}}$, the common claim concerns energy/activity. For $död_{\text{BIO}}$, the referent of the subject/NP does not consume or produce physical energy any longer, while for $död_{\text{ELEC}}$, the referent, which is a device often run by electricity,

such as a computer or a phone, does not show any activity.

For both *levande* 'alive' and *död* 'dead', metaphorical use seems to make the word gradable, however, only in the "ART" sense (*levande*_{ART} and *död*_{ART}). [Section 6.1.2](#) contains an elaboration of how these senses can be accounted for.

So far, it has been suggested, from the author's linguistic intuition and dictionary data, that *levande*_{BIO} and *död*_{BIO} have a relation of oppositeness, so that *levande*_{BIO} is the opposite of *död*_{BIO} and vice versa. The opposite of *en levande katt* 'a live cat' would be *en död katt* 'a dead cat'. Likewise, *levande*_{ART} and *död*_{ART} seem to be opposites. The opposite of *en levande stadsdel* 'a live neighbourhood' may be *en död stadsdel* 'a dead neighbourhood'. But *levande*_{CANDLE} seems to have no opposite term in *död* 'dead' or anything that has to do with (the concept of) death. Instead, it is suggested, still from author's linguistic intuition and dictionary data, that the opposite of *levande*_{CANDLE} is *elektrisk* 'electrical' (*levande ljus - elektriskt ljus* 'candles - electrical light'). *Död*_{HEAT} has no correspondence in *levande* 'alive' or (the concept of) life. In order to find opposites to *död*_{HEAT}, a paraphrase needs to be formulated. The opposite of *dött lopp* 'dead heat' would (still according to the author's intuition) be something like *lopp där en vinnare koras* 'a heat where a winner can be singled out' and the opposite of *dött kapital* 'dead capital' would be *effektivt kapital* 'effective capital', and for *dött utrymme* 'dead space' possibly *utnyttjat utrymme* 'space that is being used'. Likewise, *död*_{ELEC} has no correspondence in *levande* 'alive'. However, it is possible to say something like "Får du *liv* i datorn?" 'Can you get some life into the computer?', so that the connection *död* 'dead' = no energy/activity and *liv* 'life' = energy/activity holds for the referents related to this use (computers, phones, cars etc.) The opposite of *död* about computers, phones, TV-sets, engines etc. would, anyway, not be *levande* 'alive', but (according to the author's intuition) a paraphrase like *som fungerar* 'working' - or, rather, just a computer, a phone, a TV-set, an engine - since these devices are normally expected to work.

Figure 3. Relations of oppositeness between *levande* 'alive' and *död* 'dead' and other words.

In Figure 3, it can be seen that *levande* 'alive' and *död* 'dead' are opposites in some senses, but not in others. Two senses of *levande* 'alive' and *död* 'dead' have a possibility of being symmetrical, while this is not the case for the last sense of *levande* 'alive' (*levande_{CANDLE}*) and for the two remaining senses of *död* 'dead' (*död_{HEAT}* and *död_{ELEC}*). In the next section, the semantics of *levande* 'alive' and *död* 'dead' will be examined, and there will be an investigation of whether the two senses of *levande* 'alive' and *död* 'dead' show semantic symmetry.

6.1.2 An account of the semantics

In order to try to account for the semantics of each sense of *levande* 'alive', and each sense of *död* 'dead', claims are formulated. The claims have been formulated by analysing elicited data, the author's linguistic intuition, dictionary articles and corpus data.

Claims concerning *levande*_{BIO} 'alive'

1. the referent of the subject/NP has a pounding heart
2. the referent of the subject/NP has a working brain
3. the referent of the subject/NP is a system, which consumes and produces energy
4. the referent of the subject/NP is a system that can propagate
5. the referent of the subject/NP undergoes some kind of change
6. the referent of the subject/NP has the capacity of self-propelled motion
7. the referent of the subject/NP expresses itself

For the claims concerning *levande*_{BIO}, data from the elicitations have mainly been used. As mentioned in relation to the network model of *levande* 'alive' (see [Figure 1](#)), 9 informants (out of 24) related to movement. 7 informants described *levande* 'alive' in terms of biological functions, such as "working heart and brain". 4 informants mentioned change. Definitions related to energy, such as *kraftfull* 'powerful', were suggested by 3 informants and 3 informants wrote something about light and/or sound (this can be connected to energy and to the capacity of expressing oneself). The author's linguistic intuition also formed a useful source in this process. Common knowledge about biology, such as what distinguishes live plants or germs from dead ones is included in this intuition. The corpus was used to discern sub-senses (see metonymic uses and the "*levande* uppslagsbok-type" 'walking encyclopaedia-type' below).

*Levande*_{BIO} is the prototype, and, in terms of number of claims, the richest. For some uses, all the claims are relevant, for some uses, only a few (or one). For a young, healthy man/woman, probably all claims are valid, while for a germ, only the claims about energy and propagation hold. The claim about change should be understood in terms of growing, ageing or some other physical change of the body. The claim about expressing oneself should be understood as humans and animals being able to communicate in some way: talking, expressing feelings through mimicry or body language, but also (for humans) to express oneself in more elaborate ways, such as painting, performing music etc. Some of the claims, such as the claim about motion, are more central, and others are more peripheral.

It could perhaps be argued that the claims should ideally operate on the same level of abstraction. The claim involving a system which consumes and produces energy can subsume some of the other claims. Still, it is valuable to retain the claim on energy. The first reason is that it captures well the conditions for live micro-organisms and plants (they do not have properties like pounding heart, brain, capacity to express themselves, etc.), and the second reason is that energy (however abstract) seems to be a key concept that is hard to ignore for both *levande* 'alive' and *död* 'dead', as will be shown below.

The main opposite to *levande*_{BIO} seems to be *död* 'dead', but in certain sub-senses, it may have other opposites. *Levande*_{BIO} may be contrasted to 'fake'. This is the case in *levande blommor* 'fresh flowers' - *konstgjorda blommor* 'artificial flowers', which is the opposition that the dictionary SAOB suggests. "Fake" may also include various mimetic reproductions, such as pictures, animations, visual recordings, audio recordings as well as toys depicting real animals. The claims "has a pounding heart" and "capacity of self-propelled motion" seem most important for this sub-sense of *levande*_{BIO} 'alive'. A real person has a pounding heart and can move, while a picture has no heart and cannot move. *Levande* 'alive'

is sometimes used in the expressions *livs levande* 'in real life' and *i levande livet* 'in real life', which refers to meeting somebody (a person) or something (an animal), as opposed to seeing them in pictures, on TV etc., see (15).

- (15) Hur många svenskar har sett livs levande lodjur i skogen?
'How many Swedes have seen lynxes in real life in the forest?'

To meet somebody, face to face, in a canonical encounter (Clark 1973) seems to be an essential quality connected to *levande* 'alive'.

Metonymic uses

There are also metonymic uses (sub-senses) of *levande*_{BIO}, where *levande* describes not a human, but a group of humans, see (16), or an activity performed by humans, see (17).

- (16) Världens äldsta nu *levande* rockband, ungefär, i en Las Vegas-show à la grotesque.
'The world's oldest rock band still alive, or something like that, in a Las Vegas show à la grotesque.'
- (17) Varje stad och liten ort har fest på gatorna med *levande* musik, gatustånd, eldar och parader.
'Every town and little community organises a party in the streets, with live music, market stalls, bonfires and parades.'

In (16), a rock band is called *levande* 'alive', and in (17), music is described as *levande* 'alive' ('live' is a more idiomatic translation). The latter use (sub-sense) is rather common in order to separate live performances from recorded ones, be it music, theatre or other forms of culture. The opposite is then not *död* 'dead' but rather *inspelad* 'recorded'. To use *levande* in this sub-sense is an extension of *levande* as opposed to fake etc., that was discussed in the preceding paragraph.

The *levande uppslagsbok* 'walking encyclopaedia'-type

An interesting use of *levande* 'alive' is when the participle describes a human referred to by a noun which is normally used about inanimate objects.

- (18) Hon berättar att det görs regelbundna mätningar om vilka som lyssnar och beskriver dem som en blandning av män och kvinnor, *levande* uppslagsböcker eller mer allmänt musikintresserade personer.
'She tells that regular measurements are taken concerning who listen, and she describes them as a mixture of men and women, walking encyclopaedias or people with a more general music interest.'

The noun *uppslagsbok* 'encyclopaedia' normally refers to an inanimate object. Here, *levande* 'alive' has its non-metaphorical sense (*levande*_{BIO}) - it refers to a human that has a pounding heart, working brain, etc., but the noun *uppslagsböcker* 'encyclopaedia' is used in an extended sense. The idea can also be referred to as *vandrande uppslagsverk* 'walking encyclopaedia' / *uppslagsverk på två ben* 'encyclopaedia on two legs', which shows how important the claim about motion is. Other uses are *levande exempel* 'live example' and *levande illustration* 'live illustration'. The opposite of *levande* 'alive' in this case is not *död* 'dead', but rather inanimate. Possibly, a use of *död* 'dead' meaning 'has never had life'.

Generic sense

Another interesting case is when *levande* 'alive' is used in the expression *föda levande ungar* 'be viviparous'. Here, *levande* 'alive' is used in a generic sense. It is possible for one specific animal to be viviparous and give birth to dead offspring at the same time. The opposite to *levande* 'alive' is then not *död* 'dead', but rather a paraphrase where for instance *lägga ägg* 'lay eggs' is included (for some reason, mammals are often contrasted with birds and other species that give birth to their offspring in this way).

Claims concerning *levande*_{ART}

- the referent of the subject/NP undergoes some kind of change
- the referent of the subject/NP moves, or includes motion
- the referent of the subject/NP expresses something that makes an impact
- the referent of the subject/NP has, in relation to a norm, a high level of energy

For the claims concerning *levande*_{ART}, elicited data, the author's linguistic intuition and corpus data have been used. For *levande*_{ART}, the number of claims has been reduced compared to *levande*_{BIO}. Change, motion, expression and energy form the claims, and each claim has a counterpart in *levande*_{BIO}.

The claim about change should be understood as the referent changing, either in a physical way (like a town growing bigger) or in a more abstract way (like a film that develops an intrigue in an unexpected way). In sample (19), the question is raised of whether a human who feels constant happiness (that does not undergo any change) is *levande* 'alive'.

- (19) Men är en människa i ett tillstånd av oföränderlig lycka ens *levande*?
Den konstanta lyckan utesluter alla kontraster, alla känslor som inte innebär lycka, allt motstånd som alstrar aggression eller vånda, det vill säga de kontraster i erfarenhet och känsla som utgör livets väv.
'But is a human being, in a state of unchanging happiness, even alive?
The constant happiness excludes all contrasts, all feelings that do not mean happiness, all resistance that generates aggression or torment, that is the contrasts of experience and feeling that form the web of life.'

The rest of the claims about *levande*_{ART} have been slightly modified from *levande*_{BIO} 'alive'. The claim concerning motion is, for *levande*_{BIO}, formulated as the referent having the capacity of self-propelled motion. The claim about *levande*_{ART} reads "moves or includes motion". This distinction (that the referent does not move itself, but rather includes motion) is relevant for *levande* 'alive' about places, where the place does not move, but people, vehicles etc. within the area do, see (20).

- (20) Vi vill skapa ett *levande* centrum och få hem köpkraften igen, säger Jan Lejdelin.
'We want to create a living city-centre and bring back the purchasing power again, says Jan Lejdelin.'

The next claim concerns expression. For *levande*_{BIO}, the referents may express no matter what, but for *levande*_{ART}, the referent should express something that makes an impact (touches, moves) an addressee. This is exemplified by the sample (21).

- (21) Jag, en bleksiktig protestant, har mött *levande* ikoner med en oerhörd utstrålning.

'I, a bloodless Protestant, have met live icons with a tremendous charisma.'

In this sub-sense, the canonical encounter (although now the encounter is not between two live human beings, but between a human being and an object) is present again. A referent, that can convey a feeling of such an encounter, may be described as *levande* 'alive'. Sample (22) is an even clearer example of this.

(22) "Konsten är helt död om ingen tittar på den. Men så fort någon tittar ett endaste ögonblick så blir den *levande*" skriver hon i förordet.

"Art is totally dead if nobody is watching it. But as soon as somebody is watching for only a single moment, it becomes alive" she writes in the preface.'

The last claim is about energy. For *levande*_{BIO}, the claim reads that the referent is a system that consumes and produces energy. For *levande*_{ART}, it is rather the production of energy that is relevant, and now energy in a more abstract form than for *levande*_{BIO}. What is described as *levande*_{ART} 'alive' has a high level of energy, it is strong, powerful and active. A sample where this *levande* 'alive' is used is shown in (23).

(23) Den faktorn ska man inte förakta i ett land där fotbollsspelaren Denis Law kunde utnämna den engelska VM-segern 1966 till sitt livs sorgligaste dag och där segern vid Bannockburn 1314 fortfarande är ett *levande* minne.

'This fact should not be despised in a country where the football player Denis Law could describe the English World Cup victory in 1966 as the saddest day of his life, and where the victory at Bannockburn 1314 still is a living memory...'

It is interesting to note that for *levande*_{ART}, which concerns *levande* in an extended (metaphorical) sense, the characteristics that constitute the claims also get a more extended meaning: this holds partly for the claim concerning change (the change can be either physical or abstract), and for the claim concerning energy (the energy is not measurable in Joule anymore, but has a more abstract meaning).

In this sense, *levande* 'alive' is gradable (see (3) about a film that is *ytterst levande* 'extremely alive'). So, this is a "certain context" as discussed by Jones (2002), Murphy (2003) and Paradis & Willners (2006). Probably, the aspects of "expresses something that makes an impact" and "has a high level of energy" are the characteristics of the referent that can be gradable (a referent can affect more or less, and it can have more or less energy).

Claims concerning *levande*_{CANDLE}

- the referent of the subject/NP includes motion

The third sense of *levande*, which is used in the collocation *levande ljus* 'candles', has only one claim, concerning motion. It has been formulated by analysing dictionary data and the author's linguistic intuition. It is the flickering flame of the candle that mimics the irregular motion of live beings. *Levande*_{CANDLE} has a metaphorical sense. The motion of the flame gives the impression of being "self-propelled", even if language users know it is not.

Claims concerning *död*_{BIO}

- the referent of the subject/NP has not a pounding heart (any longer)
- the referent of the subject/NP has not a working brain (any longer)
- the referent of the subject/NP does not consume or produce energy (any longer)
- the referent of the subject/NP cannot propagate (any longer)
- the referent of the subject/NP does not change (any longer)
- the referent of the subject/NP has no capacity of self-propelled motion (any longer)
- the referent of the subject/NP does not express itself (any longer)

The claims concerning $död_{BIO}$ have been formulated mainly by analysing elicited data and the author's linguistic intuition. As was mentioned in relation to the network model of $död$ 'dead' (see [Figure 2](#)), informants mentioned lack of biological functions (5 informants), lack of motion (5 informants) and lack of warmth (5 informants).

It seems as if the claims for $död_{BIO}$ mirror the claims for $levande_{BIO}$ in a symmetrical way, so that on the whole the negated claims concerning $levande_{BIO}$ are valid for $död_{BIO}$. The special uses of $levande_{BIO}$, however, have no correspondence in $död_{BIO}$. The metonymic sub-sense, exemplified by *levande musik* 'alive (live) music', the generic type in *föda levande ungar* 'be viviparous lit: give birth to live offspring' and the interesting collocation where the participle is non-metaphorical and the noun is metaphorical (*levande uppslagsbok* 'walking encyclopaedia') do not take $död$ 'dead' as their opposite. Further, there is a use of $död_{BIO}$, where $död$ 'dead' describes referents that have never had biological life, see (24).

- (24) Jag kunde slå på folk och döda ting som bilar för skojs skull.
'I could beat people and dead things like cars just for fun.'

For this use, the relevant claims would be that the referent does not have a pounding heart, a working brain, etc. The time adverbial "any longer" is absent. The opposition of *döda ting* 'dead things' can either be *levande varelser* 'alive (living) creatures', if the creature has life in the present time, or the opposition is something like *organiskt material* 'organic substance', which is about a substance that has had life, but does not any more, such as dead plants, dead bodies etc. Here is another difference between *levande* 'alive' and $död$ 'dead', since *levande* 'alive' seldom describes such substances (that have had life, but do not anymore).

To sum up, $levande_{BIO}$ and $död_{BIO}$ are relatively symmetrical when it comes to their semantics. However, there are some uses (metonymical etc.) where the use differs.

Claims concerning $död_{ART}$

- the referent of the subject/NP involves little change
- the referent of the subject/NP involves little motion
- the referent of the subject/NP involves little expression
- the referent of the subject/NP has, in relation to a norm, a low level of energy

The claims have been formulated by analysing all four types of data.

For $död_{BIO}$ the claims express the referent's lack of biological functions. For $död_{ART}$,

other functions are relevant; still, they have their counterparts in the biological ones. The relation between $död_{\text{BIO}}$ and $död_{\text{ART}}$ mirrors the relations between $levande_{\text{BIO}}$ 'alive' and $levande_{\text{ART}}$. It is interesting to note that for $död_{\text{ART}}$, the functions may exist, but not to an adequate extent (or quality). In sample (25), two restaurants are described by using $dött$ 'dead'.

(25) För partyfolket: Skipper's och Skagerack. Nää! Helt *dött!* Så ska det inte behöva se ut en torsdagskväll.

'For those who like to party: Skipper's and Skagerack. Nope! Totally dead! It need not look like this on a Thursday night.'

It is reasonable to believe that the restaurants in sample (25) do not lack motion totally. There are probably some waiters moving around and perhaps a few guests, too, but not to the extent that can satisfy the taste of the speaker.

In this sense, $död$ 'dead' is gradable (see (8) about an extremely dead relationship). So, this is a "certain context" as discussed by Jones (2002), Murphy (2003) and Paradis & Willners (2006). It seems as if the two claims about expression and energy are in focus when $död_{\text{ART}}$ is used gradably. A very low level of energy would trigger a use such as *väldigt död* 'very dead' and so would a referent that involves very little expression. Change and motion do not seem as sensitive to gradability or perhaps it is not so meaningful to describe them as "more of" or "less of".

It seems that $levande_{\text{ART}}$ and $död_{\text{ART}}$ are relatively symmetrical when it comes to their semantics.

A claim concerning $död_{\text{HEAT}}$

- the referent of the subject/NP does not produce any result

The claim has been formulated by analysing dictionary data, corpus data and the author's linguistic intuition.

The claim reads that the referent does not produce any result: there is no outcome. The claim can be related to the claim concerning $död_{\text{BIO}}$, that the referent cannot propagate any longer. Capital that does not yield interest is called *dött kapital* 'dead capital', and time which is not used in an efficient way is called *dödtid* 'dead time' (this is a compound, but semantically related). A heat that does not produce a winner is called *dött lopp* 'dead heat'. Propagation means to produce an offspring, and the link with the production of something valuable is rather clear.

There is no correspondence to $levande$ 'alive' for this sense.

A claim concerning $död_{\text{ELEC}}$

- the referent of the subject/NP involves no energy/shows no activity (does not work)

The claim has been formulated by analysing corpus data and the author's linguistic intuition.

The referent is often an electric device such as a telephone, a computer, a TV-set, a car engine (the latter runs on petrol but depends on battery power for ignition). For $död_{\text{BIO}}$, biological functions are in focus, while $död_{\text{ELEC}}$ concerns non-biological, electrical, and for the device fundamental functions. The referent does not work as

expected - it does not work at all. It does not involve any energy/shows no activity. Here there is a clear connection to *död*_{BIO}, whose claims includes one about not consuming and producing energy.

There is no counterpart in *levande* 'alive' for this sense.

6.1.3 Syntactic distribution

In this section, word class and attributive versus predicative function will be investigated.

Word class

According to the Swedish standard grammar (Teleman et al. 1999), the words *levande* 'alive' and *död* 'dead' belong to different word classes. *Levande* 'alive' is a participle, while *död* 'dead' is an adjective. Some dictionaries, however, treat both words as adjectives. A comparison between words related to 'life' and 'death' can be undertaken. For 'life', there are the verb *leva* 'live', the noun *liv* 'life' and the participle *levande* 'alive'. There is no morphologically simple adjective in the "life-family". The adjective *livlig* 'lively' is a derivation, while *livfull* 'vital' is a compound. It can be noted that these adjectives do not concern biological functions in the first place, but rather qualities such as (abstract) energy. There is also the seldomly used participle *levd* 'lived', which is present in the form *upplevd* 'experienced'. For 'death', there are the verb *dö* 'die', the noun *död* 'death', the adjective *död* 'dead' and the participle *döende* 'dying'. There is also another verb in this "family", namely *döda* 'kill', to which the participles *dödande* 'killing' and *dödad* 'killed' are related. This causative meaning, 'make somebody die' is not lexicalised in the "life-family", which means that the meaning 'make somebody live' does not correspond to a single word related to *leva* 'live'. This may instead be expressed by *föda* 'give birth to'. The compound participle *livsuppehållande* 'life-sustaining' may be related, too. On the whole, the concept 'dead' seems richer; it has more lexicalisations, and these lexicalisations are formed by morphologically simple words. This fact can be attributed to the heavy information value that the concept 'dead' has, compared to 'alive'. Of the two terms, *levande* 'alive' is unmarked and *död* 'dead' is marked. *Levande* 'alive' is evaluatively positive, while *död* 'dead' is negative (one of the criteria in Lehrer 1985 that indicate what term is unmarked and what is marked).

Further, *död* 'dead' often takes the verb *lever* 'lives' as its opposite. If a question is posed whether a person is dead or alive in Swedish, this is either phrased as *Lever din mamma?* 'Does your mother live?' or *Är din mamma död?* 'Is your mother dead?', never as *?Är din mamma levande?* 'Is your mother alive?' The negating answer to a question like *Är din mamma död?* 'Is your mother dead?' would be *Nej, hon lever* 'No, she is alive/she lives', never *?Nej, hon är levande* 'No, she is alive'. Here, *lever* 'lives' and *är död* 'is dead' form an opposite pair.

The fact that *död* 'dead' often takes *lever* 'is alive' as its opposite may partly be attributed to the fact that *leva* 'live' and *levande* 'alive' seemingly have very similar meaning. The opposites concerning *leva* 'live', *levande* 'alive' and *död* 'dead' may be grouped as in Table 1.

Table 1. Opposites related to the concepts 'alive' and 'dead'.

| Words of the "life-family" | Words of the "death-family" |
|--|--|
| <i>leva</i> 'live' | <i>dö</i> 'die' |
| Sample: Idag <i>lever</i> betydligt fler med aids... | Sample: Människorna <i>dör</i> inte längre i aids... |

'Today, considerably more people live with aids...'

leva 'live'

Sample: Nu i fredags såg Henry Holmberg, far till Paulina Brolin, videon: - Det var uppmuntrande att se att de *lever*.

'Last Friday, Henry Holmberg, the father of Paulina Brolin, watched the video: - It was encouraging to see that they are alive (lit. that they live).'

vara levande 'be alive'

Sample: Även om ett foster är *levande*...

'Even if a foetus is alive...'

'The people do not die from aids anymore...'

vara död 'be dead'

Sample: Haideh är *död* sedan några år.

'Haideh has been dead for a few years.'

vara död 'be dead'

Sample: Lena Palm är en av dem som själv fött ett barn som var *dött*.

'Lena Palm is one of those who, herself, has given birth to a child who was dead.'

The verb *leva* 'live' takes both *dö* 'die' and *vara död* 'be dead' as its opposites. (The linguistic intuition of the author is the source for this claim.) The verb form *leva* 'live' probably stresses the concept as a state, while the participle *levande* 'alive' instead stresses the concept as a quality. The participle *levande* 'alive' can be used as a predicative, as in the sample *Även om ett foster är levande* 'even if a foetus is alive' from Table 1, a fact which implies that the participle has some similarities to an adjective. Adjectives in general have greater possibilities to express qualities than verbs have. In order to contrast with *vara död* 'be dead', *leva* 'live' seems more frequent in Swedish than *vara levande* 'be alive'. Aktionsart is also an issue here. Both *leva* 'live' and *vara död* 'be dead' describe states, while *dö* 'die' describes a punctual event, which can be contrasted both with *leva* 'live', but also with *föd* 'be born', which describes a punctual event. Cruse (1986) calls *be born - live - die* a lexical triplet. While *live* refers to a continuance of a state, *be born* and *die* refer to a change to an alternative state (Cruse's terms). This difference (maybe asymmetry), regarding what Aktionsart the verbs have, probably has an impact on how the related word *levande* 'alive' is used, and offers a hint on why it is not used as the opposite of *död* 'dead' in phrases such as *Är X död?* 'Is X dead': the focus in such a question is the state of X, not his/her qualities.

This can be taken even further. When informants were asked to describe two pictures, one which showed a live person, another one which showed a dead person, very few mentioned *levande* 'alive' in relation to the live person, while they did mention *död* 'dead' or *sårad* 'hurt' for the dead person. When describing the live person, remarks such as *glad* 'happy' or *som dansar* 'dancing' dominated. In this context, *en död man* 'a dead man' has just *en man* 'a man' as its opposite.

Attributive versus predicative

All the corpus samples, including both metaphorical and non-metaphorical uses of *levande* 'alive' and *död* 'dead', have been sorted and categorised according to their syntactic properties. The adjective *död* 'dead' / the participle *levande* 'alive' is either attributive, as *död kropp* 'dead body', predicative, as *Betty är död* 'Betty is dead', or the head of a noun phrase, as *de döda* 'the dead ones'. Such a noun phrase may function as subject in a clause. The words can also be part of a sentence, which does not form a clause: *Fem döda i Paris-Dakar-rallyt* 'Five dead in the Paris-Dakar Rally'. This type is rather common in headlines in the corpus,

which consists of newspaper articles. Finally, the word can stand alone in an adjective/participle phrase, as *Helt dött!* 'Totally dead'.

The balance between the various syntactical constituents for *levande* 'alive' and *död* 'dead' respectively is found in Table 2.

Table 2. The balance of syntactical constituents for *levande* 'alive' and *död* 'dead'.

| | <i>levande</i> 'alive' N=598 | <i>död</i> 'dead' N=697 |
|--|---------------------------------|----------------------------|
| Attributive | 75% | 37% |
| Predicative | 20% | 39% |
| Head of a noun phrase | 5% | 18% |
| Part of sentence, which does not form a clause | - | 4% |
| Adjective/Participle phrase | 0% | 1% |
| Total | 100% | 99% |

As can be seen in Table 2, *levande* 'alive' and *död* 'dead' have very different patterns when it comes to their syntactic function in the clause. *Levande* 'alive' occurs mainly in the attributive position (75%), while *död* 'dead' appears as often in the attributive position (37%) as in the predicative position (39%). For *levande* 'alive', the predicative position is not so common (20%), while other positions are very rare. For *död* 'dead', the adjective is head of a noun phrase in one fifth of the samples (18%). In order to explain this asymmetry, a few words should be said about the predicative and the attributive position. The predicative is part of the proposition of a clause, while the attributive does not need to be. This would mean that the word *död* 'dead' is more often part of the proposition in the corpus, than the word *levande* 'alive' is. In newspaper text, it can be assumed that the fact that somebody is dead has a higher information value than the fact that somebody is alive. This can be related to *död* 'dead' being marked, while *levande* 'alive' is unmarked. The more expected a certain quality regarding an object is, the less necessary it is to express this quality with an adjective (Ungerer & Schmid 1996). If we talk about a human or an animal, we do not state that it is alive, since this is presupposed. Probably it is part of the semantics or the prototype of a human, a cat, a dog, etc. that it is alive. In (26), a sample where *död* 'dead' is in the predicative position, and part of the proposition, is shown.

- (26) En pojke som enligt polisen med stor sannolikhet är den försvunne tioåringen från Rinkeby, påträffades på måndagseftermiddagen *död* vid Eggeby Gård på Järvafältet, inte långt från Rinkeby.
'A boy, who, according to the police, is very possibly the missing ten-year-old from Rinkeby, was found dead on Monday afternoon at Eggeby Gård at Järvafältet, not far from Rinkeby.'

There are cases where *levande* 'alive' occurs in the predicative position, and is part of the proposition, with a high information value. This is the case if a person expected to have been killed in an accident is, nevertheless, found alive, see (27).

- (27) Schaktet ligger 60 meter under markytan och strax ovanför det utrymme där den 24-årige gruvarbetaren Georg Hainzl återfanns *levande* efter att ha suttit instängd i 10 dagar.
'The shaft is located 60 metres below the surface and right above the space where the 24-year-old miner Georg Hainzl was found alive after having been entombed for 10 days.'

Uses like (26) are rather common in the corpus, while uses like (27) are rare. According to Bolinger (1967) and Telemann et al. (1999), adjectives in an attributive position often refer to the function of the referent, while adjectives in predicative position concern qualities of the referent, regardless of function. *levande* 'alive', which is more common as attributive, would then describe the referent relating to its qualities as, for instance, *författare* 'author' or *konstnär* 'artist' (examples from the corpus), while *död* 'dead' would to a greater extent describe the full referent, the human being behind the nominal phrase *en kvinnlig pilot* 'a female pilot' or *morfar* 'grandfather' (examples from the corpus). According to the intuition of the author, this is in accordance with how *levande* 'alive' and *död* 'dead' are used. If a female pilot is dead, her whole being is gone. But if an artist is described as *levande* 'alive' (in a metaphorical sense), this property mainly concerns her oeuvre/her artistic qualities.

6.2 The domains

The corpus samples have been categorised and sorted according to whether the sense of *levande* 'alive' and *död* 'dead' can be described as metaphorical or non-metaphorical. Non-metaphorical sense is identical to *levande*_{BIO} and *död*_{BIO}, while metaphorical sense subsumes the other senses. In Table 3, the numbers are shown.

Table 3. Balance of non-metaphorical and metaphorical sense in the corpus.

| | <i>levande</i> 'alive' N=598 | <i>död</i> 'dead' N=697 |
|------------------------|------------------------------|-------------------------|
| Non-metaphorical sense | 37% | 79% |
| Metaphorical sense | 62% | 21% |
| Non-categorised | 1% | 0% |
| Total | 100% | 100% |

From Table 3 it is clear that usages of *levande* 'alive' and *död* 'dead' differ widely in terms of metaphorical uses. Metaphorical use is by far the most frequent in the corpus for *levande* 'alive'. Nearly 2/3 of the uses of *levande* 'alive' involve the metaphorical sense. For *död* 'dead', the opposite is true: non-metaphorical use is definitely the most common in the corpus. 4/5 of the uses of *död* 'dead' involve the non-metaphorical sense. The explanation of this phenomenon is probably that *levande* 'alive' is redundant information in most cases where the non-metaphorical sense could be used. The high frequency of non-metaphorical *död* 'dead' is supposedly due to the fact that *död* 'dead' is marked and has a high information value.

The samples where *levande* 'alive' occurs in its non-metaphorical sense relate to referents that are human beings, animals, plants and micro-organisms. The balance between these referents can be seen in Table 4.

Table 4. The balance of referents that are described by non-metaphorical *levande* 'alive'.

| Type of referent described as <i>levande</i> 'alive' | Frequency N=221 |
|--|-----------------|
| Human beings | 58% |
| Animals | 24% |
| Plants | 3% |
| Micro-organisms | 4% |
| Unspecified | 11% |
| Total | 100% |

Samples about animals involve contexts about transportation across nation borders in relation to legislation, as in the sample shown in (28).

- (28) Bakgrunden till de stränga regler för hantering av *levande* importerade kräftor är alltså att signalkräfter och andra amerikanska kräftarter alltid utgör ett hot mot flodkräftan eftersom den har pestsvampen med sig i skalet och överför sjukdomen till flodkräftan.

'The strict rules regarding the handling of live imported crayfish should be understood against a background where the American species always pose a threat to Swedish crayfish since it bears the plague in its shell and transmits the disease to the Swedish crayfish.'

Animals may serve as food, and as such, the animals leave one category (live beings) for another category (food). Food is prototypically not alive. Although there is an obvious connection between meat (food) and a live being, this connection seems to be denied to some extent in the human mind. In the elicitation test, two pictures, one of a live hen and one of a chicken drum-stick were organized as a pair. The sight of the two pictures mostly aroused laughter among the informants. The laughter may be interpreted as a way of hiding feelings of guilt. Several informants elaborated on this and made comments like "When you see it like this... you lose your appetite..."

Still other uses of non-metaphorical *levande* refer to living creatures in general ("unspecified" in Table 4), including expressions such as *allt levande* 'all that is alive', *levande varelser* 'living creatures', and *levande material* 'living matter'.

It is interesting to see that *levande* 'alive' modifies animals nearly half as often as it modifies humans in the corpus, although newspaper text has so much more text on humans compared to animals. Both for humans and animals, being alive is part of the prototype. The reason that animals are nevertheless described as *levande* 'alive' is probably that live animals form a topic in texts on customs and legislation (8 of the samples are from the same article on legislation on importing crayfish, see sample (28) above). The animals are described more as goods, for which being alive is not part of the prototype.

The samples where non-metaphorical *levande* 'alive' nevertheless is used about humans, relate, for instance, to people discovered alive after accidents, as was the case in (27) in the preceding section, or people who have been buried alive or burnt alive, see (29).

- (29) Enligt samtida källor brändes de *levande* på berget, med ansiktena vända mot Solberga prästgård.

'According to contemporary sources, they were burned alive on the mountain, with their faces turned towards Solberga vicarage.'

In the context, to be burnt alive is non-expected, hence the need to spell it out. Other uses involve collocations such as *levande uppslagsbok* 'walking encyclopaedia' which was discussed above. Still other uses where non-metaphorical *levande* 'alive' describes humans involve people sharing a canonical encounter, as opposed to recordings/reproductions. A rather substantial proportion of the samples involve metonymical expressions such as *levande musik* 'live music', which are related to *levande människor* 'live people'. The balance of the various uses is shown in Table 5.

Table 5. The balance of uses where *levande* 'alive' describes humans.

| Type of use where <i>levande</i> 'alive' describes humans | Frequency N=128 |
|--|--------------------|
| Metonymical expression related to humans | 13% |
| Expressions of the <i>levande uppslagsbok</i> 'walking encyclopaedia'-type | 23% |
| Other uses | 63% |
| Total | 99% |

It is interesting to note that the metonymical expressions of the type *levande musik* 'live music' together with the expressions of the type *levande uppslagsbok* 'walking encyclopaedia' form a rather large part (36%) of the uses in which *levande* 'alive' describes humans. In these uses, *levande* 'alive' does not modify a noun for which the prototype includes that 'it is alive' (*musik* 'music', *uppslagsbok* 'encyclopaedia' etc.)

The relative frequency of the types of referents described as *död* 'dead', is shown in Table 6.

Table 6. The balance of referents that are described by non-metaphorical *död* 'dead'.

| Type of referent described as <i>död</i> 'dead' | Frequency N=548 |
|---|-----------------|
| Human beings | 92% |
| Animals | 7% |
| Plants | - |
| Micro-organisms | 1% |
| Unspecified | 0% |
| Total | 100% |

As can be seen in Table 6, non-metaphorical *död* 'dead' modifies nouns referring to humans in the great majority of samples. Animal referents are few, and referents formed by plants and micro-organisms are even fewer. Referents that are unspecified are rare, too. The type of referents probably mirrors the balance of general newspaper text about human beings vis-à-vis text about animals more accurately than was the case for *levande* 'alive', see Table 4. A comparison between Table 4 and Table 6 reveals a difference between the referents non-metaphorical *levande* 'alive' and non-metaphorical *död* 'dead' are used to describe. Non-metaphorical *levande* 'alive' describes humans less than non-metaphorical *död* 'dead', and when it does, two special constructions are included: one consists of metonymical expressions such as *levande musik* 'live music' and one is a use in which the noun has a metaphorical sense, as *levande uppslagsbok* 'walking encyclopaedia'. Further, *levande* 'alive' describes more animals, plants, micro-organisms and unspecified referents (such as *allt levande* 'all alive') compared to *död* 'dead'. The reason for the differences is probably the fact referred to above that *levande* 'alive' offers redundant information for human beings.

The metaphorical uses of *levande* 'alive' and *död* 'dead' have slightly different domains. For metaphorical *levande* 'alive', the domain of artistic expression, culture and tradition is the greatest. For metaphorical *död* 'dead', place is the greatest domain (followed by artistic expression). As has been mentioned above, electrical devices are described as *död* 'dead', but not as *levande* 'alive', and the same goes for heats (races); these are described as *död* 'dead', but not as *levande* 'alive'. Humans can be described by metaphorical *levande*, as in (30), but to use *död* 'dead' in this way is rare.

(30) För människan är bara *levande* om hon erkänner sin delaktighet i andras liv, det vill säga i historien, i skulden, i en gudom som bara gör sig påmind genom sin frånvaro.

'Because human beings are only alive if they admit their part in other people's lives, that is, in history, in guilt, in a divinity that only makes itself reminded through its absence.'

In (30), a human is described as *levande* 'alive' if (and only if) he or she admits that she has influence on other people's life.

6.3 *Levande* 'alive' and its opposites - *död* 'dead' and its opposites

In the light of the results presented so far, it is possible to refine the map of the relation of oppositeness between *levande* 'alive' and *död* 'dead', which was first shown in [Figure 3](#). Now, more opposites can be added to the three senses of *levande* 'alive', as well as to the four senses of *död* 'dead'.

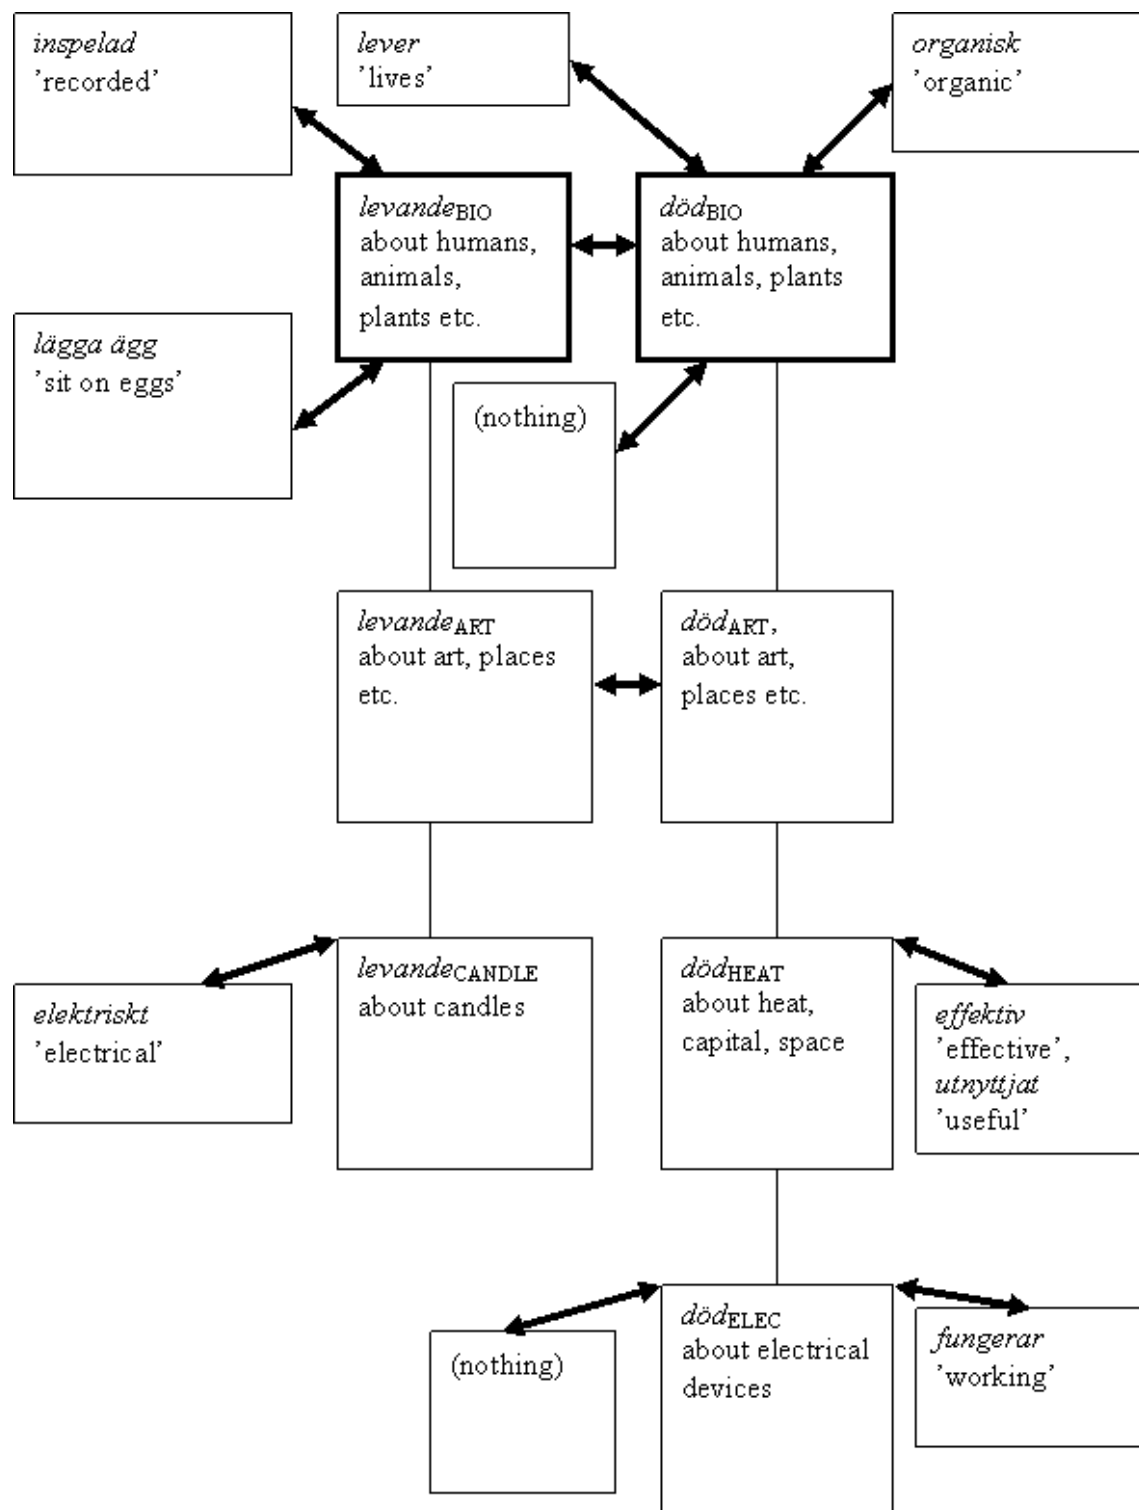

Figure 4. Updated map showing relations of oppositeness between *levande* 'alive' and *död* 'dead' and other words.

Levande 'alive' and *död* 'dead' are each other's opposite in some cases (*levande_{BIO-ART}* and *död_{BIO-ART}*) but not in other cases. *Levande_{BIO}* also has *inspelad* 'recorded' as an opposite, to distinguish live performances from recorded ones (e.g. music from CDs). *Levande_{BIO}* also takes a paraphrase, for example including *lägga ägg* 'lay eggs' as an opposite, to separate mammals that *föder levande ungar* 'give birth to live young/are viviparous' from non-mammals (in this case birds). [3] *Levande_{CANDLE}* 'alive' about candles has *elektriskt* 'electric' as its opposite. *Död_{BIO}* also has *lever* 'lives' or "nothing" as its opposite (the opposite of *en död man* 'a dead man' is just *en man* 'a man'). Further, *död_{BIO}* takes *organisk* 'organic' as its opposite, for the distinction between *döda ting* 'dead things' and *organiskt material* 'organic material' (substances that have had life, but now are dead). *Död* about

heat, capital and space takes *effektiv* 'effective' or *utnyttjad* 'used' as its opposite. *Död*_{ELEC} about technical devices takes either "nothing" as its opposite (the opposite of a *död dator* 'dead computer' is simply a *dator* 'computer'), or needs a paraphrase such as *som fungerar* 'which works'. Figure 4 shows a complex pattern for the opposites related to *levande* 'alive' and *död* 'dead' respectively. Adjectives (*elektrisk* 'electrical'), participles of a verb form (*inspelad* 'recorded'), verbs (*fungerar*), verb phrases (*lägga ägg*) and "nothing" form opposites to *levande* 'alive' and *död* 'dead', which in the first place belong to different word classes. One sense (*levande*_{BIO}) may have more than one opposite, which challenges the idea that a criterion for polysemy is that another opposite indicates another sense (Croft & Cruse 2004).

7. Concluding discussion

In this section, the results will be reviewed and related to earlier research and theoretical implications.

It is clear that *levande* 'alive' and *död* 'dead' do not show distributional symmetry. Thus, Cruse's (1986) claim that opposites show distributional symmetry does not hold for the pertinent pair. This agrees with Murphy (2003) and Krishnamurty (2002) who write that opposites/antonyms do not have identical distribution. Further, the words do not describe the same nouns (things), as Muehleisen (1997) suggests good opposites should.

Regarding the discussion of whether concepts are included in the relation of opposites, the present study supports the idea that they should be included. An argument for this standpoint is the fact that, strictly speaking, *död* 'dead' and *levande* 'alive' do not belong to the same word class. Furthermore, *död* 'dead' not only takes *levande* 'alive', but also *lever* 'lives' as its opposites. *Levande* 'alive' and *lever* 'lives' belong to the same conceptual family, but are different words, belonging to different word classes. The study strengthens results from Fellbaum (1995) and Nowak (2006), but challenges results presented in Miller et al. (1990), Gross & Miller (1990), and Murphy (2003). In this, the study supports the theoretical assumption of cognitive linguistics that conceptual knowledge and lexical knowledge are not separate but integrated with each other.

The fact that the claims for *levande* 'alive' and *död* 'dead' include Motion is in accordance with another theoretical assumption in cognitive linguistics, namely that meaning is associated to experience-based conceptual archetypes (Langacker 2002). A third assumption, that domains are part of the meaning, is also supported; the base domains SPACE and TIME (Langacker 1987) are implicit, since both space and time are essential for motion. For change, too, time is essential. The base domains SPACE and TIME are connected to human embodied experience. The domain ENERGY is also part of the semantics.

A more cognitive approach to opposites may be suggested. *Levande* 'alive' and *död* 'dead', a pair that certainly has "the clang" and forms a prototypical opposite pair, probably have many qualities in common with other opposites. Some aspects of the semantics, namely the claims that capture the senses, and the relation between senses of one of the words on the one hand and the remaining word on the other hand, show symmetry. Distribution patterns of the two words are not symmetrical. The domains of the words do not show symmetry or strict similarity. The issues of markedness, information value, Aktionsart, and the prototype of the words that the pertinent words combine with are factors that may be taken into consideration in order to account for the asymmetries. Other, less prototypical opposites than *levande* 'alive' and *död* 'dead' may display even more asymmetries

and differences. It is assumed, as Justeson & Katz (1992) suggests, that words may be more or less antonymous (opposite) rather than simply antonymous or not antonymous (opposite).

Acknowledgements

The research has been financed by Anna Ahlströms and Ellen Terserus stiftelse, by Åke Wibergs stiftelse and by INTAS.

The author would like to thank the following people for valuable comments: An anonymous reviewer, Staffan Hellberg, Annika Johansson, David Jones, Lynne Murphy, Jan Svanlund and Heli Tissari. Your input has improved the content considerably. The responsibility for obscurities that remain is of course mine.

Notes

[1] <http://spraakbanken.gu.se>

[2] It should be noted that the use of *lopp* 'heat/race' is metaphorical here. This seems to be the most common way to use *dött lopp* 'dead heat'.

[3] There are other forms of propagation than to lay eggs, but for some reason, laying eggs is mostly what is contrasted to being viviparous.
